Ropes, Arthur Reed ("ADRIAN ROSS"), English dramatist and poet: b. Lewisham, Kent, 23 Dec. 1859. He was educated at Cambridge. Among his numerous dramatic productions are: 'Faddimer' (1889); 'In Town' (1892); 'Gaiety: a Greek Slave' (1898); 'San Toy' (1899); 'The Messenger Boy' (1900); 'Gaiety: a Country Girl' (1902). He has also published: 'Poems' (1884); 'Short History of Europe' (1889); 'On Peter's Island' with Mary E. Ropes (1901); etc.

Ropes, John Codman, American military historian: b. Saint Petersburg, Russia, 28 April 1836; d. Boston, Mass., 28 Oct. 1899. He was graduated from Harvard in 1857, and from his admission to the bar in 1861 until 1870, practised law in Boston, but devoted the remainder of his

life to historical writing. As the founder of the Military Historical Society of Massachusetts he started the movement for the collection of historical data relating to the Civil War by the United States Government. He spent much time also in the collection of material bearing upon the life of Napoleon. His published books are: 'The Army Under Pope' (1881); 'The First Napoleon' (1885); 'The Campaign of Waterloo' (1893-4); and 'The Story of the Civil War' (1894-9).

Rops, rôps, Félicien, Belgian artist: b. Namur 1833; d. 1898. His illustrations for the 'Crocodile,' a journal published at Brussels, appeared for the first time in 1855 and established his reputation as an artist of original genius. But his main employment from that date was book illustration, and many novels of the day have been published with his brilliant pictures, which reflect the cynical spirit of some modern literature with great imaginative power. Many of his drawings are, however, too sheerly naked and unreserved to be pleasing. But his etchings are almost unique in power of execution, especially the series known as 'Sataniques' which while they belong to decadent art are masterpieces of technique. He founded the International Society of Etchers at Brussels and has had a great influence on modern schools of art in Europe. Consult Ramiro, 'Catalogue de l'Œuvre Gravé de Félicien Rops' (1887).

Roque, rôk. Croquet and roque are two varieties of the same game. Croquet is played upon a grass lawn on which the boundaries of a rectangular court are indicated by a chalk line, or by a slight ridge. Roque is played on a specially prepared earth court, with the corners cut off diagonally, the borders curved upward and bounded by india-rubber cushions. In each game the object of each player is to drive his playing ball, by means of a mallet, through a series of iron arches, each in its proper order, and from the proper side, and to strike a peg driven into the ground for that purpose, in the fewest number of "turns" at play. After the first stroke a player may continue, if he has by that stroke either run through the proper hoop or hit another ball with his. In the former case he may try at another hoop, in the latter he must take his own ball to that which he hit with it, and, after placing them side by side, hit his own ball in such a manner that the impact of the blow will move the two. After that he may attempt to run through the next arch, or to hit some other ball with his. Should he fail in any shot he loses his "turn," and his opponent takes up the play.

In croquet the size of the court has varied a good deal, with a tendency to become smaller; 80 feet long by 45 feet wide is a usual measurement, but that depends upon the number of hoops or arches used, which may vary from six to ten; and upon their position with regard to each other. The preferable arrangement is that known as the 'Championship' or "Six hoop" plan. The croquet balls are three and five eighths inches in diameter, and weigh fourteen and a half ounces each. The mallets vary from two feet nine inches to three feet in length. The width of the arch of the hoops is three and three quarter inches. Any number of couples of players may play, up to four.

Roque is a much more scientific variety of the game. The court is 72 feet long and 32 feet wide, rectangular, with each corner, for eight feet, cut off diagonally. The surface is well rolled dirt sprinkled with sand. It is surrounded with rubber cushions, so that caroms can be made off the balls the same as they are in billiards. All the arches, of which there are eight, are three and a half inches in diameter. In the centre of the court is a tunnel or cage the arch of which is three and one eighth inches, and it is 18 inches in length. The balls are of hard rubber and are three and a quarter inches in diameter. The mallets' heads are seven and a half inches long, by two and a quarter to two and a half inches in diameter, with a handle from 8 to 15 inches long. Only two players play against each other, each playing two balls.

Both games have elaborate rules which must be studied carefully to obtain a full appreciation of either game. Croquet is the descendant of the old game of "Pall Mall," popular in England up to 1700; but that game died completely out of knowledge, except in a remote corner of Ireland, from whence it emerged as croquet in the middle of the 19th century. It became a very popular game in Great Britain, from whence it passed to America and became equally popular. In both countries it suffered a partial eclipse on the introduction of lawn tennis. It is played in the west on grass as croquet and in the east on the courts above described as roque. For croquet rules, etc., consult 'The Complete Croquet Player' (1896); for roque consult Spalding, 'Athletic Library' (1893).

Roquefort, rôk-fôr, France, a village in the department of Aveyron in the vicinity of which large quantities of the well known variety of cheese of the same name is made from ewe milk. Pop. (1901) 855.

Roqueplan, Joseph Etienne Camille, zhô-zêf â-tê-ên kä-mêl rôk-plân, French painter: b. Mallemort, Bouches-du-Rhône, France, 1802; d. 1855. He studied at Paris under Gros and Pujol. His two pictures exhibited at the Salon of 1827 and illustrative of Sir Walter Scott's writings won him a place among the leaders of modern French painting. His most remarkable works include 'The Amateur Antiquary'; and 'The Well near the Tall Fig-Tree.' He was equally successful in genre and landscape, and his faithful transcripts of Pyrenean scenery are among the most delightful of modern French pictures.

Roquette, rô-kê't, **Otto**, German author, critic and poet: b. Krotoschin, Posen, 19 April 1824; d. Darmstadt 18 March 1896. Educated at Heidelberg, Berlin, and Halle, he taught at Dresden until his 39th year, at Berlin in 1862-9, and then in the Darmstadt Technische Hochschule, where he was professor of German language, literature, and history. He wrote an excellent history of German literature (1872; 3d ed. 1879); the novels, 'Im Haus der Väter,' 'Das Buchstabirbuch der Leidenschaft,' and 'Die Prophetenschule'; two volumes of dramatic poems (1867-76), and lyrics and tales.

Roraima, rô-râ'ê-mä, a mountain of South America, in lat. 5° N., on the boundary of British Guiana and Venezuela. It is 8,740 feet high, the top forming a rugged rocky plateau, and the steep rocky sides render the summit almost

inaccessible. It was ascended in 1884 by Mr. Everard im Thurn. The flora and fauna of the summit are scanty.

Ror'er, Sarah Tyson, American teacher of domestic science: b. Richboro, Pa., 18 Oct. 1849. She was graduated from the academy at East Aurora, N. Y., and was married in 1871 to W. A. Rorer. She was for many years principal of the Philadelphia School of Domestic Science, and has lectured widely. She was editor and part owner of 'Table Talk' in 1886-92, edited 'Household News' in 1893-7, and since then has been on the editorial staff of the 'Ladies' Home Journal.' She is also director of the Pennsylvania Chautauqua School of Domestic Science. Her publications include: 'Mrs. Rorer's New Cook Book'; 'How to Use a Chafing Dish'; 'Colonial Cookery'; 'A Book on Diet and Cookery'; etc.

Ror'ic Figures (Fr. *figures roriques*, from Lat. *ros*, dew), a name applied to certain curious images rendered manifest upon breathing on polished solid surfaces, when these have been previously exposed to contact or close proximity of the objects thus represented, and usually at the same time acted upon by light, heat, or electricity. The singularity of these phenomena is, that they consist usually in the production at the first of a sort of latent or invisible image, but this may afterward be developed or brought out, somewhat in the manner of photography.

Rorkes (rôrks) Drift, Africa, a post station on the Tugela River, in Natal, memorable for the heroic defense of a British force of 80 men under Lieutenants Bromhead and Chard. They were guarding the hospital and the commissariat, when they were attacked by a Zulu force of 4,000, the night of 22 Jan. 1879. The British used biscuit boxes and rice bags for a barricade, and kept the enemy at bay until relieved the morning of the 23d. Six times in succession the little force drove out Zulu warriors who had got within the barricade.

Rorqual, rôr'qwal, a name which is of Scandinavian origin, and signifies a whale having longitudinal furrows on the belly. As generally employed, it comprises the finback, sulphurbottom, and humpback whales, or the subfamily *Balanopterinae*, exclusive of the genus *Rhachianectes*. The sulphurbottom is a particular kind of finback, characterized by great size, a mottled coloration, and various osteological peculiarities. In the North Atlantic there are three species of finbacks, one species of sulphurbottom, and one species of humpback. The finbacks are the common finback (*Balanoptera physalus*), the pollack whale (*B. borealis*), and the little piked whale (*B. acuto-rostrata*). The whale which is most frequently seen on the east coast of the United States, and of which stranded individuals are found every year at different points, is the common finback, *B. physalus*. It is from 60 to 70 feet long when full-grown, and is readily distinguishable by its gray and white striped whalebone, gray upper surfaces, and white belly, and under surfaces of pectoral fins and flukes. The dorsal fin, which is rather more than a foot high, is situated a little in advance of the last fourth of the length of the body. Though numerous

species of finbacks and humpbacks have been described from different parts of the world, the five forms above mentioned are everywhere recognizable. If others exist they at least resemble these very closely. The sulphurbottom feeds on small crustaceans, and the finbacks and humpbacks on various fishes, such as the cod, pollack, herring, capelin, etc. They all engage in seasonal migrations. During the summer months great numbers congregate about Newfoundland, Iceland, and the north of Norway. For gray whale, or hardhead, and further information relating to finbacks and humpbacks, see WHALE.

Rory O'More, rô'ri ô-môr', a novel by Samuel Lover, published in 1836. In spite of its stilted style and improbable incidents, this story is valuable in its delineation of Irish character, and in its picture of the Irish uprisings at the close of the 18th century.

Rosa, rô'zä, Carl Augustus Nicholas (originally ROSE), German opera conductor: b. Hamburg 22 March 1842; d. Paris 30 April 1889. He studied violin playing at Leipsic, made a tour at 12; and gained the violin prize at the Paris Conservatoire. He came to America as conductor of Mr. Bateman's concert tour, and met the singer Euphrosyne Parepa, to whom he was married in 1867. His opera company, headed by Mme. Parepa-Rosa, included Wachtel, Santley, Ronconi, and Formes. In 1871 he became manager of the Carl Rosa Opera Company in London and produced operas in English both in London and in the provinces until his death.

Rosa, rô'sä, Salvatore or Salvator, Italian painter: b. Renella, near Naples, 20 June 1615; d. Rome 15 March 1673. His eldest sister having married Francesco Francanzano, a painter, Salvator from him acquired a taste for art. He then became a pupil of Falcone and Ribera (q.v.). But his taste was formed by the study of nature among the wilds of the Apennines rather than by other artists. During one of his rambles in the Abruzzi he was seized by brigands with whom he is said to have associated for some time, but left them at last and went to Naples, where he worked in such want that he was often obliged to sell his pictures to the meanest hucksters and for a pittance. At last one of his pictures was observed by the painter Lanfranco, who recommended Salvator to notice, and procured him patronage. He removed to Rome, where he established his reputation. In 1647, when the revolt under Masaniello occurred, he joined *La Compagnia della Morté*, which Falcone commanded, and on the defeat of the cause he returned to Rome, where he was not, however, permitted to remain. He went to Florence, where he was patronized and employed by the grand duke and other members of the family of Medici. At length, returning to Rome on the death of his enemies, he painted many pictures for the churches in that city. His great ambition was to be a famous historical painter, but he is actually best known as a painter of landscapes and battles. His landscapes present wild and desolate scenery; with rocks rising like towers, broken, splintered tree trunks waving their leafless arms; storm and lightning convulse the heavens, and the figures introduced are those of bandits, soldiers, or witches. Among

his extant works are: 'Prometheus,' 'Belisarius,' 'St. Roche Wounded,' some landscapes and battle-scenes, in Rome; 'Jesus Disputing with the Doctors,' 'Daniel in the Lions' Den,' 'Jesus Walking on the Water,' in Naples; 'Souls in Purgatory,' in Milan; 'Conspiracy of Catiline,' and his own portrait, in Florence; 'The Soldiers of Gideon,' 'Bandits in Council,' 'St. Jerome in the Desert,' and some landscapes, in Munich; 'Mercury and the Woodman,' 'Landscape with Figures,' in the National Gallery; 'Moses at the Rock,' 'Halt of the Soldiers,' at Hampton Court; 'Prometheus,' 'Sisyphus,' at The Hague; 'Regulus,' 'Cadmus,' at Copenhagen; 'The Prodigal Son,' in St. Petersburg; 'The Angel Raphael' and 'The Young Tobias,' 'The Shade of Samuel Appearing to Saul,' in the Louvre; 'Jesus in the Garden of Olives,' 'Resurrection of Christ,' in Toulouse. He was distinguished as a poet and musician and his satires and other poems have been often printed.

Ro'sa America'na, in numismatics, the name applied to a coinage issued in 1722 by Great Britain for America of a mixed metal resembling brass, and called Rosa Americana or Wood's money, after its manufacturer, William Wood. The royal letters patent described this money as two-pence, pence, and half-pence. See NUMISMATICS.

Rosa, Monte, mōn'tē rō'sā (ancient MONS SYLVIVS), a mountain of the Alps (q.v.), on the boundary between Italy and Switzerland, near the Matterhorn, and about 40 miles east of Mont Blanc (q.v.). It is formed by the union of several mountain ridges. Where the ridges meet four chief angles are formed, the one on the northeast, which is most precipitous, enclosing the glacier of Macugnaga, another on the northwest originating the great Gorner glacier or glacier of Zermatt, a third on the southwest containing the glacier of Lys, and the fourth on the southeast occupied by several large but less prominent glaciers. The loftiest peak, Dufourspitze, 15,217 feet in height, was first ascended in 1855. There are three other peaks, respectively 15,132, 15,005, and 14,965 feet high.

Rosaceæ, rō-zā'sē-ē, the Rose family, a natural order of herbaceous plants, shrubs, and trees, with alternate simple or compound leaves accompanied at their base by two persistent stipules. Many of our commonest edible fruits belong to this order, such as strawberries, raspberries, brambles, plums, apples, quinces, cherries, almonds, peaches. They have a calyx of one sepal, with four or five divisions, and the corolla has as many petals as the calyx has divisions, but is sometimes wanting. The stamens are generally very numerous and distinct, and are inserted with the petals round the ovary. The pistil presents various modifications. Sometimes it is formed of a single carpel or several entirely free and distinct carpels, placed in a tubular calyx. Sometimes these carpels adhere by their outer side to the calyx; sometimes they are united, not only to the calyx, but to each other; and sometimes they are collected into a kind of capitulum or head. The fruits, consequently, are highly varied, and their modifications afford the chief distinguishing marks of the sub-orders. In Engler and Prantl's 'Pflan-

zenfamilien' the *Rosaceæ* are divided into 13 tribes, and these tribes are grouped in six sub-orders. The sub-order *Spiræoideæ* comprises the tribes *Spiracæ* (queen-of-the-meadow), *Quillajæ* (soap-tree), and *Holodisceæ*. The tribe *Pomoideæ* (apple, pear, etc.), forms a sub-order by itself. Under the sub-order *Rosoideæ* are classed the tribes *Kerrieæ* (*Kerria japonica*), *Potentillæ* (raspberry, strawberry, etc.), *Cercocarpeæ*, *Ulmariæ*, *Sanguisorbæ* (lady's-mantle, etc.), and *Roseæ* (roses). *Neuradoideæ*, *Prunoidæ* (sloe, etc.), and *Chrysobalanoidæ* (cocoa-plum), are tribes each of which constitutes a sub-order. The plants of this order are chiefly found in the cold and temperate climates of the northern hemisphere.

Rosacea, **Acne Rosacea**, or **Gutta Rosea**. See ACNE.

Rosales, rō-sā'lēs, Philippines, pueblo, province of Nueva Ecija, Luzon; on a tributary of the Agno River, two miles from its junction with the Agno; 38 miles north of San Isidro. It is connected by highway with Manila and with towns to the north. Pop. 11,519.

Rosamond, rōz'a-mōnd, English mistress of Henry II., commonly called "Fair Rosamond." She was the daughter of Walter, Lord Clifford, became the mistress of Henry II., and died probably about 1176. The king is said to have set apart for her residence a building surrounded by a labyrinth at Woodstock. The intrigue was finally discovered by the jealous Queen Eleanor, who forced her to drink poison. These details, however, have no historic basis. She was buried in the chapter-house of Godstowe nunnery, where her tomb was long to be seen.

Rosaniline, a derivative of aniline (q.v.), the base of magenta, fuchsine (qq.v.), etc. It is a colorless substance, having the formula $C_{20}H_{21}N_3$. Many of its crystalline salts are of very brilliant colors.

Rosario, rō-sā'rē-ō, Argentina, in the province of Santa Fé, on the right bank of the Paraná, lies 160 miles northwest of Buenos Ayres. It is the second city of the republic in commercial importance, and the centre of the entire trade for the 11 provinces lying between Paraná and the Andes. Many handsome buildings are of recent construction, such as the new courts, theatre, banks, and hotels. Other improvements, such as telephone, and a new railway from the capital opening up a new and vast territory, adduce to its rapid development and progress, and it is virtually a rival of Buenos Ayres. Exports, agricultural products, were valued at more than £5,850,000. Pop. (1900) 112,461.

Rosario, Philippines, pueblo, province of Batangas; on the southeastern coast at the mouth of the Rosario River; 13 miles northeast of Batangas, the provincial capital. It is an important road centre. During the last insurrection the town was destroyed by the insurgents. Pop. 12,450.

Also the name of two smaller pueblos in Luzon: (1) in the province of Cavite, on the Manila coast road, eight miles southwest of the town of Cavite, pop. 6,390; (2) in the province of Unión, situated in a mountainous district, 30

miles southeast of San Fernando, connected with coast highway; pop. 2,250.

Rosary of the Blessed Virgin Mary, a popular and highly approved form of devotion in the Roman Catholic Church. It consists in the recital of 15 decades of Aves (see AVE MARIA) each decade preceded by a Paternoster and followed by a Gloria (see DOXOLOGY); as the prayers are said, they are counted off on a string of beads. Five decades form a chaplet and in each chaplet are contemplated events or "mysteries" connected with the life of Christ: the mysteries of the first chaplet are, the Annunciation, Visitation, Birth of Christ, his Presentation in the Temple, and his Finding there: these are the Joyful Mysteries. In the other chaplets are contemplated the Five Sorrowful Mysteries — the Agony in the Garden, Scourging, etc.; and finally the Five Glorious Mysteries — Resurrection, Ascension, etc. The Rosary of 15 decades was introduced by St. Dominic in the 13th century.

Rosary Sunday, the first Sunday in October; a feast instituted by Gregory XIII. for the Confraternity of the Rosary, and made of universal observance after the victory of the Emperor Charles VI. over the Turks at Lepanto in 1571, in gratitude to the Blessed Virgin. This victory is supposed to be in answer to the prayers of the Fraternity of the Rosary, a Roman Catholic order established in the 15th century for the purpose of averting public calamity by the means of prayers. An impetus was also given to the devotion of the rosary by Leo XIII., who enjoined its daily use in public during October. Roses are blessed and distributed as souvenirs, and the rosary is recited continually during the day.

Rosas, Juan Manuel de, hoo-än' mä-noo-ël dā rô'säs, Argentine dictator: b. Buenos Ayres 30 March 1793; d. near Southampton, England, 14 March 1877. He was descended from a noble family of Spain and first came into public notice as leader of the republicans against the aristocratic party of the Unitarios. He was commander of the police of Buenos Ayres in 1826, but the revolution headed by Lavalle forced him to retire. He succeeded a little later in overcoming Lavalle and becoming governor, 1829-32. Though forced out of office he held control of the army and in 1835 became dictator for five years. His appointment was twice renewed and until 1852 no meetings were held of the national congress or the constituent assembly. Rosas exercised a despotic rule and attempted to annex the neighboring states by force under the pretext of their formerly belonging to the vice-royalty of Buenos Ayres. He took advantage of the rivalry of Oribe and Rivera to intervene in the affairs of Uruguay, made an unsuccessful invasion in 1839 after the fall of Oribe's government and repeated the attack in 1843. A long siege followed and the closing of the Paraná to navigation, and the violation of the treaties of 1828 and 1840 finally led to combined interference on the part of England and France. Buenos Ayres was blockaded, but little was effected save the opening of the Paraná, as the river provinces could not be induced to rise against Rosas. England withdrew in July 1848 and France six months

later. The opposition party against Rosas was growing more powerful, however, and the treaty of 1849 which denied to the neighboring provinces navigation privileges of the Plate, the Uruguay, and the Paraná finally brought to his opponents the support of Brazil, and Rosas was defeated at Monte Caseros, 3 Feb. 1852. He made his escape to England, where he lived the remainder of his life. The Argentine congress passed sentence of death upon him in 1861 as "a professional murderer and robber."

Roscelin, rös-ël-än, **Rousselin**, or **Rucelin**, **Jean**, French theologian of the 11th century: b. probably in the diocese of Soissons. He was educated at Rheims, and came into public notice while canon of Compiègne by citing Anselm as supporting his view of the Trinity, which in effect conceived God as existing as an individual and consequently the Trinity as three Gods. The synod of Soissons in 1092 compelled Roscelin to recant, after receiving from Anselm a refutation and denial of Roscelin's position and claims. Continuing to teach his peculiar views he was deposed. He went to England to attack Anselm, then archbishop of Canterbury, at the opportune moment of his difference with the king, but failing in his purpose returned to France. Later he settled at Tours and entered into a controversy with Abelard, his former pupil, on the grounds taken by the latter in maintaining the unity of the Trinity. After this controversy Roscelin disappears from history. Of his writings only a letter to Abelard is extant. In the history of philosophy he is classified as a nominalist and in theology as a tritheist.

Roscher, rōsh'ēr, **Wilhelm**, German political economist: b. Hanover 21 Oct. 1817; d. Leipsic 4 June 1894. Following Savigny, who introduced into Germany the historical treatment of jurisprudence, Roscher broke with the theoretical economists and entered on the study of the history of economics, treating political economy less as an abstract science and more as a branch of history, and making economic fact and past development rank mere economic ideas and theories. From 1848 he was professor at Leipsic. His two great works are: 'System der Volkswirtschaft' (1854-81); and 'Geschichte der Nationalökonomik in Deutschland' (1874).

Roscius, rōsh'ŭs, Roman actor: b. Colonium, near Lanuvium, 134 B.C.; d. about 61 B.C. He was born a slave and early adopted the histrionic profession for his master's profit. His success on the stage was phenomenal. It is said that at one time he earned 1,000 denarii (about \$175) daily, and Pliny estimates his annual profits at 50,000,000 sesterces (about \$2,000,000). This may be exaggerated, but he was a favorite actor at a period when the Roman passion for the stage was at its height. He was easily enabled to purchase his freedom from his *peculium*, or perquisites as a slave, took the name of Quintus Roscius Gallus, and wore the emblem of equestrian rank, a gold ring, given him by Sulla. The Roman populace and nobles he moved with equal facility to tears or laughter by his irresistible histrionic power, for while he was a tragedian unparalleled in the history of the ancient Roman stage, he was also a comedian of fresh and natural humor. Cicero did not disdain to receive instructions from the great

actor, whom the first orator of Rome always spoke of in terms of affection and admiration.

Roscoe, rōs'kō, Sir Henry Enfield, English chemist: b. London 7 Jan. 1833. He was educated at University College, London, and at Heidelberg, making a special study of chemistry. He occupied the chair of chemistry at Owens College, Manchester, in 1857-87, since when he has been emeritus professor there. He was knighted in 1884, sat in Parliament for South Manchester in 1885-95, and in 1896-1902 was vice-chancellor of the University of London. He has received high honors from the universities and learned societies of England and has published: 'Investigations on the Chemical Action of Light' (1871); 'Lessons in Elementary Chemistry' (1871); 'A Treatise on Chemistry' (1878-89); 'The Hydrocarbons and their Derivatives,' with Schorlemmer (1881-92); etc.

Roscoe, William, English biographer: b. near Liverpool 8 March 1753; d. Toxteth Park, Liverpool, 30 June 1831. At 16 he was articled to an attorney in Liverpool, and this obliging him to study Latin, he read and made himself master of the Latin classics. He next studied the Italian and French languages, and in the former became uncommonly proficient. Having finished his clerkship, he was taken into partnership by an attorney of considerable practice and carried on the whole of his business. In 1777 he published a collection of some of his earlier poems and when the question of the slave-trade came uppermost Roscoe took a warm part in favor of its abolition, and joined Clarkson in his endeavors to that end. His 'Scriptural Refutation of a Pamphlet on the Licitness of the Slave-Trade' and his 'Wrongs of Africa,' appeared in 1788; and in 1796 he brought out the work which gained him celebrity, the 'Life of Lorenzo de' Medici, called the Magnificent' (1795), since translated into Italian, French, and German. About 1797 Roscoe retired from the practice of an attorney, and entered himself as a student of Gray's Inn, with a view to the bar. He published the 'Life and Pontificate of Leo X.' in 1805, and in 1806-7 represented Liverpool in Parliament. He had previously entered into business at Liverpool as a banker, a move which eventually landed him in great pecuniary difficulties. He was the author of several political pamphlets, and the mover and supporter of several public works in Liverpool. To the botanic garden and to the Athenæum he lent much effective assistance. Consult his 'Life and Correspondence' (1833) by his son, Henry Roscoe.

Rose, rōz, Chauncey, American philanthropist: b. Wethersfield, Conn., 24 Dec. 1794; d. Terre Haute, Ind., 13 Aug. 1877. In 1825 he settled in Terre Haute as a merchant, where by his investments in land he became wealthy. He was an active promoter of railroad interests and was especially interested in the Terre Haute and Indianapolis Railroad. Though legally entitled to the fortune of his brother John he disposed of almost the entire amount of \$1,600,000 in benevolent enterprises which he knew his brother to have favored, and later founded from his own fortune the Rose Polytechnic Institute to which he left the greater share of his estate.

Rose, Frank H., English engineer and journalist: b. Lambeth, England. He was educated in the London elementary schools and in the night classes, served as an engineer's apprentice in 1872-8, and then joined the Lambeth Society of Amalgamated Engineers. He gained a considerable influence over industrial thought of the day, was almost constantly an officer in the Amalgamated Engineers, living in Liverpool and in Manchester in 1893-1903 as a district organizer, since when he has entered upon a political and journalistic career.

Rose, George ("ARTHUR SKETCHLEY"), English dramatist and novelist: b. London, England, 19 May 1817; d. there 11 Nov. 1882. He was graduated from Oxford in 1845, took orders in the Church of England in 1848, and after holding several curacies became in 1855 a Roman Catholic. He then engaged in tutoring and later devoted himself to a literary career in which he achieved a considerable success. His 'Mrs. Brown' monologues were published in 32 volumes (1866-70) and enjoyed wide popularity. His other works include: novels, 'A Match in the Dark' (1878); and 'A Marriage of Conscience' (1879); plays, 'The Dark Cloud' (1863); 'How Will They Get Out of It?' (1864); 'Money Makes the Man' (1870); and also several works of travel, 'The Great Country, or Impressions of America' (1868); 'Out for a Holiday' (1870); etc.

Rose, rō'zē, Gustav, German mineralogist, brother of Heinrich Rose (q.v.): b. Berlin 28 March 1798; d. there 15 July 1873. He studied under Berzelius at Stockholm, in 1822 became keeper of the mineralogical collection in the University of Berlin, and in 1826 was made extraordinary and in 1839 ordinary professor of mineralogy in that institution. Beside several essays in Poggendorff's 'Annalen,' he wrote 'Elemente der Krystallographie' (1833); 'Ueber das Krystallisationsystem des Quarzes' (1846); 'Das krystallochemische Mineralsystem' (1852). With Humboldt and Ehrenberg he made in 1820 a journey to northern Asia, an account of which he gave in a work entitled 'Reise nach dem Ural, dem Altai und dem kaspischen Meer' (1837-42).

Rose, Heinrich, German chemist: b. Berlin 6 Aug. 1795; d. there 27 Jan. 1864. He first devoted himself to pharmacy, studied in Berlin, in Stockholm in 1819 under Berzelius, and from there went to Kiel, where he took his degree. In 1823 he became extraordinary and in 1835 ordinary professor of chemistry at Berlin. As a practical analyst in the department of inorganic chemistry he holds a high rank, and the result of his labors can be found in his memoirs inserted in the 'Annalen' of Poggendorff. His 'Manual of Analytical Chemistry' (1829) was translated into French, English, and Swedish. In 1844 he discovered a new metal in the tantalites of Bavaria which he called niobium.

Rose, rōz, Sir Hugh, LORD STRATHEARN, English diplomatist: b. Berlin 8 March 1803; d. Paris 16 Oct. 1885. He entered the British army in 1820, was military attaché to the Turkish army in 1840, was consul-general for Syria 1841-8, as secretary to Lord Stratford de Radcliffe was *chargé d'affaires* at Constantinople in 1852-4, and was commissioner at the French

headquarters during the Crimean war. He was sent to India in 1857 to command the Central Indian army, and virtually reconquered Central India. Though his campaign was overshadowed by that of Sir Colin Campbell, it is generally admitted that his operations were more skilful and brilliant than his chief's, on whose death he became commander-in-chief in India. He held the same post in Ireland 1865-70, was raised to the peerage in 1866, and made field-marshal in 1877.

Rose, Hugh James, English theologian: b. Little Horsted, Sussex, 1795; d. Florence 22 Dec. 1838. He was graduated from Trinity College, Cambridge, in 1817; and elected professor of divinity to the University of Durham in 1833. He was one of the leaders of the Oxford movement, and it was at his rectory, Hadleigh, Suffolk, in July 1833, that a resolution was made to publish 'Tracts for the Time.' 'He was,' says Dean Church, 'the most accomplished divine and teacher in the English Church. He was really a learned man. He had the intellect and energy and literary skill to use his learning. He was a man of singularly elevated and religious character: he had something of the eye and temper of a statesman, and he was profoundly loyal to the Church.' It is not too much to say that by his early death the Tractarian movement lost its balance wheel. See OXFORD MOVEMENT. Consult: Church, 'The Oxford Movement' (1891); Mozley, 'Reminiscences.'

Rose, Sir John, Canadian financier: b. Turiff, Aberdeenshire, 2 Aug. 1820; d. Caithness-shire 26 Aug. 1888. He was educated at King's College, Aberdeen, and in 1836 removed with his parents to Canada. He served as a volunteer during the rebellion of 1837, in 1842 was admitted to the bar, and soon established a large practice at Montreal. He entered Parliament as member for Montreal in 1857, and after the Union until his retirement in 1869 represented Huntingdon. He was solicitor-general in 1857, minister of public works in 1859, and in 1864 was appointed commissioner for the settlement of claims under the Oregon treaty with the United States. In 1867-9 he was minister of finance, then retired from office, went to England and engaged in banking. He represented the English government on a confidential mission to the United States which led to the treaty of Washington in 1870, and until his death was regarded as the unofficial representative of Canadian interests in England. He was created a baronet in 1872 and in 1886 became a privy-councillor.

Rose, Attar of. See ATTAR.

Rose-breasted Grosbeak. See GROSBEEK.

Rose-chafer. See GRAPE INSECT PESTS.

Rose Festival, a peculiar kind of festival which is celebrated annually on 8 June in some French villages. A similar gala-day is celebrated in Los Angeles, Cal., annually in June.

Rose-mallow. See HIBISCUS.

Rose-noble, an English gold coin of the value of \$1.65, first struck by Edward III., in 1334, and so called because it was of the same value as the noble, a money of account, and was stamped on one side with the figure of a

rose. It ceased to be coined in the reign of Henry V.

Rose, Order of the. See ORDERS, ROYAL.

Rose Polytechnic Institute, an institution of collegiate grade at Terre Haute, Ind. Its organization was begun as early as 1874, but it was not opened to students until 1883. It is governed by a board of nine members, of whom one is an alumnus elected by the alumni. The institute offers four courses, each of four years' duration. They are in mechanical engineering, electrical engineering, civil engineering and architecture, and chemistry. From the first the practical work in the institute shops has been an important feature of the curriculum. The degree of bachelor of science is conferred for the completion of any of these courses; that of master of science, two years after graduation if one year is spent in graduate study; the degrees of mechanical engineer, electrical engineer, or civil engineer are conferred upon those who have the master's degree after two years' successful professional work. The grounds and buildings of the institute are valued at \$145,000, the library contains 11,000 volumes (1904). The original endowment from the founder, Chauncey Rose, was over \$500,000, and additions to this fund have since been made; the annual income in 1903-4 was \$45,000. The students numbered 210, and the faculty 20.

Rose Window, a circular window, divided into compartments by mullions and tracery radiating from the centre, also called Catharine wheel and marigold window according to modifications of the design. It forms a fine feature in the church architecture of the 13th and 14th centuries, and is mostly employed in the triangular spaces of gables. In France it is much used, and, notwithstanding difficulties of construction, attained great size. Notable examples are found in the windows in the cathedrals of Amiens, Chartres, Paris, and in that of Rheims Cathedral, which is over 40 feet in diameter.

Rose-wood, the commercial name for chestnut-colored, dark-veined woods, brought chiefly from Brazil, of varying origin, but mainly the product of *Dalbergia nigra*, one of the *Leguminosae*. It is imported, not in logs or planks, since the large heart-wood rots easily, but in segments, and is sold by weight, being valued according to its richness of color. When cut it gives out a faint rose-odor, and is fine and hard, takes a high polish, and is much in demand for cabinet making and pianos, being used solidly and in veneer, although somewhat difficult to work on account of its resinous veinings.

Rose of Jericho, or **Resurrection Plant**, a small, annual, cruciferous plant (*Anastatica hieracifolia*) which grows in the desert regions about the Red Sea. It bears minute white flowers succeeded by tiny pods, containing a few seeds. When the seeds are ripe, the leaves fall off, the branches curl inward and interlace, enclosing the pods still holding their seeds, and become dry and rigid, causing the plant to assume the form of a ball, ready to be blown hither and thither by the winds of the dry season. When the plant is deposited in a damp place, it exercises its remarkable hygroscopic powers, rapidly uncoils, and lets the seed escape

in soil suitable for germination. This habit of curling up when dry, and rapid absorption of water, forcing the apparently dead limbs to spread open, as if alive again, has caused the plant to be collected and sold as a curiosity.

Rose of Lima, Saint, a religious woman of Spanish America: b. Lima, Peru, 1586; d. there 24 Aug. 1617. Her baptismal name was Isabel, but from her fine complexion she was given the name of Rose. She early showed herself resolute in avoiding the self-indulgence of society and the world. As a symbol of the life she had chosen she planted her garden only with bitter herbs and interspersed them with figures of the cross. In her religious exercises she took the great mystic, Catharine of Siena, as her model. When her parents fell into poverty she was taken into the family of the treasurer Gonsalvo, by the devout wife of that gentleman, and by her labor day and night supplied the necessities of her parents. When she was importuned by her friends to marry, she refused, and as her duty to her parents forbade her taking the veil, she emphasized her refusal by joining the Third Order of Saint Dominick, and the religious strictness and exalted piety of her life was an example which won the admiration, sometimes the imitation, of the worldly and profane. On her death the chapter of the cathedral, the senate, and all the most honorable companies of the city took turns in carrying her body to the grave. She was canonized by Clement X. in 1671 and 30 August was appointed for her festival.

Rose of Lippe, The. See ORDERS, ROYAL.

Rose of Sharon, a name given to an ornamental malvaceous shrub, the *Hibiscus syriacus*. But the rose of Sharon of the Bible was doubtless a bulbous plant, probably a kind of narcissus. See HIBISCUS.

Ro'seate Spoonbill. See SPOONBILL.

Roseate Tern. See TERN.

Rosebery, rōz'bēr-ī, Archibald Philip Primrose, EARL OF, English statesman and author: b. London 7 May 1847. He was educated at Eton and Oxford; became Earl of Rosebery in 1868; as a member of the House of Lords entered his political career without the advantage of a training in the Commons, but soon proved himself a brilliant debater; in 1872 was a commissioner on Scottish endowments; and was successively rector of the great Scottish universities of Aberdeen (1873-81) and Edinburgh (1882-3). From August 1881 to June 1883 he was under-secretary of state for the home department, in 1884 became first commissioner of works, and in 1886 was appointed secretary of state for foreign affairs in Gladstone's government. He was generally approved for his skilful treatment of the difficult questions connected with the war between Bulgaria and Servia, and the coercion by the European concert of Greece, then threatening war with Turkey. He was also one of the firmest supporters in the Upper House of Gladstone's first Home Rule bill. With the defeat of the bill, and of the government at the general election, he passed from office. He soon, however, entered upon a new activity, and one with which up to his time peers had been supposed to have nothing to do,—namely the municipal business of London.

Upon the organization of the London county council, a representative body, chosen by popular suffrage and responsible to the public, he at once enlisted himself in the service of the improved system of government promised thereby, on 17 Jan. 1888 became a member of the council, and on 12 February was made its chairman. In June 1890 he resigned. Following his example, many others of rank and prominence entered the council, whose work was raised to an important position in English public life. For some months in 1892 he was again president of the council. Upon Gladstone's accession to power in that year, he once more became secretary for foreign affairs. He maintained a strong advocacy of Imperial federation; made in September 1894 a notable and characteristic speech before the Lords on the Home Rule bill, which, though passed by the Commons, was thrown out by the Upper House after a four-days' discussion; and brought to a satisfactory end the serious coal strike of 1893. When Gladstone finally retired from political life in 1894, Rosebery was summoned to form an administration, notwithstanding that there were other Liberals whose length of service was thought by many to give them precedence. Many influential Liberals objected, too, it was said to a prime minister without the House of Commons. No remarkable events attended his administration. The Liberal majority was not large; and before long there were evidences of an increasing division within the party, due in large measure to opposition to his supposed imperialistic views. His government was once or twice discomfited, and finally on 21 Jan. 1895 was defeated in the committee on army estimates. He resigned on 22 January and became the leader of the Liberal opposition. In October 1896 he resigned even this position. He had made several of his finest speeches, but found himself at apparent odds with the majority of his party. In May 1898 he spoke eloquently on Gladstone before the House of Lords, and in 1899 was elected lord rector of Glasgow University. He is distinguished for his many and varied attainments, and as a ceremonial and commemorative orator is unequalled in England. Marked characteristics of his speeches are their literary quality, derived from a very extensive reading, and that skilful irony whose presence he has so admirably indicated in the writings of Stevenson. As an author, he is known for his 'Life of William Pitt' (1891), already becoming a sort of classic; a 'Life of Sir Robert Peel' (1899); and 'Napoleon: The Last Phase' (1900), a most careful and interesting narrative of the captivity at St. Helena, with a severe arraignment of English blunders in the treatment of the emperor. Consult the 'Life and Speeches' (1900) by Coates, a eulogy throughout; also the collection, 'Appreciations and Addresses' (1899). See GREAT BRITAIN, History.

Roseburg, rōz'bērg, Ore., city, county-seat of Douglas County; on the Umpqua River, and on the Southern Pacific railroad; about 200 miles south of Portland. It is the commercial and trade centre for the fertile valley of the Umpqua, in which farming, fruit-growing, stock-raising, and mining are carried on. The chief manufactures are flour, dairy products, canned

fruits, beer, wagons and carriages. It has the Oregon State Soldiers' Home. Pop. (1890) 1,472; (1900) 1,690.

Rosecrans, rō'zē-krānz, William Starke, American soldier: b. Kingston, Ohio, 6 Sept. 1819; d. near Redondo, Cal., 11 March 1898. He was graduated at West Point, entering the army as 2d lieutenant of engineers in 1842, but in 1844 returned to West Point as assistant professor of engineering. From 1847 to 1854 he superintended the repair of various harbors on the eastern coast, but resigned his commission in the last named year, and retired to private life in Cincinnati, where he became a consulting engineer and architect. He entered upon his career in the Civil War in the volunteer army, his first service being the organization of the Ohio troops. From colonel of the 23d Ohio Volunteers, he was promoted brigadier-general, U. S. V., in May 1861, and 23 June was placed in command of three brigades under McClellan in the campaign of western Virginia, where he was victor in the battles of Rich Mountain and Carnifax Ferry. He served in the Department of Western Virginia until he succeeded Gen. Pope in command of the Army of the Mississippi. After successfully defending Corinth in western Tennessee during the siege of 11 June 1862, he was put in command of that district by Gen. Grant, with headquarters at Jackson, Tenn. His memorable career as commander of the Army of the Cumberland began in October 1862, and in June 1863 he moved upon the Confederate army under Gen. Bragg, whose forces he had been holding in intrenchment during the Northern victory at Vicksburg, causing Bragg's retreat over the Cumberland Mountains to Chattanooga. In the battle of Chickamauga, 19-20 Sept. 1863, Rosecrans was badly defeated. He was soon after transferred to the Department of the Missouri, and in 1864 relieved of his command. He retired to Cincinnati, where he remained until 1868, when he was appointed minister to Mexico. In 1865 he was brevetted major-general in the United States army. In 1881-5 he represented California in Congress. From 1885 to 1893 he was register of the United States Treasury, and his beautiful signature is to be seen on the treasury notes of that period. He was restored to the rank of brigadier-general and placed on the retired list of army officers in 1898.

Rose'fish, a large red fish (*Sebastes marinus*) of the rockfish family (*Scorpanidae*), taken numerous on far northern coasts, where it frequents shallow shore-waters, while southward it remains at considerable depths. It bites readily to hand or trawl lines, its flesh is good and it is profitable for market as it reaches a length of two feet. Its color is orange-red. Many local names belong to it, as red perch, snapper, Norway haddock, hemdurgan, etc. The rosefish feeds upon crustaceans, small fish, and mollusks; and the young, at least, are among the most important food-resources of cod and halibut.

Rose'mary, a shrubby, strongly aromatic plant (*Rosmarinus officinalis*), growing wild in the southern parts of Europe and also cultivated. It belongs to the Mint family (*Labiata*) and has axillary, pale blue flowers with two stamens.

The stem is three or four feet high, bearing opposite, linear and sessile leaves with revolute margins which are dark-green, smooth and shining above, white and cottony beneath. Rosemary is tonic and slightly stimulant, and formerly enjoyed considerable repute as a medicine. It yields, by distillation, a light pale essential oil of great fragrance, which is used in hair pomades. The herb is also used for seasoning in Italy. Rosemary is often referred to in folk-lore: it was supposed to restore youth when eaten; it was woven into brides' wreaths, and otherwise employed at weddings, and was carried to funerals and thrown on the graves, because, as it did not soon fade, it was a symbol of remembrance. "There's rosemary, that's for remembrance."

Rosenau, rō'zē-now, William, American rabbi and educator: b. Wollstein, Germany. After coming to America he studied in the public schools of Philadelphia and Cincinnati and was graduated from the Hebrew Union College in Cincinnati in 1889. He was rabbi in Omaha, Neb., 1889-92, and has been rabbi in Baltimore since 1892. He has been instructor and is now associate in rabbinica at Johns Hopkins University and among his publications are: 'Semitic Studies in American Colleges'; 'Hebraism in the Authorized Version of the Bible'; 'Jewish Ceremonial Institutions and Customs.'

Rosendale, rō'zēn-dāl, N. Y., village in Ulster County; on the Rondout River, the Delaware & Hudson Canal, and the Walkill Valley Railroad; about eight miles south by west of Kingston (q.v.). It is noted for its manufacture of hydraulic cement (q.v.). Most of the cement derived from the natural cement rock, in the United States, comes from Rosendale. Pop. (1890) 1,706; (1900) 1,840.

Rosenfeld, rō'zēn-fēlt, Sydney, American dramatist: b. Richmond, Va., 26 Oct. 1855. Educated in the public schools of Richmond and New York, he early displayed a fondness for literature and play-writing, and some of his dramas have won fair success. Among the plays of which he is author in whole or in part are: 'The Senator'; 'A Possible Case'; 'A House of Cards'; 'The Passing Show'; 'Lady or Tiger.' He has also adapted 'The Black Hussar'; 'Nanon'; 'Prince Methusalem'; etc.

Rosenthal, rō'zēn-tāl, Max, American artist: b. Turck, Russian Poland, 28 Nov. 1833. At 14 he studied art in Paris, and coming to Philadelphia in 1849, he entered the Academy of Fine Arts, chromo-lithography being his specialty. In 1861 he followed the Army of the Potomac and executed drawings of every camp until Gettysburg. Some of his best work is seen in illustrated plates of the report of the United States Military Commission to the Crimea (1860) and in Dickinson's 'Numismatics of the United States.'

Rosenthal, Toby Edward, American painter: b. New Haven, Conn., 15 March 1848. He studied at Munich in the studio of K. Raupp (q.v.) and in 1868 came under the instruction of Piloty. After producing many genre pictures he attracted attention by his 'Sebastian Bach and his Family at their Morning Devotions' (1870), which was purchased by the Leipsic Museum. After a visit to his home in the United States he returned to Munich and painted 'Elaine the Fair' (1874) from Tennyson's idyll

ROSEOLA — ROSES

of 'Elaine.' He also produced some humorous pictures, such as 'He Laughs Best Who Laughs Last' (two panels); and 'The Girls' Boarding School in Alarm' (1877). His name will be perhaps best remembered for his 'Trial of the Escaped Nun, Constance de Beverley' (from Sir Walter Scott's 'Marmion'); and 'A Dancing Lesson in the Time of the Empire.'

Roseola, any rose-colored rash occurring, usually in a symptomatic character, with some febrile disorder, as measles, scarlet fever, etc., or with gastric disturbances. The term is often applied, though inexactly, to German measles and to mild forms of other diseases attended with a rash of similar appearance to that seen in roseola.

Roses, flowers of the type-genus *Rosa*, of the order *Rosaceæ*. The species are exceedingly variable; probably no other genus calling forth so wide a range of botanical opinion. Most botanists recognize about 100 species; Bentham and Hooker estimate the number at less than 40; but Gandoger describes more than 4,000 as indigenous to Europe and western Asia. The number of horticultural varieties, crosses and hybrids is probably several times larger than in any other genus; more than 3,000 varieties are listed in French catalogues, and since new ones are added annually the list consists of active members. The roses are widely distributed in the temperate and cold parts of the northern hemisphere extending in the respective continents southward to India, Abyssinia and northern Mexico. They are erect, climbing or trailing shrubs, generally prickly-stemmed; bear alternate, odd-pinnate, though sometimes simple, leaves and generally large, showy, pink, white, yellow or purple flowers borne singly or in terminal corymbs, followed by generally showy berry-like fruits (hips) which contain several bony akenes. Probably no flower has played so important a rôle in the garden and in literature. It was prized in the cradle days of the Aryan race and is frequently mentioned in the writings prior to our era. China and Japan, however, seem to have been less attracted to it than more western races. In very early times the flowers exhibited their characteristic tendency to double; indeed, it is probably the first flower cultivated in this state, and is now more often thought of in this form perhaps than in its natural single form. The single roses are, however, useful and popular in park planting.

Except for ornamental purposes roses are of small importance; the only uses made of them are the preserving of the fruits of a few species for food and the manufacture of perfumes, especially attar or otto of roses and rose water from the flowers of some other kinds, principally *R. alba* and *R. damascena*, which are extensively grown in southeastern Europe, particularly Bulgaria and adjacent Asia and in southern France, in which last country the leading rose is the Provence, a hybrid variety of *R. centifolia*. The flowers are either put in stills or are macerated. In the distilling process the essential oil is extracted by steam and condensed. In each process there is considerable perfume in the water used and in the maceration process, which is most popular in France, this "rose water" is the product sought rather than the attar which is regarded as a by-product. These

perfumes are among the most important of the world, and it is said that the importations of the attar alone into the United States is greater than the importations of any citrus perfume such as lemon oil, oil of bergamot, etc.

Unquestionably the roses are the most important flowers cultivated. They are prized by every one who cares for flowers at all and throughout the civilized world are probably grown in more gardens than any other flowers. How important they are commercially appears by the statistics quoted in the article *FLORICULTURE* (q.v.). In the United States alone the number of blossoms annually grown for sale has been estimated at 100,000,000, valued at about \$6,000,000. Yet the development of this industry, which now demands the greatest skill of specialists, has sprung from insignificance in 1870; and in 1850 it did not exist.

From the botanist's standpoint the classification of Crépin in his 'Primitiæ Monographiæ Rosarum,' seems to be one of the most satisfactory and is followed by botanists perhaps more frequently than perhaps any other; from the gardener's standpoint Barron in the 'Cyclopedia of American Horticulture,' divides the roses into 19 groups with more or less subdivision. Among these the following are probably the most important. *Provence*, perhaps most familiar in America in one of its types, the fragrant globular flowered moss roses; *Damask* and *French*, fragrant-flowered, robust growing, hardy prolific roses; *Ayrshire*, very hardy climbing roses with solitary fragrant white to deep crimson flowers; *Briers*, small perishable-flowered garden roses more useful in shrubberies than for cut flowers; *Multiflora*, with large corymbs of rather short lived flowers, and popularly known as ramblers, used largely in wild gardens, though the crimson Rambler and its sub-varieties which belong to the polyantha subdivision are used for porch decoration for which they are admirably adapted; *Evergreen*, the foliage continuing very late in autumn; for example, *R. Wichuraiana*, a very popular hardy trailer which grows anywhere; *Hybrid perpetual*, upright growing, though sometimes pendulous, shrubs which bear flowers of all types and colors and embrace the largest number of varieties of any group but so greatly mixed as to preclude separation and definition; *Hybrid teas*, a group of the preceding, the members being the result of crosses with the Chinese tea-scented rose, especially rich in forcing varieties; *China* or *monthly rose*, a perpetual-blooming rose chiefly interesting because of its effect upon other roses by hybridizing through its variety the tea rose; *Musk*, very fragrant light colored rather tender roses best known in their derivatives, and noisettes, which blossom later, are harder than the type, and will grow in any soil but are little used probably because the blending with the teas seems to have impaired their hardiness; *Polyantha*, perpetual-flowering multiflora climbing varieties bearing small flowers in clusters and especially promising as the parents of a nebulous group of varieties adapted to American requirements; *Perpetual briers*, best known in America by one of its component species *R. rugosa*, a hardy Japanese rose much used in exposed situations for hedges, screens, etc., and useful for hybridizing with many other species.

ROSES

Rose species are propagated by seeds which are either sown as soon as the hips are ripe or are stratified in sand until spring. If allowed to become dry they may require two years to germinate, but if treated as above they generally sprout the first spring. Many species may be propagated by means of cuttings of nearly mature wood taken during summer and rooted under glass. Others will grow from mature wood cuttings taken in autumn and rooted in the spring like currants and gooseberries. Layering is generally practised with such species as do not root readily from cuttings; for example, *R. hemispharica* and *R. eglanteria*. Some species such as the cinnamon rose (*R. cinnamomea*), the Carolina rose (*R. carolina*) and the Damask rose (*R. damascena*), may be propagated by suckers, division or by cuttings of the roots which in the last case should be dug in autumn, stored in sand or sphagnum in a frost-proof cellar until spring when they are planted in nursery rows. Grafting and budding are also practised, but are frequently unsatisfactory where regular intelligent attention cannot be given to the removal of the suckers that generally spring from the stock. For greenhouses and for forcing cuttings of semi-mature wood are nearly universally used. They may be taken at any time, rooted with bottom heat in sand, and kept in pots until large enough to be transplanted upon the branches.

In general, roses thrive best upon loamy soils, rich in plant food and humus, well drained but moist, in situations sheltered from the wind but where they will receive the sunlight at least half the day. They do not generally succeed upon very loose or sandy soils, but often do upon heavy clays. They are seldom difficult to transplant with ordinary care, are easy to cultivate and generally simple to prune. The removal of weak and old wood is the most important pruning detail. But care must be taken especially with climbing varieties to preserve the long sturdy shoots, since they are most prolific of blossoms. Indoor roses cultivated for cut flowers are generally pruned so as to have the flowers borne singly at the ends of long stems sometimes, as in the case of American Beauty, exceeding 4 feet in length. But this is a special florist's practice and is dependent not only upon the method of pruning but upon the management of the plants otherwise. In the garden the plants may usually be set about 30 inches apart in beds about four feet wide, the plants of one row being preferably opposite the intervals of the other so as to obtain full light and air. Beds of this width need not be tramped on when the flowers are being gathered. Cultivation consists in keeping the surface loose and open at all times by raking, a rather shallow forking being given each spring. In the autumn a liberal mulch of stable manure should be spread upon the beds and the coarser parts removed in the spring before the annual forking. The removal of all dead, failing or puny shoots should precede the cultural operations. Many gardeners give applications of liquid manure just as the flower buds appear and preferably preceding a shower. When well managed a rose bed should be satisfactory for ten or more years.

A large number of insects feed upon the rose both out of doors and in the greenhouse.

Of those which sometimes prove troublesome in the garden the rose beetle or chafer is perhaps the most annoying, since it feeds upon the petals of the opening flowers, thus ruining them. The only remedy which has been satisfactorily applied is hand picking. Plant lice (see APHIS) and scale insects (q.v.) are often found upon roses, but in the garden are not usually very troublesome. Slugs occasionally skeletonize the leaves by working upon the undersides and several caterpillars, beetles, etc., also live upon the foliage, usually, however, in insufficient numbers to do damage. In the greenhouse some of the above species may appear, but they are usually debarred by correct methods of management, especially as to ventilation, temperature and humidity. The red spider, not an insect but a mite, is sometimes troublesome where the air is allowed to become too dry. Management will also prevent the so-called plant diseases occasionally found in poorly ventilated houses; indeed, attention to the details mentioned is in many leading houses found more expedient and satisfactory than recourse to the so-called remedies for either insects or maladies.

Y., 1891); Vergara, 'Bibliografia de la Rosa' (Madrid 1892).

M. G. KAINS,

Crop Expert.

Roses, Wars of the, the name given to the protracted struggle between the houses of Lancaster and York for possession of the English throne, in the second half of the 15th century. The appellation was derived from the badges adopted by the contending parties, a white rose by York and a red rose by Lancaster. The outbreak of the war was brought about by the growing discontent of the people with the evil fortunes of the war against France and the oppressive taxes necessitated by the heavy military expenditures. The imbecile Henry VI. (q.v.) had shown himself quite incapable of the tasks of government and this served to enhance the power of Richard, Duke of York, the representative of the claims of the house which had been driven from the throne in 1399 in the person of Richard II. The Duke of York's great opponent was Margaret, wife of Henry VI., a woman of great strength of character and much ability. The first battle of the war was fought in 1455 at St. Albans and resulted in a victory for the Yorkists whose head became, for the second time, protector of the realm. War broke out again in 1459 and began auspiciously for the Lancastrians. The Duke of York and the Earl of Warwick and Salisbury were compelled to flee the country. In June 1460, they returned, however, and defeated the Lancastrian forces at Northampton and took Henry VI. prisoner. A compromise was effected by which Henry VI. was to retain the crown until his death, when it was to pass to the Duke of York. Queen Margaret, however, would not consent to this wrong to her son, and continued the struggle. At Wakefield 30 Dec. 1460, the Yorkists were defeated and the Duke of York was killed and

A LA FRANCE ROSE.

ROSETTA — ROSICRUCIANS

soon after the Lancastrians gained a second victory at St. Albans. Edward, Earl of March, the Duke of York's eldest son, joining forces with Warwick succeeded in getting possession of London, which was a fervent supporter of the Yorkist cause, and was elected king, setting out immediately to meet the enemy on whom he inflicted a bloody defeat at Towton (29 March 1461). Henry VI. fled to Scotland and the remnants of Lancastrian resistance were crushed out at Hedgley Moor and Hexam in 1464. A quarrel between Edward IV. and the Earl of Warwick led the latter to embrace the Lancastrian cause. Returning from France with a large force in 1470 he compelled Edward to seek refuge in Holland. Henry VI. was released from captivity and replaced upon the throne. Edward IV., however, returned to England in the early part of 1471 and on 14 April decisively defeated Warwick at Barnet, the "king-maker" himself falling in the fight. On 4 May a Lancastrian force under Queen Margaret was overthrown at Tewkesbury and the young Prince Edward met his death there, most probably by assassination after the battle. Henry VI. died in the Tower a few days later and Edward IV. was securely established on the throne. The last battle in the long conflict was fought in 1485 when Henry of Richmond, representative of the Lancastrian claims, overthrew Richard III. (q.v.) at Bosworth Field and ascended the throne as Henry VII. By his marriage to Elizabeth, the daughter of Edward IV., he united in himself the claims of the rival houses. See ENGLAND, *Civil History*. Consult: Gairdner, 'Lancaster and York' (1886).

Rosetta, rō-zēt'a (Ar. RESHID), Egypt, a city near the mouth of the Rosetta Canal,—a branch of the Nile,—formerly the medium of communication between Cairo and Alexandria, which gave to Rosetta a commercial importance which it has lost by the opening up of other channels of traffic. From 1798 to 1807 Rosetta was captured in turn by the French, English, and Turks. Pop. 13,500.

Rosetta Stone, a slab of black basalt of ancient Egypt, now in the British Museum, chiefly noted as having furnished the key for the decipherment of the Egyptian hieroglyphics. The stone was discovered in 1799, during the excavation of Fort St. Julien, near Rosetta, Egypt, by M. Boussard, an officer of engineers in the French army of occupation. Three years later the stone was brought to England and deposited in the Museum. The stone was erected in 195 B.C. by the priests of Egypt in honor of Ptolemy Epiphanes and in commemoration of his remission of the dues of the sacerdotal body (q.v.). It bears an inscription duplicated in three languages, in Greek, in hieroglyphics or sacred, in demotic or common characters, and this fact enabled Dr. Thomas Young in 1818 and later, M. Champollion, in 1822, to decipher it in the three languages and thus furnish a key for the reading of the hieroglyphics (q.v.). The Rosetta Stone is 3½ feet long, 2½ feet wide, and nearly a foot thick. See ARCHEOLOGY; HIEROGLYPHICS.

Rosetta Wood, an East Indian wood, of unknown origin, reddish orange in color, with darker veinings. The wood is close, hard and very beautiful when first cut, but soon becomes darker by exposure. It is used in fine cabinet work, and is imported in logs.

Rosewater, Andrew, American civil and sanitary engineer: b. Bohemia 31 Oct. 1848. After a course of study in the common and high schools of Cleveland, Ohio, he became flagman in the engineer corps of the Union Pacific Railroad, engaging in explorations and surveys in 1864 and later in other engineering positions on the same road. He was assistant city engineer of Omaha, Neb., 1868-70 and city engineer 1870-5. He was in charge of the construction of the Omaha and Northwestern Railroad 1878-80; was resident engineer of the Omaha Water Works Company, 1880-1, and from 1881-7 was city engineer. Between 1887 and '91 he was consulting and designing engineer of sewerage for 25 cities. Since 1897 he has been city engineer of Omaha and president of its board of public works.

Rosewater, Edward, American journalist b. Bukovan, Bohemia, 1841; d. Omaha, Neb., 31 Aug. 1906. Coming to America in 1854, he became a telegraph operator and for two years (1861-3) was in the United States military telegraph corps. In 1863 he went to Omaha, Neb., as manager of the Pacific Telegraph. In 1871 he was elected to the Nebraska Legislature. In 1871 he founded the *Omaha Bee*, and edited it till his death. He was vice-president of the Universal Postal Congress at Washington, 1897, and the original founder of the Omaha Trans-Mississippi Exposition (1898).

Rosicrucians, rō-zī-kroo'shī-anz, a real or imaginary secret society, the alleged existence of which became known unexpectedly at the beginning of the 17th century. Early in that century appeared several books concerning the society, which are now generally ascribed to Johann Valentin Andrea, a Lutheran clergyman, and among which is the 'Fama Fraternitatis R.C.' (1614). This work is the story of a certain holy and reverend Brother Christian Rosenkreuz, a German noble of the 14th century, who, inspired with the lofty ambition of reforming the world, spent a large portion of his days among the Brahmans, and in Jerusalem, Damascus, Egypt, Morocco, Fez, etc., in the pursuit of wisdom. Returning to Germany he founded an order, consisting of but few members, who met in a house erected by himself, and called Sancti Spiritus Domus, where he died at the age of 106. His burial-place was to be kept a secret by all the adepts, but he ordered the words "Post CXX annos patebo" to be inscribed upon one of the doors of the house of the order. To this work was added another, 'Confession of the Society and Brotherhood of the Rosy Cross,' addressed to the learned of Europe. This tract declared that the order had no intention of interfering with the religious or political action of states, but only desired the improvement of mankind by the discovery of the true philosophy. Whether such a society ever existed is still an open question. Many will have us believe that the above treatises were meant by Andrea to satirize in serio-comic style the philosophical follies of the age, having no expectation of them being regarded otherwise than as fiction. The fraternity had fallen out of public attention for a long time, when in the latter half of the 18th century the interest in their organization was revived, especially by the noted impostor Cagliostro, who gave out that he was a Rosicrucian.

Ros'in, or Resin, the name given to the resin of coniferous trees employed in a solid state for ordinary purposes. It is obtained from turpentine by distillation. In the process the oil of the turpentine comes over and the rosin remains behind. There are several varieties of rosin, varying in color from the palest amber to nearly black, and from translucent to opaque. It differs somewhat according to the turpentine from which it is derived, this being obtained from numerous species of pine and fir. It is used in the manufacture of sealing-wax, varnish, cement, soap, for soldering, etc. Colophony is a name for the common varieties. See **NAVAL STORES**.

Rosmini, rōs-mē'nē, Antonio Rosmini-Serbatì, Italian philosopher: b. Roveredo in the Italian Tyrol, 25 March 1797; d. Stresa 1 July 1855. He began the course of studies for the priesthood at Padua in 1817, and was ordained in 1821. He became deeply versed in philosophy, ancient and modern, and revolved in his mind a comprehensive system to serve as a basis for the truths of revelation, while on the practical side he planned an institution for the training of teachers and priests. From 1826 to 1828 he lived mostly in Milan, thought out the rule of his new order, visited Rome, gained the approval of Pius VIII. both for special studies and for the institution of his order, and published his 'New Essay on the Origin of Ideas' (1830).

After a few years of labor at Trent he settled in 1837 at Stresa on the west shore of Lago Maggiore and, surrounded by loving and devoted friends, sent volume after volume to the press. His dream in politics, as expressed in his 'Constitution according to Social Justice' (1848), was a confederation of the states of Italy under the Pope as perpetual president. For a brief period he basked in the papal favor, and was promised by Pius IX. a cardinal's hat; and on the Pope's flight to Gaeta, he followed, but now found the pontiff's mind turned against him and never afterward regained his confidence. His 'Constitution' and 'The Five Wounds of Holy Church' were next prohibited by an irregular meeting of the Congregation of the Index called at Naples. But in 1854 the Congregation of the Index, the Pope presiding, declared Rosmini's writings entirely free from censure, and enjoined perpetual silence on all his accusers. The 'Institute of the Brethren of Charity' survived its founder, and among the Rosminian Fathers, who are mostly Italians or Englishmen, are to be found at the present day some of the ablest and most devoted sons of the Roman Church. In England it has foundations at Ratcliffe, Loughborough, Cardiff, Wadhurst, Rugby, and established in 1876 its central house at St. Ethelreda's, Holborn, once the domestic chapel of the palace of the bishops of Ely.

The foundation of Rosmini's philosophy is being considered as the form of the intelligence—an elemental intuition of which is implanted by Nature herself. Intuition gives us ideas, of which we may affirm (1) that they are not nothing; (2) that they are not ourselves; (3) that they have a mode of existence of their own, entirely different from that of real or subsistent things, and independent of the bodily sense. Their two essential characteristics are universality and necessity; for real objects and sensations are always particular, instead of being

universal and generic, and every object which involves no contradiction is necessarily possible. These two characteristics involve two others, infinity and eternity; the origin of the ideas comes from God, for man does not receive them from the things themselves. The one indeterminate and wholly universal idea is that of being or existence; we cannot determine the subsistence of an object until we first have the idea of it, therefore perception involves the idea which is further isolated from all the other elements of the perception by the process of universalization, through which it may be realized an indefinite number of times. When the ideas are all fully or perfectly determined, they are called concrete; when they remain to a certain extent indeterminate, they are abstract. Being is incorporeal, independent of space, spiritual, and therefore incorruptible and immortal. It is independent of time; as being in its essence is always being, and as it would be a contradiction in terms for being to cease to be being, it is eternal. But since it was united to the soul in time, it must have existed before it and be independent of it. And thus we reach an Intelligence anterior to human intelligence—an Eternal Mind. This eternal mind is God's, and therefore God exists, and His existence and the immortality of the soul remain the true foundation of morals. Consult: Tommaseo, 'Antonio Rosmini' (1855); Lockhart, 'Life of Antonio Rosmini' (1866); Werner, 'Rosmini und seine Schule' (1884); and, above all, Thomas Davidson, 'Philosophical System of Rosmini' (1882).

Ross, rōs, Alexander, British soldier: b. Scotland 1742; d. London 29 Nov. 1827. He entered the British army in 1760, and was made captain in 1775. He served as aide-de-camp to Lord Cornwallis in the war of the American Revolution, and arranged for his surrender at Yorktown. He afterward served with Cornwallis in India, and in 1812 attained the rank of general.

Ross, Alexander, Canadian fur trader and author: b. Mairnshire, Scotland, 9 May 1783; d. Manitoba 23 Oct. 1856. He emigrated to Upper Canada in 1805 where he was for some years a teacher. In 1810 he joined the fur-trading expedition of John Jacob Astor and established trading posts in the most isolated regions. He wrote the earliest and most graphic accounts of the Columbia and Oregon country, with the opening up of which he was for years identified. He also had a prominent part in the colonization of Manitoba. Among his works are: 'Adventures of the First Settlers on the Oregon and Columbia Rivers' (1849); 'Fur Hunters of the Far West' (1855); and 'Red River Settlement: Its Rise, Progress and Present State' (1856).

Ross, Alexander Milton, Canadian naturalist: b. Belleville, Ontario, 13 Dec. 1832; d. Detroit, Mich., 27 Oct. 1897. At 13 he came to New York, where he became a compositor on the *Evening Post* and a protégé of William Cullen Bryant. In 1851 he began to study medicine, and during the Civil War was a surgeon in the Union army, but rendered his greatest service to the cause as confidential correspondent to Lincoln in Canada. His subsequent life was chiefly devoted to the study of natural history, in the pursuit of which he has added valuable in-

formation concerning the fauna and flora of Canada. He published: 'Birds of Canada' (1872); 'Butterflies and Moths of Canada' (1873); 'Forest Trees of Canada' (1874); 'Ferns and Wild Flowers of Canada' (1877); 'Mammals, Reptiles and Fresh Water Fishes of Canada' (1878).

Ross, Clinton, American novelist: b. Binghamton, N. Y., 31 July 1861. He was graduated from Yale in 1884, and began his career in newspaper work in New York. He is the author of: 'The Silent Workman' (1886); 'The Speculator' (1888); 'The Adventures of Three Worthies' (1891); 'Improbable Tales' (1892); 'A Trooper of the Empress' (1898); 'Heroes of Our War with Spain' (1898); 'The Tale of Many Gods' (1903); etc.

Ross, George, American patriot: b. New-castle, Del., 1730; d. Lancaster, Pa., July 1779. On his admission to the bar in 1751 he settled in Lancaster, Pa. As a member of the Pennsylvania assembly 1768-70, he drew up the declaration of rights which was presented by the assembly to the proprietary government. He was a member of the Continental Congress from 1774-7, and as such was one of the signers of the Declaration of Independence. In 1779, three months before his death, he was made judge of the admiralty court of Pennsylvania.

Ross, Sir James Clark, English explorer: b. London 15 April 1800; d. Aylesbury, Buckinghamshire, 3 April 1862. He was a nephew of Sir John Ross (q.v.) whom he accompanied on the voyage in search of a northwest passage in 1818. Between 1819 and 1827 he accompanied Captain Parry upon his four Arctic explorations, and was a member of the expedition of his uncle in 1829-33. His discovery of the north magnetic pole in 1831 raised him to the rank of post-captain; but it was in his memorable voyage to the Antarctic Ocean in 1839-43 that he rendered his most valuable contribution to science. He succeeded in reaching lat. 78° 10', and discovered a great ice-bordered continent which he named Victoria Land, and an active volcano which was called Mount Erebus after the discoverer's ship. For these services he was knighted in 1844. In 1848 he was a member of the party which made an unsuccessful attempt to discover the fate of Sir John Franklin. He became rear-admiral in 1851. An account of his Antarctic expedition was published by him in 1847, entitled 'A Voyage of Discovery and Research in the Southern and Antarctic Regions.' Consult: O'Byrne's *Naval Biographical Dictionary*; Markham, 'Fifty Years' Work of the Royal Geographical Society.'

Ross, Janet Anne Gordon, English author: b. London 24 Feb. 1842. She was married to H. J. Ross, a banker of Alexandria, Egypt, in 1860, was for three years Egyptian correspondent of the London *Times*, and since 1867 has lived in Italy. She has published: 'Italian Sketches' (1887); 'Three Generations of Women' (1888); 'Leaves from our Tuscan Kitchen' (1899); 'Florentine Villas' (1901); etc. The two works last named have been reprinted in this country.

Ross, John, American patriot: b. Ross-shire, Scotland, 29 Jan. 1726; d. Philadelphia, Pa., March 1800. After a mercantile experience

of 20 years in Perth, he emigrated to America at the beginning of the rebellion of its colonies, and became at once a staunch defender of the cause of independence. In June 1774, as chairman of the meeting of Philadelphia merchants in protest against British importations, he signed the agreement presented to the authorities and otherwise resisted unjust taxation.

Ross, Sir John, English Arctic explorer: b. Balarroch, Scotland, 24 June 1777; d. London 30 Aug. 1856. He entered the navy at 9 and was promoted lieutenant in 1805. His first Arctic expedition was made in 1818, when, with Lieutenant Parry, he made a voyage in search of a northwest passage to the north pole. His second Arctic voyage was made in 1829 in a small vessel equipped at the expense of Sir Felix Booth, high sheriff of London, which proved inadequate for the purpose. The exploring party was frozen up in the ice for four winters, and was rescued in 1833 by Ross's old ship, the *Isabella*, in Lancaster Sound. He was knighted for his services in 1834, and made rear-admiral in 1851. In 1839 he was appointed consul at Stockholm, and served until 1845.

Ross, John, or **Kooweskoowe**, Indian chief: b. Georgia 1790; d. Washington, D. C., 1 Aug. 1866. He was a Cherokee half-breed who became chief of his tribe in 1828. In 1817-19 Georgia attempted to remove the Cherokees from its borders through a bribe offered to Ross, who had received an English education and was a man of importance in his tribe. He exposed the attempt and continued to repulse the concerted effort of the people of the State to effect their removal. In 1829 Ross, as chieftain, successfully appealed to the Supreme Court of the United States against the action of the Georgia legislature in expelling his people, nevertheless the Cherokees were banished in 1838.

Ross, Jonathan, American jurist and statesman: b. Waterford, Vt., 1826; d. Saint Johnsbury, Vt., 22 Feb. 1905. He entered Dartmouth College in 1847 and was graduated in 1851. He earned his early education by working on his father's farm during the summer, and by teaching school during the winter. After graduating, he taught in Craftsbury, and was principal of the academy at Chelsea, Vt. Meanwhile he studied law, and was admitted to the Orange County bar in 1856, practising until he was elected in 1870 as assistant judge of the Supreme Court. He was elected chief judge in 1890. Judge Ross was State attorney for Caledonia County 1862-3, represented Saint Johnsbury in the legislature 1865-7, and in 1869 was a member of the last council of censors held in the State. In 1870 he represented Caledonia County in the State Senate, was for several years a member of the State board of education, and early in 1899 was appointed by Gov. Smith to succeed Justin S. Morrill in the United States Senate.

Ross, Sir William Charles, English painter: b. London 3 June 1794; d. there 20 Jan. 1860. Entering the schools of the Royal Academy (1808) he carried off five silver medals, during his career as a student, and when he was but 15 (1809) exhibited at the Royal Academy 'Mordecai Rewarded'; 'The Judgment of Solomon'; and the portraits of a mother and child as 'Venus and Cupid.' In 1821 his 'Judgment

of Brutus' gained the gold medal of the Society of Arts. His most ambitious religious picture, 'Christ Casting out the Devils from the Maniacs in the Tombs,' exhibited at the Royal Academy (1825), was the last large canvas that he executed. Henceforth he devoted himself to miniature. He was elected R.A. in 1839 and became the most fashionable painter of his time in his chosen department. He painted Queen Victoria, Prince Albert, and their children, the King and Queen of the Belgians, and was summoned to Lisbon to paint the King and Queen of Portugal, Prince Louis Napoleon, (afterward Napoleon III.) sat for him; and he also painted every personage of his day in England distinguished for rank or genius. The total number of these exquisite works, as calculated from his own memoranda, was 2,200. He wisely attempted to give to the miniature that breadth of treatment which distinguished Reynolds, whom he evidently took for his model. His drawing was invariably correct, and marked by a nameless elegance enhanced by the truthfulness and clearness of his flesh tints and his clever handling of textures. His miniatures are still considered the models of their class in England. He was an enthusiast in his profession and on his death-bed almost his last words were expressions of regret that photography would destroy the art of painting in miniature.

Rosbach, rös'bän, or Rosbach, Prussia, a village of Saxony, in the government of Merseburg, 17 miles south of Halle, famous for the battle fought in its vicinity 5 Nov. 1757, when 22,000 Prussians under Frederick the Great defeated 43,000 French and Imperialist troops commanded by Soubise and the Prince of Saxe-Hildburghausen. The allies' loss was 1,700 killed and 7,000 taken prisoners, while the Prussian loss amounted to only about 500 killed.

Rosse, rös, William Parsons, 3D EARL OF, British astronomer: b. York 17 June 1800; d. Monkstown, Ireland, 31 Oct. 1867. He was educated at Dublin University and at Magdalen College, Oxford, where he was graduated in 1822. He was member of Parliament for King's County from 1823 to 1834, and succeeded his father in the earldom in 1841. In 1845 he was elected a representative peer of Ireland, but took little interest in politics. During the stormy discussions on the first reform bill he was occupied with the construction of his first famous reflecting telescope, the speculum of which had a diameter of three feet, and was soon superseded by one of double the size. The two great defects which had hitherto baffled opticians in constructing large reflecting mirrors were spherical aberration and absorption of light by specula, and in the casting of those of large size there arose the apparent impossibility of preventing cracking and warping of the surface on cooling. Even the proper admixture of the metals for the reflector had to be ascertained by numerous and costly experiments. At last, however, a gigantic speculum, weighing three tons, was turned out without warp or flaw and was then polished and mounted on a telescope 52 feet in length in Lord Rosse's park at Parsonstown, at a cost of \$150,000. The sphere of celestial observation was immensely widened by an instrument so powerful; nebulae which had defied Herschel's telescope were resolved into stars, and new nebulous mist was revealed to the observation. The con-

struction of the telescope, effected under the earl's direction and superintendence, is fully described in the 'Philosophical Transactions' of the Royal Society, of which body he was president 1849-54.

Rosselli, rös-sē'l'ē, Cosimo, Italian painter: b. Florence 1439; d. there 1507. He was a pupil of Neri di Bicci, the representative of the early Florentine school, and this school furnished the guiding principles of his artistic life, which was especially influenced also by the work of Benozzo Gozzoli. The altar-pieces and frescoes which he produced were filled with figures dressed in the costumes of his day, and the realistic minuteness of his faces seems to suggest that they were portraits of his contemporaries. He was in short a genuine Pre-Raphaelite of the Florentine school. His finest work is a fresco in the chapel of Sant Ambrogio at Florence: 'The Exhibition of a Miracle-working Chalice,'—a fashionable religious function of old Florence, displaying the silks, laces and jewelry of the time in all their splendor. Among other good works of his may be mentioned: 'The Coronation of the Virgin' and an 'Assumption,' both at Florence. He was called to Rome in 1480 by Sixtus IV. and contributed to the decoration of the Sistine Chapel, with the approval of the Pope who admired his lavish use of gold and ultramarine. Among his pupils the most celebrated were Pietro di Cosimo and Fra Bartolommeo (q.v.). He produced few easel pictures, but one of these, 'The Annunciation' (1486), was sold in 1847 for \$1,627 in England.

Ros'ser, Thomas Lafayette, American soldier and civil engineer: b. Campbell County, Va., 15 Oct. 1836. He entered West Point from the State of Texas in the class of 1861, but when President Lincoln ordered that class into the field after the attack upon Fort Sumter, Rosser resigned and entered the Confederate army, in which he was appointed 1st lieutenant of artillery and later captain. In 1862 he was made lieutenant-colonel and shortly afterward colonel of the 5th Virginia regiment under J. E. B. Stuart. In 1864 he became major-general in the army of Northern Virginia. He refused to surrender at Appomattox; escaped through the Federal lines, and while trying to reorganize scattered troops was captured and made a prisoner of war. After the war he studied law, but did not practice. In 1868 he became assistant-engineer in the construction of the Pittsburg and Connellsville Railroad; engaged on the Northern Pacific in 1870, becoming the next year chief engineer of its construction through Minnesota, Dakota and Montana; in 1881 became chief engineer of the Canadian Pacific railway. In 1886 he returned to Virginia to reside, and in the war with Spain in 1898 commanded a volunteer brigade.

Rossetti, rös-sēt'tē, Christina Georgina, English poet, daughter of Gabriele Rossetti (q.v.): b. London 5 Dec. 1830; d. there 29 Dec. 1894. She was educated at home and her first verses were written in 1842 and printed in the private press of her grandfather, Gaetano Polidori. She was probably her brother Dante's first model and many portraits of her exist both as portraits and as figures in his paintings. A volume of her verse came from the Polidori press in 1847 and, later, after the establishment of 'The Germ' in 1850, she contributed to it

under the name of "Ellen Alleyne." Of a deeply religious temperament, she was a devoted High Churchwoman and her writing, aside from devotional manuals and strictly religious works, was mainly poetry of a devotional character. 'Goblin Market,' however, published in 1862, is not of this type; and for original and purely imaginative qualities was never afterward approached by her. She also wrote 'The Prince's Progress' (1866); 'A Pageant' (1881); stories and nursery rhymes under the titles, 'Commonplace' (1870), and 'Sing Song' (1872); 'Verses' (1873), and such religious works as 'Annus Domini' (1874); 'Called to be Saints; the Minor Festivals' (1881); 'Time Flies: a Reading Diary' (1885); 'The Face of the Deep' (1892). From 1871 to her death she was for most of the time an invalid. Consult: Mackenzie Bell, 'Christina Rossetti: a biographical and critical study' (1898).

Rossetti, Dante Gabriel, English poet and painter: b. London, 12 May 1828; d. Berchington, 10 April 1882. His full name was Gabriel Charles Dante, but for literary purposes he rearranged it in the form by which he is now remembered. He was one of four children, all of whom, especially himself, his sister Christina and his brother William Michael, achieved fame in literature. His father, Gabriele Rossetti, professor of Italian in King's College, was an Italian exile, an enthusiastic patriot, himself a poet, and author of several critical works on Dante. He had married Frances Mary Lavinia Polidori, of English and Italian blood.

Dante Gabriel was educated at home, in an atmosphere of culture and fine enthusiasms; from his ninth to his fourteenth year he attended King's College. During that time he received some instruction in drawing, and upon leaving college he gave himself to the study of art, entering the Royal Academy in 1848. At the same time he began his translations from Dante and other Italian poets, showing from the first more genius in poetry than in painting. His great poem, perhaps his most remarkable, 'The Blessed Damozel,' was written about 1847. In 1848 he entered the studio of Ford Madox Brown, where he met Woolner, Holman Hunt, and Millais—the group that with himself and Madox Brown constituted the so-called pre-Raphaelite brotherhood. In 1850 William Michael Rossetti edited *The Germ*, a short-lived but famous magazine devoted to pre-Raphaelite ideals: in its page appeared 'The Blessed Damozel' and other work of Dante Gabriel Rossetti's. Just what were the ideals of the pre-Raphaelites is hard to define; they stood in general for the devotional sincerity in art of those painters who preceded Raphael, and for freedom from modern academic canons; yet Rossetti himself was not strictly a pre-Raphaelite; his drawing was quite in his own style, little affected by the manner of the old painters.

For some time Rossetti had to face the proverbial artist's struggle; his pictures were not bought, and the peculiarities of his drawing were severely criticised. Ruskin's kindly defense of the pre-Raphaelites, however, encouraged the whole group. Shortly afterward Ruskin made Rossetti a standing offer to buy, up to a certain sum, all of Rossetti's painting that pleased

him. The arrangement lasted for some time, to Rossetti's great benefit. Through Ruskin he met Sir Edward Burne-Jones, who introduced him to Morris and Swinburne. Ruskin also generously assumed the cost of Rossetti's first volume, the 'Early Italian Poets,' a collection of translations which appeared in 1861. Rossetti afterward paid back the loan, and the book was reprinted in 1874 under the title of 'Dante and His Circle.'

In most of Rossetti's early pictures, his Beatrices and ideal ladies were copied after his wife, Elizabeth Eleanor Siddal, herself a poet and artist, whom he had married in 1860. Mrs. Rossetti was an invalid; the poet had no delusions as to the sadness shortly in store for him. But when, in 1862, his wife accidentally hastened her fate by an overdose of laudanum, Rossetti gave way impetuously to his grief, and in his impulsive despair buried in his wife's coffin the manuscript of his poems, for the most part inspired by her.

In the course of the next seven years—during which time he continued his painting with success, and also began the use of chloral—his friends persuaded him to recover his manuscripts, which he did in 1866. The following year appeared his 'Collected Poems,' containing the 'House of Life' sonnet sequence in its original complete form. In October 1871, Robert Buchanan, under the pen-name of "Thomas Maitland," wrote an essay entitled 'The Fleshly School of Poetry,' in the *Contemporary Review*. The purpose of this article was to show that Rossetti's poetry in thought and expression, was indecent; and to make his point the writer did not shrink from misquoting Rossetti or perverting his meaning. Rossetti made an adequate reply in an article called 'The Stealthy School of Criticism,' and in later editions somewhat unnecessarily withdrew the verses that had most offended Buchanan. But the injustice of the attack preyed upon him until his mind was deranged; at one time only the loving care of his friends prevented him from committing suicide.

He partly recovered his mental poise, and for a time entirely recovered his poetic and artistic faculties, which seemed at first not to be affected by his use of chloral. Several of his best pictures belong to this time; the 'Babes and Sonnets' were published in 1881. These last years, however, were years of pitiful suffering and gradual collapse. His friends sheltered him from his worst moods and cared for him to the end.

In both painting and poetry Rossetti's personality expressed itself with unusual evenness throughout his career, and in 'The Blessed Damozel,' one of his earliest poems, almost all his qualities can be traced. Like so much of his other writing, it was illustrated, set to painting, as it were, by himself; but without such aid the pictorial genius is strong in the verse. The ideas are typically concrete; not only the Damozel, leaning on the bar of Heaven, is seen, with the lilies in her hand, and on earth the fall of autumn leaves, and in the sky the "curled moon"; but from all points of view the appeal is to the eyes, as in that imaginative glimpse of the world spinning far below the bridge of Heaven: and in the picture of

souls ascending to God like thin flames—such as William Blake could have drawn; and in that “strong level flight” of the angels. The three lilies in the Damozel’s hand and the seven stars in her hair, and the five handmaidens of the Virgin, are definitely numbered for the effect of concreteness; Rossetti habitually employs the device, as Keats employed it in the ‘*Belle Dame Sans Merci*,’ after the manner of the old English ballads—a manner that strongly influenced Rossetti. Partly from the ballads ‘*The Blessed Damozel*’ derived some of its mediæval flavor; but the quality was really personal with the poet. Here as in his other poems Rossetti manages to reproduce the romance of the archaic, without any great reproduction of the archaic itself. The furnishing of Heaven in the poem is quaint and remote, in effect like the lovely names of the five handmaidens; but the thought or attitude of no particular past time is revived. Perhaps some of this pseudo-archaic flavor comes from the strange verse-music, which Rossetti introduced into English. The secret of much of its charm is veiled in the poet’s genius, but its most striking trait, its melancholy evenness, can be explained by Rossetti’s training in Italian prosody. In writing English poetry he departs radically from the genius of English metre; instead of fitting the words, with their natural accents undisturbed, into the regular beat of the verse—so placing them that the natural reading of the line would determine the rhythm,—Rossetti allows a preconceived rhythm to determine the accent of the words, as in the line “With her five handmaidens, whose names,” etc.

These characteristics of ‘*The Blessed Damozel*,’ and others besides, reappear more marked in other poems—the subtlety of thought, in ‘*Love’s Nocturne*’; the mediæval mood of devotion, altogether or almost religious, in ‘*Ave*,’ and in ‘*The Portrait*,’ with its splendid closing image; the ballad element, together with the unusual skill in reproducing physical sensation, in ‘*Eden Bower*,’ ‘*Troy Town*,’ and the longer ballads; and the same sad, even music in them all. Among his other verse the elaborate ballads—‘*Rose Mary*,’ ‘*The White Ship*,’ ‘*The King’s Tragedy*,’ show Rossetti’s debt to ballad literature, and at the same time mark the wide gulf between the clear simplicity of the old narratives and the wrought loveliness of his work. In his shorter ballads, however, such as ‘*Stratton Water*,’ he is much simpler. What hold he had on real life is powerfully concentrated in ‘*Jenny*,’ probably his most thoughtful poem.

Rossetti’s sonnet sequence, ‘*The House of Life*,’ undoubtedly places him among the masters of the sonnet form, though none of the sonnets, perhaps, are so well known as ‘*The Blessed Damozel*.’ Technically, they have more of the rise and fall of the best Italian models than is usual in English poetry, and at times, as in the first sonnet, or the twenty-fourth or the twenty-fifth, their cadence is superb. But in many of them the mystical subject-matter is baffling, and Rossetti’s characteristic evenness of manner, here also an evenness of mood, makes the sequence monotonous at last. Perhaps Rossetti’s best sonnets were written singly for pictures—as the beautiful ‘*Lilith*,’ and the ‘*Venus Verticordia*,’ with the three wonderful lines at the end.

The most widely known of Rossetti’s trans-

lations are the three from Villon, especially the ‘*Ballad of Dead Ladies*,’ and Dante’s ‘*Vita Nuova*.’ In all of his translated verse, however, the same traits are found as in his original work—the same exquisite, rather than great mood, the same concrete, yet remote, aspects of beauty, and the same un-English music of the verse. He has many imitators in both his arts.

Bibliography.—The best edition is by W. M. Rossetti. For biography and criticism, consult Introduction to the above; ‘*Dante Gabriel Rossetti; His Family Letters*,’ with memoir by W. M. Rossetti; Hall Caine, ‘*Recollections of Dante Gabriel Rossetti*’; Walter Pater, in ‘*Appreciation*’; the same essay in Ward’s ‘*English Poets*.’

JOHN ERSKINE,
Associate Professor of English in Amherst College.

Rossetti, Gabriele, Italian poet: b. Vasto, Abruzzo Citeriore, 28 Feb. 1783; d. London, England, 26 April 1854. He was educated at the University of Naples and in 1814 was appointed curator in the Museum there. He joined the Liberals and in 1815 became a member of the secret society of the Carbonari. He was a supporter of the constitution which King Ferdinand was forced to grant as the result of a military uprising, and when in 1821 the constitution was abrogated and its adherents proscribed Rossetti was compelled to fly the country. He went first to Malta and in 1824 to London where he was engaged as a teacher of languages and was elected professor of Italian at King’s College, London, in 1831. In his political opinions he continued an ardent Liberal, but was in favor rather of a constitutional monarchy than a republic. In religion, though never wholly abjuring the Roman Catholic creed, he was for many years practically a freethinker, though in later years he accepted an undogmatic form of Christianity. In 1835 blindness compelled his resignation from the college. His works include: ‘*Dante, Commedia*’ (1826); ‘*Lo Spirito Antipapale che produsse la Riforma*’ (1832); ‘*Poems*’ (1833); ‘*Il Mistero dell’ Amor Platonico del Medio Evo*’ (5 vols., 1840); ‘*La Beatrice Dante*’ (1842); ‘*Il Veggente in Solitudine*’ (1846); ‘*L’Arpa Evangelica*’ (1852); etc.

Rossetti, Maria Francesca, English author, daughter of Gabrielle Rossetti (q.v.): b. London, England, 17 Feb. 1827; d. there 24 Nov. 1876. She engaged in teaching and in literary work, the latter being chiefly of an educational or religious character, and in 1874 entered the sisterhood All Saints’ Home, London, where she died. Her works include: ‘*Exercises in Idiomatic Italian*’ (1867); ‘*A Shadow of Dante*’ (1871); ‘*Letters to My Bible Class*’ (1872); etc.

Rossetti, William Michael, English poet and art critic, son of Gabrielle Rossetti (q.v.): b. London 25 Sept. 1829. He was educated at King’s College, London, and entered the excise office in 1845. From 1860–94 he was assistant secretary to the board of inland revenue, and is at present professional assistant to the same board for estate duty on pictures and drawings. He has published: Blank verse translations of Dante’s comedy ‘*The Hell*’ (1865); ‘*Lives of*

Famous Poets' (1878); 'Life of Keats' (1887); 'Mémorial de Dante G. Rossetti' (1895); 'Gabriele Rossetti' (translated autobiography 1901); etc., besides much editorial work, including the works of many poets and the 'Rosetti Papers' (1862-70-1903).

Rossi, Francesco de, frän-chës'kō dā rös'sē, known as Il Cecco di Salviati, Italian painter: b. Florence about 1510; d. Rome 1563. He was a pupil of Michelangelo and Parmigiano and a painter of history and mythological subjects. Little is known of his life, excepting that he went to France, made enemies by his eccentric conduct and reckless wit, and found little patronage there. He is said by Vasari to have decorated many Italian palaces and there are examples of his work in several of the great European collections, including his 'Charity' in the English National Gallery; and his 'Holy Family' in the Prado Gallery, which show him to be somewhat mannered in execution, but none the less a painter of the Florentine school at its best.

Rossi, Giovanni Battista de', jō-vän'nē bät-tēs'tā dā, Italian archæologist: b. Rome 23 Feb. 1822; d. there 20 Sept. 1894. He was distinguished for his studies of the inscriptions of the early centuries of the church, and made important discoveries in the catacombs. He was made a member of the Berlin Academy of Sciences and corresponding member of the French Institute. He published: 'Inscriptiones Christianæ Urbis Romæ septimo Sæculo Antiquiores' (1861); 'Roma Sotteranea Christiana' (1864-77).

Rossini, Gioachino Antonio, jō-ä-kē'mō än-tō'nē-ō rös-sē'nē, Italian composer: b. Pesaro 29 Feb. 1792; d. Passy, near Paris, 13 Nov. 1868. He was born of poor parents, and when only 10 was able to support his mother by singing solos in church. He also took the part of Adolfo in Paer's 'Camillo' at the theatre of the Commune—his only appearance as a dramatic singer. He began his musical studies with his parents, but later he studied composition and counterpoint under Tesei and Mattei, both of Bologna. His first opera, 'Demetrio e Polibio,' was composed before his studies under the latter, and even at that stage of his career he had mastered the art of imbuing his music with feeling. His first public appearance as a dramatic composer was at Vienna in 1810, when his opera 'La Cambriale di Matrimonio,' was performed. Successful though it was, it did not contain any definite evidence of power to assert a new school or create a radical change in style. It had been preceded in 1808 by 'Il Pianto d'Armonia per la Morte d'Orfeo,' a cantata, which gained the prize at the Liceo and was performed in public on 8 August of that year. His next composition was 'Didone abbandonata,' a cantata, followed by an opera buffa, 'L'Equivoco stravagante,' which brought him fresh triumphs. Early in 1812 he produced two buffa operas, 'L'Inganno felice' and 'L'occasione fa il Ladro, ossia il Cambia della valigia,' each of which contained several songs full of force and original melody. He attempted one oratorio, 'Ciro in Babilonia,' which unhappily proved a failure. In the autumn of 1812 he wrote a musical two-act comedy 'La Pietra del Paragone,' produced at the Scala with immense success. In the finale occurs the first instance of his employment of

the *crescendo*, for which he became famous later, and which Mosca declared had been borrowed from his own 'Pretendenti delusi.' In 1813 Rossini composed 'Tancredi,' an opera based on Voltaire's drama, full of good situations and patriotic sentiment. Its choruses are rich in martial passages. 'Di tanti palpiti' became popular everywhere, and made Rossini the most famous composer living. During that year he also wrote 'L'Italiana in Algeri,' containing the charming trio 'Papataci' and the patriotic air 'Pensà alla Patria.' During the next two years Rossini wrote eight operas, including the well-known 'Barbiere di Siviglia' and 'Otello,' while in 1817 he produced his celebrated operas 'La Cenerentola,' 'La Gazza ladra' and 'Armida,' but critics still regarded him as a "mere musical figure-maker and a diluter of melody into mere ornament." 'Ermione,' his next opera, has been styled a "system of word-painting." His next notable compositions were 'Adelaide di Borgogna' (or 'Ottone Rè d'Italia,' as it is sometimes called), and another oratorio, 'Mosè in Egitto.' The former was produced during the Carnival of 1818 and was warmly received, and the latter at the San Carlo in Naples. During the summer of 1818 he wrote 'Adina, o il Califo di Bagdad' for the San Carlo theatre in Lisbon, and 'Ricciardo e Zoraide' for the San Carlo in Naples, an opera full of ornament. His 'La Donna del Lago' seemed to show that Scott's works were becoming popular even in Italy. In this opera and others that followed, such as 'Maometto,' 'Zelmira,' 'Semiramide,' etc., it was plain that Rossini was half a century ahead of his day. His style was changing; his gaiety had disappeared; he was becoming serious. He now visited England, on the invitation of the manager of the King's theatre in London, to write an opera for that house, to be called 'La Figlia dell' Aria,' for which he was to receive about \$1,200. He arrived in London in December 1823, with his wife, Isabella Colbran, a singer, to whom he had been married about two years, and while there was much lionized. He acted as accompanist at numerous soirées, gave several concerts, singing the solos on two occasions in a cantata which he had composed for the occasion under the title 'Homage to Lord Byron,' and in five months had acquired nearly \$35,000. He then undertook the musical direction of the Théâtre Italien in Paris for 18 months at a salary of about \$4,000 a year. He here reproduced some of his operas, for example, 'La Donna del Lago,' 'Semiramide,' 'Zelmira,' etc., and also brought out a new one—'Il Viaggio a Reims, ossia l'Albergo del Giglio d'Oro'—composed for the coronation fêtes of Charles X. The sinecure positions of "Premier Compositeur du Roi" and "Inspecteur Général du Chant en France," were now given him, with an annual income of 20,000 francs, or about \$4,000. He then revised the music of 'Maometto,' brought out under the title 'La Siège de Corinthe,' and also reproduced 'Mosè,' with many improvements and additions, some of the interpolated airs being taken from 'Armida' and 'Ciro in Babilonia.' He next resolved to try his skill at lyric opera, and adapted to the 'Le Comte Ory' some of his favorite music in the 'Il Viaggio a Reims,' but it is said that the best part of the drinking chorus was borrowed from Beethoven's 8th Symphony. His next opera, commonly re-

garded as his masterpiece, was 'Guillaume Tell,' which was produced at the Académie on 3 Aug. 1829.

With its completion the prolific career of the composer may be said to have ended, for though he lived nearly 40 years longer, a few songs, his 'Stabat Mater' and the 'Petite Messe Solennelle' are about all he wrote. These 40 years were spent at Bologna and at Passy, where he died.

Determining to revisit Bologna, where his mother had died in 1827 and where his father was still living, he resigned his post, but made an agreement with the government to compose operas for the French stage for the next ten years, and to produce one every two years, receiving 15,000 francs for each. Should this plan not be carried out, he was to receive a pension of 6,000 francs. On account of the abdication of the king of France and the revolution of 1830, he returned in November 1830 to Paris. The new government, however, was not willing to recognize the agreement above mentioned, and for several years he fought his case in the courts, it being eventually decided in his favor. During this time he wrote his 'Stabat Mater.' In 1836 he again left Paris for Bologna, where his father died in 1839. He now wrote a number of songs and choruses, among which may be cited 'Inno popolare,' for the accession of Pius IX. His wife died in October 1845, and two years later he married Olympe Pelissier, whom he had met in Paris. In 1855 he again returned to Paris. His 'Petite Messe Solennelle' was produced on 14 March 1864, and he afterward scored it for a full orchestra, in which form it was given at the Théâtre Italien on 28 Feb. 1869, three months after his death. "Next to the Emperor," writes one of his biographers, "he became the first man in this city of arts and artists."

Rossini's position among the world's greatest composers has been much discussed. His joyous disposition and light-heartedness have been used as arguments against classing him with such profound composers as Mozart and Beethoven, the latter of whom is recorded as having characterized Rossini's work as "degrading the art in general wantonness with a negligence bordering on frivolity." It has been often said that Rossini's melodies are conspicuous for great sweetness and wonderful sensuous attraction, as for instance in the first finale of 'Cenerentola,' or as evidenced by the jolly roguery of the 'Barber of Seville.' This is unquestionably true, and these are the fruits of his special form of genius. They are his natural endowment, and probably if he had at that time tried ever so hard to write in a different vein, he would have failed. His melodies were intended to please the public, for whom he wrote, and they fulfilled their mission to perfection. That he accomplished much for music cannot be gainsaid, and especially for operatic music in Italy.

Rossini devoted his talents very largely to composing operas, and the list of his works contains the titles of between 50 and 60, including a few which he recast. It should be remembered that with few exceptions he, an Italian, wrote for Italians, and therefore gave them that for which they craved. If he overstepped their limitations, they were dissatisfied; as for instance in 'Otello,' where he was actually compelled to modify the tragic termina-

tion in order to save it from being banished from the Italian stage. The Italians wanted nothing very romantic or sentimental, but as long as Rossini filled his operas with buffoonery and comical situations, they met with unqualified success. All this was changed in 'Guillaume Tell,' the music of which manifests a mind filled with deep emotions and a profound appreciation of the romantic. It is as though he had suddenly determined to disarm his critics by proving himself capable of rising to great heights when the occasion demanded. This work has been well described as a great tone-painting of Switzerland, a kind of pastoral symphony in opera form to which the fable of William Tell is only an accessory. The basic characteristics of his previous operas are absent here, and as though transformed by magical power, he suddenly appears no longer as the buoyant artist of old, but as one in whom had been created an innate love of the true and the beautiful. The sensuous gave place to a grand conception of all that was worthy in musical art.

Notwithstanding the immense popularity of Rossini's compositions, there have been pointed out certain peculiar features repeated over and over again which have caused some of his critics to temper their praise. Nor were these peculiarities entirely of Rossini's own creation, some of them having been borrowed from the works of Generali, Velluti, and others. Prominent among them is the use of the crescendo, "which," says one, "appears as regularly and invariably in his overtures and finales as horseradish with a joint of roast beef." The constant use of triplets is another mannerism which has provoked adverse criticism, while the undue prominence of appoggiaturas (leaning notes), in many cases of longer duration than the harmonic notes to which they are attached, has also been condemned, as well as his practice of closing his periods by modulating them from the major tonic to the minor mood of the lesser third below, or of the great third above the major tonic. A more serious charge made against him was that of plagiarism, it being stated that besides resorting to the national airs of Italy, he availed himself to a great extent of the ideas of Generali, Cimarosa and other Italian composers, as well as of several German composers, such as Haydn, Mozart, Krommer, etc. Thus, while no competent critic has denied that Rossini possessed genius of an extraordinary character, many are inclined to believe that his inventive faculties were confined within quite measured limits.

In spite of all this, there can be no doubt that his compositions form a memorable epoch in the history of musical art. It was he, moreover, who substituted singing for the endless recitatives which had been in vogue, and he also gave the bass voice a leading part, insisting, too, that a singer should sing the notes of the composer without any additions of his own. He also made the chorus an important feature, and fortified the orchestra by adding wind instruments to the strings, which alone had hitherto been used.

It cannot be questioned that wherever his operas appeared, they became firmly established and in many instances almost banished the classic works of the greatest masters who had preceded him. Thus, in Italy, they nearly sup-

planted the works of Pæsiello, Mayer and others, including even Cimarosa. In Germany the national predilection was for graver music, but even there Rossini was, as one of his biographers puts it, "lord of the ascendant." While he rarely, if ever, reached the tragic *grands* of Gluck, or the intense feeling of Mozart and Weber, his music is never dolorous and heavy, as is the case with some of the best compositions of the German school. Forceful and precise rhythm is another of his principal characteristics, while his scores are notable for their simplicity of outline and primary conception, although his manner of decorating the framework was at times intensely florid. Consult biographies by Beyle-Stendhal (1823, new ed. 1892); Azvedo (1865); Edwards (1869); Zanolini (1875).

Rossiter, rōs'ī-tēr, **Thomas Pritchard**, American artist: b. New Haven, Conn., 29 Sept. 1817; d. Cold Spring, N. Y., 17 May 1871. He early developed a talent for art and secured Jocelyn of New Haven as his instructor. He studied in Rome 1840-6, and on his return opened a studio in New York, where he was elected a National Academician in 1849. He painted historical and religious subjects, and was an admirable colorist.

Rossland, rōs'land, Canada, an incorporated city since 1897, in the West Kootenay District, British Columbia, on the Canadian Pacific and Spokane Falls and Northern railways, near the international boundary-line. It is the receiving and distributing centre for one of the richest gold-mining districts of British Columbia. Silver and copper are also found; and great smelters and reducing works have been erected here and at Trail, about 10 miles distant. The town is well built, and has schools, churches, wholesale and retail stores, banks, and daily and weekly newspapers. Pop. (1901) 6,159.

Rostand, rōs-tān, **Edmond**, French poet and dramatist: b. Marseilles 1 April 1869. He obtained his education at the Marseilles Lycée and the Collège Stanislas of Paris, and in 1891 was admitted to the practice of law. His first book, 'Les Musardises' (1890), a collection of verse, attracted scant notice; nor was 'Pour la Grèce' (1897), a poem which he recited for the benefit of wounded Greeks and Cretans in the Græco-Turkish war, much more successful. As a playwright, however, he at once met favor. His 'Les Romanesques' (1894), and 'Princesse Lointaine' (1895), both in verse, were applauded by public and press. But they were quite outdone by his 'Cyrano de Bergerac' (1897), a five-act drama in verse, which proved to be one of the most conspicuous successes of the modern stage, being presented in Paris 500 times consecutively, with Coquelin in the title-role. It was given also in the United States in English by Richard Mansfield and in French by Coquelin. It employs the historic figure of de Bergerac (q.v.), duelist and author. 'L'Aiglon' (1900), based on the story of the King of Rome, was given in the United States by Sarah Bernhardt, who created the part in Paris, and, in English, by Maude Adams. Rostand was elected to the French Academy 30 May 1901, the youngest "Immortal" ever admitted. His versification is finished and brilliant, his wit keen and polished; and added to these, his work displays a certain enthusiasm and spontaneity. He contributed,

with Stephen Phillips (q.v.), to the much talked of renaissance of the poetic drama. Among English translations are 'Cyrano' by Thomas and Guilenard (1898) and Hall (1898); 'L'Aiglon' by Parker (1900); 'Les Romanesques' by Fleming ('The Fantasticks' 1900) and Hendee ('The Romancers,' 1899).

Rostock, rōs'tōk, Germany, in the grand duchy of Mecklenburg-Schwerin, on the left bank of the Warnow, 80 miles northeast of Lübeck, is one of the most important cities on the Baltic. It consists of three parts: The Old, the New, and the Middle Town. The east or old town bears the impress of an old Hanse town; the Middle Town is the most modern and best-built. The most noteworthy points of interest are: the palace of the grand duke; the town-house, with its seven towers; the church of Saint Mary (1400) and other parochial churches; the university (1419), attended by about 500 students; the house in which Blücher was born, and the one in which Grotius died; schools, hospitals, etc. The fine promenades surrounding the city were formed on the site of the old fortifications. There is an extensive trade in agricultural products and salt, and important fisheries. Pop. (1900) 54,735.

Rostopchin, rōs-tōp'chīn, or **Rastopchin**, **Feodor Vassilievich**, COUNT, Russian general: b. Province of Orel, 23 March 1763; d. Moscow 12 Feb. 1826. He entered the Imperial Guards as lieutenant, was highly promoted under Paul I., but afterward dismissed in disgrace. Under Alexander he became governor of Moscow, and exercised an important influence over the campaign of 1812, even if the assertion of the French that the burning of the city was his work should be untrue. He himself denied this charge in his 'Vérité sur l'Incendie de Moscou' (1824). It is certain, however, that he caused his villa near Moscow to be burned, and took measures for the destruction of the magazines in that city. In 1814 he accompanied the Emperor Alexander to the Congress at Vienna. He afterward traveled, and spent several years in literary pursuits in Paris. His works include a number of historical memoirs, comedies, etc., written in French and Russian, and published in 1853. Consult Schnitzler, 'Rostopchine et Koutousoff' (1863); Segur, 'Vie de Comte Rostopchine' (1872).

Rostov, rōs'tōf, or **Rostoff**, Russia, in the government of Ekaterinoslav, picturesquely situated on a prominent summit above the Don, 20 miles from its mouth in the Sea of Azov. It is the oldest town of eastern Russia, a centre of considerable traffic, and some domestic industries, and its annual fair establishes the prices of cotton goods preliminary to the great fair of Nijni-Novgorod. The chief objects of trade are grain, flour, tobacco, drugs, herbs, saddlery, linen manufactures, and enameled sacred pictures. It has ever counted as an important point, from the period when first contended for by Slavs and Finns. After the Mongolian invasion it declined, and was successively plundered by Tartars, Lithuanians and Poles. Electric lighting, street railroads, and telephones are among its modern features. The ancient cathedral (1216) contains precious sacred relics of Christian missionaries and princes. Pop. (1897) 119,889.

ROSTRA — ROTARY STEAM ENGINE

Ros'tra, a name given the platform or stage in the forum in Rome, whence the orators used to harangue the people, so called from the beaks (*rostra*) of the ships taken, in 338 B.C., from the Antiates, with which it was adorned. It was a circular structure raised on arches, with a stand on the top, bordered by a parapet, the access to it being by two flights of steps.

Roswitha, rös'vê-tā, or **Hrotswitha**, hröts'vê-tā, German poet: b. about 932; d. about 1002. She was of Saxon birth and a nun in the Benedictine convent of Gandersheim, Brunswick; the first German poet and the first dramatist since the Roman period. She wrote sacred legends, a poetical chronicle of the reign of Otto I., and six Latin comedies for performance before the sisterhood. The latter were imitations of Terrence, and without attempting a development of character they displayed rapidity of action and good theatric effect. Her works were first published at Nuremberg in 1501; translations were made by Benedixen in 1850-3. The best edition was published by Barack in 1858. Consult Köpke, 'Hrotsuit von Gandersheim' (1869).

Rosy Finch, one of the large finches of the genus *Leucosticte*, several species of which inhabit the higher parts of the Rocky Mountains and the colder parts of northwestern America, coming southward in winter. Their plumage is suffused with rose-red, brightest in the males, and in the spring they have a loud and pleasant song. The best known species is *L. tephrocotis*, common in Colorado and Utah in winter. Consult Coues, 'Birds of the Northwest' (1874).

Rot, a disease in sheep and other gramivorous animals, produced by the hydatids *Fasciola hepatica* and *Distoma lanceolatum*, often living in great numbers in the gall-ducts and bladder of the animal. (See SHEEP.) Also the popular name for many fungoid diseases of plants. See DISEASES OF PLANTS; FUNGI.

Rota Romana, rō'tā rō-mā'nā, or **Ruota Romana**, signifies an ecclesiastical tribune of the Roman Catholic Church situated at the papal court; from this situation probably comes the name of the tribunal, since the old papal courts were decorated with mosaics in the shape of wheels or *rotæ*. The Rota Romana was at one time a body of vast judicial power, having jurisdiction not only over all cases of appeal and all disputes of beneficiary and patrimonial nature, but as well over the more important class of all cases concerning ecclesiastical benefices. These last are no longer within the jurisdiction of the court, its power being diminished of necessity by the political position of the papacy of to-day. But over the first two classes named the court has full jurisdiction, its decree being final, inasmuch as the only appeal permitted is one directly to the Pope.

The Rota Romana was, and still is, a collegiate body, although its constitution has undergone radical changes in recent years. Originally it was composed of 12 prelates, mostly Italians, but representing also the other papal states of Catholic Christendom. The meetings which took place in the palace of the Pope twice a week were of supreme importance in the administration of the Roman Catholic Church law throughout the world. The tribuna is now divided into two colleges or senates.

Rotary Steam Engine, a type of engines in which the pistons rotate within the cylinder, or the cylinder upon the pistons, thus giving a continuous rotary motion and eliminating the loss of power consequent to the necessary change in the direction of motion of a piston working horizontally in a cylinder, as in the case of an engine operating with a reciprocating action.

The varieties of rotary engines are numerous, consisting of machines equipped with one, two, three, and four pistons on single axes, or of pistons working in pairs on several axes, operated by steam injected against them, or working by the reactive action of steam emitted tangentially. The basic principle was suggested by the inventors of the last century, among whom Watt, Cartwright, and Galloway may be included; while among the notable engines of this class may be mentioned the Schantz (Swedish), the Thompson (Scotch), the Behrens (American), and the Pillens and Hill (English), in all of which the pistons revolve within the cylinder, and differ from each other only in the details of the mechanical arrangements employed to utilize the pressure of the steam.

In another form perfected by Harris, portions of the engine are attached to two hubs and run in different directions. The hollow trunnions of one axis carries the two radial arms which emit steam at their ends tangentially against vanes carried on the other axis with a direct driving action. By gearing the two motions are utilized upon a single shaft. The latest development, and perhaps the most efficient, is that perfected by William M. Hoffman, of the type in which the cylinder revolves around the pistons upon an elliptical steam-chest supported by a hollow shaft through which the steam is admitted and exhausted.

Fig. 1 shows a side view of the engine in which A is the revolving cylinder; B, steam entrance to hollow shaft; C, shaft and ellipse support; D, bearings of revolving cylinder; E, steam exhaust from hollow shaft, and F, power connection for gearing or belting.

Standard for holding stationary shaft and core.

Fig. 2 shows a cross section of the cylinder A; the ellipse E, supported by sleeves upon the hollow shaft S; and two segmental blade pistons B and C, which extend the entire length of the cylinder to which they are attached by the cranks G.

By construction the expansion chamber L is formed of three sides—the inner surface of the cylinder, and the outer surface of the ellipse,

ROTATION—ROTATION OF CROPS

both of which are rigid, and the convex surface of the piston B, which is free to move into and out of its housing D.

In operation, the steam is admitted at one end of the hollow shaft S, and exhausted at the

FIG. 2.

other after having been utilized by the action of an automatic cut-off arrangement which allows it to enter the chamber L, through the port F, where it expands and pressing against the piston B, moves it forward over the ellipse, thus causing the cylinder to revolve. As the piston B approaches the greater dimension of the ellipse, it is forced into its housing D, where it forms an abutment against the escape of steam; while the piston C, arrives opposite the port F, exhausts the steam, and relieved of the pressure of the greater dimension of the ellipse emerges from its housing H, and forms the free side of a new chamber L, into which the steam is again admitted by the automatic cut-off to expand and continue the action already described.

Rotary engines are designed to obtain the greatest possible efficiency with the least amount of fuel consumption, and a great reduction in engine-room floor space. Engines capable of developing 300 horse-power, at 2,000 revolutions per minute have been successfully and economically operated.

W. MOREY, JR., C.E.,
Consulting Engineer.

Rotation, (a) in astronomy, the turning round of a planet on its imaginary axis, like that of a wheel on its axle. The rotation of the earth is performed with a uniform motion from west to east, and occupies the interval in time which would elapse between the departure of a star from a certain point in the sky and its return to the same point. The only motions which interfere with its regularity are the precession of the equinoxes and nutation. The time taken for the rotation of the earth measures

the length of its day. So with the other planets. The sun also rotates as is shown by the movement of spots across its disk (see SUN). The earth's rotation slightly increases the force of gravity in moving from the equator to the poles. Sir William Thomson, reasoning from some small anomalies in the moon's motion, inferred that 10,000,000 years ago the earth rotated one seventh faster than it does now, and that the centrifugal force then was to that now as 64 to 49; (b) in botany, the movement of the protoplasm observed in the cells or cell-walls of certain plants. Little or nothing is definitely known as to the causes that bring it about, but it is probably related to the similar motion in amoeba and other low orders of animal life; (c) in mechanics. See MECHANICS.

Rotation of Crops, the order in which crops are grown during a series of years on the same land. The advantages of this practice are: (1) All plants tend to exhaust the soil, but in different degrees, hence a rotation tends to maintain a balance. Thus at the Rothamsted Experiment Station, England, where wheat has been grown on the same land for 62 successive years without manure or fertilizers, the average yield is about 13 bushels per acre, or nearly the same as the average yield in the United States, while where grown in a four-course rotation of rutabagas, barley, beans or clover, wheat, the average yield during a period of 52 years is nearly 27 bushels per acre, without manuring or fertilizing. (2) All plants do not take up the same ingredients in the same proportion; thus, crops rich in carbonaceous matter take up relatively small amounts of food from the soil, but large quantities from the air, the latter costing nothing. (3) Some crops give better opportunity for cleaning land, as corn, potatoes. Others cannot be tilled and favor the growth of weeds, as wheat, oats. (4) When several crops are grown on a farm the labor is distributed over a greater portion of the year and it is more economical. The social evils consequent on temporary employment at high wages for a short period of the year, and idleness the rest of the time, cannot be overlooked. (5) Plants vary in their ability to assimilate the plant food in the soil; thus buckwheat and rye are able to flourish where wheat and cabbages could hardly live. (6) The legumes enrich the soil in nitrogen. (7) A variety of crops is essential where cattle and other live stock are kept. (8) In a rotation the increase of destructive insects and diseases is hindered, owing to their not having the necessary crop to prey upon. (9) Some crops permit the sowing of others among them, thus saving time; clover and grass seeds being sown among barley and wheat, wheat sown among corn. (10) Some crops permit the aggregation of the soil particles when they become excessively reduced by tillage, hence land is laid down to grass, alfalfa. (11) Certain crops aid in accumulating humus, as grass, hence such should follow two or three years of exhaustion by tillage. Admitting air to the soil tends to destroy humus and to reduce the water-holding capacity. The loss of humus has converted garden-spots in New York and other Eastern States, northern Africa, Asia Minor, and Spain into wastes, and Sicily, the granary of Italy in the time of the Romans, is now comparatively sterile.

ROTATION OF CROPS

Rotations are described according to the number of years required to complete a circuit, as three-course, four-course, etc. In the latter the tillable land is divided into four parts and each crop is grown on part of the farm each year. The folly of growing the same crop on the same land for several successive years was noted by the Romans and others, as also the benefits derived from growing a leguminous crop, as alfalfa or clover, previous to a grain crop, as wheat. These observations remained unutilized until a comparatively recent date. Rotations have gradually grown into their present forms according to circumstances, and have been and are modified as required and as our knowledge increases. Attention was first drawn to their value in 1777, in a treatise by Dickson of Edinburgh, Scotland.

One of the earliest recorded systems was the "outfield" and "infield," in which part of the land was used for growing grain until its crop-producing power was so reduced that it became unprofitable, when it was allowed to lie idle for a number of years. Increase of population caused a modification, the land being rested or "fallowed" a year at intervals; thus, among the Jews, this was repeated every seventh year. A system of continuous single-cropping has been pursued in the Western States with distinct loss to the nation. Where land is weedy and in dry districts, as parts of California, the east of England, etc., bare fallowing or the cultivation of the soil without growing a crop is still considered good practice, sufficient moisture being conserved to ensure a profitable crop the succeeding year. A development from this system consisted of the introduction of green crops, either intertillage crops, as corn, turnips, potatoes, cabbages, etc., if the land was weedy and needed cleaning, or of legumes, as clover. The advantages of a crop-fallow are that the land is turned to profitable use; it is cleaned and the available nitrogen present as nitrates, is not so liable to be lost by percolation, being taken up by the crops; that humus is produced from the root-residue; and that if a leguminous crop is grown it enriches the soil in nitrogen by means of the bacteria on its roots.

In 1788 Marshall of England stated that a common rotation was: 1st year, wheat, barley, or bigg; 2d year, oats, beans and pulse; 3d year, bare fallow. A distinct advance was made with the realization of the value of the Norfolk four-course, which was practised on light land and originally consisted of roots, barley, clover, wheat. The principles involved are: (1) that a deep-rooted crop shall succeed a shallow-rooted one, barley being shallow-rooted and clover deep-rooted; (2) that crops of the same natural order and somewhat like tendencies, as wheat and barley, both being straw-crops and more or less subject to similar enemies, shall not succeed each other; (3) that a weedy crop shall be followed by a cleaning one, as the roots after the wheat; and (4) that a leguminous crop shall have a place in each rotation. The advantages of this system were: (1) The wheat was grown after a nitrogen-gathering crop; the clover stubble was readily prepared for wheat in the fall, or if stock feed was scarce it could be pastured late and spring wheat or oats grown instead. The wheat was harvested in time to permit the land being fall-plowed and cleaned for

the succeeding root crop. (2) The fallow crop, roots, received manure and intertillage, and gave an opportunity to clean the land and stir it deeply. It furnished work for the horses in summer in cultivating, and a bulky crop of succulent feed for stock, which with the hay furnished considerable manure. (3) A grain-crop follows well after a root crop, and generally little or no plowing is needed. Barley is a good crop to seed with, as it occupies the land but a short time and is not so exacting on the soil moisture as oats. (4) The clover requires a firm seed-bed, and if the roots were consumed on the land and shallow tillage given in fitting the land for the barley such was secured. The barley permitted a good growth of clover which enabled it to withstand the winter. This crop supplied the hay. The disadvantages of this system are that it is too short, the land being liable to become both clover and turnip sick, and the turnips affected with "club-root." Under these circumstances clover and turnips could be taken every eighth year, substituting beans, peas or cowpeas for the former, and potatoes, etc., for the latter. Such close cropping renders the rotation expensive, the labor bill being high, but the cost may be reduced by leaving the grass and clover seeding down for two or three years, thus making a five or six years' rotation, or it may be used as the basis for a 7 or 8 course. This rotation is capable of adaptations as follows: (1) Grain—wheat, oats, barley, rye, corn, buckwheat; (2) Cleaning or fallow crop—corn, potatoes, sugar beets, mangels, tobacco, cabbages, turnips, rutabagas, rape, cowpeas, soy beans, sorghum, etc.; (3) Grain—barley, oats, rye, wheat, corn; (4) Legume—clover, grass and clover, cowpeas, soy beans; (5) Legume—grass and clover, mown once and pastured, or pastured all the year.

In the United States the rotations of crops vary considerably in different sections. In many places the succession of crops is dictated rather by accident or convenience than by any well considered principles. Corn and wheat or oats formed a common two-course rotation with the early settlers, until the land failed to produce a crop of wheat when corn was grown every second year, the land going to weeds in the interval. The "Eastern Shore rotation," which is a two-course, consists of corn followed by oats, with a secondary crop of Magothy Bay beans. The growth of this leguminous crop, while curtailing the yield of oats, furnishes considerable green manure for plowing in. The first system on the best cultivated farms in Virginia was a three-course, beginning with corn, and succeeded by wheat, in which the grass and weeds were allowed to grow and be grazed the third year. One well known farmer in Virginia grew clover in place of the weeds the third year to furnish green manure. A later rotation was: (1) corn or oats; (2) wheat and clover sown; (3) clover grown and plowed under in August, and the land seeded to wheat for the fourth year.

An old and successful rotation recorded for New England is corn, oats, and timothy and clover, the latter remaining down for three years, thus two plowings are required in five years, one for corn, and a light plowing for oats, the grass and clover seed being sown among the oats. A modern three-course rotation for the Eastern States is potatoes

winter rye, clover. This is a modification of a well-known Middle Western rotation, potatoes, winter wheat, clover. It embraces a root crop, a cereal and a leguminous crop. It is well suited to light and medium soils and is economical in labor, but one deep plowing being required in three years, that for the potatoes, the land being prepared for the rye by disking. The potatoes are a cash crop, the rye furnishes bedding and feed for stock, and the clover furnishes hay, and is not left down long enough to be seriously injured by the clover-root worm. The rotation is too short for many places, and probably the land would become clover-sick. It may be converted into a four-course by growing a crop of corn after the clover, and into a five-course by sowing grass with the clover and leaving them down for two years, thus corn, potatoes, rye, grass (timothy, redtop, etc., clover), mown, grass mown and grazed. In this way two fifths of the tilled land is plowed each year, that for corn and potatoes; the land for potatoes may be plowed in fall after the rye is sown in September, thus reducing the spring work. If milch cows are kept, the corn furnishes grain and stover or may be cut for silage, the rye may be cut green for fodder or allowed to mature, and the area in potatoes might be reduced and cowpeas, soy beans, peas and barley, or some other fodder or silage crop substituted.

For a dairy farm having half the land in permanent pasture, a satisfactory four-course is (1) corn (cut for silage); (2) oats, the land being fall-plowed, the crop furnishing grain and bedding; (3) wheat (sown in fall, the grain being sold or consumed, the straw used for bedding); (4) clover (sown in spring in the wheat). This rotation permits of carrying the maximum amount of live stock and having a large supply of manure; thus enabling the crop-producing power of the soil to be maintained or increased. The live stock furnish constant employment and enable the farmer to make two profits, that of the grower and the manufacturer.

A common rotation in the Middle West is corn, wheat and clover. The wheat is sown in the corn with a one-horse drill before the latter is mature, the clover being sown in the wheat. Labor is a serious problem and this system economizes it, but one plowing being required.

Consult Wheeler, 'A Rotation of Crops,' Bull. 74, 75, 76, Agr. Exp. Sta., Rhode Island (1900); Gilbert, 'Memoranda of the Rothamsted Experiments' (1901).

SAMUEL FRASER,

Instructor in Agronomy, Cornell University.

Rotch, rōch, **Abbott Laurence**, American meteorologist: b. Boston, Mass., 6 Jan. 1861. He was graduated from the Massachusetts Institute of Technology in 1884, and in the following year established and has since maintained at his own expense a meteorological observatory at Milton, Mass. On 14 Dec. 1906 he was appointed professor of meteorology at Harvard University. He was the first meteorologist in the United States to measure the height and velocity of clouds, and to use kites with a self-recording instrument for this purpose. He also made experiments in wireless telegraphy. He has written 'Sounding of the Ocean of Air' (1900).

Rotherham, rōth'er-am, England, town in the West Riding of Yorkshire, at the confluence of the Rother and the Don, five miles northeast of Sheffield. The most notable buildings are the market-hall, post-office, court-house, corporation offices, council hall, and a large number of educational, literary, and benevolent institutions, including a mechanics' institute. The town possesses extensive metal works, potteries, glass works, and rope yards. It is of Roman origin and was of some importance in the Anglo-Saxon period. Pop. (1901) 54,348.

Rothermel, rōth'er-mēl, **Peter Frederick**, American painter: b. Luzerne County, Pa., 8 July 1817; d. near Pottstown, Pa., 15 Aug. 1895. He was educated as a land surveyor, but at 22 studied painting, and about 1840 opened a studio as a portrait painter at Philadelphia, and eventually turned his attention to historical subjects. Among his earlier works are 'Christabel' and 'Katherine and Petruchio.' He has also painted many American subjects, among them 'De Soto Discovering the Mississippi,' 'Columbus Before Isabella the Catholic,' the 'Noche Triste' from Prescott's 'Conquest of Mexico'; 'Patrick Henry Before the Virginia House of Burgesses'; and 'The Battle of Gettysburg.' His pictures reveal a fine sense of color and a power of dramatic composition which are not common; but he has a tendency to exaggeration and his overtrained action is very often less genuinely effective than sensational.

Rothschild, rōths'child (Ger. rōt'shilt). The famous European financial house known as Rothschild was founded by Mayer Anselm Rothschild: b. Frankfort-on-the-Main 1743; d. 19 Sept. 1812. He was of Jewish parentage, and was destined for the priesthood, but found commercial pursuits more to his liking, and engaged in trading, afterward entered a banking house in Hanover. His industry, frugality, and sound business methods made him in a few years the master of a small capital, and he returned to Frankfort, where he established the banking house still in existence. The firm originally consisted of his five sons, who established branches of the house in different European cities: Anselm, b. 12 June 1773; d. 6 Dec. 1855; resided in Frankfort; Solomon, b. 9 Sept. 1774; d. 27 July 1855; lived in Vienna; Nathan, b. 16 Sept. 1777; d. 18 July 1836; located at London; Karl (Baron), b. 24 April 1788; d. 10 March 1855; resided in Naples; and Jacob (Baron), b. 15 May 1792; d. 15 Nov. 1868; resided in Paris. The political events of 1813 raised the house of Rothschild to the important position it has since occupied in the commercial and financial world. In 12 years the Rothschilds raised by way of loan or subsidy an amount exceeding £100,000,000 sterling which was distributed by them in nearly the following proportions: England, £40,000,000; Austria, £10,000,000; Prussia, £8,000,000; France, £16,000,000; Naples, £10,000,000; Russia, £5,000,000; several German courts, £1,000,000; Brazil, £2,000,000; exclusive of various other large sums. The remarkable degree of success attained by the house, setting aside the favorable circumstances of which they have taken advantage, may be largely attributed to their strict adherence to two fundamental maxims laid down by the founder of the house. The first

of these is their conducting all operations in common. Every proposition of magnitude is laid before each member of the firm, fully discussed, and then executed by their united efforts. The second principle is to set definite limits to each operation and never to aim at exorbitant profits. Their wealth has increased in an unexampled degree, and their reputation and credit have been steadily fortified by fair dealing, reasonable terms, and sagacious and systematic operations which are clearly planned and judiciously executed. The Rothschilds are extremely punctual in meeting their contracts, and before the introduction of the telegraph their couriers were frequently in advance of the government. The advantages of their system and their strength were clearly shown when in 1848 they met conjointly a loss of several millions, which would have crushed any other house, but which the enormous scope of their resources enabled them to meet without difficulty. The members of each succeeding generation are admitted into the firm and much intermarriage among cousins indicates that the family is destined long to retain its control of European finance. Lionel Nathan, b. 22 Nov. 1808; d. 3 June 1879, was the first Jew admitted to the English Parliament, and his son Nathaniel Mayer, b. 8 Nov. 1840; d. 13 June 1905, was created a baron in 1885. Since 1815 the Rothschilds have raised for Great Britain \$1,000,000,000; for Austria, \$250,000,000; for Prussia, \$200,000,000; for France, \$400,000,000; for Italy, \$300,000,000; for Russia, \$125,000,000; for Brazil, \$70,000,000; and in 1895 they purchased \$15,000,000 of the United States bonds controlled by the Belmont-Morgan syndicate. Consult: Reeves, 'The Rothschilds' (1887); 'Das Haus Rothschild' (1857); Von Scherb, 'Geschichte des Hauses Rothschild' (1893); Michaud et Villeneuve, 'Histoire de Saint-Simonisme et de la Famille de Rothschild' (1847).

Rotifera, a group of small, usually microscopic animals, are familiarly known as wheel animalcules, because of the presence at the anterior end of a crown of cilia which in their vibration suggest the rotation of a wheel. The opposite (posterior) end of the body is prolonged into a stalk (foot) which is the organ of attachment in sessile forms or is used in walking by such as are free. It is often segmented and may be terminated by one or two pointed toes, while a cement gland in the foot aids in fixation. The anatomy is simple and usually easily studied in the living animal. In general it recalls that of the embryonic annelid with which the rotifers are often genetically connected (see *TROCHELMINTHES*). A vascular system is wanting and the excretory system consists of "flame-cells." The sexes are separate, but the males are rare, degenerate, and needed only for the production of the fertilized winter eggs. Summer eggs develop parthenogenetically. The rotifers are abundant and widely distributed, but confined almost entirely to fresh water. They were among the very first of microscopic organisms to receive attention, and have always been favorite objects of study. A few forms are parasitic in habit and almost all are capable of desiccation and subsequent revival.

Rotteck, röt'ték, **Karl Wenceslaus Rotdecker von**, German historian and publicist: b. Freiburg in Baden 18 July 1775; d. there 20 Nov. 1840. He was educated at the University of Freiburg, adopted the profession of advocate, but turned to the study of history, and in 1798 was appointed professor of that department in Freiburg University, a chair exchanged in 1818 for that of natural and international law. In 1819 he was chosen by his university as their representative in the first chamber of the states of Baden, and there proved an ardent champion of political reform. He was one of the founders of 'Der Freisinnige,' a journal with strong democratic leanings, and brought upon himself the displeasure of the conservative party, who compelled him to resign his professorship, and discontinue the editing of all public prints for five years. An ineffectual attempt was made to exclude him from the second chamber of the states, to which he had been elected representative in 1830; but he continued to hold this seat till his death. His chief work is 'Allgemeine Weltgeschichte' (1813-27). Numerous translations of the original work, or an abridgment published by Rotteck, entitled 'Auszug aus der Weltgeschichte,' have appeared in most European languages. It is a critical narrative of prominent events written from a liberal point of view. Other works are: 'Lehrbuch des Vernunftrechts und der Staatswissenschaften' (1829-30); 'Lehrbuch der ökonomischen Politik' (1835); 'Kleinere Schriften' (1829-30); and, with Welcker, a 'Staatslexikon' (1834-44).

Rot'tenstone, a decomposed mineral substance, consisting chiefly of alumina with about one ninth of carbon and half as much of silica. It is supposed to be formed almost wholly by decomposition of shale, and is chiefly found in Derbyshire, England, in South Wales, and near Albany, N. Y. It is either grayish, blackish, or reddish-brown in color, is soft and easily scraped to powder, and is much used for cleaning and polishing metallic surfaces, glass, etc. The term rottenstone is now used to include the tripoli of commerce (first imported from Tripoli, Africa), and also any kind of silicious material suitable for the same purposes.

Rotterdam, röt'ér-däm (Dutch, röt-tër-däm'), Netherlands, one of the chief cities and busiest ports of the country, 36 miles by rail southwest of Amsterdam. Important waterways connect the town with the sea and with the interior. Thus vessels of deep draft may approach quite near, and the amount of tonnage entering Rotterdam (including that which is connected with the inland traffic), is only surpassed by London among European ports. The Hoog Straat, built on the protecting dike, divides the city into Binnenstad and Buitenstad. The intersecting canals cut the Buitenstad into islands. The canals or "havens" are Rotterdam's streets, generally speaking, and the principal buildings line the main "havens." In the Groote Markt is a statue to Erasmus, who was a native of Rotterdam. Saint Lawrence Church, founded in 1414, contains an excellent organ and some fine marble monuments to celebrities. There are churches of all denominations, government offices, academy of fine arts, various museums, several hospitals, and good schools. There are also zoological gardens and a public park.

The modern public buildings form a remarkable contrast to the quaint old-time wooden gabled houses. Rotterdam carries on an active foreign and domestic trade with her colonies, Europe and America. The imports include native produce from her eastern and western colonies, and grain, coal, oil, seeds, etc. The exports are linen, flax, dairy products, gin, and manufactures. Rotterdam boasts many flourishing mills and other industrial works. Pop. (1900) 332,185.

Rotti, röt'tē, **Rottee**, or **Rotto**, an island belonging to the Netherlands, in the Indian Ocean, northwest of Australia and southwest of Timor Island. It is of volcanic origin; its greatest length is 36 miles, and greatest width 11 miles. It has a bold, rocky coast; the surface of the interior is undulating and the soil is very fertile. The lontar, or palmyra palm, furnishes a juice which is one of the principal articles of food. Maize, rice, millet, cotton, and tropical fruits are plentiful, and cabinet woods are exported. Horses, goats, sheep, pigs, and buffaloes abound. Edible birds' nests and wax are also exported. The natives, supposed to have come originally from Java, are a fine looking race. Pop. about 70,000.

Rottmann, röt'män, **Carl**, German painter: b. Handschuchheim near Heidelberg 11 Jan. 1798; d. Munich 6 July 1850. He early established himself at Munich, but finding little congeniality in the studies of the academy, interested himself in the natural scenery of the country, which formed the environs of the city, and by his independent studies he actually instituted a new school of German landscape. His masterly pictures attracted the attention of King Louis, who engaged him to paint a series of Italian landscapes; and his frescoes, executed between 1829 and 1833 in the arcades of the palace gardens, are remarkable for color and masterly power in line. Among his oil paintings may be mentioned: 'The Acropolis of Sicyon' and his 'View of Corfu,' now at Munich in the new picture gallery; 'The Fountain of Callirrhoe,' at Munich; 'Perugia,' in the National Gallery at Berlin. While he was a powerful and imaginative painter in oil, his chief claims to recognition in modern art history are his mastery of water colors and his skill in genuine naturalism.

Roubaix, roo-bā, France, in the department of Nord, six miles northeast of Lille, is a prosperous manufacturing town, containing many mills and factories, dye works, and tanneries. Its public buildings are unimportant. Its woolen and linen manufactures and its carpets are celebrated. Pop. (1901) 124,660.

Roubillac, roo-bē-yāk, **Louis François**, French sculptor: b. Lyons about 1695; d. London 11 Jan. 1762. He settled in England about 1720, and a monument designed by him for the Duke of Argyll in Westminster Abbey brought him into great repute. Among his monumental works are statues of Bishop Hough in Worcester Cathedral; of Sir Peter Warren; of Handel in Westminster Abbey; of Shakespeare in the British Museum; and of Sir Isaac Newton at Cambridge.

Rouen, roo-ōñ, France, chief town of the department of Seine-Inférieure, situated on the

right bank of the Seine, 87 miles southwest of Paris, ranks next to Lyons as a manufacturing city, and is one of the most attractive provincial towns of the republic. Rouen possesses much interest in its public buildings, many of which are almost perfect specimens of Gothic architecture. They include the venerable cathedral of Notre Dame, the product of centuries of construction; begun in 1220 under Philippe Auguste, it has seen many vicissitudes, but its imposing façade surmounted by lofty towers, its richly decorated walls, its exquisite wood carvings, fine sculpture, and beautiful rose-windows, render Notre Dame one of the most remarkable and artistic of Christian temples. The abbey and church of Saint Ouen also in the Gothic style, whose aerial tower terminates in a crown of fleurs-de-lis; the Church of Saint Maclou, a fine specimen of florid Gothic; the Tour de la Grosse-Horloge; the Palais de Justice, of the 15th century, remarkable for the delicacy and boldness of construction; the Hotel de Bourgtheroulde (15th century), with fine reliefs; the archiepiscopal palace; the musée or picture gallery, containing a fine collection of paintings by French masters; and the ancient Halles or market buildings. There is a large library and several museums of scientific collections. In the Place de la Pucelle Joan d'Arc was burnt. Rouen is the birthplace of Corneille, Fontenelle, Boieldieu, and Flaubert. It is the see of an archbishop, and seat of law courts, and possesses a chamber of commerce, an exchange, mint, and schools of science, art, and the higher professions. The staple manufacture is cottons, in every form, one class of which is so specialized as to be known as *rouenneries*. Besides woolen goods, machinery, chemicals, etc., there are numerous industrial works for weaving, refining, and smelting. The location of the city favors trade. The main articles are corn, flour, wool, cotton, coal, petroleum, wine, brandy, colonial produce, and manufactured goods. Rouen was built before the conquest of Gaul by the Romans. It was captured and pillaged by the Normans in the 9th century. Then it was long held by the English until 1449. Pop. (1901) 115,914.

Rough and Ready, a popular nickname applied to President Zachary Taylor during the Mexican War.

Rough-leg, a buzzard-hawk of the genus *Archibuteo*, especially *A. lagopus*, so called because feathered down to the toes. It is known throughout the northern regions of both continents, and is typically whitish, streaked with rust-red; but the American form best known is a melanotic variety (*A. lagopus sancti-johannis*), which frequents the maritime districts of the Atlantic coast, and is less often seen in the interior, except northerly. The western United States and Pacific coast have a second species (*A. ferrugineus*), called in California squirrel-hawk, which is rusty brown, marked with gray, white, and black; or sometimes plain dark chocolate brown. These hawks are large (23 to 24 inches in length), and of fierce and noble appearance; but they have none of the dash and spirit of the falcons, and indeed seem inferior to the buteos in this respect. Their quarry, though diversified, is always humble; they prey upon various field-mice and other very small quadru-

ped, lizards, and frogs, and even insects, rarely attacking birds of any kind, and then only the most defenseless. Open fields, especially in the vicinity of water, are their favorite resorts. They appear heavy and indisposed to active exertion; flying slowly and heavily, and often remaining long motionless on their perch. They show some analogy to the owls in points of structure, as well as in their partially nocturnal habits. Wilson observes that it habitually courses over the meadows long after the sun has set, and Audubon calls it the most nocturnal of our species. The nest is ordinarily built of sticks, etc., in a high tree; sometimes, however, on cliffs. The eggs, three or four in number, measure about $2\frac{1}{3}$ by $1\frac{3}{4}$ inches, largely blotched with different shades of brown, sometimes mixed with purplish slate markings.

Rough Riders, a name borne by the 1st Regiment of United States cavalry and also by the 2d United States volunteer cavalry in the Spanish-American War. The original Rough Riders were the men who carried messages through the Western States before the organization of the pony express in 1859, and the name was used by William F. Cody in his "Wild West" show, which contained a "Congress of the Rough Riders of the World." The army regiments were thus named because of the great number of western ranchmen in their ranks, and played a prominent part in the Spanish-American War. The first regiment was organized by Leonard Wood, who was commissioned colonel, and Theodore Roosevelt became lieutenant-colonel. Before the disbanding of the regiment in 1898 a Rough Riders' Association was formed, to which all members of the regiment are eligible, the right of membership to descend to the eldest son. See ROOSEVELT, THEODORE, and WOOD, LEONARD.

Rough-winged Swallow, a small blackish migratory swallow (*Stelgidopteryx serripennis*) of the United States generally, where it nests in summer in holes in banks, in crevices of rocks, etc., and has the general habits of the bank swallow (q.v.). The genus, of which several other species are known in Central and South America, is peculiar in having the outer web of the first wing-quill converted into a series of stiff recurved hooks, which may be supposed useful in creeping into their holes and in clinging to vertical or overhanging surfaces. Considering the general likeness of the bird otherwise to the bank swallow, the fact that this species often makes its nest and lays its pure white eggs in some cranny about a bridge or building is noteworthy. Consult COUES, 'Birds of the Colorado Valley' (1878).

Rouge, roozh, a cosmetic prepared and used to impart artificial bloom to the cheeks or lips. It is applied by means of a camel's hair pencil, puff-powder, or a hare's foot. When rouge is properly prepared, it is said that its application does not injure the skin. Jeweler's rouge is an impalpable preparation of oxide of iron, obtained by heating the yellow oxalate of iron till it decomposes, carbonic acid escaping, and only a red powder being left. It is used for polishing silver, and for this purpose should be of the finest quality.

Rouge et Noir, roozh ā nwör, or **Trente et Quarante**, trönt ā kā-ränt, a modern game

of chance played with the cards belonging to six complete packs. The punters or players stake upon any of the four chances: *rouge*, *noir*, *coulour*, and *inverse*. The banker then deals a row of cards for noir, until the exposed pips number between 30 and 40 (court-cards count 10, aces 1), and a similar row for rouge. That row wins which most nearly approaches the number 31, and players staking on the winning color receive their stake doubled. *Coulour* wins if the first card turned up in the deal is of the winning color; in the contrary case *inverse* wins. When the number of pips in both rows are equal it is a *refait*, and a fresh deal is made; but if both happen to count exactly 31 it is a *refait de trente-et-un*, and the banker claims one half of all stakes. This last condition places the banker at an advantage calculated to be equal to about $1\frac{1}{4}$ per cent on all sums staked.

Rouget, Georges, zhörzh roo-zhā, French painter: b. Paris 2 May 1784; d. there 9 April 1869. He studied at the Ecole des Beaux Arts, and later under David, who employed him to finish many of his pictures. He became in consequence an imitator of that master. He painted a large number of portraits, those of Louis XVIII. and of Charles X. being noteworthy, and historical subjects. Of the latter are: 'French Princes Paying Homage at the Cradle of the King of Rome' (1812); 'Death of St. Louis' (1817), at Versailles; 'Œdipus and Antigone' (1819), at Rouen; 'Francis I. Pardoning Rebels of La Rochelle' (1822); 'Marriage of Napoleon and Marie Louise' (1837); 'Napoleon Receiving the Decree of the Senate Proclaiming Him Emperor' (1838); 'Death of Napoleon' (1846). Several of the churches of Paris contain religious subjects painted by him; but the major part of his work may be seen at the Versailles Museum.

Rouget de Lisle, roo-zhā dē lēl, **Claude Joseph**, French song-writer: b. Lons-le-Saulnier, France, 10 May 1760; d. Choisy-le-Roi 27 June 1836. He published 'Fifty French Songs, Words of Various Authors, Set to Music by Rouget de Lisle' (1826); etc., but is chiefly remembered as the author of both the words and music of 'The Marseillaise' (q.v.).

Rougon-Macquart, roo-gōn mā-kār, **Les**, a series of 20 novels by Emile Zola, relating the history of a family under the Second Empire and published 1871-93. The novels were intended to form a scientific study of heredity as well as a photograph of French social life. The series begins with 'La Fortune des Rougons' (1871), and this was followed by 'La Curée' (Rush for the Spoil: 1872); a study of the financial world of Paris at the time Haussmann laid out the boulevards; 'La Conquête des Plassans' (1874); 'Le Ventre de Paris' (The Markets of Paris; or Fat and Thin: 1875); 'La Faute de l'Abbé Mouret' (1875); 'Son Excellence Eugène Rougon' (1876), a story of political life; 'L'Assomoir' (Drink: 1877); a story of life among the workmen of Paris; 'Une Page d'Amour' (1878), a physical and psychological study of the various phases of a woman's passion; 'Nana' (1880), a study of the life of a courtesan and actress; 'Pot-Bouille' (1882), a study of the life of the bourgeoisie; 'Au Bonheur des Dames' (The Ladies' Paradise: 1883), a study of the mammoth de-

partment stores; 'La Joie de Vivre' (1884); 'Germinal' (Master and Man: 1885), a study of life in the mines; 'L'Œuvre' (1886), a study of artist life; 'La Terre' (1888), a study of peasant life and the greed for land; 'Le Rêve' (1888); 'Le Bête Humaine' (1890), a study of railway life; 'L'Argent' (1891), a study of stock speculation; 'La Débâcle' (The Downfall: 1892), a study of the Franco-Prussian war and the Siege of Paris; 'Le Docteur Pascal' (1892). In this last story Pascal Rougon collects all the data relating to his family, and sums up their history.

Rouher, Eugène, é-zhân roo-är, French statesman: b. Riom 30 Nov. 1814; d. Paris 3 Feb. 1884. He studied law and practised his profession in Riom until his election to the Legislative Assembly in 1849. He became a confidant of Napoleon III. and was appointed minister of justice. In 1863 he was made minister of state, and in 1870 became president of the Senate and chief of the Napoleonic cabinet. In 1860 the famous treaty with England was effected largely through his instrumentality in which the free trade policy of Napoleon was inaugurated. His activity in state affairs continued until the fall of the empire when he fled from France. In 1872 he returned as the Corsican representative in the Assembly, and remained in office until 1875. He was to the last the leader of the Bonapartists.

Roulers, roo-lâ (Flem. *Kousselaere*), Belgium, on the Mandel, 17 miles south of Bruges, carries on an active industry in the manufacture of textiles, and a trade in linen, chicory, etc. Pop. (1900) 23,238.

Roulette, roo-lêt, a French game of chance, in which a small ivory ball is thrown off by a revolving disk into one of 37 or 38 compartments surrounding it, and numbered from 1 to 36, with one or two zeros. Players who have staked upon the number of the compartment into which the ball falls receive 36 times their stake; less if they have staked upon more than one number. There are also other chances on which stakes may be placed.

Roumania, a variant spelling of RUMANIA (q.v.).

Roumanille, roo-mä-nêl-ê, **Joseph**, modern Provençal poet: b. Saint-Remy, near Avignon, 1818. He was the first French poet to conceive the idea of reviving, as a literary tongue, the local dialects of southeastern France. Accordingly he gathered round him an enthusiastic band of friends, and with their assistance collected materials for a grammar and lexicon and also founded a consistent system of orthography. It was in his programme to produce, and favor the production of, genuine poetry, such as would speak to the hearts of the peasantry to whom this dialect was vernacular. In 1852 he edited a collection of Provençal poems by several authors under the title 'Li Provençalo.' It was mainly under his inspiration that the society of the 'Felibres' was formed, and he was the second president of its consistory.

Round, William Marshall Fitts, American journalist and reformer: b. Pawtucket, R. I., 26 March 1845; d. Achusnet, Mass., 2 Jan. 1906. He was educated at Harvard, became a journalist

and engaged actively in prison reform. He had served as United States delegate to various European prison congresses, was director and corresponding secretary of the National Prison Association, which he reorganized, and he also organized the Burnham Industrial Farm at Canaan, N. Y. He was the originator of the "Mill" system of awards, now used in many institutions both at home and abroad, and was editor of 'Lend-a-Hand Record.' He wrote 'Achshah' (1877); 'Child Marian Abroad' (1880), 'Rosecraft' (1884); 'Torn and Mended' (1885).

Round, a short, simple musical composition, written generally for three or more voices on the same clef. Each voice takes up the melody after the first has sung the first phrase or so, the third following the second, as it followed the first, and so on, until after a certain number of repetitions the signal is given to stop. It is evident that the melody must be so constructed that each phrase must harmonize with the other, so that, when all the voices are singing, a three- or four-part harmony is heard.

Round Robin, a written protest or remonstrance, signed in a circular form by several persons, so that no name shall be obliged to head the list. This method of bringing grievances to the notice of superiors was first used by French officers, whence its derivation from *rond ruban*, "round ribbon."

Round Table, The. See ARTHURIAN LEGENDS.

Round Towers. See TOWERS.

Roundabout Papers, The, the title of a work by William Makepeace Thackeray. He became editor of the 'Cornhill Magazine' in 1859 and 'The Roundabout Papers' were sketches for this periodical. They appeared simultaneously, between 1859 and 1863, with 'Lovel the Widower' and 'The Adventures of Philip,' and represent the author's best qualities as an essayist.

Roun'delay. (1) A song of any sort in which a line, refrain, or idea is constantly repeated. (2) The tune of such a song. (3) A dance in a circle. (4) Specifically, a fixed verse-form, originating in France, and better known as the *rondeau* (q.v.).

Rounders, a game played with a bat and a ball by two parties or sides, on a piece of ground marked off into a square or circle or pentagon, with a batter's station, and three (or more) goals or bases at equal distances. On the ball being thrown toward him the batter tries to drive it away as far as he can and run completely round the goals, or over any one of the four parts, before the ball can be thrown back to the batting station. The batter is declared out if he fails to secure a run after having had three balls, if a fielder returns the ball so as to strike him while running, or if the ball from his bat is caught in the air by one of the fielders. See BASEBALL.

Roundfish. See WHITEFISH.

Roundworms, or **Thread-worms**, worms of the phylum *Nemathelminthes* (q.v.), so called because of their elongated and cylindrical form. They are separable into three classes: (1)

Nematoda, or roundworms, strictly speaking; (2) *Acanthocephala*, the hook-headed or spiny-headed worms; and (3) *Chatognatha*, the arrow-worms,—a small class of obscure pelagic organisms. The most celebrated of the nematodes is the common roundworm (*Ascaris lumbricoides*), which infests the human intestines, especially in the case of children, who are said to "have worms." These parasites look like earthworms, are 5 to 15 inches long in the grown female, and a quarter of an inch thick, yellowish, with a dorsal and ventral white line, and two brown lateral lines. The three-lobed mouth is terminal at the anterior end, and the anus near the pointed "tail," which varies in form with the sexes. The organization is complicated, and the sexes are always separate, and the males always the smaller. The eggs are produced at the rate of several thousands a day. After fertilization they are enclosed in a tough shell, and are voided by the host with the feces. How the worm gains access to the human intestine is not precisely known. "It is possible," say Parker and Haswell, "that the eggs containing developing embryos, or the embryos themselves, after liberation from the egg-shell, may be taken in by drinking, without previous filtering, water into which fecal matter has been discharged. On the other hand it is quite possible that there may be an intermediate host, such as . . . occurs in several members of the class." Aside from occasional inflammations of the intestine, and obstruction of the bowel from their clumping, they cause no great harm, and various medicines, called vermifuges, expel them. Other species inhabit the intestines of the pig, the horse, the frog, etc. The last named (*A. nigrovenosa*) is remarkable in being hermaphroditic, and for its life-cycle. It begins by the worm entering from the water the mouth of a frog and making its way into the lungs, where it resides long enough in a hermaphroditic condition to produce eggs. These hatch and the embryos cut their way through to the enteric canal, where they escape with the feces. Then they develop into a mature form (*rhabditis*) in which the sexes are separate; in this the fertilized eggs develop in the body of the female, and when fully formed make their way through the walls of the uterus and proceed to devour the whole substance of the mother, leaving only the cuticle. Gaining their freedom they exist in the mud until taken into some frog's mouth, and a new cycle is begun. This is the form of alternate generations called heterogeny—the alternation of a hermaphroditic with a dioecious form.

Closely related to this are various parasitic nematodes, of which one is the thread-worm (*Oxyuris vermicularis*), or "pin-worm," which infests the rectum or lower bowel of children particularly, and gives rise to distressing symptoms, chief of which is an intolerable itching. Its length averages a quarter of an inch; and occasionally inflammation results from their presence in large numbers.

The eel-worms (*Gordius*), guinea-worms, vinegar-eels and similar more or less dreadful parasites also belong here, the worst of which, perhaps, is the trichina.

The class *Acanthocephala*, or spiny-headed

worms, includes a few genera of parasitic worms of which *Echinorynchus* is chief. Most are minute, but *E. gigas*, affecting the pig, may be 12 to 18 inches long; few other cases of their affecting mammals are known, the majority of species infesting inferior animals. These worms have at the head a protrusile proboscis, covered with rings of recurved hooks, which is buried in the wall of the intestine of the host, enabling the worm to hold its place. The development is complicated. The embryos escape from the intestines of the host, and die unless they are swallowed by some creature suitable for the development, such as certain shrimps for the fish-parasites, and a beetle for *E. gigas* of the pig. Should this "intermediate host" be eaten by the fish or the pig the developing worm fixes itself in the intestine and matures. See EEL-WORM; FILARIASIS; GUINEA-WORM; PARASITISM; TRICHINOSIS. Consult: Parker and Haswell, 'Text-book of Zoology' (1897), and authorities cited under PARASITISM.

Rouquette, roo-kët', **Adrien Emmanuel**, American Roman Catholic priest and author: b. New Orleans, La., 13 Feb. 1813; d. there 15 July 1887. He was educated in France, where he studied law, and was graduated from the University of Rennes in 1833. Returning to America he abandoned law for the priesthood and his cherished career as a missionary to the Choctaw Indians, among whom he had spent some years in his boyhood. In 1859 he established a mission in the Indian village at Bayou Lacombe, and thenceforth devoted his life to the Choctaw people, by whom he was greatly beloved. His writings include: 'Les Savanes, Poésies américaines' (1841); 'Poèmes patriotiques' (1860); 'Catherine Teghekwitha' (1873).

Rouses (rows'iz) **Point**, N. Y., village, port of entry, in Clinton County; on Lake Champlain, and on the Delaware & H., the Rutland, and the Grand Trunk R.R.'s; on the boundary between the United States and Canada; about 160 miles north by east of Albany and 21 miles north by east of Plattsburg. A railroad bridge about one mile in length spans the portion of the lake between the State of New York and Grand Isle, in Vermont. The village has steamer connections with the Lake Champlain ports, and by way of the lake and the Richelieu River with many places in Canada. Rouses Point receives a large part of the custom receipts of the Champlain district. In 1900 the imports were \$15,309,725 and the exports \$5,211,770. The manufactories are a large printing house, railroad repair shops, lumber mills, and machine shops. It has the Charbonneau Institute, a high school, public and parish schools, and two public libraries. Rouses Point was a noted locality in the discovery days, and at the time of the Revolution and the War of 1812. Just on the frontier, on an island, is Fort Montgomery. Pop. (1890) 1,856; (1900) 1,675.

Rousseau, roo-sô, **Jean Baptiste**, French poet: b. Paris 6 April 1671; d. Brussels 17 March 1741. In 1701 he was admitted into the Academy of Inscriptions and Belles-lettres, and his lyric compositions procured him high reputation among the French literati; but his turn

JEAN JACQUES ROUSSEAU.

for satire and his quarrelsome temper at length involved him in disgrace. He was found guilty of having written against persons of consideration, and was exiled from France in 1712. The latter part of his life was spent in the Netherlands, where he obtained a pension from the Duke of Artemberg, which he resigned on having forfeited the favor of that nobleman. An edition of his works was published under his own inspection, by Tonson 1723, and since his death they have been often printed in various forms. One of the best editions is that of Amar, with a commentary and life of the author (1820). The same editor has also published his 'Œuvres Poétiques' with a commentary (1824).

Rousseau, Jean Jacques, zhōn zhāk, French author; b. Geneva, Switzerland, 28 June 1712; d. Ermenonville, near Paris, 2 July 1778. In 1726 he was articed to an engraver, whose severity disgusted him with his situation. He therefore ran away from his master, and after wandering for some days arrived at Conflignon, where he was received into the house of the curé of the village, and for some time hospitably treated. By this clergyman he was recommended to the notice of Madame de Warens, who sent him to a charitable institution in Turin, where he abjured Protestantism in favor of Catholicism. He left Turin to lead an unsettled existence. In the autumn of 1741 he went to Paris, where, under the recommendation of Réaumur, he read a paper before the Academy of Sciences on certain grand improvements he fancied he had made in musical notation. That body came to the conclusion that, though the improvements were ingenious, they were neither new nor practicable. He lived a very precarious life in the capital, without fixed abode or means of support, until appointed secretary to M. de Montagu, French ambassador at Venice. After a residence of a year and a half in that city he quarreled with his harsh and avaricious chief, and returned to Paris in 1742, and there earned his living by copying music, employing his leisure hours in the study of natural science. About this time he became intimate with Diderot, Grimm, D'Holbach, and Madame d'Épinay. In 1750 he gained the prize offered by the Academy of Dijon, on the question whether the revival of learning has contributed to the improvement of morals, taking the negative side of the question, it is said, at the suggestion of Diderot. He soon after brought out his 'Devin du Village,' a comic opera, of which he had himself composed the music. This piece was received with general favor, and the author was almost worshipped by the French; but the appearance of his celebrated 'Letter on French Music' (1753), in which he pointed out its defects, excited a general storm. Singers and connoisseurs who could not wield the pen contributed to spread calumnies, pasquinades, and caricatures against the author, who retired to Geneva. By his change of religion he had lost the rights of a citizen. He now again embraced Protestantism, and was formally reinstated in the privileges of a free citizen of Geneva. From Geneva Rousseau went to the Hermitage, a retreat near Paris, provided for

him by Madame d'Épinay (1756), but the next year quitted the Hermitage and returned to Paris; and fixing himself at Montmorency, finished his 'Contrat Social,' his 'Julie, ou la Nouvelle Héloïse,' and his 'Emile.'

His celebrated work on education, 'Emile, ou de l'Éducation' (1762) was condemned by the Parliament of Paris on account of its religious views, and he himself sentenced to imprisonment. He wished to retire to Geneva, but was also threatened with imprisonment there, and his book was burned by the common hangman. He therefore took refuge in Moitiers-Travers, a small village of the Prussian province of Neuchâtel, where he again found himself among Protestants, the simplicity of whose worship was agreeable to him. Here, too, he obtained a protector and friend in the person of Marshal Keith, governor of the province, but the intrigues of his enemies pursued him even hither. The Geneva clérge assailed him from their pulpits, and he wrote his celebrated 'Letters from the Mountains' in reply to their attacks. This work, with his 'Letter to the Archbishop of Paris,' and his 'Dictionnaire Physique Portatif,' were publicly burned in Paris in 1765. New troubles drove him from Moitiers, and he resided two months on Peter's Island, in the Lake of Bienné. His residence here produced his 'Botaniste sans Maître.' Neither was he long tolerated here; the authorities of Berne ordered him to quit the country without delay in the severest season of the year. On reaching Paris he became the object of ridicule to the philosophers, but was kindly received by Hume, whom he accompanied to England; but yielding to his unfounded suspicions of his friends in England he left the country, and returned to Paris in 1767. In 1768 he published his 'Musical Dictionary,' and soon after appeared his melodrama of 'Pygmalion.' In May 1778, he retired to Ermenonville. The principal traits of Rousseau's character were an enthusiastic passion for love and freedom, a spirit of paradox, an inflexible obstinacy, and a warm zeal for the good of men, combined with a gloomy hypochondria. His influence was great in Europe, particularly in France, where it contributed toward the Revolution. There are standard editions of his works by Augus (1822) and Musset-Pathay (1823-6). Consult also Rousseau's own 'Confessions'; de Rothschild, 'Lettres Inédites de J. J. Rousseau' (1892); and the 'Lives' in French by Girardin (1875) and Chuquet (1893), and in English by Morley (1873).

Rousseau, Lowell Harrison, American soldier and legislator; b. Stanford, Ky., 4 Aug. 1818; d. New Orleans 7 Jan. 1869. He was admitted to the bar in 1841, engaged in practice at Bloomfield, Ind., and was a member of the Indiana legislature 1844-5. He served in the Mexican War and in 1849 opened a law office in Kentucky, and became famous as a criminal lawyer. In 1860 he entered the Kentucky senate, but resigned to join the Union army. He was commissioned brigadier-general of volunteers in 1861, promoted major-general in 1862, and fought at Stone River, Chickamauga and Chattanooga. From 1863-5 he was in command of the district of Tennessee and successfully

defended Fort Rosecrans during the siege of Nashville. He took his seat in Congress in 1865, but in the following year resigned it in consequence of being reprimanded by that body for a public assault upon Representative Grinnell of Iowa. He was, however, soon re-elected and served another year. In 1867 he was appointed brigadier-general in the regular army and assigned officially to receive Alaska from Russia and assume control of the territory. He was summoned from this post to testify in the trial for impeachment of President Johnson and was afterward until his death in command of the Department of the Gulf with headquarters at New Orleans.

Rousseau, Pierre Etienne Théodore, French painter: b. Paris 15 April 1812; d. Barbizon, near Fontainebleau, 22 Dec. 1867. He was a pupil of Rémond (1826) and of Lethière, but quickly parted company with all current theories of art, and showed himself an original interpreter of nature, while he fought the battle of the new landscape—"paysage intime"—through the 13 years during which his pictures were excluded from the Salon by the Academic Jury, which has since then been happily abolished. He traveled through the Auvergne and Normandy and painted the scenery with the main object of breathing human feeling into the colors and forms of external nature. He is the central figure of the Barbizon school and must be looked upon as the founder of the modern school of French landscape painting, as opposed to the Romanticism of Claude Lorraine, Poussin and their followers. It has been well said of him: "He occupied the highest place because he was the most perfect master. The grand aspect of landscape and its tenderness are equally familiar to him. He renders with the same mastery the smile of creation and its terrors; the broad open plain and the mysterious forest; the limpid, sun-bright sky or the heaping of the clouds put to flight by storms; the terrible aspect of landscape or those replete with grace. He has understood all, rendered all, with equal genius. The greatest contemporary painters have each a particular stamp, Corot painting the grace; Millet, the hidden voice; Jules Dupré, the majestic strength. Théodore Rousseau has been by turns as much a poet as Corot, as melancholy as Millet, as awful as Dupré; he is the most complete, for he embraces landscape art absolutely."

In 1848 he took up his residence on the edge of the forest of Fontainebleau and derived most of his inspiration from the surrounding scenery. How he drew the motif of his work from this environment is seen in the fine picture in the Metropolitan Museum, New York, 'Edge of the Woods.' Among other characteristic works may be mentioned: 'View of the Valley of Paris and the Banks of the Seine'; 'The Forest Height of Compiègne' (1833); 'Avenue of Isle-Adam'; 'Entrance to the Forest of Fontainebleau' (1862); and 'Marsh in the Landes' (1854); the last two being in the Louvre. His early style was sketchy with some carelessness of touch, although absolutely sincere and impressionistic. Latterly he indulged in excessive detail,

and never seemed to know when his pictures were finished, but all his landscapes were tinged with the deepest poetic spirit. Yet he never really won recognition during his lifetime, and after an unsuccessful auction sale of his works in 1861 thought seriously of seeking a home in some foreign capital. It is said that the sense of this depreciation wore away his health. Yet in the last year of his life he took the medal of honor and since his death the genuine merit of his pictures has been acknowledged and as early as 1873 his 'Scene near Fontainebleau' was sold for \$2,360. Consult: Sensier, 'Souvenirs de Théodore Rousseau' (1872).

Rove-beetles, or Cocktails, names applied to a tribe of Beetles, the *Staphylinidae*, characterized by elytra only about one fourth of the length of the abdomen. A common species is the "Devil's Coach-horse," (*Goërius olens*), a fanciful name given to it from its diabolical aspect when it curls up the abdomen and opens its jaws. These beetles are carnivorous in habits, and are apt to bite if incautiously handled. The habit of cocking the tail has been alleged to have for its object the function of pushing the hinder wings under the short elytra, which are formed by the front wings and which protect the hinder or functional wings. These beetles fly about chiefly in the dusk and at night. The tarsi generally possess five joints.

Rovuma, rō-voo'mä, a river of Africa, which rises east of and near Lake Nyassa, and flows east into the Indian Ocean. It forms the boundary between German East Africa and Portuguese East Africa. It is about 500 miles long. For about 80 miles from the mouth, there are high lands along the banks, and about 160 miles from the ocean are a number of beautiful cascades and waterfalls. The river is navigable for some distance.

Rowan, rō'an, Andrew Summers, American army officer: b. Gap Mills, Va., 1859. He was graduated from West Point in 1881 and after the opening of the Spanish-American war in 1898 was sent to communicate with General Garcia. He made a landing from an open boat near Turquino Peak, Cuba, on 24 April 1898, and with much difficulty succeeded in reaching Garcia, obtained full information of the insurgent army, and made the return trip successfully. He was promoted 1st lieutenant, U. S. A., for this service, and in 1899-1902 was on duty in the Viscayas Group, Philippine Islands. He has since been professor of military science and tactics at the Kansas State Agricultural College. He has written 'The Island of Cuba' (1898).

Rowan, Stephen Clegg, American naval officer: b. near Dublin, Ireland, 25 Dec. 1808; d. Washington, D. C., 31 March 1890. He came to the United States when very young and in 1826 was appointed a midshipman in the navy, receiving promotion to lieutenant in 1837. He saw active service in the Mexican War and in 1855 he was appointed commander. At the outbreak of the Civil War he was in charge of the Pawnee, and on 25 May he engaged in the attack on the Confederate batteries at Acquia Creek, the first naval engagement of the War. He assisted in the capture of Fort Hatteras and was promoted captain and commodore for

his services. He was engaged at Roanoke Island and Albemarle Sound, and later captured Fort Mason, thereby restoring National authority in North Carolina. He was in command of the New Ironsides at Forts Wagner, Gregg, and Moultrie, received the thanks of Congress, and in 1866 was promoted rear-admiral. He became vice-admiral in 1870, and from 1883 until his retirement in 1889 was chairman of the light-house board.

Rowbotham, rō'bōt-am, John Frederick, English Anglican clergyman, poet, and historian: b. Bradford, Yorkshire, 18 April 1859. He was educated at Oxford, traveled extensively on the continent, and took orders in the Church of England in 1891. He was vicar of Ratley in 1892, rector of Huntley in 1895, British chaplain of Budapest and Hungary in 1896, and vicar of Abbotsley 1897-1900. He has published: 'The History of Music' (3 vols., 1887); 'Poetical Works' (1889-90); 'The History of the Troubadours and the Courts of Love' (1895); 'The God Horus, a Novel of Ancient Egypt' (1898); 'The Human Epic' (1902); etc.

Rowe, rō, George Fawcett, English-American actor: b. Exeter about 1829; d. New York 29 Aug. 1889. He made his first appearance on the stage in Australia in 1854; toured through India, China, and Peru, and appeared in New York in 1866 under Mrs. John Wood's management at the Olympic. His most famous part was Wilkins Micawber in Halliday's dramatization of 'David Copperfield.' He also played Silas Wegg in 'Our Mutual Friend,' and many other comic and farcical parts, some in pieces of his own composition, such as 'Brass'; 'The Geneva Cross'; 'Found Drowned'; and 'The Sleigh Bells.' His last appearance was at the Colosseum Theatre, London, as Rufus Potts in 'Forward to the Front,' 27 April 1889.

Rowe, Nicholas, English dramatic poet: b. Little Barford, Bedfordshire, 1674; d. 6 Dec. 1718. He studied at Westminster, entered a student at the Middle Temple; but turned his chief attention to literature. At 24 he produced his tragedy of the 'Ambitious Step-mother'; 'Tamerlane' followed in 1702. His next dramatic performance was the 'Fair Penitent,' remodeled from the 'Fatal Dowry' of Massinger. In 1704 he wrote 'The Biter,' a comedy, which being a failure, he thereafter kept to his own line, and from that time to 1715 produced his 'Ulysses,' 'Royal Convert,' 'Jane Shore,' and 'Lady Jane Grey.' On the accession of George I. in 1715 he was made poet-laureate. He wrote a few tender and pathetic ballads, translated Lucan's 'Pharsalia,' and edited the plays of Shakespeare (1709). The memoir prefixed to the plays contains much traditional matter judiciously presented.

Rowing, Mechanics of. Rowing is the method of propelling a boat by the use of oars. It consists of two parts—the stroke, and the feather, which are executed by a series of very complicated motions designed to apply a maximum of available motive energy in pushing the boat through the water, and at the same time insure the least amount of deviation from a straight course.

In preparing to row, the oarsman sits on the thwart, facing the stern and exactly opposite the handle of his oar, the loom of which

rests in the rowlock with the button on the inner side of the thowl pin. To obtain the maximum effect from the power exerted, he should sit about two inches from the after edge of the thwart, the body being held square and upright, the back straight and rigid, the feet pressed firmly against the opposite stretcher or foot board with the heels close together and the toes apart, so as to keep the knees separate. The handle of the oar should be held firmly by both hands which should be about three inches

FIG. 1.— Position beginning of stroke.

apart, with the outside one close to the end of the handle, the fingers being above and the thumb underneath. The grasp should be a flexible hold with the fingers and not a clutch with the whole hand. The forearms should be kept below the level of the handle, with the elbows down, close to the sides of the body. The wrists should be relaxed and dropped, so that the oars will lie flat upon the surface of the water.

The stroke is characterized by three distinct phases—the beginning, the pulling through, and finishing, and the "recovery" which includes

FIG. 2.— Position half-way through stroke.

the "feather." In taking the stroke, the body is inclined forward, the backbone being kept straight and rigid, the chest thrown forward and held up as high as possible, while the stomach is kept well out and down between the legs. The arms should reach out perfectly straight from the shoulders to the wrists, and the action of the shoulder joints and the hips should be

perfectly free and easy. In reaching forward, the oar handle is grasped firmly by the fingers, and the hands are shot out quickly straight from the body, and as soon as the oar has passed over the knees, the wrists are raised so as to bring the blade at right angles to the surface of the water and preparatory to dipping it, at the beginning of the stroke when the arms reach the extreme limit of their forward movement di-

FIG. 3.—Position finishing of stroke.

rectly over the stretcher. At this instant, the hands are raised and the blade is dropped firmly into the water and buried until it is covered up to the shoulder. The stroke is pulled through by bracing the muscles of the back, loins, and shoulders, and by swinging the body backward, with the feet pressing hard against the stretcher, and the arms held perfectly rigid. The weight of the body is thus transferred from the seat to the stretcher and the handle of the oar, and when the body, in swinging backward, has reached a perpendicular position, the oar handle is pulled back home to the chest until the

FIG. 4.—The "Recovery." (Position of the hands and wrists in the act of feathering.)

knuckles almost touch the bottom of the breast bone, by the action of the shoulders and a gradual bending of the elbow joints, while the forearms are kept as nearly as possible in a horizontal position.

At the finish of the stroke, the whole strength of the arms and shoulders is exerted, but care is taken not to use the biceps, which if exerted, would tend to raise the arms and consequently bury the blade. At this point, the body is not allowed to "wait," but is continued to swing back until it is overtaken by the hands. When the hands reach the breast bone, they are dropped quickly about two inches so as to lift the blade out of the water, then turned back-

ward at the wrists until the knuckles touch the breast, so as to produce the "feather," in which the flat of the blade is made parallel with the surface of the water; then the arms are shot forward again close along the legs, accompanied by the forward swing of the body, in the "recovery." A quick recovery is effected by keeping the back straight and rigid, the knees not dropped too low, and by bracing the muscles of the body, and especially those of the stomach.

The operations of rowing from a fixed, or from a sliding seat, are very much the same. In the latter case, the stroke is taken by extending the arms to their full length, and swinging the body forward, simultaneously, with the assistance of the foot straps on the stretcher, the knees being kept slightly apart and the back straight. When the oar is dipped at the beginning of the stroke, the knees are straightened out gradually, and the body thrown backward, simultaneously, so that at the finish of the stroke, the legs are straight and the body and shoulders thrown well back. The recovery is effected by bringing the body to the upright position by the action of the hips, and then the motions described above are repeated in taking another stroke.

FIG. 5.—A common but very bad position. (Beginning of stroke.)

The motion of the body should be as constant and steady as that of a pendulum, while the action of the hands and the wrists, producing the dipping and the feathering, should be entirely free from jerks. When the boat contains a number of oarsmen, each one keeps his eyes on the back of the oarsman opposite to him, and times his swing from it, or in other words "keeps eyes in the boat." In governing his blade it is generally understood that the blade should be kept square or perpendicular to the surface of the water, but in properly constructed boats the thowl is slightly inclined aft, so that the blade is given a slight inclination forward, and presses against the water at an angle a little off the perpendicular. This obviates any tendency to row deep. On the other hand, if the thowl is inclined too much, the blade will have a tendency to fly out of the water.

A boat is "held" or has its headway stopped, by laying the blade flat and then sinking its forward edge slightly into the water. The blade is thus buried at an acute angle and checks the way of the boat gradually until it has been sufficiently reduced to allow of the blade being reversed square, to "back water." If the boat is under much headway, any attempt to back water before it has been held, would be attended with disastrous results, as the resistance would prove greater than the strength

of the oarsman and make him catch a "crab" and throw him flat on his back, if it did not cause a fracture of the oar.

In sculling, a scull or oar is held in each hand, instead of one oar handle being held in both hands, as in rowing. The grip on the scull is governed by the rules applicable to the grip on the oar handle in rowing, but with the exception that, the thumb should cap the butt of the scull handle with the top joint and not clasp around it. The action of the body, legs, arms, wrists and hands, are also the same as in rowing, but, in sculling some advantage may be gained by allowing the body to swing farther back at the finish of each stroke. Both hands should work together, and both blades should enter and leave the water at the same time. It is obvious that if one hand lags behind the other in any one of these movements, the resulting uneven strokes would deflect the boat from a straight course.

W. MOREY, JR.,
Consulting Engineer.

Rowland, rō'land, Henry Augustus, American scientist: b. Honesdale, Pa., 27 Nov. 1848; d. Baltimore, Md., 16 April 1901. He was graduated from the Rensselaer Polytechnic Institute in 1870, and taught for a year in Wooster College, Ohio, but in 1872 returned to the Institute, where he was instructor in physics, becoming assistant professor in 1874. He studied for a time in Germany, and in 1876 accepted the chair of physics at Johns Hopkins University, which he occupied until his death. He was a member of the Electrical Commission in Paris in 1881, and was elected to the National Academy of Science in that year. He was the inventor of a greatly improved process of ruling large diffraction gratings directly on concave mirrors, constituting what is known as the dividing engine (q.v.), with which he succeeded in making photographs far superior to any which had then been made. He made numerous valuable investigations and experiments, particularly in electricity, among them an extremely accurate determination of the ohm, a work which he afterward extended under the government. He was author of more than 100 scientific papers and monographs, among which are: 'Magnetic Permeability' (1873); 'Magnetic Effect of Electric Connection' (1876); 'Research on the Absolute Unit of Electrical Resistance' (1878); 'On the Mechanical Equivalent of Heat' (1880); 'Photographs of the Normal Solar Spectrum' (seven plates, 1886); etc.

Rowlandson, rō'land-sōn, Mary White, American captive among the Indians. She was carried away by the Indians on the occasion of an attack on Lancaster, Mass., 10 Feb. 1675, during King Philip's war. For a time she was kept in an Indian village near the site of Petersham, Worcester County, and later was taken by her captors across the Connecticut, and after about three months was redeemed. Her 'True History' of her captivity and restoration was printed at Cambridge, New England, and in London, in 1682. A fifth edition was prepared by Joseph Willard (1828). The work, though not always clear as to detail, is interesting, and throws a graphic sidelight on Indian existence with its cruelty and squalor.

Rowlandson, Thomas, English artist: b. London July 1756; d. there 22 April 1827. He

was sent at 15 to Paris, and there studied art and gained a taste for pleasures of the town. The £7,000 left him by a French aunt he gambled away, yet he hated debt, and maintained his uprightness of character. He traveled over England and Wales, and enjoyed life to the full in his tavern and the company of friends like Morland, Gilray, and Bunbury. Rowlandson possessed rare dexterity of touch and fertility of imagination; and, though not seldom vulgar, he was never feeble. He was a relentless hater of Napoleon, belittling his greatness by countless travesties. Some of his best known works are his 'Imitations of Modern Drawings' (1784-8), and his illustrations to 'Syntax's Three Tours,' the 'Dance of Death,' Sterne's 'Sentimental Journey,' 'Peter Pindar,' the 'Bath Guide,' 'Munchausen,' etc.

Rowson, rō'sōn, Susanna Haswell, American actress and author: b. Portsmouth, England, 1762; d. Boston 2 March 1824. Her first work, the novel, 'Victoria,' appeared in England in 1786, and in 1792 she made her stage debut at Edinburgh. In 1793-6 she acted in the United States, closing at Boston with a comedy by herself, 'Americans in England.' From 1797 until her retirement in 1822 she conducted with much success a seminary for young ladies, first at Boston, and from 1800 at Medford. Her most popular work was 'Charlotte Temple, or a Tale of Truth' (1790), which had in its time wide sale, but is called by Wendell a "comically extravagant example" of a literary manner then much in favor. Further she wrote, among several volumes: 'The Inquisitor' (1788); 'The Volunteers' (1793); 'Miscellaneous Poems' (1804). There is a memoir by Nason (1870).

Rowton, row'tōn, Montagu William Lowry-Corry, 1ST BARON OF, English lawyer and philanthropist: b. 8 Oct. 1838; d. London 9 Nov. 1903. He was educated at Trinity College, Cambridge, became a barrister in 1863, and entered upon a successful career as a lawyer. He was secretary to the Earl of Beaconsfield in 1866-8 and in 1874-80, and was secretary of the special embassy sent to the Berlin congress in 1878. He was created a baron in 1880. He established the Rowton lodging houses in London some three years before the Mills Hotels were instituted in New York. They were built with the idea of furnishing decent and comfortable lodgings for workmen and furnishing them also with well-cooked and substantial food at very moderate rates, yet at the same time with the intention of keeping the enterprise on a paying basis. He was chairman of the Rowton Houses and of the Guinness Trust until his death.

Rowton Heath, England, a place near Chester, which was the scene of a battle 24 Sept. 1645, in which the Parliamentary forces defeated the Royalists. After the crushing disaster of Naseby, King Charles I. fled to Wales, and next formed the desperate project of marching north to Montrose. Chester was then being besieged by Sir William Brereton, but the king succeeded in finding an entrance, and charged Sir Marmaduke Langdale to raise the siege. The Parliamentarians had just been reinforced by Poyntz's Yorkshire horse when Sir Marmaduke attacked them. He was utterly defeated, with

a loss of 300 killed and 1,000 prisoners, and the disaster, added to Philiphaugh, stripped the unhappy king of his last hope.

Roxbury, rōks'būr-ī, Mass., now a part of the city of Boston, annexed in 1867. It has a diversified surface, a remarkable alternation of hills and hollows, which furnish opportunities for picturesque building sites, and which has made a great portion of Roxbury a residential section. There are a number of manufactories, among which are cotton and woolen mills, machine shops, cordage factories, carpet factories, and organ works. A free Latin school was established in Roxbury in 1645. The place was for many years the scene of the labors of John Eliot (q.v.), the "Apostle of the Indians," and his remains are in the "ministers' tomb" in the old burial ground. It is also the birthplace of Joseph Warren (q.v.) of Revolutionary fame. The township of West Roxbury, which contained the villages of West Roxbury and Jamaica Plain, was set off from Roxbury in 1852. When Roxbury was annexed to Boston it had a population of about 40,000.

Royal Academy of Arts, The. See ACADEMY OF ARTS, THE ROYAL.

Royal Academy of Music, London, England, an institution established in 1823, mainly through the exertions of Lord Burghersh (afterward Earl of Westmoreland), and incorporated by royal charter in 1830. The purpose for which it was founded was to afford a first-class musical education in the various branches of music, and to properly equip those who make music a profession. It receives a grant from the government, and from this and other sources is able to award to successful competitors a large number of scholarships and prizes. Instruction is given in musical composition, singing, and instrumental playing. Concerts are given at intervals by the pupils. Connected with the R.A.M. are associates, fellows, and licentiates, besides honorary members. Among its principals have been Sir George Macfarren and Sir A. C. Mackenzie.

Royal and Protestant Order of Saint John. See ORDERS, ROYAL.

Royal Arcanum, The, the name of one of the largest and strongest of the fraternal and beneficial societies in the United States. It was first organized 23 June 1877 at Boston, Mass., by Dr. Darius Wilson and John Andrew Cummings. The original council in Boston had but nine members. Other councils were soon established in the same city, and the order spread rapidly throughout the New England States. It has since grown at a rapid rate, and there are councils in every State and in almost every city and town in the Union. The business of the order is conducted in Boston, where the society owns a substantial building, in which the supreme council meets. The society is governed through councils which are dominated by the supreme council or governing body. The membership qualifications are good health and character; and the age limit is embraced in the ages between 21 and 55. Benefit certificates are issued for \$1,500 and \$3,000, payable at the death of a member. Should a member desire to increase his insurance over the limit fixed by the society he can do so by making application for the in-

crease in the Loyal Additional Benefit Association, formed in 1889, practically within the Royal Arcanum, and incorporated in 1890 under the State laws of New Jersey.

The officers of the supreme council or governing body of the society consist of supreme regent, supreme vice-regent, supreme orator, sitting past supreme regent, supreme secretary, supreme treasurer, supreme auditor, supreme chaplain, supreme warden, supreme sentry, and legal adviser. The grand councils and subordinate councils have a similar roster of officers.

The remarkable growth of membership in the Royal Arcanum is evidenced by the following official figures:

| | Membership | Grand Councils | Subordinate Councils |
|-----------|------------|----------------|----------------------|
| 1898..... | 193,573 | 22 | 1,762 |
| 1902..... | 249,644 | 27 | 2,004 |
| 1903..... | 258,746 | 28 | 2,045 |

For the same period the total number of deaths in the order and the total amount of benefits paid were as follows:

| | Number of Deaths | Amounts Paid |
|----------------------------------|------------------|--------------|
| 1898..... | 16,479 | \$47,886,199 |
| 1902..... | 25,714 | 73,817,678 |
| 1903..... | 27,480 | 76,190,352 |
| Emergency fund 31 Oct. 1902..... | | \$1,813,141 |
| Emergency fund 28 Feb. 1903..... | | \$1,885,786 |

The emblem of the association is a royal crown within a circle, on the circumference of which are 10 small Maltese crosses with the motto, "Virtue, Mercy, and Charity."

Royal Arch Masons. See MASONIC FRATERNITY.

Royal College of Music, London, England, an institution established in 1883 in South Kensington under the presidency of the Prince of Wales, afterward Edward VII. It was endowed at its commencement by gifts to the amount of \$630,000. Pupils of either sex are admitted either as fee-paying students or as scholars or exhibitioners. There are 52 open free scholarships and 11 close free scholarships, besides the council exhibitions, the Savage Club exhibition, the exhibitions of the associated board of the Royal Academy of Music (q.v.) and the Royal College of Music, etc. Prizes and medals are also awarded to the students in accordance with the results of examinations. The associateship may be obtained by outsiders as well as pupils on passing a qualifying examination, and entitles the holders to use the initials A.R.C.M. The professorial staff includes several eminent names.

Royal Crown of Hawaii, Order of. See ORDERS, ROYAL.

Royal Family, The, in its widest sense, as referring to Great Britain, embraces all the British descendants of the royal house; in its narrower sense it includes only the queen-consort and queen-dowager, with all the lineal descendants of the sovereign. The husband of a queen-regnant is not as such a member of the royal family. The members of the royal family have precedence before all peers and officers of state; but an heir-presumptive has no rank or precedence as such, as his position may be altered by the birth of an heir-apparent.

Royal Fern. See OSMUNDA.

Royal George, English man-of-war, sunk in Portsmouth harbor, England, 29 Aug. 1782.

While undergoing repairs at the keel the vessel suddenly careened and filled with water, going down with all on board. The ship, the principal vessel of Lord Howe's fleet, was commanded by Admiral Kempenfeldt, and carried about 1,100 persons, including nearly 300 women and children. The disaster was commemorated in an elegy by Cowper, 'The Loss of the Royal George.' The first attempt to raise the vessel was made in 1817; but it was not until 1839 that portions of the ship and its cargo were brought to the surface, when the sunken mass was exploded by means of great quantities of gunpowder.

Royal Geographical Society. See GEOGRAPHICAL SOCIETY, ROYAL.

Royal Institution of Great Britain, an institution founded in 1799 by Count Rumford, Sir Joseph Banks, and other men of science, and incorporated in 1800. It was reconstituted on a wider basis in 1810, and has for objects the promotion of scientific and literary research, the teaching of the principles of experimental science, the exhibition of the applications of these principles to the arts, and the affording of opportunities for study. Many distinguished chemists and physicists have conducted their researches in the laboratories. The library contains some 60,000 volumes.

Royal Lion, Order of. See ORDERS, ROYAL.

Royal Louis Order, The. See ORDERS, ROYAL.

Royal Observatory, Greenwich, the famous English observatory founded by Charles II. in 1675. The first observation was made 19 Sept. 1675. The director of the observatory is styled the astronomer royal, and is under the official control of the admiralty, but receives his appointment directly from the prime minister, and holds office by warrant under the royal sign manual. The largest instrument is a 28-inch refractor, with a spectroscope attached which has been recently mounted. Photographs of the sun are taken on every available day, and after being measured are carefully stored for reference. Magnetic and meteorological observations, made continuously, form an important branch of the works. The chronometers used in the English navy are purchased, and generally examined at the observatory. Hourly and daily time-signals are sent out from the observatory through the post-office telegraphs giving Greenwich time to all parts of the country.

Royal Order of Victoria. See ORDERS, ROYAL.

Royal Orders. See ORDERS (ROYAL) AND DECORATIONS OF HONOR.

Royal Society of Edinburgh, a society which was incorporated in 1783, having been developed from the Philosophical Society of Edinburgh, commenced in 1739. Among its early members were Hume, Reid, Edmund Burke, Hutton, Dugald Stewart, and James Watt; and among its presidents have been Sir Walter Scott, Sir David Brewster, the Duke of Argyll, Lord Moncrieff, and Sir William Thomson.

Royal Society, London, an organization which owes its origin to a club of learned men who were in the habit of holding weekly meet-

ings in London as early as 1645, but the year 1660 is generally given as the year of its foundation. Charles II. took much interest in the proceedings of the society, and in 1682 granted a charter to the "President, Council, and Fellows of the Royal Society of London for Improving Natural Knowledge." Lord Brouncker was first president of this incorporated Royal Society. Meetings are held weekly from November to June for the purpose of reading and discussing scientific papers; and the more important of these are published in the annual 'Philosophical Transactions,' first issued in 1665, and now forming a most valuable series. Accounts of the ordinary meetings, with abstracts of papers, etc., appear also in the periodical 'Proceedings,' begun in 1800. Scientific research has at all times been both initiated and encouraged by the Royal Society, and many of the most important scientific achievements and discoveries have been due to its enlightened methods. It deservedly enjoys an influential and semi-official position as the scientific adviser of the British government, and not only administers the \$20,000 annually voted by parliament for scientific purposes, but has given suggestions and advice which have borne valuable fruit, from the voyage of Captain Cook in the Endeavour in 1768 down to the Challenger expedition, more than a century later. The society has an independent income.

Royal University of Ireland, an examining institution with its seat at Earlsfort Terrace, Dublin. It was founded in 1880 in pursuance of the provisions of the University Education (Ireland) Act, 1879, to take the place of the Queen's University, a similar institution established in connection with the Queen's Colleges (q.v.). The Royal University corporation consists of a chancellor, a senate, and graduates, the government being vested in the chancellor and senators, the latter not to exceed 36 in number. It has power to confer all such degrees and distinctions as are conferred by any university in the United Kingdom except in theology; these may be bestowed on all male and female students who have matriculated in the university and passed the prescribed examinations, no residence in any college or attendance at any course of instruction in the university being obligatory on any candidate for a degree other than a degree in medicine or surgery, the university in this respect resembling that of London. An act of 1881 provided for the payment of \$100,000 a year out of the surplus funds of the Irish Church for the purposes of the university. The university has a considerable staff of examiners, but no professors. A certain number of exhibitions and scholarships are conferred on those who pass examinations with high distinction.

Royall, roi'al, Isaac, American soldier; b. Massachusetts about 1720; d. England October 1781. He was a wealthy citizen of Medford, was its representative for many years in the general court, and for 21 years was a member of the executive council. He served in the French war, and in 1761 was appointed brigadier-general, the first resident of New England to attain that rank. At the outbreak of the American Revolution he remained loyal to the crown, and in 1775 left the country. His estates were confiscated and he was proscribed in 1778, but seems to have borne no enmity to his native land,

as he bequeathed 2,000 acres of land in Worcester County to found a law professorship at Harvard, and made various other patriotic bequests. The town of Royalston, of which he was one of the original proprietors, was named in his honor, and the chair of law was established in his name at Harvard in 1815.

Royce, rois, Josiah, American philosopher and educator: b. Grass Valley, Nevada County, Cal., 20 Nov. 1835. Graduated (1875) from the University of California, he studied also at Leipsic and Göttingen (1876) and the Johns Hopkins University (1877-8), and in 1878-82 was instructor in English in the University of California. From 1882 to 1885 he was instructor in philosophy at Harvard, in 1885 was appointed assistant professor, and in 1892 was elected to the professorship of the history of philosophy, which he still retains. His views are very similar to those of T. H. Green (q.v.), the great English representative of the Neo-Kantian or Neo-Hegelian movement, and his position may be studied in the historico-critical work, 'The Spirit of Modern Philosophy' (1892). His clear, distinguished style as writer and lecturer has served to enhance his reputation in the United States, among whose leaders in philosophic inquiry he is highly ranked. Besides 'California from the Conquest to the Vigilance Committee of 1856' (1886), and 'The Feud of Oakfield Creek' (1887), a work of fiction, he has written: 'A Primer of Logical Analysis' (1881); 'The Religious Aspect of Philosophy' (1885); 'The Conception of God' (1897); 'Studies of Good and Evil' (1898); 'The Conception of Immortality' (1900); Ingersoll lecture on immortality, 1899; 'The World and the Individual' (1900-1; Gifford lectures, 1899-1900); 'Outlines of Psychology' (1903).

Roycrofters, roi'krōf-tērz, The, the name applied to a colony of artisans and artists living at East Aurora, Erie County, N. Y. The founder of the Roycroft colony was Elbert Hubbard (q.v.), who in 1893 established here a printing establishment and a monthly periodical called 'The Philistine.' Hubbard, imbued with a socialistic doctrine similar to that of William Morris (q.v.) of England, gradually gathered about him numerous kindred spirits, and since 1900 the Roycrofters have been producing hand-made books, furniture, and wrought-iron work, and have established schools of music, painting, and sculpture. There are numerous workshops, a library, church and other buildings at East Aurora, occupied by the Roycrofters, who have increased in number until the colony numbers several hundred.

Royer-Collard, rwā-yā-kō-lār, Pierre-Paul, French statesman and philosopher: b. Sompuis, Marne, 21 June 1763; d. Chateaufieux 4 Sept. 1845. He was educated at the colleges of Chaumont and Saint Omer, and later became an advocate in Paris. He was an active participant in the pre-Revolutionary movement, and was elected one of the representatives of the commune of Paris. During the ascendancy of the Jacobins he retired to his native province, where he succeeded in avoiding their suspicions. In 1797 the department of Marne sent him to Paris as a member of the Council of the Five Hundred, and there he endeavored to serve the republic. But his sympathies were not with the Napoleonic

regime. His correspondence with Louis XVIII. began at this period, which was also marked by his temporary retirement from political life. In 1809 he was appointed to the chair of philosophy in the University of France, and later became known as the head of the "doctrinaire" school. At the Bourbon restoration in 1814 he was made councillor of state, and chief of public instruction. In 1827 he was admitted to the French Academy, and in 1828 became president of the chamber of deputies. In 1842 he retired from public life. He left few published works, but these reveal him as at all times on the side of freedom and enlightenment. In the support of the house of Bourbon he sought the overthrow of an empire which seemed to him to have usurped greater privileges than those of the monarchy it supplanted. His biography has been written by Barante (1878), Spuller (1895), and Vingtain (1858). For an outline of his philosophy, consult Jouffroy's translation of Reid.

Roze, rōz, Marie, French opera singer: b. Paris 2 March 1850. She was a favorite opera singer of Paris for many years. Her first appearance in London was in 1872. There she was received with favor also, and sang in Italian opera during the next four years. She was married to Mr. Mapleson, her manager, in 1897, and sang for two years in America, when she returned to the London operatic stage.

Ruatan, roo-ā-tān', or Roatan, rō-ā-tān', an island of Central America, in the Bay of Honduras, is 30 miles long by 10 miles wide. Its coast has dangerous reefs, except at the south, where there are a few good roadsteads, and at the east, where there is one, called Port Royal, which is ample and deep, though difficult of access. The soil is fertile and the cocoa-palm, figs, and vines grow spontaneously, while all vegetable growth is abundant. Ruatan has three dependencies, Bonaca, Utila, and Barbareta, comprising the colony of the Bay Islands. These islands were ceded to Honduras in 1856 by Great Britain. Pop. from 2,000 to 4,000.

Rubaiyat, roo'bāi-yāt, a Persian word, the plural of *rubai*, signifying quatrain or epigram. Various forms of the *rubai* were borrowed from the Arabic, and one specific form was invented by Abul Khair of Mahna. It is this style of *rubai*, affording the most concise expression to views of religion and philosophy, that was developed by Omar Khayyam (q.v.), a selection of whose quatrains, translated into English by Edward Fitzgerald (q.v.), became so widely known as popularly to be called 'The Rubaiyat.'

Rubber. See INDIA RUBBER.

Rubber Manufactures, American. The rubber industry in the United States began with the discovery of the process of vulcanization in 1840. It had been used by the South American natives before the discovery of America. It was not until 1770, however, that rubber was utilized in any civilized country; then a few pieces of it were sent to England to be used by artists for erasing pencil-marks. The first rubber imported into this country, in 1800, came in the form of bottles, and was looked upon simply as an interesting curiosity. During the next 20 years sea-captains coming from South American countries were constantly bringing with them specimens of "gum elastic," as it was then more generally

RUBBER MANUFACTURES

called, simply as the strange product of a distant land. In 1813 a patent was granted Jacob Hummel, of Philadelphia, for a gum-elastic varnish, of which there seems to be no further mention. Some 10 years later, in 1823, a Boston sea-captain, coming from South American ports, brought with him a pair of rubber shoes which excited the greatest interest. In 1825 500 pairs of rubber shoes, made by the natives along the Amazon, were brought into Boston; they were thick, clumsy, and unshapely, but they sold readily, at \$3 to \$5 per pair; for, with all their heaviness and awkwardness, it was found that they were a secure protection against dampness. During the next 15 years probably over 1,000,000 pairs of these shoes were brought into this country and sold at these very considerable figures.

In 1831 it was discovered that by dissolving the crude rubber in spirits of turpentine and adding a quantity of lampblack there could be obtained a varnish which, when spread over leather or cloth, gave a hard, smooth, impervious surface. The Roxbury India-Rubber Company was organized and received its charter in 1833. Its business was prosperous, but was actually doomed to speedy failure as the preparation used was not durable, melting and sticking in summer and cracking in winter. Charles Goodyear, a bankrupt hardware merchant of Philadelphia, became interested in the method, and learning of its imperfection set himself to remedy the fault. By 1836 the Roxbury Company had ignominiously failed. After six years of experiment, in 1838 Goodyear found a solution of the difficulty. The story goes that as he was sitting by the kitchen stove desanting on the possibilities of rubber, he struck a handful of rubber and sulphur against the hot stove, thus accidentally discovering the secret of vulcanization.

In 1840 he secured the assistance of two New York capitalists and built a factory in Springfield, Mass. Here, four years later, he took out a patent for preparing rubber by the process of vulcanization, and began to sell licenses for the manufacture of various articles under this patent. The license to manufacture rubber boots and shoes was sold to Leverett Candee, of New Haven, the founder of L. Candee & Co., a company which has continued to the present time an important factor in the American rubber footwear industry. The license to manufacture rubber gloves he granted to the Goodyear's India-Rubber Glove Manufacturing Company, of Naugatuck, Conn. The license to manufacture door-springs, which seemed a very trivial branch of the industry, but which later grew to considerable proportions, was granted to Daniel Hodgman, of New York; and various other licenses were given out to different companies. All branches of the rubber business as we find it in this country to-day took their permanent rise from the date of Goodyear's patent. Mechanical goods, and especially belting, began at this time to receive considerable attention. Some rubber garments were also made. An immediate demand for the poncho—a blanket for horsemen, with a hole in the centre for the rider's head—came from the far Southwest and from Mexico; and various druggists' sundries also began to find their way into the market. With the discovery of hard rubber the field of rubber's usefulness was still further largely extended. But the importations of crude rubber

at Salem, Mass., to which port the greater part of the rubber then imported was brought, amounted in 1851 only to 334,000 pounds, in 1852 to 1,961,000 pounds, and in 1854 to 2,055,000 pounds.

The Civil War gave a great impetus to the rubber industry, notably to the clothing branch; blankets were needed for the soldiers, and the government gave out large contracts. The boot and shoe industry increased rapidly with the other branches of rubber manufacture, so that, from an output in 1860 of the value of \$795,000, the yearly output in 1870 had increased to \$8,000,000. The manufacture of mechanical goods took a rapid start shortly after the War. This was owing to a considerable extent to the great increase of railroad building at that time. The railroads called for large quantities of packing, and for hose to be used in conveying steam and gas. The impetus given to manufacturing in general made an increased demand for rubber belting. The first rubber belt was patented in this country in 1836, but this particular branch of the rubber industry reached no considerable size until after the War, when rubber belting was in demand for mills, factories, and elevators, and especially for all outdoor machinery. It possessed several advantages over leather belting: its lower price, the greater friction between the belt and the wheel, and the fact that it was not affected by exposure or by moisture. The making of rubber tires began in 1877, with the solid tire, which gave way to the cushion tire. It in a short time and in a less degree was displaced by the pneumatic tire. It is estimated that at least 3,000,000 pounds of rubber are now annually used in the making of bicycle tires, and twice as much more for tires for carriages, wagons, and automobiles. Next in importance to rubber tiring, which stands next to hose, belting, and packing, comes the making of rubber mats. This industry has enjoyed a constant and rapid growth, until we have mats for floors and for stairs, pitcher-mats for tables, and coin-mats for counters—and all in an infinite variety of design. Rubber tiles, which have recently come into use, are desirable not only because of their cleanliness and durability, but for their noiselessness. The introduction and rapid growth of the typewriter industry has consumed a constantly increasing quantity of rubbers in various details of typewriter construction. Several hundred thousand pounds of rubber are used each year by one company alone in the manufacture of rings for preserving jars. The making of pencil erasers consumes a large quantity, and there is a large annual output of goring, in which rubber thread is used. A quarter of a million dollars' worth of rubber is used in this country each year in the making of cushions for billiard-tables. Other important items are rubber stamps, tennis balls, footballs, golf-balls, etc. There are now about 40 companies making rubber mechanical goods, with an aggregate capital of about \$30,000,000, employing 10,000 men, and having an annual output valued at from \$35,000,000 to \$40,000,000. Our export trade in mechanical goods amounts to about \$2,000,000 a year.

The attempt to utilize the waterproof properties of the caoutchouc gum in the manufacture of clothing was one of the earliest directions which rubber invention took, especially in Eng-

RUBBER MANUFACTURES

land. In this country very little was done in this department of rubber manufacture until the Civil War, and the great demand to which it gave rise for rubber coats and blankets. After the War rubber coats continued to be made, but they were chiefly of a heavy sort and almost solely for men. For women's use the light gossamer came out about 1875. But excessive competition resulted in such deterioration of quality as seriously to affect its popularity. About 1885 the manufacture of mackintoshes for both men and women was started in this country. About 20 factories, with a capital of more than \$6,000,000, manufacture mackintoshes. Another important branch of the rubber industry in the United States is the making of druggists' sundries. The pioneer in this industry was the Union Rubber Company, located in Harlem. It derived its license direct from Goodyear, and began to manufacture druggists' sundries in 1857, making syringes, water-bottles, bandages, air-pillows, and air-cushions. The atomizer was a later development, and came into vogue in 1880. There are some 10 companies engaged in this branch of the business in this country at the present time, with a capital of between \$4,000,000 and \$5,000,000, and with an annual output of about \$4,000,000. After Goodyear had brought his vulcanization process to a fair degree of perfection he turned his attention to the making of hard rubber, in which he was greatly assisted by his brother Nelson, who in the year 1851 obtained a patent for the production of hard rubber. Hard rubber differs from soft rubber in containing a much larger proportion of sulphur, and in the degree of heat used in vulcanization, which is considerably higher than that at which soft rubber is vulcanized. The first article made in hard rubber to any considerable extent was the comb. It is said that Goodyear's experiments in this line made his combs cost twenty times as much as the ivory combs then in use; but the rubber comb has now practically displaced all other kinds. For twenty years after the invention of hard rubber the India-Rubber Comb Company practically enjoyed its monopoly; but other companies entered the field after the expiration of the Goodyear patent. In 1898 the American Hard Rubber Company, with a capital of \$2,500,000, was formed, and absorbed the various individual companies engaged in this line of manufacture. The annual output of hard rubber goods is in the neighborhood of \$3,000,000, and about 2,500 operatives are employed in this branch of the rubber trade. The principal articles of manufacture are electrical appliances, combs, syringes and syringe fittings, fittings for pipes, buttons, harness trimmings, and various desk articles, such as ink-wells, penholders, and rulers. It is the boot and shoe industry, however, that has led in rubber manufacture in this country from the very first. For many years it used the great bulk of the rubber imported into this country; but the later development of other branches of the rubber business has been so large that now the boot and shoe industry comprises probably not over 40 per cent of the rubber manufactured in the United States. From an annual output in 1860 of the value of \$795,000, the value of the rubber boot and shoe product grew in 1870 to \$8,000,000, in 1880 to \$16,000,000, in 1890 to \$24,000,000, and in 1900 to \$40,000,000. There are now a dozen or more

large factories engaged in the manufacture of rubber boots and shoes. Their combined daily capacity is over 180,000 pairs of boots and shoes; they employ 17,000 workmen, and their aggregate capital is \$50,000,000. Their aggregate output for 1900 was 40,000,000 pairs of boots and shoes. We have as yet done comparatively little in the way of exporting rubber boots and shoes, our annual exports in this line rarely exceeding \$1,000,000. The reason has been chiefly that the American demand has been so large and has so constantly increased that our manufacturers have not yet felt the necessity of looking for a broader field. They have consequently made no effort to appeal to foreign buyers by making rubbers particularly suited to their local conditions. The rubbers which we export go chiefly to England, the Continent, Japan, and China. A very important event in the history of the rubber boot and shoe industry in the United States occurred in the fall of 1892, when the United States Rubber Company purchased nearly all of the large footwear interests in the United States. This centralization of the rubber industry has already resulted in conspicuous economies; for while the different factories have remained under their former individual management, they have shared their individual advantages in common, the patents and secret processes of one factory becoming the property of all. In this way all the improved methods, a part of which each factory enjoyed before, are now shared equally and fully by all the different factories. There has also been a great saving in the matter of purchasing crude rubber, a large single purchase being made at a great advantage over a number of smaller scattered purchases. In reducing the necessity of carrying large stocks, in diminishing the duplication of a vast number of expensive lasts, and in various other ways, marked economies have been effected, while at the same time the quality of the goods has been more uniformly excellent than heretofore. The combination of all that was best in the methods of the different companies has proved a potent agency in advancing the rubber footwear industry in this country toward the universal goal of all industrial enterprises—better product at a lower cost. The entire rubber industry in the United States, in its five branches, footwear, mechanical goods, clothing, druggists' sundries, and hard rubber, consumes considerably more than one half of the rubber manufactured in the world. The consumption of rubber in this country increased from 9,830,000 pounds in 1875 to 17,835,000 pounds in 1880, to 31,949,000 pounds in 1890, and to 50,000,000 pounds in 1900. To this large amount must be added the rubber which is obtained by the reclaiming process, which has now been brought to such a state of perfection that very little rubber goes to waste, old rubber articles being collected and subjected to a process which eliminates from the compound everything but the rubber. It is probable that the amount of this reclaimed rubber used annually in this country equals 40,000,000 pounds, making the total yearly consumption of rubber 90,000,000 pounds. The rubber industry in the United States in 1901 is 20 times what it was in 1860, five times what it was in 1870, and has trebled since 1880. There are \$100,000,000 of capital invested in the various branches of rubber manufacture in this country, and the value of the

RUBBER-TREES

yearly product is fully \$100,000,000, while 200,000 people depend upon it for their support. See also INDIA RUBBER.

Rubber-trees, the sources of caoutchouc (q.v.) or india-rubber (q.v.) are botanically various and widely distributed in the warmer parts of the world. They belong to the four allied groups *Moraceæ*, *Euphorbiaceæ*, *Artocarpaceæ*, and *Apocynaceæ*, but not all the members of these families yield caoutchouc, while a similar juice may be obtained from certain outside plants, but not in commercial quantities. This substance (latex) is one of those, like the "milk" of the milkweeds, and many others, which are elaborated in the green surface cells and conducted through the plant, for its nourishment, by the lactiferous canals. In the rubber plants they run just beneath the bark, and often carry the sticky juice in excess, so that "in the gigantic trunks of tropical fig-trees," as Kerner says, "the latex often wells up in large quantities from rifts in the bark which have arisen spontaneously, and thickens into long strings and ropes of india-rubber hanging down like a mantle." A rough test of whether a tree-juice has the true properties of caoutchouc is to rub some of it between the fingers until it exhibits the recognized elastic threads; inferior juices of other trees are sometimes mingled with it by native gatherers, as adulterants, and these may in some cases nearly ruin the whole package, by developing other qualities in coagulation, as, for instance, those of gutta-percha (q.v.).

The caoutchouc-yielding trees occur in all tropical regions, but are different botanically in each region. The principal commercial supply and the best is obtained from the valley of the Amazon, and is known to the trade as Pará rubber; but all other parts of northern South America ship it in large quantities. That which comes from the valleys of the Amazon and Orinoco (Brazil, Guiana, and Venezuela) is chiefly the product of the euphorbiaceous genus *Hevea*, and especially of *H. brasiliensis*, a tree often 60 feet in height, branching from the base, which, with two or three similar species, grows abundantly in the hot, steaming lowlands along the river courses; the juice is obtained by tapping the trees, by means of incisions in the bark in the evening, and collecting the deposition next morning. Each tree will yield about six ounces in three days, and then must be allowed to rest. The main resources in Guiana are the species *H. guayensis* and *paucifolia*, the former of which is called by the natives "cahoutchou." That exported from Maranhão is similar. The Ceará rubber is derived from a smaller euphorbiaceous tree (*Manihot glaziovii*), which grows over a large area in that part of Brazil, and is tapped when about two years old. The Pernambuco or Mangabeira rubber is the product of a small, drooping tree (*Hancornia speciosa*) of the family *Apocynaceæ*, which grows on the hills and yields the edible fruit "mangaba," for the sake of which it is frequently cultivated in orchards. This is a comparatively poor sort of rubber. Nearly all of the crude rubber above mentioned is exported to Europe, the United States deriving its supply mainly from Colombia, Ecuador, Central America, and Mexico. This is mainly the product of a tree (*Castilloa elastica*) of the family *Artocarpaceæ*, related to the breadfruit.

It is a lofty tree, with a trunk three feet or more in diameter, and large, hairy, oblong leaves, which grows in the rich soil of wet, low-lying, heavily forested valleys. With some allied species it flourishes from Mexico and Cuba to the mountains of Venezuela and the Andes, which separate it from the heaves of Brazil. It reaches its best size and condition in Panama and Nicaragua, where an average tree is expected to yield 20 gallons of milk, or about 40 pounds of crude rubber. Honduras rubber is good, but that from Guatemala is inferior.

The Asiatic supply comes from various parts in Assam (via Calcutta), and eastward to Borneo, and is chiefly produced by the rubber-fig (*Ficus elastica*). The trees may be tapped when 25 years old, and for 50 years afterward will yield 40 pounds of caoutchouc every three years. A large variety of other plants and trees in the Malayan and Papuan region yield rubber, some of which is excellent and of growing importance commercially, and everywhere the early rough and wasteful methods of obtaining the product are being corrected. It is also obtained in northern Australia, in Fiji, and in various neighboring islands. More than 100 different trees are known to give rubber-making juices in commercial quantities, while in a great many others, as lettuce, poppy, milkweed, and others, it is present in small quantities. The juice of the Brazilian *Hevea* trees is said to yield about 30 per cent of pure rubber; but a product of less than 15 per cent is not regarded as commercially profitable.

Africa is now the principal source of the rubber supply of the world next to South America. The bulk of that from the west coast and equatorial region is obtained from various climbing shrubs belonging to or allied to the apocynaceous genus *Vahea*, few of which are well known to botanists. In Liberia and somewhat elsewhere are rubber-bearing figs; and a large part of the extensive product of Madagascar and the Mozambique coast is derived from a *Walbergia*, species of which also give much of the caoutchouc received from the Malayan Islands.

Cultivation of Rubber Trees.—Attempts have been made in most countries, where suitable conditions prevail, to propagate the rubber trees in plantations of prescribed dimensions, and capable of rational supervision by experts, rendering the planter independent of native delinquencies and assuring annual crops of first quality for an indefinite number of years. It has been demonstrated that the rubber tree can produce, under proper management, a regular and increasing crop, for each year of its natural life, without being injured. The experiment of re-stocking the former rubber forests of the southern states of Mexico is now being carried on by American capitalists with prospects of success. Many thousands of acres of rubber lands have been purchased from the Mexican government, and are rapidly being developed in plantations. Progress has been retarded on account of lack of previous knowledge or precedent in the business, yet the difficulties seem to have been surmounted, and it is now demonstrated that the rubber tree can be artificially cultivated when conditions under which its growth is stimulated are understood. In Chiapas, the numerous river-bottoms afford the character of soil acquired,

favorable atmospheric conditions, and abundance of rain-fall. Covered with thick tropical forest growth, which it is necessary to clear, the rubber tree shoots, raised from seed in neighboring nurseries and about a foot high, are planted in the clearings to the number of 200 trees to the acre. But little further care is required. At six years of age the tree is tapped, yielding a small first crop. Hundreds of thousands of every age, from one to four years, are growing in apparent strength and luxuriance, with a prospect of affording an ever increasing supply of the crude product annually. The Central American rubber-tree will not flourish in swamps, though moisture is a prime requisite. The altitude it affects varies in different lands, preferably but little above sea-level, but in some localities 1,000, 1,500, or even 3,000 feet above tide water. The rubber-plant so commonly grown as an ornamental house-plant is the East Indian fig (*Ficus elastica*).

Rubble Work. See MASONRY.

Rubefacients, substances or agents which, when applied for some time to the skin, occasion a redness and increase of heat. When the irritant effect of any agent amounts to blistering, or causes discharge of pus or matter, the action is said to be vesicant or suppurative. All these agencies are included under the one term counter-irritants, the rubefacient action being the mildest of the three, and dependent generally upon the form and duration of the application; as, for instance, mustard or ammonia may be used so as to produce only the most transient redness, or may be made to cause blistering or suppuration. Among the most commonly used rubefacients are hot water, ammonia, mustard, oil of turpentine, powdered ginger, spirit of wine, camphor, and chloroform vapor.

Rubellite, the red or deep pink variety of tourmaline (q.v.); when transparent, valued as a gem.

Rubens, roo'bēnz, **Peter Paul**, Flemish painter: b. Siegen, western Germany, 29 June 1577; d. Antwerp 30 May 1640. He was the son of a person of good citizen family who had gone from Antwerp to Cologne on account of religious oppression, and who, while there, had become the steward of Anne, wife of William of Orange-Nassau, the famous liberator of the United Provinces. He was compelled to remove to Siegen, a small town, because of offenses committed, and it was not until his death in 1588 that the widow was able to return to Antwerp. There the boy studied in the Jesuit College and was page to a lady of rank. He studied art first with Tobias van der Haegt, and afterward with Adam van Noort, but his chief master was Otto van Veen (called Otto Vaenius). With this artist, who was court painter to the Regent of the Netherlands under Spain, the Infanta Isabella Clara Eugenia, Rubens remained from 1596 to 1600; and at the end of that period of time went to Italy. It is evident that he had the best introductions; and yet the young man's courteous manners and liberal training, as well as his great ability as a painter of portraits, must have made him welcome at once.

At Venice he met the famous and magnificent Duke of Mantua, Vincenzo Gonzaga, who at once employed him, sending him first to Rome, placing him near his own person at his own pal-

ace in Mantua, and sending him to Spain in 1603. While in Mantua he painted the famous triple altar-piece for the Prince's chapel; a work of which the greater part of the middle composition is in the Church of Saint Trinità in Mantua, one wing at Nancy in the Provincial Museum, and one at Antwerp. It was not until 1608 that he returned to the North, finding his mother dead on his arrival; and settled in Antwerp, his home from that time. It was then that he painted the first of the two wonderful pictures which are in the Cathedral of Antwerp, the 'Raising of the Cross'; and two years later, for the Company of the Arquebusers, its companion, the famous 'Descent from the Cross,' which is in itself a perfect embodiment of Rubens' art. He married, and now having property, both from his own inheritance and labor, and in right of his wife, bought land and built himself a house, of which drawings remain and in which he lived for 30 years in the fashion of a very wealthy burgher; though having, through the practice of his art, unusually close relations with the Infanta's court and the nobility, both Spanish and Flemish. It was in this capacity that he went to Spain on a mission for his patroness, the regent of the Netherlands, and her husband, the Archduke Albert of Austria, and was sent from Spain to England by the famous minister, Olivares. It is not to be forgotten that he was looked upon as a subject of the Spanish monarchy, and that in his capacity as a good Catholic he would have felt no objection to this view of the case, though he never took sides strongly against the Protestant rising of many of his countrymen. In England he was knighted by King Charles I. Finally in 1630, being then in his 54th year, he returned to Antwerp and married a second time. From this time onward his art employed him almost incessantly, in spite of a short intervention due to religious divisions between the northern and southern provinces; and his fame and popularity increased until his death in 1640 in Antwerp.

Few artists have had so varied a career, with so many other subjects of high interest to interfere with the peaceful pursuit of their art; and yet few artists have approached Rubens in the amount of artistic work done. This is to be accounted for in part by his extraordinary skill and success in assimilating the work of his many assistants (their names are those of men afterward famous in their art, chief among them Jordaens and Van Dyck); but partly also by the almost unexampled facility of work which he gained and which remains unique in the records of the art of painting. In his earlier days he copied great numbers of paintings by Italian masters, as was the custom then, and there can be no doubt that his facility and range were greatly increased by this practice. His work done after the age of 30 is uniformly wonderful for his power over all his materials, and all the different processes which enter into painting on a large scale. The fresh and rosy scheme of color which he adopted must have been natural to his instincts; original with him and not derived; moreover, his strong and intelligent drawing, though gained by practice in many schools, was still his own creation. His tendency to excess of action and to the appearance of violence, as

PETER PAUL RUBENS.

in the famous 'Fall of the Rebel Angels,' in Munich, and many similar works, does not seem to imply a headlong or self-forgetful mood; he seems to have been always master of himself, and his paintings were always popular (that is, in sympathy with his times), in style and management. He became in this way the typical artist of his epoch and the most admired master, the man chosen for great state undertakings in art as well as in diplomacy. It was in this capacity that he was employed by the Queen Dowager of France, widow of Henry IV., to decorate her palace of the Luxembourg in Paris, and the great paintings which are now in the new Hall of Rubens in the Louvre were prepared for that purpose. Studies for them are at Munich.

All the treatises on Flemish painting deal with Rubens, and the dictionaries of artists give him much space. The most important book devoted to him is that by Emile Michel, translated into English as 'Rubens, his Life, his Work, and his Time' (London 1899). This book is very richly illustrated. The collections of artists' biographies do not always contain Rubens' biography; but an excellent life of him by Charles W. Kett is included in the series called 'Illustrated Biographies of Great Artists' (1878-9). There are many books published in Belgium, either in French or in Flemish, which deal with the different stages in his remarkable career, and some of these are readily accessible. The essay on Rubens in 'Great Masters' by John La Farge (New York, 1904) is of great critical value. The 'Gazette des Beaux-Arts' has several important papers with elaborate illustrations.

RUSSELL STURGIS.

Rubicon, roo'bī-kōn, a river in Italy, of some celebrity in Roman history, Cæsar having by crossing this stream, at that time regarded as the northern boundary of Italy, finally committed himself to the civil war. Hence the phrase, "to pass the Rubicon," is to take the decisive step by which one commits himself to a hazardous enterprise. It is very doubtful under what modern name the Rubicon now exists, the honor being claimed by two streams—the Fiumicino and the Luso.

Rubidium, a rare metal discovered by Bunsen and Kirchhoff in 1860, by means of spectral analysis, in the residue obtained by evaporating a large quantity of the mineral water of Dürkheim, Germany. The metal and its salts exhibit two dark red lines in the blue part of the spectrum—hence the name, from the Latin *rubidus*, "dark red." Rubidium has the atomic weight 85.4, and the symbol Rb. It is a white, shining metal, having a specific gravity of 1.52; at ordinary temperatures—even so low, indeed, as -10° C.—it is soft as wax; it is easily oxidized; when thrown on water it decomposes that liquid with evolution of hydrogen, which takes fire because of the heat produced in the reaction. Rubidium forms one of the metals of the alkalis, being analogous in its properties with potassium and sodium: its compounds also closely resemble those of these metals; thus it forms a characteristic hydrate (RbHO), which is a white, solid substance, feeling unctuous to the touch, deliquescent in the air, and dissolving in water to form a strongly alkaline liquid. Rubidium forms one chloride (RbCl), bromide

(RbBr), and iodide (RbI), and in all its compounds comports itself in a manner precisely analogous with potassium and sodium.

Rubinstein, roo'bīn-stīn, **Anton Gregor**, Russian composer and pianist: b. Wechwotynetz 30 Nov. 1830; d. 20 Nov. 1894. His parents were Jewish and soon after his birth removed to Moscow. His mother, being a good musician, was his first teacher; he next studied with Villoing, a Frenchman, and at nine played in a concert at Moscow. He accompanied his teacher to Paris, where in 1840 he played before the most distinguished musicians. He was advised by Liszt to study in Germany and after a concert tour in England, Holland and elsewhere, he settled in Berlin to study theory under Dehn. He returned to Russia in 1848 settling in Saint Petersburg. In 1855 he was enabled to visit Germany again for study; here also he succeeded in finding publishers for his compositions, and made concert tours that extended to London and Paris. In 1858 he was again in Saint Petersburg, where he was appointed court pianist; in 1859 he became director of the Russian Music Society and in 1862 founded the Saint Petersburg Conservatory, and was director until 1867. He made concert tours in Europe in the following years and appeared in America in 1872-3. As a piano player he occupied the front rank; in perfection of technique he had few peers and was excelled by none. As a composer he was prolific, brilliant; but showed a lack of self-discipline which prevented his compositions from attaining the highest merit. He wrote operas, pianoforte pieces, orchestral scores and songs; his best known works being the Ocean Symphony and the pianoforte concertos in G major and D minor and the trio in B-flat. His operas, such as 'The Maccabees' (1875); 'Paradise Lost' (1875); 'Sulamith' (1883), have had but a partial success.

Ruble, roo'bl, or **Rouble**, a silver coin, the standard of money in Russia, containing 278 grains of fine silver, and equal to about 76 cents in American money. In actual circulation there is little but paper money, valued at from ten to twenty per cent below its nominal value. A ruble is divided into 100 copecks. Half and quarter rubles, and fifth, tenth, and twentieth parts of a ruble, are coined in silver; gold coins of the nominal value of three rubles (the imperial ducat) and five rubles (the demi-imperial) are also coined.

Ru'bric (Lat. *ruber*, red), was the name applied to those portions of old manuscripts and books which, for typographical embellishment or on account of their importance in the text, were printed in red ink. Often, as in the old monastic manuscripts, only initial letters in the paragraph were so treated. With the development of the copyist's art, however, rubricated manuscripts became ornate; the initial letter of every noun, perhaps, was rubricated, chapter headings, thumb-nail indexes, marginal comments, and in cases whole passages of the text were highly ornamented rubrics.

The use of the red letter text became common in the case of religious treatises, and so from the fact that certain rules and directions in prayer books, explanations and responses,

are printed in red ink. This is the case with the Roman missal, where the matins, lauds, beatifications, etc., are always in red; in the liturgy, where the directions for the performance of the service are in red. In the old Bibles the chapter heads were so treated. Modern typography discards such profuse use of colored ink and usually substitutes in its place type of a different face from the rest of the text, but the portions thus emphasized are still called rubrics.

Spanish custom has given another significance to the word, wherein it is meant to denote the flourish so common after Spanish signatures. This likewise results from the fact that the rubrics were the most conspicuous features of a page.

Ru'bus, a genus of plants of the order *Rosaceæ*, of which more than 1,500 species have been described, but probably only 200 are well marked, the remainder being intermediate forms. They are mostly natives of the northern hemisphere and are especially abundant in Europe. About 40 are indigenous to North America. They are mostly shrubs whose stems (canes) are biennial or annual, prickly, erect, curving, climbing or trailing. They have simple or compound alternate leaves, white or pink flowers usually in corymbs or racemes, followed generally by compound fruits consisting of many drupelets. In the blackberry the drupelets are united to the receptacle; in the raspberry they are not. Besides the raspberry, blackberry, and dewberry (q.v.), many species are useful for food or ornament. Among the best known are the European bramble (*R. fruticosus*), wineberry (*R. phanicolasius*), flowering raspberry (*R. odoratus*), and the cloudberry, yellowberry, bake-apple berry (*R. chamamorus*). The Rocky Mountain flowering raspberry (*R. deliciosus*), the brier rose, bridal rose or strawberry-raspberry (*R. rosafolius*), and *R. cratagifolius* are well known ornamental species in shrubberies, etc. See BLACKBERRY, RASPBERRY, etc.

Ruby, the rich red, transparent variety of corundum. The name is sometimes used for other red gems (see RUBY SPINEL), and improperly for richly colored garnets, of the variety pyrope. The stones called Cape rubies and Arizona rubies are only fine pyropes, coming respectively from the South African diamond mines and from Arizona and New Mexico. (See PYROPE.) Siberian ruby is a term sometimes applied to gems of rubellite or red tourmaline (q.v.), and Brazilian ruby to the deeper shades of pink topaz, altered to that color by heat. The true rubies recently mined in the Cowee Valley, in North Carolina, have attracted much interest, being in some cases as fine as those from Burma; but they are mostly small, and it is not certain whether they will prove of real importance. They occur in a greatly decomposed igneous rock, in the same manner as the very similar crystals of sapphire from Yogo Gulch, Montana. The rubies of Burma, formerly spoken of as Pegu, are derived from a crystalline limestone. In these cases, and indeed generally, the gems are largely found in gravels and surface deposits formed from the decomposition of the

parent rocks. Like all the deeply-colored corundum gems, rubies are strongly dichroic, their color varying with the direction in which light traverses the crystal, whether transverse or parallel to the axis of the prism. The presence of microscopic cavities or of included crystals of extreme minuteness, disposed in a certain parallelism to the crystalline axes, produces the optical effect known as asterism, which is exhibited by the highly prized gems called star rubies (and star sapphires). In less amount or when irregularly distributed, the same causes produce defects known as "silk," and cloudiness. Many efforts have been made to produce the ruby by chemical means, and a dozen or more processes have been devised with greater or less success within the past 50 years, but with little practical result. Crystals have been obtained, of fine color, but mostly small, or in flat hexagonal plates too thin to furnish gems. Some years ago, larger pieces appeared in the market, that caused some concern from their close resemblance to natural rubies. The process was not made known, but was judged to be that discovered by Frémy and Feil, by fusing an aluminate of lead with silica. They were detectable by the microscope, which showed that they contained minute cavities that were rounded and bubble-like, while those in real rubies are angular and crystalline. The French "Syndicate of Diamonds and Precious Stones" decided that all such rubies must be sold as "artificial," under penalty of fraud.

Ruby Matrix is a name recently given to a beautiful combination of red or pink corundum with a bright green variety of hornblende (amphibolite) found at the Cullakenee corundum mine in Clay County, North Carolina; it has been proposed to use it as an ornamental stone, though the ruby-corundum is not transparent enough to cut gems.

Ruby Spinel, this mineral is an aluminate of magnesia. It crystallizes in octahedrons, with a hardness of 8, and a specific gravity of 3.5 to 3.7, usually of some shade of red, sometimes very rich, and transparent to translucent. Fine specimens make beautiful gems, known as spinel rubies, not readily distinguishable from true (corundum) rubies, though less hard, less dense, and less valuable. The historic "Black Prince" ruby, in the crown jewels of England, is believed to be a spinel. True rubies may also be distinguished from spinels by the dichroism which belongs to all the deeply colored corundum gems. Red spinel has several other varieties, with special names; it is called Balas ruby when the color is rich pink, rubicelle when it inclines toward an orange red, and almandine ruby when it tends toward a purplish. Spinel is a frequent associate of the true ruby, in Burma, Siam, Ceylon, etc. It usually occurs in crystalline limestones, though occasionally found in other metamorphic, and even in volcanic, rocks.

Ruby-throat. See HUMMING-BIRD.

Rückert, Friedrich fräd'rīn rük'ärt, German poet and Orientalist: b. Schweinfurt, Bavaria, 16 May 1788; d. Neuses, near Coburg, 31 Jan. 1866. His education was received at Heidelberg and at Würzburg. He first began

to write under the pseudonym of 'Freimund Raimar,' and 'Deutsche Gedichte' appeared with that signature. From 1826 to 1831 he occupied the chair of Oriental languages in the University of Erlangen, and while there was called to Berlin as privy councillor to Frederick IV. Here he also pursued his work as a philologist and poet. He retired to private life in 1848, becoming one of the most prolific writers of his day. He had a remarkable command of language and wrote almost every known form of verse. His original poems relating to the East are: 'Morgenländische Sagen und Geschichten' (1837); 'Rostem und Suhrab: eine Heldengeschichte' (1838); and 'Die Weisheit des Brahmanen' (1836-9). His adaptations include 'Die Verwandlungen des Abn Seid' of Hariri (1826); 'Nal und Damajanti' from the 'Mahabahrata' (1828); 'Amrilkais' (1843); and 'Hamasa' (1846). Among his other works are 'Saul und David' (1843); 'Liebesfrühling' (1844); and 'Lieder und Sprüche' (1866). Consult biographies by Beyer (1868-77); Konrad Fischer (1889); and F. Reuter, 'Rückert in Erlangen und Joseph Kopp' (1891).

Ruckstuhl, rük'stool, **Frederic Wellington**, American sculptor: b. Breitenbach, Alsace, 22 May 1853. At two he was brought to America by his parents who settled in Saint Louis, Mo. His art studies were begun in 1883 in Paris. His first exhibit, a life size nude figure called 'Evening,' won honorable mention in the Salon of 1888. His principal works are: a bronze figure 'Victory,' on the soldiers and sailors' monument at Jamaica, Long Island; the bronze 'Solon,' in the Library of Congress, Washington, D. C.; and the heads of Goethe, Franklin and Macaulay which form a part of the façade; and the heroic marbles 'Wisdom' and 'Force' above the New York Appellate Court building in Madison Square, New York.

Rudder, an oar or other instrument by which a ship is steered, being that part of the helm which consists of a piece of timber which enters the water, and is attached to the stern-post by hinges, on which it turns. The action of the rudder may be thus explained: While it remains in line with the keel, the force of the water gliding past the deadwood, or narrow portion of the stern, is equal on both sides of the rudder, and equilibrium is maintained; but if the rudder be forced to one side the pressure is taken off on the opposite side, while from acting at a less angle the water exercises an increased pressure on the side to which the rudder is turned. The effect is to force the stern round on the centre of gravity as a pivot, the ship's head, of course, turning to the same side as that on which the rudder is. When the head has sufficiently deviated from its former line the rudder is permitted to resume its straight position. In sailing on a wind, the rudder is kept permanently on one side to counteract the tendency to make leeway.

Rudder Fish, so named from being perceived usually in the wake of ships, following the movement of the rudder, and doubtless attracted by the refuse thrown overboard, is a small fish of the genus *Palinurus* allied to the mackerel family, very common in the Pacific and Atlantic oceans. *The Palinurus perci-*

formis, the rudder perch, or black pilot fish of the fishermen of Martha's Vineyard, attains a length of from nine to twelve inches, and is caught on the coasts of Massachusetts and New York, specimens having been obtained in Boston Harbor hovering around the sterns of vessels or keeping near such floating bodies as casks, planks, logs, and other flotsam. The back and top of the head is brownish with black blotches, the sides bluish-white with minute black dots, and the under parts lighter; the color of the young is a bright bronzed black, variegated with yellow circular spots, obscure reddish hues and streaks of white and yellow lining the sides; there is a depression between the eyes which are protected by an overhanging bony ridge, and in front of the fleshy rays of the dorsal are eight short spines. The rudder fish belongs to the division of the scomberoids in which the first dorsal is composed of isolated spines connected by a low membrane, but unlike the scomberoids there are one or more spines in front of the anal fin.

Rudder Grange, a humorous story by Frank R. Stockton, which appeared serially in 1879 and was the first of the author's books to attract general attention. A slight thread of story suffices to connect a series of humorous episodes which result from the efforts of a young couple to establish themselves in a summer home at once desirable and inexpensive. In 'The Rudder Grangers Abroad' and 'Pomona's Travels' (1894), the principal figures in 'Rudder Grange' reappear.

Ruddiman, rüd'i-man, **Thomas**, Scottish scholar: b. Raggel, Banffshire, October, 1674; d. Edinburgh 19 Jan. 1757. He was graduated at Aberdeen in 1694, revised and edited several works by Scottish authors, and to the famous poetical translation of Virgil's 'Æneid,' by Bishop Douglas, added a glossary, which brought him fame as a Latin scholar. In 1714 he published his 'Rudiments of the Latin Tongue,' a work which supplanted all previous Latin grammars in use in Scotland, and which he lived to see pass through 15 editions. In 1715 became a publisher and in this capacity edited and brought out many famous books, and in 1725 the first volume of his own 'Grammaticæ Latinæ Institutiones,' and an abridgement of the three volumes in 1740. Consult: Chalmers, 'Life of Ruddiman' (1794); Chambers, 'Eminent Scotsmen.'

Ruddy Duck, a rather small, quick-diving handsome duck (*Erismatura rubida*), which is to be found throughout North and Central America, breeding in all suitable localities. It is related to several foreign sea-ducks, the Australian musk-duck, etc., but is itself confined to this continent. This duck is about 17 inches long, and chiefly tawny brown, the drake becoming glossy chestnut in full breeding plumage; considerably waved and dotted, and the lower parts mottled silver-white.

Rude, François, frän-swä rüd, French sculptor: b. Dijon 4 Jan. 1784; d. Paris 3 Nov. 1855. He was originally a blacksmith, but entered the Ecole des Beaux Arts in 1807 and was under the instruction of Cartellier. From 1815 to 1827 he worked at Brussels decorating the royal palace and subsequently settled at Paris, where his real artistic life began. His

chief works, which indicate a combination of antique simplicity with modern naturalism, are his 'Mercury' (1827), now in the Louvre; his 'Neapolitan Fisher Boy,' also in the Louvre; his 'Louis XIII.,' as a boy 1842; 'Sepulchral Monument of Cavaignac,' in the cemetery of Montmartre (1847); a 'Crucifixion' and the 'Maid of Orleans' (1852), both in the Louvre; 'Hebe' and 'Love as the Conqueror of the World,' in the museum at Dijon.

Rüdiger, Fedor Vasilievitch, Russian count and general: b. Courland, 1780; d. Carlsbad, Bohemia, 22 June 1856. He came of a noble Courland family, and entered the army when a youth. He saw active service in Germany and France during the campaigns of 1813-14 as a major-general; in 1828-29 served as a lieutenant-general in the war with Turkey; and after the suppression of the Polish rebellion, was promoted to be general of cavalry. Under Paskevitch he followed the campaign in Hungary in 1849, took an active part in the battles of Waitzen and Debreczin, and on Görgey's attempted retreat to Arad, pursued him and compelled his surrender at Világos. During Paskevitch's absence in the Crimea in 1854, Rüdiger was appointed lieutenant-governor of Poland.

Rudinger, Nicolaus, German physician and professor of anatomy; b. Rüdesheim, Prussia, 25 March 1832; d. Munich 23 Aug. 1896. After studies at the universities of Heidelberg and Giessen, he was graduated M.D. in 1855 at the latter university. He had exhibited a natural aptitude for anatomy and became assistant to his instructor Bischoff in the University of Munich, where in 1881 he was appointed Professor of Anatomy. In his lectures and his contributions to professional periodicals, photographic reproductions of his operations were notable features; from 1867 to 1870 he was co-editor of 'Monatsschrift für Ohrenheilkunde' and in 1877 of 'Beiträge zur Anthropologie und Urgeschichte Bayerns'; the most valuable of his numerous publications are 'Atlas des peripherischen Nerven-systems des menschlichen Körpers' (1872); 'Atlas des menschlichen Gehörorgans' (1875); and 'Topographisch-chirurgische Anatomie des Menschen' (1873-79).

Rudini, roo-dē'nē, Antonio Starrabba di, MARQUIS, Italian statesman: b. Palermo, Sicily, 6 April 1830. In 1866 he became mayor of Palermo, and in 1867 a member of the Chamber of Deputies. He was appointed minister of the interior in the following year, but served only a few months. After the fall of the Menabrea cabinet he held no prominent office until in 1891, when, having become the head of the constitutional party, he succeeded Signor Crispi in the ministry of foreign affairs, and was made premier. In 1892 the premiership passed again to Crispi, but in 1896 Rudini returned to power as a result of Signor Crispi's disastrous Abyssinian policy. He continued in the premiership until 1898, when he resigned his office. His renewal of the Triple Alliance and conclusion of peace with Abyssinia were the most important of his executive acts, while his continued yielding to the pressure of the radical party, and failure to weld the conservative elements of the Italian parliament are quoted against his administration.

Rudler, Frederick William, English scientist, educator, and writer: b. London 8 July 1841. A predilection for scientific study and research led to an early appointment as assistant in the Museum of Practical Geology in 1861. In 1870 he was elected assistant secretary to the Ethnological Society, and from 1876 to 1879 was professor of natural science in the University College of Wales, an appointment he resigned on being made curator of the museum. He was one of the lecturers of the London Society for the Extension of University Teaching; in 1880 was president of the anthropological department of the British Association; and in 1889 president of the Geologists' Association. He was appointed director of the Anthropological Institute, and editor of its 'Journal,' was co-editor of Ure's 'Dictionary of Arts,' and as a prolific contributor of scientific subjects to encyclopedias and technical periodicals is well-known.

Rudolf I., roo'dōlf, emperor of Germany, founder of the imperial house of Austria: b. 1 May 1218; d. Gernersheim 15 July 1291. He was the eldest son of Albert IV., count of Hapsburg and landgrave of Alsace, was brought up in the court and camp of the Emperor Frederick II.; and on the death of his father succeeded to lands of a very moderate extent, which, in the spirit of the times, he sought to augment by military enterprises. He gained some territory by his marriage in 1245 and more by his frequent military aggressions. In 1273, while encamped before the walls of Basel, he received the unexpected intelligence that he was elected king of the Romans, and emperor, in preference to Alphonso, king of Castile, and Ottokar, king of Bohemia. His confirmation was not attained without some difficulty, however. Pope Gregory X. induced the King of Castile to withdraw his pretensions, but the King of Bohemia, at that time one of the powerful princes in Europe, persisted in his opposition, and a war ensued, in which he was defeated and compelled to sue for peace, and agree to pay homage. He broke the treaty in 1277, but the following year was defeated a second time, and slain. The Diet of Augsburg in 1282 formally conferred Austria, Styria, Carinthia, and Carinola on Rudolf's two sons, Albrecht and Rudolf, as a joint inheritance. He restored peace and order to Germany, and wisely put down the private fortresses, which served as a retreat to banditti and to ferocious nobles. For these and other eminent services in the same spirit he obtained the title of "a living law," and was regarded as a second founder of the German Empire. He asked the Diet at Frankfort to secure the imperial throne to his son Albrecht, but the electors were jealous of the powerful family and their refusal caused such mortification to the aged emperor that he did not long survive. Consult: Kopp, 'König Rudolf und seine Zeit' (1845-9, continued by Busson 1871); Hein, 'Rudolf von Habsburg' (1874); Schulte, 'Geschichte der Habsburger' (1887); Zisterer, 'Gregory X. und Rudolf von Habsburg' (1891).

Rudolf II., emperor of Austria: b. Vienna 18 July 1552; d. Prague 20 Jan. 1612. He was educated in Spain, and before the death of his father, Maximilian II., was crowned king of Hungary in 1572; king of Bohemia in 1575, the same year being also crowned at Ratisbon

king of the Romans. He succeeded to the Austrian throne 12 Oct. 1576. His disposition was mild and his tastes inclined toward literature rather than toward government. Early in his reign he began to impose restrictions upon the holding of public offices by Protestants and in some districts civil war resulted. The western parts of the empire were enabled to overcome the designs of the king, and by 1603 the Protestants formed an offensive and defensive alliance at Heidelberg to maintain their civil and religious liberties. In Austria, Bohemia and Hungary, however, the Protestant religion was for a time practically suppressed. The Turks made constant inroads in the east and in 1596 Mahomet invaded Hungary, captured Erlau and defeated the Austrians under Archduke Maximilian, though he ceased his incursions at this point. In 1608 Rudolf's brother Matthias, who had made a treaty with the Turks and pacified the disaffected Hungarians, compelled Rudolf to acknowledge him king of Hungary and governor of Austria and Moravia. With this confirmation of Matthias' power the states of Austria regained the religious privileges they had enjoyed under Maximilian. In 1611 Rudolf was formally deposed and Matthias succeeded him. He was the patron of Kepler and Tycho Brahe and the astronomical calculations produced by these two are known as the "Rudolphine Tables." Consult: Gendely, 'Rudolph II. und seine Zeit' (1863-5).

Rue, a perennial (*Ruta graveolens*), wild in the Mediterranean regions, but also cultivated. Its stems are about two feet high, bearing alternate decompound bluish green leaves, pellucid-dotted, with an acrid juice and bitter taste; and corymbs of yellowish green small four-merous flowers, with crimped petals. Rue has been employed medicinally on account of its antispasmodic and stimulant properties, and was also used in folk medicine as a disinfectant, probably because of its strong and disagreeable odor and taste, which, however, did not prevent its use as salad. Rue also entered largely into magic rites, and witch-lore. Early missionaries in England were said to have sprinkled water from brushes made of rue, whence the name referred to by Ophelia. "There's rue for you . . . We may call it, herb of grace o' Sundays," and Perdita speaks of it, with rosemary, as one of the flowers for remembrance.

Ruff, a sandpiper (*Machetes pugnax*) of the northern parts of the Old World, the female of which is called "reeve." It is about 10 inches long, and the bill $1\frac{1}{4}$; above it is varied with black, rufous, and gray, arranged in oblique bands on the scapulars and tertiaries, and whitish below; primaries dark brown, with green reflections above and with inner webs finely mottled toward the base; the tail transversely barred; sides of rump white, bill brown, and legs yellow. The males in spring have the feathers of the neck developed into a kind of ruff, whence the common name, and the face is covered with reddish papillæ; they fight during the breeding season, unlike most wading birds; they are also polygamous, and larger than the females, in these respects seeming to form one of the links between wading and gallinaceous birds. The colors of the ruff vary exceedingly, and no two are precisely similar. They

are natives of northern Europe and Asia, migrating southward during winter, and they are found chiefly in flocks, in marshy districts; they feed at night, on worms, insects, and larvæ; the nest is made of coarse grass, and is placed in a hollow of the ground; the eggs are 4 or 5, pointed, green, with brown specks. Their flesh is highly esteemed for the table; they are taken alive in nets, and are fattened for market on bread and milk and boiled wheat, in a dark place to prevent their fighting; great numbers are sent from Holland to London.

Ruffed Grouse. See GROUSE.

Ruffed Lemur. See LEMUR.

Ruffin, Edmund, American agriculturist: b. Prince George County, Va., 5 Jan. 1794; d. near Danville, Va., 15 June 1865. He was educated at William and Mary College, served in the Virginia legislature, was for many years president of the Virginia Agricultural Society, and in 1833-42 editor of the 'Farmer's Register.' He was an ardent state-rights man, and as member of the Palmetto Guard of South Carolina fired the first shot on Fort Sumter in 1861. He committed suicide because of his unwillingness to live under the United States government. He published: 'Essay on Agricultural Education' (1833); 'Anticipations of the Future to Serve as Lessons for the Present Time' (1860); edited William Byrd's 'Westover Manuscripts' (1841); etc.

Rugby, England, a market town of Warwickshire, 81 miles by rail northwest of London. It is picturesquely situated on an eminence south of the Avon, and is celebrated for its public school. (see RUGBY SCHOOL). The parish church recently restored, the modern municipal offices, and the free public library are other noteworthy features. Pop. (1901) 56,221.

Rugby, Tenn., the place in Morgan County, about 140 miles north of Chattanooga, where Thomas Hughes (q.v.) and others from England established a colony in 1880. They purchased a large tract of land, laid out a town, divided the remaining portion into farms and parks, and established several industries. It is in a rich mining and agricultural region on the Cumberland plateau. The settlement proved a failure; but the place is now a health resort.

Rugby School, a famous English public school founded in 1567 by Lawrence Sheriff, who bequeathed for its support property in Manchester Square, London. Until the second quarter of the 19th century its importance was local in character, however, but under the headmastership of Arnold (q.v.) 1828-42, it became one of the greatest schools of England,—to be ranked with Westminster, Eton, and Harrow. Among famous headmasters who followed Arnold are Archbishop Tait, the late Dean Bradley of Westminster, the late Archbishop Temple, and John Percival, now bishop of Hereford, who was succeeded in 1895 by Rev. Herbert Armitage James, the present headmaster. The roll of distinguished Rugby scholars is a long one; among them may be mentioned Matthew Arnold, Dean Stanley, Landor, Clough, Thomas Hughes, author of 'Tom Brown's School Days,' Dean Vaughan and Lord Derby. Under the mastership of Dr. Temple (1857-69) the chapel was rebuilt, a gymnasium erected, and other

new buildings added, while under Dr. Jex-Blake (1874-87) still more building was carried on, and Rugby is to-day particularly modern in the character of its buildings, which are Elizabethan in style, and in its appointments generally. Consult: Goulburn, 'The Book of Rugby School' (1856); Hughes, 'Tom Brown's School Days' (1857); 'Life of Thomas Arnold' (1860); Bloxam and Payne-Smith, 'Rugby: its School and Neighborhood' (1889); Rouse, 'History of Rugby School' (1898).

Ruge, roo'gè, **Arnold**, German socialist: b. Bergen, Prussia, 13 Sept. 1802; d. Brighton, England, 31 Dec. 1880. He was educated at Heidelberg, Jena, and in the University of Halle, where in 1830 he became a professor. His first literary production was a translation of Sophocles' 'Œdipus in Kolonos' (1830). He was later identified with the founding of the 'Hallesche Jahrbücher' and became known as an advocate of radical doctrines. In 1843 he went to Paris, where he was associated with Karl Marx, and there published his 'Zwei Jahre in Paris.' In 1847 he started a journal, 'Die Reform,' in Berlin. Accused of complicity in the revolution of 1848, he fled to England. He was there identified with Mazzini and Ledru-Rollin in their efforts to organize a democratic league for the establishment of political equality throughout the world. The movement to unite the provinces of Germany in 1866-70 was strengthened by his sympathy, and his services in this cause were recognized by the German empire. He published: 'Political Pictures' (1848); 'Our System' (1850); 'In Former Times' (1862-7); and a 'Manifesto of the German People' (1866).

Rügen, rü'gèn, an island belonging to Germany; in the Baltic Sea; area, 377 square miles. The coast has many indentations; on the northeast the island terminates in a chalk cliff, nearly perpendicular and about 400 feet above the water. Peculiar shaped boulders are found on different parts of the island. According to Tacitus, the ancient Germanic goddess Hertha (Earth) was worshipped here at Hertha Lake. The soil is fertile; agriculture, stock-raising, and fishing are the chief occupations. The coast villages are popular sea-bathing resorts. Bergen is the capital. Pop. 46,800.

Rugendas, roo'gèn-däs, **Georg Philipp**, German painter: b. Augsburg 1666; d. there 1742. After six years' study of his art his right hand became disabled, but he continued to work with his left. He painted and engraved much. His pictures are full of spirit and ease; there is an endless variety in the attitudes of his horses. Such was his zeal for art that during the siege of Augsburg in 1703 he freely exposed himself amid the fire and carnage that he might be able faithfully to delineate the scenes around him. Among his engravings, all labored with uncommon care, are distinguished six large ones representing this siege.

Ruger, roo'gér, **Thomas Howard**, American army officer: b. Lima, N. Y., 2 April 1833; d. Stamford, Conn., 3 June 1907. He was graduated from West Point in 1854, studied law, and in 1855-61 was engaged in practice. At the outbreak of the Civil War he was appointed lieutenant-colonel and was prominent in numerous engagements. He suppressed the draft

riots in New York in 1863, was in command of a division at Gettysburg, served under General Sherman, and in 1864 was brevetted major-general of volunteers. He was mustered out of the volunteer service in 1866, and in that year was appointed colonel in the regular army. In 1868 he was military governor of Georgia, superintendent at West Point in 1871-6, and in 1876-8 was in command of the Department of the South. He was promoted major-general in 1895, and in 1897 was retired.

Ruggles, rüg'lz, **Timothy**, American lawyer, politician, and loyalist: b. Rochester, Mass., 20 Oct. 1711; d. Wilmet, Nova Scotia, 4 Aug. 1795. He was graduated from Harvard in 1732, represented Rochester in the general court in 1736, opened a law office at Sandwich, Barnstable County, and was connected with many cases of local importance in Plymouth, Bristol, and Barnstable counties. Subsequently he removed to Hardwick. In 1755 he was second in command to Sir William Johnson at the battle of Lake George, in 1756 was made judge of the court of common pleas of Worcester County, and represented Hardwick in the general court. In 1762-3 he was speaker of the house, and from 1762 until the Revolution chief justice of the court of common pleas in Worcester County. He served with distinction in 1759-60 in the expeditions against Quebec and Montreal, and in recognition received the sinecure post of surveyor-general of the King's forests. He was a delegate in 1765 to the Stamp-act congress at New York, and was elected its president. Upon his refusal to forward to Great Britain the addresses and petitions passed by the congress, he was reprimanded by the general court. From that time he was identified with the royalist cause. In 1774 he was made mandamus councillor, and in consequence was forced for safety to flee from Hardwick to Boston, then garrisoned by the British. He made some efforts to recruit a loyalist corps, and in 1779, on the departure of the British troops, went with them to Nova Scotia, where he became a proprietor of the town of Digby. He was a scholar and wit, and an excellent, though aggressive, pleader.

Rugs. See CARPET.

Ruhmkorff, room'kôrf, **Heinrich Daniel**, German inventor: b. Hanover 1803; d. Paris 21 Dec. 1877. He removed to Paris in 1839, where he continued to reside. In 1851 he invented the induction coil which bears his name.

Ruisdael, rois'däl, or **Ruysdael**, **Jacob van**, Dutch painter: b. Haarlem 1626; d. there 1682. He was the son of a painter, and probably studied art under his father and an uncle, who was also a painter. In 1648 he entered the guild of his native city, and some nine years later settled in Amsterdam, where he received citizen rights in 1659. He appears to have traveled throughout his native country and in parts of Germany and Switzerland. Ruisdael was not much appreciated during his lifetime, but is now ranked among the greatest of the Dutch painters of landscape. His pictures, comprising well-chosen forest, waterfall, shore, mountain, and similar scenes, are often of a melancholy, but always of a deeply poetical character. The figures in them were painted by Berchem, Van de Velde, Van Ostade, Wouwerman, Lingelbach, and others. All the chief European

galleries contain examples of his work, the number in the National Gallery being 12. Consult: Michel, 'Jacob Van Ruysdael et les Paysagistes de l'Ecole de Harlem' (1890).

Rule Britannia, the national song of Great Britain, the joint production of James Thomson and David Mallet, first performed before Frederick, prince of Wales, at Cliefden House, 1740. See NATIONAL SONGS.

Rules of Faith, the phrase-worn *regula fidei* of polemical theology is the term applied to what is considered the code from which the Christian faith is to be derived, and has been in use since the 2d century. The items of the creed differ in the various sects. The Reformers held that the Scriptures alone could be safely accepted as a rule of faith. Roman Catholics hold that the testimony of the Church is the true rule of faith, regarding the Church as the vital and infallible organ of the teachings of Jesus Christ under the guidance of the Holy Ghost, while they look upon the Bible as the divinely inspired word of God to be interpreted by the Church. Protestants acknowledge the authority of Christ, his apostles, and all inspired writers, but deny that any doctrine not contained in the Scriptures has any binding authority. Certain members of the English Church admit what they call the consent of the fathers as authoritative interpretation of the Scriptures.

Rule Nisi, nisi, or Rule to Show Cause, in English and United States law, an order granted by the court on an interlocutory application (formerly always *ex parte*), directing the party opposed to the applicant to do or abstain from some act unless (*nisi*) he can show cause why the order should not be obeyed. If cause is shown, the order is "discharged," otherwise it is made "absolute."

Rule of Three. See PROPORTION; ARITHMETIC; ARITHMETIC, HISTORY OF.

Rules of the Road, the official designation of regulations adopted by national or international authorities for the management of vessels in storms, fogs, or other danger. Under act of the United States Congress, in 1896, the rules already established were considerably changed to comport with the schedule to be observed by vessels of all civilized nations on and after 1897. These rules apply also to inland waters, excepting the Great Lakes, for which a special set has been devised. The following is a synopsis of the new rules: "Vessels are in the first place cautioned against showing any other lights than their distinguishing ones in such a way as to permit any possibility of confusion. An additional white light is, however, given to a steam vessel under way to be carried at least 15 feet lower than the one now provided for, and forward of its vertical line. A vessel which is towing another vessel or barge is also allowed a small white light to be carried aft, and in such a position that it shall not be visible forward of the beam, which may be used for the towing vessel to steer by. The following regulations are also provided for small vessels:

"1. Steam vessels of less than 40 tons shall carry (a) in the fore part of the vessel, or on or in front of the funnel, where it can best be seen, and at a height above the gunwale of not less than nine feet, a bright white light

constructed and fixed as prescribed in article two (a), and of such a character as to be visible at a distance of at least two miles. (b) Green and red side lights constructed and fixed as prescribed in article two (b) and (c), and of such a character as to be visible at a distance of at least one mile, or a combined lantern showing a green light and a red light from right ahead to two points abaft the beam on their respective sides. Such lanterns shall be carried not less than three feet below the white light.

"2. Small steamboats, such as are carried by seagoing vessels, may carry the white light at a less height than nine feet above the gunwale, but it shall be carried above the combined lantern mentioned in subdivision one (b).

"3. Vessels under oars or sails of less than 20 tons shall have ready at hand a lantern with a green glass on one side and a red glass on the other, which, on the approach of or to other vessels, shall be exhibited in sufficient time to prevent collision, so that the green light shall not be seen on the port side nor the red light on the starboard side.

"4. Rowing boats, whether under oars or sail, shall have ready at hand a lantern showing a white light which shall be temporarily exhibited in sufficient time to prevent collision. Additional regulations are provided for pilot vessels on duty at their stations as follows: On the near approach of or to other vessels they shall have their side lights lighted, ready for use, and shall flash or show them at short intervals, to indicate the direction in which they are heading, but the green light shall not be shown on the port side, nor the red light on the starboard side. A pilot vessel of such a class as to be obliged to go alongside of a vessel to put a pilot on board may show the white light instead of carrying it at the mast-head, and may instead of the colored lights above mentioned, have at hand, ready for use, a lantern with a green glass on the one side and a red glass on the other, to be used as prescribed above. A vessel in or near a fair-way, when aground, is required to carry in addition to it, the two red lights which signify a vessel not under control but not desiring assistance. A steam vessel under sail only, but having her funnel up, shall carry forward where it can best be seen, one black ball or shape, not two feet in diameter.

"The manner of fog signaling is also more definitely fixed as follows: Article 15. All signals prescribed by this article for vessels under way shall be given: (1) by "steam vessels" on the whistle or siren. (2) By "sailing vessels" and "vessels towed" on the fog horn. The words "prolonged blast" used in this article shall mean a blast of from four to six seconds' duration. (a) A steam vessel having way on her shall sound, at intervals of not more than two minutes, a prolonged blast. (b) A steam vessel under way, but stopped, and having no way on her, shall sound, at intervals of not more than two minutes, two prolonged blasts, with an interval of about one second between. (c) A sailing vessel under way shall sound at intervals of not more than one minute, when on the starboard tack, one blast; when on the port tack, two blasts in succession, and when with the wind abaft the beam, three blasts

in succession. (d) A vessel when at anchor shall, at intervals of not more than one minute, ring the bell rapidly for above five seconds. (e) A vessel when towing a vessel employed in laying or in picking up a telegraph cable, and a vessel under way, which is unable to get out of the way of an approaching vessel through being not under command, or unable to maneuver as required by the rules, shall instead of the signals prescribed in subdivisions (a) and (c) of this article, at intervals of not more than two minutes, sound three blasts in succession, namely, one prolonged blast followed by two short blasts. A vessel towed may give this signal and she shall not give any other. Sailing vessels and boats of less than 20 tons gross tonnage shall not be obliged to give the above-mentioned signals, but, if they do not, they shall make some other efficient sound signal at intervals of not more than one minute." See COLLISION.

Ruling Machines, in blank-book manufacture and bookbinding, are instruments used for ruling paper, metal, etc. The first machine of this kind was invented by a Dutchman, resident in London, in 1782, and was subsequently greatly improved by Woodmason, Payne, Brown, and others. F. A. Nobert devised a ruling machine in 1845 for the production of microscopical test plates, diffraction gratings, and micrometers, etc., and more recently Benjamin Day, a New York artist, patented one for use by artists.

Rum, a distilled liquor obtained from the fermented juice of the sugarcane or molasses. Rum owes its flavor to a volatile oil and butyric acid, a fact which has been taken advantage of to prepare a butyric compound called essence of rum to enable the spirit-dealer to manufacture a fictitious rum from malt or molasses spirit. The color is usually imparted after distillation by adding burnt sugar or caramel.

Rum, Romanism, and Rebellion, in American political history; at a meeting of clergy, in which all denominations were supposed to be represented, held in the Fifth Avenue Hotel, New York, during the Presidential campaign of 1884, in the interest of the Republicans, Rev. R. B. Burchard described the Democrats as the party of "Rum, Romanism and Rebellion." This remark was unfortunate for the Republicans, and aided in a great measure to win the election for the Democrats.

Rumania, roo-mă'nî-ă, or **Roumania**, a kingdom of southeastern Europe, bounded by Austria-Hungary, Russia, the Black Sea, Bulgaria, and Servia. Area, 50,720 square miles. It comprises the provinces of Moldavia and Wallachia, prior to 23 Dec. 1861, Danubian principalities; to these have been added the province Dobrudja on the Black Sea. The principal towns are Bucharest, the capital; Jassy, Galatz, Braïla, Botosai, Ploësti, Craïova, Berlad, Fosceni.

Topography.—The surface consists mainly of undulating and well watered plains of great fertility: from the Carpathian Mountains on the north and west borders, where the summits range from 2,600 feet to 8,800 feet, they gradually slope downward to the river Danube which for 505 miles flows through Rumanian territory, and forms the major portion of the southern

boundary with Bulgaria. The entire kingdom is in the basin of the Danube, the chief Rumanian tributaries of which are the Alt or Aluta, the Arjish, Jalomnitza, Buzeo, Sereth, Berlad and Pruth, the last forming the eastern boundary with Russia. The Danube forms a number of marshy lakes as it approaches the alluvial region of the Dobrudja, mostly a land of steppes and marshes, unhealthy and uncultivated, through which the Danube discharges itself into the Black Sea by the Saint George, Sulina, and Kilias channels.

Geology, Natural Resources, etc.—In the region of the Carpathians, the geology is of the Tertiary period practically completed at the end of the Miocene period, and almost entirely composed of primitive rocks. The kingdom possesses considerable mineral wealth; rock-salt abunds in the vicinity of the Carpathian Mountains, and the salt mines of Wallachia are apparently inexhaustible. Petroleum and asphalt are abundant; a great quantity of salt-peter is produced, chiefly in the northern part of the country; sulphur is found in more limited quantities. The only metal of importance is copper, which has been worked to some extent; gold is washed from the sands of several streams. About one sixth of the surface is covered with forests of oak, fir, beech, and other valuable timber trees.

The fauna includes stags, wild boars, bears, wolves, foxes, wild goats, hares, and martens; while fish abound in the rivers. The climate is subject to greater extremes than at the same latitude in other parts of Europe; the summer is hot and rainless; the winter, sudden and severe, the Danube and its tributaries being regularly frozen for about six weeks; there is almost no spring, but the autumn is long and pleasant. Rumania is an essentially agricultural and pastoral state, fully 70 per cent of the inhabitants being directly engaged in husbandry. The chief cereal crops are maize, wheat, barley, rye, and oats; tobacco, hemp, and flax are also grown; and wine is produced on the hills at the foot of the Carpathians. Cattle, sheep, and horses are reared in large numbers.

Manufactures, Commerce, etc.—Since the passing of the law in 1887 for promoting national industries, some progress has been made in manufactures, chiefly along the line of domestic commodities. Trade is fairly active, but is almost entirely in the hands of foreigners; the internal trade is chiefly carried on by Jews, who are subject to certain disabilities. The chief exports are grain (especially maize), cattle, timber, and fruit; the chief imports, manufactured goods, coal, etc. Germany, Great Britain, and Austria-Hungary appropriate by far the greatest share of the foreign trade, the bulk of which passes through the Black Sea ports. In 1901 the exports were valued at \$70,766,175, the imports at \$58,487,172; in 1900 and 1901, the value of the exports for the first time exceeded that of the imports. In 1902 there were 2,295 miles of state railway, 4,344 miles of telegraph lines, and a rapidly extending telephone system. The government monopolizes also salt and tobacco. The French decimal coinage has been introduced, the franc being called *leu* (pl. *lei*), the centime *bari*. The metric system of weights and measures has also been officially recognized, but a diversity of local standards is still common.

RUMANIA

Government.—Since 1881 the ruler of Rumania has had the title of king, in accordance with the decision of the Rumanian Parliament. Previously the title was prince, or in Rumanian *Domnu* (*L. dominus*, lord). The present ruler was elected by the people, but the dignity is hereditary. There are two legislative houses, a senate of 120 members elected for eight years, and a chamber of deputies of 183 members elected for four years. The members of both chambers are chosen by indirect election, the first voters choosing electors, and these in their turn the deputies. A deputy must either belong to a learned profession, to a military or civil service, or have an annual income of about \$2,000, and must be 25 years of age. All citizens of full age and paying taxes are electors. The sovereign has a suspensive veto over all laws passed by the two chambers. The executive is in the hands of the sovereign assisted by a council of seven members, the heads of the departments of the interior, of finance, of war, of foreign affairs, of justice, of agriculture, commerce, and public works, and of public instruction and worship. For purposes of local government Wallachia is divided in 17, Moldavia into 13, and Dobruja into two departments, each administered by a prefect, a receiver of taxes, and a civil tribunal. Judges are removable at the pleasure of the superior authorities. The legal codes are founded on the civil law and customs of the two provinces; but though several reforms have been effected in the system of jurisprudence much yet remains to be done, especially in the administration of the law, which is said to be very unsatisfactory and corrupt. The budget estimates for 1903-4 were \$15,023,400 revenue, expenditure, \$43,500,000. The public debt in 1902 amounted to \$282,667,877.

Army and Navy.—The military forces of Rumania are divided into five classes: (1) the permanent army, with its reserve; (2) the territorial army, with its reserve; (3) the militia; (4) the civic guard; and (5) levies *en masse*. Every male inhabitant, from the age of 21 to 46, must serve three years in the permanent army in active service and five years in its reserve, or five years in the territorial infantry and three years in its reserve. The active service in the cavalry of the territorial army lasts four years, and is followed by four years in its reserve. Whether a young man enters the permanent or the territorial army is determined by lot. Those who for some sufficient reason have not been subjected to the conscription form part of the militia, and those who have finished their term in the permanent or the territorial army also enter the militia till the age of 36. After this age, in the country they enter the levies *en masse*, in the towns the civic guard. The total strength in times of peace of the permanent army is 60,000 men and 3,280 officers, with 300 pieces of ordnance. The territorial army has a total strength of 72,000 men. The militia has a total strength of 33,000 men. The effective force of the civic guard and the levy *en masse* is not definitely fixed; but altogether Rumania can put into the field about 200,000 men. The navy is insignificant, there being only one armored cruiser of any consequence.

Ethnology and Population.—The Rumanians claim to be the descendants of a colony of Romans located here by the Emperor Trajan, and

call themselves *Romeni*; hence the name of Rumania, which is now universally adopted by the natives as the name of the united principalities. The race is, however, a mixed one, being modified by Greek, Gothic, Slavic, and Turkish elements. This mixture makes itself apparent in their language, three fourths of the words of which, however, are almost pure Latin; among words in common use are, *apa* (*L. aqua*), water; *pane* (*L. panis*), bread; *alby* (*L. albus*), white; *negru* (*L. niger*), black; and so on. The conjugations also of the verbs, which are four in number, correspond exactly to the four conjugations in Latin. For a long time Greek was the language spoken by the court and the upper classes; but latterly this language has been largely superseded by the French. The population of Rumania, according to the census of 1899, was 5,912,520, among whom the Rumanians proper numbered 5,469,036. The Rumanians are in general strong and stoutly built, with black hair, brilliant eyes, and a complexion similar to that of the Italians. Besides the Rumanians proper there are about 300,000 Jews, 200,000 Gypsies, 85,000 Slavs, besides Germans, Magyars, Greeks, etc. There are also large numbers of Rumanians inhabiting Hungary, Transylvania, Bessarabia, and elsewhere.

Sociology.—Since the introduction of railways great changes have taken place in the condition of the people. The peasants were never, properly speaking, serfs, but being compelled to work gratis for the proprietor a certain number of days every year they became fixed to that part of the country in which they were born. They are now not only perfectly free, but each head of a family received during the late Prince Couza's reign a small portion of land, of which he became absolute proprietor, the landlord having been compensated by receiving bonds bearing 10 per cent interest. Their dwellings are generally of a wretched description. Many of the towns are merely agglomerations of large houses, the residences of the boyards, surrounded by the huts of their dependants. The streets are ill paved, or, as is most generally the case, not paved at all, and are usually filthy; the roads, of which there are too few, are in most cases in a wretched state. Agricultural labor, the chief employment of the inhabitants, is cheap, as most of the laborers are so poor that they engage for work to be done three years afterward, in order to obtain advances of money. More than three fourths of the population are peasants. Handicraftsmen are comparatively few in number, as the peasant usually builds his own house, and makes his own furniture and other utensils. In Moldavia there are about 3,000 boyards, besides an extensive lower nobility; in Wallachia they are still more numerous, every twenty-eighth man being a nobleman. There is no native middle class, and the higher ranks of society have only the law open to them as a profession. The commerce of the country is in the hands of the Jews and foreigners. The staple food of the inhabitants is maize; the common beverage is wine, which is produced in great quantities though mostly of inferior quality. This, however, is owing altogether to the manner in which it is made, and, as already stated, some good wine is also produced. The common people are good-humored, sober, and cleanly; murder and robbery are almost unknown.

Religion and Education.—The established religion is that of the Greek Church, to which about 97 per cent of the population belongs. At the head of the clergy are the metropolitan archbishops of Moldavia and Wallachia, the latter of whom is primate of Rumania. Each bishop is assisted by a council of clergy, and has a seminary for priests. In 1863 the national finances were so low that the government was compelled to appropriate the estates of the monasteries, whose revenues amounted to about a third of that of the state, allowing in return a sum of about £700,000 for the support of the religious communities. It was determined that the balance should be devoted to the support of schools, hospitals, the relief of the poor, etc. Rumania possesses 4,000 elementary schools, 54 high schools, eight normal schools, and two universities, besides other special schools. Education is compulsory, but is still very backward.

History.—Rumania formed an important part of the Dacian territory which was conquered by Trajan and formed into a Roman province in 106 A.D. It became the battle-field of the Goths, Huns, Bulgarians, Magyars, and Poles, who in succession held for a more or less lengthened period possession of the country. All these races left some traces of themselves among the Romanized Dacian inhabitants, thus contributing to form that mixed people who in the 11th century were converted to the Christianity of the Greek Church. About that epoch the Kumans, a Turkish tribe, established in Moldavia an independent kingdom. Two centuries later it fell into the hands of the Nogai Tartars, who so desolated the country that only in the mountains and forests was left any trace of the native population. Toward the end of the 13th century Radu Negru of Fogarash, a petty Transylvanian chief, took possession of part of Wallachia, divided it among his boyards, founded a senate of 12 members and an elective monarchy, and in the course of time conquered the whole province. About the middle of the following century Bogdan, a Hungarian chief, made a successful attempt to re-people Moldavia. Struggles for the ruling power, civil and foreign wars, and invasion by the Tartars induced the Rumanians in the beginning of the 16th century to place themselves under the protection of the Sublime Porte, and the boyards were gradually deprived of their power to elect their own ruler, whose office was bought and sold at Constantinople. Woiwodes of various nationalities were now successively appointed, but their rule proved inefficient in establishing peace and subjection to the sultan, as the boyards never lost an opportunity of making known their dissatisfaction. One of the most distinguished foreigners was Basil Lupulo, a Greek of Epirus, who promoted civilization and learning, but was deposed in the middle of the 17th century. From 1732 to 1822 the country was governed, or rather misgoverned, by Fanariot princes, who merely farmed out the revenues, enriching themselves and impoverishing the land. A considerable number of the boyards, through intermarriage with the Fanariots, were more than half Greek by descent; the court language was Greek, and the religious and political sympathies of the country lay in the same direction. In 1802 Russia succeeded in establishing a sort of protectorate over the principalities, and in 1821 a desper-

ate struggle to throw off entirely the Turkish authority almost desolated the land. In 1822 the sultan was compelled by Russia to select the princes of the provinces from natives, and seven years later to allow them to retain their office for life. In 1853 Russia took military possession of the provinces, but was compelled in a short time to retire, Turkey having received the assistance of France and England. In the treaty of Paris at the close of the Crimean war in 1856 it was agreed, among other things, that the principalities of Moldavia and Wallachia should continue to enjoy, under the suzerainty of the Porte and under the guarantee of the contracting powers, the privileges and immunities of which they were in possession; and that no exclusive protection should be exercised over them by any of the guaranteeing powers. The Porte engaged to preserve to the principalities an independent and national administration. In 1858 the principalities were united under one ruler, Colonel Couza, who took the title of Prince Alexander John I. In 1861 Moldavia and Wallachia were formally brought under one administration. A revolution which broke out at Bucharest in February 1866, forced Prince Alexander to abdicate, after which the representatives of the people elected as ruler Charles, son of the late Prince Charles of Hohenzollern-Sigmaringen. In the Russo-Turkish war of 1877-8 the principality sided with Russia, but in spite of the important services which it rendered in that war, it was compelled at the close of the war to retrocede the portion of Bessarabia which it acquired at the conclusion of the Crimean war, and to receive in exchange the Dobrudja. Early in the war the principality proclaimed its independence of Turkey, and its independence was recognized in the Treaty of Berlin, July 1878. As already stated it became a kingdom in 1881, Prince Charles becoming king as Charles I. His wife is well known as a writer under the pseudonym Carmen Sylva. His nephew and heir, Prince Ferdinand, was married in 1893 to Princess Marie, daughter of the late duke of Saxe-Coburg-Gotha.

Consult Laveleye, 'The Balkan Peninsula' (1887); Samuelson, 'Rumania, Past and Present' (1882); Walker, 'Untrodden Paths in Rumania' (1888).

Rumanian Language and Literature. The racial language, Rumanian or Wallachian, is of the Romance type (see ROMANCE LANGUAGES) derived from the Latin, but with many Slavonic, and some Greek, Turkish, and Albanian words. The number of Latin roots is variously estimated at more or less than half of the total, the next greatest element being Slavonic, according to some authorities almost equaling the Latin. The majority of the population speak what is practically the same language—the Daco-Rumanian—throughout the kingdom, in Transylvania, in the Banat, and other parts of Hungary, Bukowina, and Bessarabia. The Macedo-Rumanian, spoken south of the Danube and among the Balkans and Pindus, is largely modified by Greek; and the Istro-Rumanian, spoken in Istria and Croatia, has been much Slavonized.

The first Rumanian book, a psalter, was printed in 1577, but Rumanian literature practically dates from the chronicles of the 17th century, which are the earliest specimens of its national literature. Greek was long the language

RUMELIA — RUMINANTS

of the educated and aristocratic classes, but has been supplanted by French. In matters of general culture, little progress was made until the 19th century, when a popular Rumanian literature arose, the most interesting portion being the songs. Of these Basile Alecsandri (1821-90), one of the most notable of native poets and a patriotic and influential journalist, made a valuable collection (1866). Other distinguished names are Konstantin Negruzzi (1806-68), author of verses, plays, and historical studies, in prose and verse; Jakob Negruzzi (1843-), son of the former, author of poems, sketches, and tales widely read; Grigoie Alecsandrescu (1812-86), poet and political leader; Dimitrie Bolintineanu (1826-72), poet and novelist; and Michael Eminescu (1849-89), the great lyric poet of Rumania. German translations have been made by Kotzebue, Schott, Kremnitz, Rudow, and others, including 'Carmen Sylva' (q.v.), Queen of Rumania, herself an accomplished poet, novelist, and dramatist. Dora D'Istria (q.v.) pen-name of Elena Ghica (1828-88), wife of a Russian prince, is the author of Rumanian travel-sketches, and of historical and literary studies of great value, mostly written in French. Among authorities on the language are Hasden, Gaster, Titkin, and Franz von Miklosich, the latter the founder of Slavic philology, and author of 'Comparative Grammar of the Slavic languages,' and 'Etymological Dictionary of the Slavic languages.' There are histories of Rumanian literature by Cipariu, Densusianu, Gaster, Popfiu, and Philippide. The great dictionaries are those of Codrescu (1875), Lawrianu and Massimu, 'Dictionariulu Limbei Romane' (1876-9); Hasden, 'Etymologicum Magnum Romanæ' (1885-92); and there are standard chrestomathies by Pompiliu, and Gaster (1891). Consult Warner, 'Library of the World's Best Literature' (1899).

Rumelia, roo-mě'lĭ-a, **Eastern**, Turkey in Europe, a province established, with administrative autonomy, by the treaty of Berlin, 1878, but now united with Bulgaria, and known also as southern Bulgaria. It is bounded on the north by the Balkan Mountains, on the east by the Black Sea, on the south by a line beginning at Cape Seityn about lat. 42° 20' N., and proceeding west-southwest to the Rhodope Mountains, and on the west by the watershed between the Maritza and the Karasu. Originally it was arranged that the province was to be under the direct political and military authority of the sultan, but it was to be administered by a Christian governor-general appointed for five years by the Porte, subject to the approval of the European powers. This arrangement took effect and continued for a few years, but in 1885 the government was overturned by a popular movement and a union with Bulgaria carried out, in which the Porte has acquiesced. The capital is Philippopolis. The area is 13,700 square miles. Pop. (1900) 1,091,854. See BULGARIA.

Rum'ford, Count. See THOMPSON, BENJAMIN.

Ruminants, herbivorous split-hoofed animals, characterized especially by chewing the cud; they include the camels and llamas, giraffes, deer, pronghorns, antelopes, sheep, goats, and ox-tribe, and hence nearly all of the mammals most economically important to man. All of

these, except the camels and giraffes, are represented on the continent of North America, and two—the pronghorns and musk ox—are peculiar to it. In most no incisor or canine teeth exist in the upper jaw, the place of these teeth being supplied by a hardened or callous pad of gum, against which the lower incisors bite. Six incisors exist in the lower jaw. Canines are always present in the lower jaw, and are usually inclined forward and toward the incisors, which they nearly resemble in form. The general number of lower canine teeth is two. The molar and premolar teeth number six on each side of each jaw, and are selenodont, that is, possess flattened crowns topped by two double folds of enamel of an irregular crescentic shape. The stomach is divided into four compartments. (See DIGESTION.) In the process of feeding the herbage is rapidly cropped off by the lower incisors pressing against the hardened gum of the upper jaw. The food mixed with saliva is swallowed into the paunch, where it is simply moistened and then passes into the reticulum or second compartment. The aperture of the gullet now closes, and the mass of food contained within the gullet is propelled upward into the mouth by a muscular action similar to vomiting. Mastication of the food is now effected by a kind of rotatory motion, the lower jaw thus giving a first stroke, for example, from left to right, and the rotary motion continuing persistently afterward from right to left, or in the opposite direction to the first movement of the jaws. This is "chewing the cud." In the camels the motion of the jaws is said to be simply one from side to side. After being thus thoroughly masticated and remixed with saliva, the food is again swallowed, and passes at once on into the third stomach, and is assimilated.

Two distinct divisions of the ruminants may be recognized, according to nature of the horns, known respectively as the "solid-horned" and the "hollow-horned."

The first section includes the giraffe (although no external antlers arise), the deer and pronghorns; and the other the antelopes and the sheep, goat, and ox tribes. The antlers of deer consist of nearly homogeneous bony tissue, lighter and more porous in structure than ordinary bone; are generally much branched or forked, and are shed and renewed every year. (See ANTLERS; DEER.)

The horns of the hollow-horned ruminants are entirely different from the antlers of deer, in structure as well as in manner of growth. They are usually common to both sexes, as in our domestic cattle, are simple and not branched, and grow continuously throughout the life of the animal, though very slowly after it has reached maturity, and are never shed. They consist of a bony core—an elongated process from the frontal bone—covered with a sheath of horn. (See HORN.)

Technically speaking, the ruminant game animals of North America consist of three distinct families, two of which are represented by several genera, and some of the genera by numerous species. These families are: the pronghorns (*Antilocapridæ*); the deer (*Cervidæ*); and the sheep, goat, and ox tribes (*Bovidæ*). They are all "game animals," and some of them are rapidly approaching extermination. The pronghorns, though usually called the American

antelope, is not a true antelope, but is of a distinct family type, found only in North America, and peculiar in the fact that its horns are branched and are shed annually. (See PRONGHORN.) The deer tribe consists in America of five genera, namely, the wapiti (*Cervus*); the small deer of the United States and Mexico (*Dama*, or *Odocoileus*); a Central American brocket (*Mazama*); the moose (*Alces*), and the caribou (*Rangifer*). These are separately described under their names. Altogether between 25 and 30 species of deer exist in North America, including Mexico. Of the ox and sheep tribes or horned ruminants, the most prominent native member is the almost extinct bison (q.v.). The mountain sheep (see BIGHORN) number five species, and the Rocky Mountain goats (q.v.) number two species; but of most of these species so few examples are known, and their range is so limited that it may well be doubted whether they will ultimately be regarded as distinct. The goats and sheep are mountain dwellers, their favorite haunts are the more inaccessible parts of the higher ranges, and they are exceedingly watchful and sagacious. They have been exterminated in the more accessible parts of their ranges, and survive in comparatively small numbers and greatly restricted areas. The musk-oxen, or musk-sheep, are a very distinct type, entitled to a distinctive name free from the implication of any such alliance; but the term musk-ox (q.v.) is not likely soon to be displaced. There are two species, the barren-ground and the Greenland.

The ancestors of the higher ruminants are mainly of Old World origin, and are comparatively scarce and late in appearance in the fossil beds of our own continent. The oldest forms definitely known were those of the family *Anthracotheriidae*, pig-like animals, with teeth approaching the selenodont shape, and a complete dentition; all the bones of the five-toed feet were free. The type-genus *Anthracotherium* (q.v.) begins in the Oligocene and continues down to the Pliocene, and is known from all parts of the world. Another early group was more sheep-like in its characteristics, and forms the family *Cænotheriidae*, represented by *Cænotherium*, which flourished in the Eocene and Miocene eras. They were small-sized, more delicate than modern sheep, the dentition was complete, and four toes reached the ground. Another large group was the family *Oreodontidae*, which was limited to North America, and whose remains have been found plentifully and usually in excellent condition in the Tertiary rocks of the eastern Rocky Mountain region. The oreodonts were ancestors of deer and antelopes, and some were horned, while all had five functional toes in front and four behind. Prominent genera are *Oreodon*, of the size of a small pig; *Mesoreodon*, larger and stouter; *Casoryx*, *Agriocharus*, and most primitive of all *Protoreodon*. Another primitive family wholly European was *Anoplotheriidae*, represented by the long-known *Anoplotherium* (q.v.).

Rump Parliament, in English history, a name by which the remains of the Long Parliament was known after the expulsion of the majority of its members by the army of Cromwell, 6 Dec. 1648. It having been decided by a majority of the House of Commons that the con-

cessions made by Charles I. in the Treaty of Newport were a ground of settlement, Oliver Cromwell, who wished for the condemnation of the king, despatched two regiments under the command of Colonel Pride to coerce the House. In discharge of the resolution of the army that "none might be permitted to pass into the House but such as continued faithful to the public interests" Colonel Pride, whose regiment was stationed so as to block up all the entrances to the House of Commons, furnished himself with a list of the names of the members against whom the sentence of exclusion was passed, and as each approached prohibited him from entering. Forty-one members were placed under temporary restraint, and 160 ordered to their homes. Only 60 were admitted, all violent Independents, and these constituted the rump after the clearance wrought by Pride's purge, as it is called. This assembly, in conjunction with the army, brought about the arraignment, trial, and condemnation of Charles I. It was forcibly dissolved by Cromwell, 20 April 1653, for presuming to make a stand against certain demands of the army. Twice after this it was reinstated, but both times only for a brief period, and finally, on 16 March 1660, it solemnly decreed its own dissolution.

Rumsey, rüm'sī, James, American inventor: b. Bohemia Manor, Cecil County, Maryland, in 1743; d. London, England, 23 Dec. 1792. He was a mechanical engineer, and while engaged as the superintendent of a mill in Shepherdstown, Va., conceived plans for the application of steam to marine propulsion. In 1786 he exhibited a boat upon the Potomac which was propelled by means of a steam pump which forced a stream of water from the stern. The Rumsey Society, in which Benjamin Franklin was greatly interested, was established in Philadelphia in 1788, and later an organization of the same name in England, to further his invention, but he died while his experiments were incomplete. He wrote 'A Short Treatise on the Application of Steam' (1788).

Rumsey, William, American jurist: b. Bath, Steuben County, N. Y., 18 Oct. 1841; d. New York 16 Jan. 1903. He was educated at Williams College, volunteered in the Union army in April 1861, and was granted his diploma from the college in June. He served through the war, attaining rank of captain of volunteers in 1863, major in 1864, and brevet lieutenant-colonel in 1865, in which year he was mustered out of service. He was secretary of the United States legation in Japan in 1865-6, and in 1880-1901 served as judge in the seventh judicial district of the supreme court. He then resigned and engaged in law practice until his death.

Runciman, rün'sī-man, Alexander, Scottish painter: b. Edinburgh 1730; d. there 21 Oct. 1785. He was placed at 14 with some house-painters, who used to adorn the mantel-pieces of the houses which they painted with landscapes, of which many a specimen is still preserved in the houses of the Old Town of Edinburgh. He devoted himself entirely to this art; and acquired considerable local fame for his landscapes. In 1766 he visited Italy, where he met Fuseli, whose enthusiastic character matched aptly with his own. He spent five years in Rome, assiduously studying and copying the Italian masters; and in

1771 returned with powers increased and taste improved. Just at that time he obtained the mastership of the Trustees' Academy; and thus secured in the means of subsistence he applied his leisure to historical painting. Among his best-known productions may be mentioned: 'Macbeth and Banquo,' in a landscape; a 'Friar,' in a landscape; 'Job in Distress'; 'Samson Strangling the Lion'; 'Figure of Hope'; 'Saint Margaret Landing in Scotland'; 'Christ and the Woman of Samaria'; 'Agrippina Landing with the Ashes of Germanicus'; and the paintings in Ossian's Hall at Penicuik. The work last mentioned was the *chef-d'œuvre* of Runciman. He was remarkable for candor and simplicity of manners, and possessed a talent for conversation. Among his associates were Robertson, Hume, Lord Kames, and Lord Monboddo.

Runeberg, Johann Ludvig, yô'hân lood'-vîg roo'nê-bêrg, Swedish poet; b. Jacobstad, Finland, 5 Feb. 1804; d. Borgå 6 May 1877. He was educated at Wasa and at the University of Åbo. His first volume (1830) contained a number of lyrics and a long poem, 'Nights of Jealousy.' In 1832 appeared an epic written in hexameters 'Elgskytterne' (The Elk Hunters); in 1833 a second volume of lyrics, and in 1836 the idyl 'Itanna.' In 1837 he taught Latin literature at the university, became lector at the gymnasium of Borgå, where he remained until his death, being advanced to professor in 1844 and rector in 1847. His other works were the idyl 'Julqvällen' (Christmas Eve) and the epic 'Na donchda' (1841); Lyrics (1843); a romantic cycle, 'Kung Fjalar' (King Fjalar, 1844); narrative poems, 'Fänriek Ståls Sägner' (Ensign Stål's Stories, 1848-60); a rhymed comedy 'Kan ej' (Can't, 1862); 'Kungarne på Salamis' (The King at Salamis, 1863). His collected works were published in 1876 and posthumous works in 1878-9.

Runes, the characters used in writing by the Teutonic tribes of northwestern Europe in early times. Three classes of runes are recognized, Anglo-Saxon, German, and Scandinavian, but the differences of form which distinguish them are no wider than the differences between the alphabets employed in very ancient times by various Greek peoples—between the Old Athenian alphabet, for example, and the Old Corinthian, or between the earliest Phœnician and the earliest Hebrew. The name Rune is significant of the use to which this manner of writing was first applied. In Anglo-Saxon *rûn* means secret, and *runa* magician; and the knowledge of runes was confined to a small class—priests or sorcerers. For this reason, upon the introduction of the Christian religion the use of the runes was condemned as connected with heathenish superstitions. A poet of the 6th century, Venantius Fortunatus, tells of runes being written on tablets or slabs of ash (*fraxineis tabellis*), but there are extant numerous runes inscribed on memorial stones, rings, coins, etc., which have been found in Denmark, Norway, Sweden, Germany, and Iceland, and in Britain within the limits of the ancient kingdoms of Northumbria, Mercia, and East Anglia. The system of characters called runes gets the name Futhorc from the first six letters,

just as the Greek system is called Alphabet from the names of the first two letters, alpha and beta, A and B, or as we call our alphabet the A B C. The following examples show the agreements and differences between British and Norse runes:

| | | | | | | | |
|---|---|----|---|----|----------|-----------|---|
| ƿ | ᚠ | ᚢ | ᚦ | ᚨ | ᚫ | ᚭ | ᚱ |
| f | u | th | o | r | k | g (palat) | w |
| ᚱ | ᚳ | ᚵ | ᚷ | ᚹ | ᚻ | ᚽ | ᚿ |
| h | n | i | j | ch | p | eo | t |
| ᚰ | ᚲ | ᚴ | ᚶ | ᚸ | ᚺ | ᚼ | ᚾ |
| m | l | ng | æ | d | g (gutl) | a | o |

Anglo-Saxon Runes.

| | | | | | | | |
|------|------|--------|-------|------|------|---|---------|
| ᚦ | ᚠ | ᚢ | ᚦ | ᚨ | ᚫ | ᚭ | ᚱ |
| f, v | u, o | th, dh | q (o) | r | k, g | h | o |
| ᚲ | ᚳ | ᚵ | ᚷ | ᚹ | ᚻ | ᚽ | ᚿ |
| h, o | a | e | t, d | p, b | i | m | r final |

Norse Runes.

What is the origin of this mode of writing? Is it derived from the Greek alphabet or from the Phœnician direct? Not improbably the Phœnician manner of writing was introduced into the Baltic countries by the enterprising Phœnician traders as early as the 6th century B.C.; but though the runes are in many instances identical with characters of the Phœnician alphabet they do not represent in Futhorc the same sound values as in the alphabet of the Phœnicians: on the supposition of their derivation from that alphabet, therefore, it would be only the idea of representing voice-sounds by arbitrary written characters that would have come from the Phœnicians, not the denotations of particular sounds. Yet, though original derivation from Phœnician sources be granted, in later times Greek characters were added to complete the system.

Runjeet Singh, rûn-jê't sîng. See RANJIT SINGH.

Runkle, rûn'kl. **John Daniel**, American mathematician; b. Root, N. Y., 11 Oct. 1822; d. Southwest Harbor, Maine, 8 July 1902. He was graduated from the Lawrence Scientific School at Harvard in 1851, and having been appointed to the staff of the 'American Ephemeris and Nautical Almanac' in 1849, continued with it until 1884. He was one of the promoters of the Massachusetts Institute of Technology and held the chair of mathematics there from the time of its foundation until his retirement shortly before his death with the exception of 1870-8 when he was president. He established the 'Mathematical Monthly' in 1859 and edited it until 1861, and published: 'New Tables for Determining the Values of the Coefficients in the Perturbative Function of Planetary Motion' (1856); 'Elements of Plane and Solid Geometry' (1888); etc.

Runic Characters. See RUNES.

Runnymede, rûn'i-mêd. England, five miles east of Windsor, in Surrey, lying along the right bank of the Thames, is the celebrated meadow where the conference was held, 15 June

1215, between John and the English barons, in which the former was compelled to sign Magna Charta and the Charta de Foresta. (See JOHN.) Runnymede is now divided into several enclosures.

Run'yon, Theodore, American diplomat: b. Somerville, N. J., 25 Oct. 1822; d. Berlin, Germany, 27 Jan. 1896. He was graduated from Yale in 1842, admitted to the bar in 1846, and established a law practice at Newark, N. J. He became city attorney of Newark in 1853, city counsellor in 1856, and at the outbreak of the Civil War went to the front as brigadier-general in command of the 1st brigade of New Jersey Volunteers. He arrived at Washington on 6 May, when the threatened invasion by the Confederates had thrown the city into great alarm, and promptly took efficient measures for its defense. After the defeat of the Union army at the first battle of Bull Run when the city was in danger of invasion, he closed all approaches, stationed cannon to avert the expected attack, and thereby saved the National capital, a service for which he received the personal thanks of President Lincoln and his cabinet. He was honorably mustered out of service in July 1861 and resumed his law practice. In 1863 he was elected mayor of Newark, served as chancellor of New Jersey in 1873-87, and in 1893 was appointed minister to Germany. He was raised to the rank of ambassador in that year and remained in office until his death.

Rupee, roo-pé', in India, the name given a small silver coin. The value of this coin is nominally 50 cents, but owing to the depreciation of silver it has of late years varied between 30 and 40 cents. A rupee equals 16 annas; $\frac{1}{2}$, $\frac{1}{4}$, and $\frac{1}{8}$ rupee are also coined in silver. A *lac* of *rupees* is 100,000, and a *crore* 10,000,000 rupees.

Ru'pert, or Robert, of Bavaria, PRINCE: b. Prague 18 Dec. 1619; d. London 29 Nov. 1682. He was the son of Frederick V., elector palatine and titular king of Bohemia, by the Princess Elizabeth of England, daughter of James I., was educated at Leyden and early engaged in military service in the Thirty Years' war. During the civil war in England he had the command of a corps of cavalry, at the head of which he distinguished himself at the battle of Edgehill in 1642, at Chalgrove Field in 1643, and also at Marston Moor and at Naseby; but his impetuosity and imprudence contributed to the disastrous result of these latter engagements. In 1648 he was made commander of that part of the fleet which still adhered to Charles. Prince Rupert for some time carried on a predatory warfare against the English; but in an engagement with Blake, off the Spanish coast, he was worsted, and his whole squadron destroyed, with the exception of four or five ships, with which he escaped to the West Indies, where he supported himself by capturing English and Spanish merchantmen. Later he joined Charles II. at the court of Versailles, where his time was chiefly devoted to scientific studies till the Restoration, when he returned to England. In 1664 he was appointed with Monk, to the command of a fleet against the Dutch, and in the next war with Holland, in 1673 was made admiral of the fleet. Many useful inventions resulted from his studies,

among which are the invention of prince's metal, and although the discovery of the method of engraving in mezzotinto is not due to him, as has been erroneously supposed, he introduced the art into England. He also introduced the curious glass drops that have been named after him, Prince Rupert's drops. He was likewise one of the founders and the first governor of the Hudson's Bay Company, incorporated in 1670, and a founder of the Royal Society.

Rupert's Land, the former name of an extensive territory in Canada, conferred by Charles I. on Prince Rupert, transferred to the Hudson's Bay Company in 1670, and since 1870 included with the other parts of the Hudson Bay Territories in the Northwest Territories. The title is still retained to distinguish an Episcopal diocese; the see of the bishop of Rupert's Land is at Winnipeg. See NORTHWEST TERRITORIES.

Ru'pia, a skin disease, characterized by an eruption of small flattened and distinct bullæ surrounded by inflamed areolæ, containing a serous, purulent, sanious, or dark bloody fluid, and followed by thick, dark-colored scabs over unhealthy ulcers. Three varieties of this disease are described, *Rupia simplex*, *Rupia prominens*, and *Rupia escharotica*. *Rupia simplex* commonly appears on the legs, sometimes on the loins or thighs, and seldom on other parts. The bullæ are not preceded by any inflammatory symptoms, vary from $\frac{1}{2}$ inch to 1 inch in diameter, and contain at first a transparent serous fluid, which soon becomes turbid and purulent, and dries into scabs. The scabs are easily removed, displaying an ulcerated surface underneath, and several series of these scabs may follow before healing sets in. In *Rupia prominens* the bullæ are larger, the scabs thicker, and the ulceration deeper. The scab adheres firmly, and generally requires emollient applications to facilitate its removal. *Rupia escharotica* occurs chiefly in cachectic children and infants. It is commonly confined to the lower extremities, and begins by one or two red and livid spots, over which the cuticle is soon raised by the effusion underneath it of a serous fluid. The bullæ thus formed increase; the serum they contain becomes turbid, and of a blackish hue. A bloody and offensive sanies marks the surface of the sore, the edges of which are livid, but not very painful. Rupia is chronic, not dangerous, not contagious, but often very obstinate. It generally attacks persons debilitated by age, intemperance, bad living, or previous diseases, especially smallpox, scarlet-fever, and syphilis. The general treatment consists mainly in the administration of tonic decoctions, more especially those of cinchona, cascarilla, gentian, etc., with alkalies, a generous and nutritious diet, and warm salt water and alkaline baths. The local treatment consists chiefly of puncturing the bullæ early, and allowing the morbid secretion to escape; of poulticing in order to remove the scabs, and of applying lotions containing nitrate of silver or nitric acid, or any other slightly stimulating application.

Rupture, hernia (q.v.), especially abdominal hernia, to which the term rupture is most frequently applied in popular usage.

Rural Highways. See ROADS, IMPROVEMENT OF.

Rurik, roo'rik, founder of the Russian monarchy: d. 879. Most writers consider him to have been a Varangian, of Scandinavian origin, though Kostomorof has endeavored to prove that he was a Lithuanian. It is recorded that he came to Russia about 862, accompanied by his brothers Sinaf and Truvor, in compliance with the request of Gostomisl, a leading personage of Novgorod. One of the brothers established himself at Belozersk, the other at Izborsk, while Rurik began by fortifying himself in the ancient town of Ladoga, at the present day a miserable village on the Volkhof. The Novgorodians soon repenting, rose in rebellion against Rurik, and at their head was one of their fellow citizens named Vadim, whose valor is celebrated in the ancient chronicles, and in Russian song. Rurik succeeded in establishing a dictatorship in Novgorod in 865, and is said to have killed Vadim with his own hand. His possessions were soon afterward greatly enlarged by the death of his brothers, whose principalities, since they died without issue, Rurik united to Novgorod. In order to secure himself and his descendants in their newly acquired territory, he invited various colonies of Varangians, on whose devotion he could count, to settle in the country. Rurik died after a reign of 17 years. The family of Rurik reigned in Russia till the death in 1598 of Feodor, son of Ivan the Terrible, when it was succeeded by the closely allied house of Romanoff.

Rus'by, Henry Hurd, American botanist and educator: b. Franklin, N. J., 26 April 1855. He was educated at the University of New York, was engaged in botanical explorations and investigations under the Smithsonian Institution in 1880-96, has been professor of botany, physiology and materia medica in the New York College of Pharmacy since 1888, and professor of materia medica at Bellevue Hospital Medical College since 1897. He is a member of many scientific societies, was curator of the New York Botanical Gardens and in 1900-1 was a member of the committee which revised the botanical department of 'United States Pharmacopœia.' His publications include: 'Essentials of Pharmacognosy' (1895); 'History of the New York College of Pharmacy' (1895); 'Morphology and History of Plants' (1899); 'Five Pamphlets on the Flora of Bolivia' (1893-1901); etc.

Rush, Benjamin, American physician: b. Byberry, near Philadelphia, Pa., 24 Dec. 1745; d. Philadelphia 19 April 1813. He was graduated from Princeton in 1760, from the University of Edinburgh in 1768, and became professor of chemistry at the College of Philadelphia in 1769. He was active in the pre-Revolutionary movements, and as member of the provincial conference of 1776 moved the resolution declaring the expediency of a declaration of independence, of which he was a signer in the following month. He was surgeon to the Pennsylvania navy in 1775-6 and in 1777 was appointed surgeon-general and later physician-general of the hospitals of the middle section. In 1778 he resigned and resumed his practice and his professorship at Philadelphia. He was a member of the convention which formed the constitution of 1780, established the first dis-

pensary in the United States in 1785, and in 1787 was a member of the convention which ratified the Federal Constitution. He became professor of theory and practice of medicine in 1789 and after the Medical College was merged in the University of Pennsylvania was appointed professor of the institutes and practice of medicine and of clinical practice. In the yellow fever epidemic of 1793 Rush instituted a new method of treatment for the disease which he used with great success, visiting from 100 to 120 patients daily. He was one of the founders of Dickinson College, an advocate of the abolition of slavery, was connected with various religious and scientific societies, and was treasurer of the United States Mint from 1799 until his death. He wrote: 'Medical Inquiries and Observations' (5 vols., 1789-98); 'Essays, Literary, Moral, and Philosophical' (1798); etc.

Rush, Richard, American diplomat: b. Philadelphia 29 Aug. 1780; d. there 3 July 1859. He was graduated from Princeton in 1797, was admitted to the bar in 1800 and engaged in practice at Philadelphia. In 1811 he was appointed attorney-general of Pennsylvania and in 1814-17 was attorney-general of the United States. He was temporary secretary of state under President Monroe in 1817 and was then appointed minister to England, a post he occupied until 1825 when he was recalled to become secretary of the treasury under President Adams. He was a candidate for the vice-presidency on the ticket with Adams in 1828 and in 1836 was appointed by President Jackson commissioner to obtain the legacy for the founding of the Smithsonian Institution which was then pending in the English chancery court, returning in 1838 with the entire amount. He was appointed minister to France in 1847 and remained such until 1851 when he was recalled at his own request and spent the remainder of his life in retirement. He published: 'Codification of the Laws of the United States' (5 vols., 1815); 'Narrative of a Residence at the Court of London from 1817 till 1825' (1833); 'Washington in Domestic Life' (1857); 'Occasional Productions, Political, Diplomatic, and Miscellaneous, including a Glance at the Court and Government of Louis Philippe, and the French Revolution of 1848' (published by his sons, 1860).

Rush, William, American sculptor: b. Philadelphia 4 July 1756; d. there 17 Jan. 1833. He was apprenticed to a carver and soon became known as a maker of figure-heads which won admiration in many ports in the world. He never worked in marble, confining himself to wood and clay, but gained a high reputation for his statues, busts, and ideal figures executed in these materials. He served in the American Revolution and was a member of the city councils of Philadelphia for more than a quarter of a century. Among the most admired of his ship carvings were: 'Genius of the United States'; 'Nature'; 'Indian Trader'; 'William Penn'; 'River God.' He also executed: 'Exhortation'; 'Praise'; busts of Linnæus, William Barton, and Lafayette; statues of 'Winter,' 'Washington' (1814); etc.

Rush. Many plants growing in moist land having cylindrical stems are called rushes, al-

though generally with a qualifying adjective; as the bulrush (*Typha*), flowering rush (*Botomus*), or scouring rush (*Equisetum*), and some sedges (*Carex*). The true rushes, however, are members of the grass-like family *Juncaceæ*, containing about 200 species in the several genera, and distributed throughout the temperate zones. Some are destitute of leaves but have barren flower stems resembling leaves; some have leafy stems, the leaves rounded or somewhat compressed, and usually jointed internally; the foliage of others is very narrow, springing from the root. The round stems of the leafless species, sometimes bearing flowers, are popularly called rushes. The presence of this family in a pasture denotes bad drainage, and they are troublesome to farmers, since cattle will touch them only as a last resort. The common bog or soft rush (*Juncus effusus*) is found in wet places throughout the temperate world. It is a typical species, with glabrous tufts attaining perhaps four feet, springing from a stout rootstock, and bearing an inflorescence composed of many small greenish grass-like flowers. This species is cultivated in Japan for making mats, and with others is employed for the bottoms of chairs, baskets, coarse ropes for binding, etc. The stems of *J. conglomeratus* were formerly gathered by English farmers, and stripped of their green rind, leaving exposed a large pith with one even lengthwise rib of rind left to support it. This porous pith was then bleached and dried, and dipped in scalding grease, thus becoming the wick of a rude candle, or "rush-light," which gave a good, clear light, and, if two feet long, would burn nearly an hour. These dried rush-piths were also used in place of cotton for wicks in open lamps.

Rushes, with a few sweet herbs, were scattered before processions, and were strewn on stages in Shakespeare's time, and on the floors of houses before the advent of carpets. The strewing of rushes in the churches grew into a religious festival conducted with much pomp. These rushes on the floor generally became so filthy from overlong use that to order fresh rushes was a sincere mark of honor to a guest.

Scouring rushes are the hollow, jointed stems of the horsetail, *Equisetum hiemale*, the epidermis of which is impregnated with silica, and was formerly used for scouring metals. See DUTCH RUSH.

Bulrushes (*Typha*), or cat-tails, were somewhat employed in the place of true rushes, for mats and chair bottoms, and are also placed between barrel-staves.

Rush Medical College, located at Chicago, affiliated with the University of Chicago. It is one of the oldest educational institutions in the Northwest, having received its charter in 1837. The first lectures were delivered in 1843, and the first building erected in 1844; a larger building was erected on the same site in 1867; this was burned in the Chicago fire of 1871; and the present clinical building was erected in 1875. In 1887 the college became the Medical Department of Lake Forest University, retaining its autonomy; this relation was dissolved in April 1898, and in the same month the college was affiliated with the University of Chicago (q.v.). The government of the college is vested

in the "perpetual board of trustees" incorporated in 1837, of which the governor of the State, the lieutenant-governor, and the speaker of the house of representatives are members *ex officio*. The board has control of the financial affairs of the college and appoints the faculty; and delegates to the faculty the control of the educational work subject to the rules of the university and the approval of the trustees; by the terms of affiliation the board of trustees is composed of members not belonging to the teaching force of the college. In 1899-1900 the University offered courses corresponding to the work of the Freshman year of the Medical College, and since 1901 offers instruction in all of the courses of the first two years of the medical curriculum, in anatomy, neurology, embryology, physiology, physiological chemistry, chemistry, chemistry of medical drugs, toxicology, pathology, bacteriology and pharmacology. All the work of the first two years is offered at the university only, and the work at the college is clinical, that is, the work of the last two years of the medical course. Students who take the first-year courses matriculate and register both as students of Rush Medical College and as students of the university. Many of the courses of the Freshman and Sophomore years are required; the courses of the Junior and Senior years are all elective, a certain amount of work in each department being required for the degree of M.D. The university provides three fellowships to graduates of the college, and provides for granting the degree of B.S. to students who comply with the university requirements for that degree. The buildings of the college, distinct from those of the university, are the clinical building, Senn Hall and the laboratory building; the Presbyterian Hospital, adjoining the college, and the Cook County Hospital, opposite the college, afford material for the clinics. The library in 1904 contained over 10,000 volumes; the students in 1903-4 numbered 1,029, of whom 339 were specials and post-graduates. The college is open to women as well as men.

Rush, Scouring. See *Equisetales*, under FERNS and FERN ALLIES; DUTCH RUSH.

Rushforth, William Henry, American inventor: b. Leeds, England, 11 July 1844; d. Rutherford, N. J., 21 Aug. 1892. He entered a railroad repair shop at 12 and at 19 had become a railroad engineer. He was chief engineer in charge of 13 stationary engines in 1874 and in 1878 came to the United States, where he became engineer in a silk factory at Camden, N. J. He was the author of numerous useful inventions, among them a fire-escape ladder, a series of automatic safety signals and a feed-water heater for utilizing the heat wasted in the smoke boxes of locomotives, the latter receiving a silver medal and a diploma at the Paris Exposition of 1887.

Rushville, Ill., city, county-seat of Schuyler County; on the Chicago, B. & Q. railroad; about 53 miles northwest of Springfield, and 48 miles east-northeast of Quincy. It was settled 20 Feb. 1826 by Benjamin Chadsey, Levi Green, and Thomas Bair, members of a commission that selected a town site. It was incorporated as a village 10 May

1831, and chartered as a city in April 1898. It is in an agricultural and coal mining region; the chief manufactories are a flour mill, machine shop, wagon works, harness shops, bottling works, and file factory. It has considerable trade in farm products. The principal public buildings are the county court-house and the jail. There are six churches, three public graded schools, and the Rushville Normal and Business College. The two banks have a combined capital of \$150,000, with \$700,000 deposits. The government is vested in a mayor and a council of six members, who hold office for a term of two years. Pop. (1890) 2,031; (1900) 2,292.

EDWIN DIGSON,
Editor 'Rushville Times.'

Rushville, Ind., city, county-seat of Rush County; on Flat Rock Creek; and on the Cleveland, C. & St. L., the Cincinnati, H. & D., the Pittsburg, C. & St. L., and the Fort Wayne, C. & L. R.R.'s; about 40 miles east-southeast of Indianapolis, and 85 miles north-west of Cincinnati. It was settled in 1822, incorporated the same year, and chartered as a city in 1882. It is in a fertile agricultural region, and has considerable manufacturing interests. The chief manufactures are flour, furniture, machinery, agricultural implements, lumber, bent wood, drain pipe, clothing, clay-working machinery, and washing machines. There are nine churches, a high school, public and parish schools, two private schools, and a public library. The four banks have a combined capital of \$275,000. The government is vested in a mayor, a council of six members, elected every two years. The city owns and operates the electric light plant and the waterworks. Pop. (1890) 3,475; (1900) 4,541.

Rusk, Jeremiah McLain, American agriculturist: b. Morgan County, Ohio, 17 June 1830; d. Viroqua, Wis., 21 Nov. 1893. He removed to Wisconsin in 1853, engaged in farming, became sheriff, and in 1861 was elected to the legislature. In 1862 he entered the Union army, was commissioned major, and promoted lieutenant-colonel in 1863. He commanded a regiment in Sherman's Meridian campaign and for services in the Atlanta campaign was brevetted colonel and brigadier-general in 1865. He was mustered out of service in that year and in 1866-70 served as bank-comptroller of Wisconsin. Elected to Congress in 1871 he remained there until 1877 and in 1882-9 was governor of Wisconsin. He was first secretary of the newly created Department of Agriculture under President Harrison in 1889-93.

Rusk, Thomas Jefferson, American politician: b. Camden, S. C., 8 Aug. 1802; d. Nacogdoches, Texas, 29 July 1856. He studied law, practised in Georgia, and in 1835 removed to Texas, where he took a prominent part in political affairs. He was a member of the convention which declared the independence of Texas in 1836, was its first secretary of war, and after the disablement of General Houston took command of the army at San Jacinto. He was chief justice of Texas and in 1845 president of the convention which concluded annexation with the United States. He sat in the United States Senate in 1846-56.

Rus'kin, John, English critic and author: b. London 8 Feb. 1819; d. Coniston, Lancashire, 20 Jan. 1900. He attended lectures at King's College, London, was trained in drawing, and in 1836 went to Oxford, where he became a gentleman-commoner at Christ Church. In 1839, after two failures, he won the Newdigate prize for a poem on 'Salsette and Elephanta.' His first published works were essays in London's 'Magazine of Natural History' on geological and allied subjects (1834 and 1836), and in 1837-8 he wrote for London's 'Architectural Magazine' on 'The Poetry of Architecture' (separately published, 1893). An attack upon some of Turner's pictures in 'Blackwood's Magazine' in 1836 led him to formulate the plan of his 'Modern Painters,' the 1st volume of which appeared in 1843 as by 'A Graduate of Oxford.' The 2d volume was published in 1846, the 3d and 4th in 1856, and the 5th in 1860 (complete edition, imperial 8vo, with all the original and three new plates, six vols., 1888; 8vo edition, with reduced plates, six vols., 1897). At first intended as a defense of Turner, the work from the first assumed a wider scope, and soon became a comprehensive treatise on the principles of art. He sought to show the immense superiority of the best modern landscape-painters, especially Turner, to all the ancients, and supported the spiritual against the sensuous theory of art with an eloquence and a width of knowledge which have indeed wrought, as Sydney Smith predicted, "a complete revolution in the world of taste." The descriptions of natural scenery in the book are justly regarded as priceless gems of word-painting, and the sense of the indissoluble association of art with all other branches of human activity, so characteristic of Ruskin, became increasingly marked as the work progressed. His name was not put on the title-page till 1851.

After the publication of the 1st volume of 'Modern Painters' he continued his studies and his travels, and during a visit to Venice he definitely decided upon literature as his main work. In 1848 he married Euphemia Chalmers Gray, the 19-year-old daughter of a Scottish lawyer, for whom he had written in 1841 his fairy tale, 'The King of the Golden River' (published 1851). His married life was not very fortunate, and in 1854 the marriage was annulled, and the lady married the artist Millais in 1855. 'The Seven Lamps of Architecture' (1849) sought to do for architecture what Ruskin had already done for painting. The title and arrangement of the book are characteristic of his whole artistic criticism. All work in architecture, and in all else, should be illumined by the lamps of sacrifice, truth, power, beauty, life, memory, and obedience. In 1851 he defended Millais and Holman Hunt, two of the pre-Raphaelite leaders, in letters to the *Times*, and in the same year followed up this advocacy by a work on Pre-Raphaelitism. 'The Stones of Venice' (1851-3), the fruit of much close study and arduous toil, is a worthy companion of 'Modern Painters,' and in it, as in the earlier work, we meet the moralist as artist. The chapter 'On the Nature of Gothic Architecture,' in which his economic teaching is distinctly foreshadowed, was reprinted by

William Morris at the Kelmscott Press in 1892. In 1854 Ruskin came to know D. G. Rossetti, to whom he was a considerate and generous patron; and he was closely associated with F. D. Maurice, Furnivall, and other Christian Socialists in the work of the Working Men's College, where he taught drawing regularly for some seven years. His career as a social reformer may be dated from 1857, when he published a series of lectures on 'The Political Economy of Art' (enlarged edition, entitled 'A Joy for Ever and its Price in the Market,' 1880). His chief works of this kind are: 'Unto this Last' (1862; popular edition, 1900), originally written for the 'Cornhill Magazine'; 'Munera Pulveris' (1872), partly reprinted from 'Fraser's Magazine'; 'Time and Tide by Weare and Tyne' (1867); and 'Fors Clavigera' (1871-84), consisting of letters to the working men and laborers of Great Britain. In these the tendency to exaggeration is clearly manifest, and for a time it stood in the way of the serious consideration of his views. He laid especial stress upon the economic value of healthy, happy, honorable, self-sacrificing life; he directed attention to the vital importance of the problem of distribution and the necessity of economic co-operation; the need for a genuine national system of education, old-age pensions, and a radical solution of the housing problem was eloquently set forth by him. In this work Ruskin always professed himself a follower of Carlyle, one of his warmest friends and admirers. Some of his books published after 1855 were collections of lectures. Such are: 'The Two Paths' (1859); 'Sesame and Lilies' (1865); 'The Crown of Wild Olive' (1866); 'Work, Traffic, War, and The Future of England' (last not in first edition); and 'The Ethics of the Dust' (1866). In 1867 he delivered the Rede lecture at Cambridge on 'The Relation of National Ethics to National Art,' and was awarded the honorary degree of LL.D. by that university, and in 1893 Oxford conferred upon him its D.C.L. degree. In 1871 he was elected lord rector of St. Andrews University.

The period from 1870 till his retirement from active work was full of new schemes of social usefulness, some of them more generous in conception than practicable in execution, but all bearing eloquent testimony to the absolute sincerity of his preaching of the gospel of social righteousness and service. In 1871 he founded the Guild of Saint George, and himself paid \$35,000, a tenth of his possessions at that time, into a trust for carrying on its work. The basic principles of the guild were "that food can only be got out of the ground and happiness out of honesty," and in connection with it he started agricultural settlements, some industrial enterprises, and the Saint George's (now Ruskin) Museum at Sheffield.

In 1871 he gave up his house at Denmark Hill and purchased his well-known residence at Brantwood, on the shore of Coniston Lake. In 1870 he was appointed first Slade professor of fine arts at Oxford, and held this post till 1879, when he resigned owing to illness, and again from 1883 till 1884, when he again resigned because the university endowed vivisection. His lectures at Oxford give the best connected

account of his maturer conceptions of art and form the material of the works: 'Lectures on Art' (1870); 'Aratra Pentelici: Six Lectures on the Elements of Sculpture' (1872); 'The Eagle's Nest: Ten Lectures on the Relation of Natural Science to Art' (1872); 'Ariadne Florentina: Six Lectures on Wood and Metal Engraving' (1873-6); 'Val d'Arno: Ten Lectures on the Tuscan Art Directly Antecedent to the Florentine Year of Victories' (1874); 'The Art of England' (1884); 'The Pleasures of England' (1884); and 'Lectures on Landscape Delivered in Lent Term,' 1871 (1897). He founded a drawing school at Oxford, and it was during his professorial period that he tried the famous and exceedingly characteristic road-digging experiment. In 1878 he experienced the first of several attacks of brain fever, and from this time his excessive work at an unnaturally high pressure caused his health to break down seriously; 1878 was also the year of Whistler's libel action against him, in which the jury awarded one farthing damages. The most notable work of his period of final retirement, broken only by short journeys in search of health, is 'Præterita: Outlines of Scenes and Thoughts Perhaps Worthy of Memory in my Past Life' (1885-9), the last volume containing 'Dilecta,' or selections from his correspondence. This fragment of autobiography bears little trace of mental decay, but is notable for brilliant description, vivid recollection, and excellent portraiture of men whom he had known. Of works not above mentioned the following are the most noteworthy: 'Poems' (1850, privately printed; two vols., 1891); 'Examples of the Architecture of Venice' (1851); 'Lectures on Architecture and Painting' (1853); 'Notes on Some of the Principal Pictures Exhibited at the Royal Academy' (1855-9 and 1875); 'The Harbors of England' (1856), with engravings from drawings by Turner; 'Catalogue of the Drawings and Sketches of Turner at present Exhibited in the National Gallery' (1881); 'The Elements of Drawing' (1857), lectures delivered at the Working Men's College; 'Inaugural Address at the Cambridge School of Art' (1858); 'The Oxford Museum' (1859), with H. W. Acland; 'The Elements of Perspective' (1859), lectures delivered at the Working Men's College; 'The Queen of the Air' (1869), lectures on the Greek myths of cloud and storm; 'Mornings in Florence' (1875-7; collected, 1889); 'Proserpina: Studies of Wayside Flowers' (1875-86); 'Deucalion: Collected Studies of the Lapse of Waves and Life of Stones' (1875-83); 'St. Mark's Rest: the History of Venice' (1877-84; collected, 1884); 'The Laws of Fesole: A Familiar Treatise on the Elementary Principles and Practice of Drawing and Painting' (1877-8); 'Notes on the Drawings by Turner Exhibited at the Fine Art Society's Galleries' (1878; new edition, 1900); 'Arrows of the Chace' (1880), a collection of newspaper letters; 'The Bible of Amiens' (1880-5); 'On the Old Road' (1885), a collection of miscellaneous writings. In 1871 a collective edition of his works was begun, but extended to only 11 volumes. E. T. Cook is supervising a new complete edition of his works begun in 1903 and to be finished in 30 volumes.

There is a complete bibliography by T. J. Wise and J. P. Smart (1893). Ruskin prepared the plates, or at least the drawings, for many of his own works, and also painted some landscapes, chiefly in water color. A loan exhibition of his drawings was held in the Royal Water Color Society's rooms in 1901.

To what has already been said of the work and message of Ruskin little need be added. He was essentially a prophet, on fire with the enthusiasm of humanity, almost fierce in his opposition to every kind of insincerity and injustice. His early religious views were narrow, but in middle life he advanced to a broadly liberal position of no distinctively Christian character, though in later years he added to his religious liberalism a more definitely Christian element. What he said of 'Modern Painters' may be applied to all his work: "It declares the perfectness and eternal beauty of the work of God; and tests all work of man by concurrence with, or subjection to that." His teaching has been spread by many Ruskin societies, a Ruskin Hall for working men has been established at Oxford, and at Ruskin, Tenn., a co-operative colony was unsuccessfully attempted. Consult: Collingwood, 'Life and Work of John Ruskin' (1893); and 'Life of John Ruskin' (1900); Ritchie, 'Records of Tennyson, Ruskin, and Browning' (1892); Spielmann, 'John Ruskin' (1900); Harrison, 'Tennyson, Ruskin, Mill, and Others' (1899); Rossetti, 'Ruskin, Rossetti, and Pre-Raphaelitism' (1899); Cook, 'Studies in Ruskin' (2d ed. 1891); Hobson, 'John Ruskin, Social Reformer' (1898); Mallock, 'New Republic' (1881 — Herbert stands for Ruskin); Sizeranne, 'Ruskin et la Religion de la Beauté' (1897; Eng. trans., 1899); Smart, 'A Disciple of Plato' (1883); Waldstein, 'The Work of John Ruskin' (1894); Mather, 'Life and Teaching of John Ruskin' (5th ed., 1898); Harrison, 'John Ruskin' (1902; 'English Men of Letters,' new series); Mackail's essay in Chambers' 'Cyclopædia of English Literature' (Vol. III., 1904); Kitchin, 'Ruskin at Oxford and Other Essays' (1904).

Ruskin University, located at Glen Ellyn, Ill., a suburb of Chicago. The ideal of the institution is to unite industrial and educational work, to bring within the reach of young men and women the advantages of college education with the means of paying their own expenses chiefly from their own labor, and to teach the dignity of labor, "not as a means of livelihood only, but as the glad expression of normal life, and an absolute necessity to the acquirement of mental culture and moral character." The university had its origin in Ruskin College, established at Trenton, Mo., in 1900; it conducted there for student self-support a 2,000 acre farm, and a dairy, carried on gardening, laundering, printing, carpentering, etc., and with the co-operation of the citizens of the town established wood-working and canning factories. The larger part of the industrial equipment was not owned by the college; the college buildings also became inadequate for the increasing attendance and a new location became necessary. In January 1903 an affiliation was formed with a number of schools and colleges in Chicago under the corporate name

of Ruskin University, Ruskin College becoming the literary department of the institution; in April of that year the college was moved to Glen Ellyn. The organization of the university includes the Ruskin Industrial Guild, where employment is given in a number of occupations, printing, book-binding, cooking, laundering, horticultural and agricultural pursuits, etc. As far as possible students are given the work for which they have the most liking and aptitude. Those of the student body who become members of the Ruskin Industrial Guild are supplied with four hours of work per day on school days with an extra hour or two on Saturdays, for which they receive Ruskin script, at from 10 to 12½ cents per hour. This script they deposit in the Ruskin Industrial Bank and pay every week, their board bill and other incidental expenses, ranging from two dollars and fifty cents to three dollars per week by check upon the bank. They are required to report for duty in the industrial department just the same as for a Latin or Greek recitation, are marked by the foremen of departments as to the faithfulness in the discharge of duty and are advanced from one department to another upon the strictest sort of civil service rules. The courses offered by the University include: (1) the college preparatory course; (2) the college course, leading to the degree of bachelor of arts; (3) the normal course, leading to the degree of bachelor of pedagogy; (4) the social science course; the completion of which with work in other courses equal to the requirements of the college course, entitles the student to the degree of bachelor of social science; (5) special courses in bookkeeping and stenography, music, art, oratory, dressmaking, telegraphy, and domestic science; (6) the business course, leading to the degree of bachelor of accounts; (7) professional courses in law, medicine, dentistry, pharmacy, or the art craft, at the affiliated schools in Chicago; (8) correspondence courses. The college course is entirely elective and may be completed in three years; the completion of the special courses counts for a certain amount of credit toward the degree. The students in the college department at Glen Ellyn number about 300 (1904), and the faculty 15.

Rus'ling, James Fowler, American soldier: b. Washington, N. J., 14 April 1834. He was graduated from Dickinson College in 1854 and was professor there until 1857, when he engaged in law practice. At the outbreak of the Civil War he entered the Union army with rank as lieutenant. He served in the Army of the Potomac in 1861-3, in the Department of the Cumberland in 1863-5, and in the war department in 1865-7. He attained rank as colonel of volunteers in 1865, was brevetted brigadier-general in 1866 and mustered out of service in 1867. He was United States pension agent for New Jersey in 1868-77 and has published: 'Across America, or the Great West and Pacific Coast' (1874); 'History of Pennington Seminary' (1890); 'Men and Things I Saw in Civil War Days' (1899); 'European Days and Ways' (1902); etc.

Russ, John Denison, American physician and philanthropist: b. Chebacco (Essex), Mass.,

1 Sept. 1801; d. Pompton, N. J., 1 March 1881. He was graduated from Yale in 1823, studied medicine in the United States, in London, and on the Continent, in 1826 began practice in New York, in 1827-30 was in Greece aiding the patriots, and upon his return began the first instruction of the blind attempted in the United States. He was invited to organize the Institution for the Blind in Boston, but preferred to continue his independent work. In 1832 he became superintendent of the New York institution, a post which he resigned in 1858. His inventions and improvements for the assistance of the blind were widely used. Latterly he was active in endeavors to improve prison discipline and further the welfare of discharged prisoners.

Russell, rüs'ël, Addison Peale, American author: b. Wilmington, Ohio, 8 Sept. 1826. He rose from a printer's apprentice to be an editor and publisher, was elected to the Ohio legislature in 1855 and in 1857-61 was secretary of state for Ohio. He has published: 'Half Tints' (1867); 'Thomas Corwin' (1882); 'Characteristics' (1883); 'In a Club Corner' (1890); 'A Club of One' (1887); 'Sub-Cælum' (1893); 'Library Notes' (1875-9).

Russell, Benjamin, American journalist: b. Boston, Mass., 13 Sept. 1761; d. there 4 Jan. 1845. He was apprenticed to Isaiah Thomas, publisher of the Worcester, Mass., 'Spy,' but entered the Revolutionary army before completing his apprenticeship, and there collected war news for that paper. In 1784 he established the 'Columbian Sentinel,' which he made the most powerful organ of the Federal party in New England, and which he edited until 1828. He also established and conducted in 1795-1830 the 'Gazette,' likewise a Federalist organ. He printed the laws and state documents during the first sessions of Congress and refused to receive pay for his work until it was pressed upon him by Washington; represented Boston in the general court for 24 years; served several terms in the Massachusetts senate; was a member of the executive council, and of the Constitutional convention in 1820.

Russell, Sir Charles Arthur, BARON OF KILLLOWEN, English jurist: b. Newry, Ireland, 10 Nov. 1832; d. London 10 Aug. 1900. He began his career as solicitor in 1854, later matriculated at Trinity College, Dublin, but did not graduate; and in 1856 removed to London, entered Lincoln's Inn and was admitted to the English bar in 1859. In 1872 he was made Queen's counsel, and entered Parliament for Dundalk in 1880, but his part in debate was largely confined to questions concerning Ireland. In 1885 he was returned for South Hackney and became attorney-general in Gladstone's cabinet in 1886. His speeches in behalf of home rule were his most notable parliamentary achievements. He was leading counsel for Parnell in the investigations brought about by the Parnell Commission Act of 1888, and his six days' speech concluding the trial on 12 April 1889 is accounted his greatest forensic effort. He defended the prisoner in the Maybrick murder trial; in 1893 represented Great Britain in the Bering Sea arbitration; in 1894 was made lord of appeal; was raised to a life-peerage as baron

of Killowen, and later succeeded Lord Coleridge as lord chief justice. In 1896 he delivered an address before the American Bar Association at Saratoga, on 'Arbitration: its Origin, History and Progress.' In 1899 he succeeded Lord Herschell as one of the arbitrators to determine the boundaries between British Guiana and Venezuela. His publications aside from his address on arbitration were mainly contributions to current discussions.

Russell, David Allen, American soldier: b. Salem, N. Y., 10 Dec. 1820; d. near Winchester, Va., 19 Sept. 1864. He was graduated from West Point in 1845, served in the Mexican War and in 1847 was brevetted 1st lieutenant for gallant conduct. He subsequently served on the Pacific coast, was brevetted captain in 1854, and at the outbreak of the Civil War was assigned to aid in the defense of Washington. In 1862 he was appointed colonel and served in the Peninsular campaign under McClellan. He commanded a brigade in the Rappahannock campaign, was brevetted colonel in the regular army, assisted in the capture of the Rappahannock station and commanded a division at the battles of the Wilderness, Spottsylvania, and North Anna. He was engaged in the defense of Washington in August and September 1864, and was killed while leading his column at Opequan, Va., 19 Sept. 1864. He was brevetted major-general of regular army the same day.

Russell, Henry Benajah, American journalist: b. Russell, Mass., 9 March 1859. He was graduated from Amherst in 1881, was attached to the New York *Sun* 1884-8, was on the editorial staff of the Providence *Journal* 1888-90, and of the Hartford *Post* 1890-7. He has published 'Life of William McKinley' (1896); 'International Monetary Conferences' (1898); 'Our War with Spain' (1899).

Russell, Israel Cook, American geologist: b. near Garrattsville, N. Y., 10 Dec. 1852; d. Ann Arbor, Mich., 1 May 1906. He was educated at the College of the City of New York and Columbia School of Mines, and accompanied the United States expedition to New Zealand to observe the transit of Venus. In 1875 he became assistant professor of geology at Columbia and from 1880 was attached to the United States geological survey, for which he made surveys in the Rocky Mountains, Southern Appalachian regions, and in Alaska. In 1879 he ascended the Yukon and made his way to Lynn Canal, and in 1890-1 led expeditions to Mount Saint Elias. In 1892 he became professor of geology at the University of Michigan. His contributions to geography and geology embrace 'Geological Reconnaissance in Central Oregon' (1883); 'Geological History of Lake Lahontan' (1885); 'Quaternary History of Mono Valley, California' (1887); 'Existing Glaciers of the United States' (1889); 'Sub-aërial Decay of Rocks' (1889); 'A Second Expedition to Mount Saint Elias' (1892); 'A Geological Reconnaissance in Central Washington' (1893); 'Lakes of North America' (1895); 'Present and Extinct Lakes of Nevada' (1895); 'Glaciers of North America' (1897); 'Volcanoes of North America' (1897); 'Rivers of North America' (1898).

Russell, James Earl, American educator: b. Hamden, N. Y., 1 July 1864. He was graduated from Cornell in 1887, studied at the

universities of Jena, Leipsic, and Berlin, and in 1895-7 occupied the chair of philosophy and pedagogy at the University of Colorado. He was appointed professor of education at the Teachers' College, Columbia University, in 1897, and since 1898 has been dean of that college. He has published: 'The Extension of University Teaching in England and America' (1895); 'The History, Organization, and Methods of Secondary Education in Germany' (1899); etc.

Russell, John, 1ST EARL RUSSELL, English statesman, 3d son of John, 6th Duke of Bedford: b. London 18 Aug. 1792; d. Richmond Park, Surrey, 28 May 1878. He was educated at Edinburgh University, where he trained himself to debate at the meetings of the Speculative Society. In July 1813 he entered Parliament and soon gained prominence among the politicians of the day. He early took up the subject of parliamentary reform, and supported the repeal of the Test and Corporation Acts, and Roman Catholic emancipation. In 1828 he had the satisfaction of seeing the Test and Corporation Acts repealed by the Wellington ministry, and in April 1829 the Catholic Relief Bill became law. When the Grey cabinet was formed in 1830 Lord John Russell, then paymaster-general of the forces, was elected one of a committee of five to formulate a Reform Bill. This was brought before the House of Commons 1 March 1831 by him, and though he defended it clause by clause with extraordinary vigor, it was ultimately rejected. Upon this the Whig ministry resigned, and an appeal made to the country. The elections resulted in a majority favorable to the bill, which received the royal sanction 7 June 1832. In Lord Melbourne's second cabinet (1835-41) he was at first home secretary and then colonial secretary, and on the outbreak of the Canadian rebellion, by recognizing the right of the colonists to self-government, reconciled them to the mother country. From 1841 (in which year he became member for the city of London) to 1845, during the Peel administration, Lord John Russell led the opposition, but lent his influence in favor of the repeal of the corn-laws. He was premier 1846-52, and was able to pass his Ecclesiastical Titles Bill of 1851, prohibiting the assumption of the territorial titles by Roman Catholic bishops. Lord Derby who followed him soon resigned and under the succeeding administration of Lord Aberdeen, Russell was foreign secretary for a short time. He also filled the post of lord-president of the council from June 1854 to February 1855. He was colonial secretary under Lord Palmerston in 1855, and represented Great Britain at the Vienna conferences; but his conduct of the negotiations brought him so much unpopularity that he resigned in July of that year. When Palmerston returned to power in 1859 Lord John again became foreign secretary, with a seat in the cabinet. He took a leading part in regard to such political questions as the oppression of the Poles by Russia, the aggressive policy of German powers toward Denmark, and the disputes between England and the United States as to the neutrality observed during the continuance of the Civil War. He retained his seat for the city of London from June 1841 till July 1861, when he was raised to the peerage as Earl Russell. After the death of Lord Palm-

erston 18 Oct. 1865 Earl Russell became prime minister for the second time, Gladstone taking the lead in the House of Commons. During the session of 1866, in conjunction with Gladstone, he introduced a new Reform Bill, which failing to pass the ministry, resigned, and was succeeded by that of Lord Derby. Thenceforth Earl Russell held no office in any ministry, though he always took an active part in promoting Liberal measures.

He published among other works: 'History of the British Constitution' (1821); 'Essay on the History of the English Government' (1823); 'Memoirs of the Affairs of Europe' (1824-9); 'Essay on the Causes of the French Revolution' (1832); 'Memoirs and Correspondence of Thomas Moore' (1852-6); 'The Life and Times of Charles Fox' (1859-66); 'Selections from Speeches of Earl Russell, 1859 to 1865'; 'Recollections and Suggestions, 1813-73' (1875). Consult: Walpole, 'Life of Lord John Russell' (1889); Reid, 'Lord John Russell' (1895).

Russell, John Edwards, American politician: b. Greenfield, Mass., 30 Jan. 1834; d. Leicester, Mass., 27 Oct. 1903. He was engaged in business in South America in 1857-63, and after his return to New York was interested with Benjamin Holliday in the Overland Mail enterprise. He was secretary of the Massachusetts State Board of Agriculture in 1880-7 and in the latter year was elected to Congress, but declined a renomination. He continued active in politics, but held no further public office.

Russell, John Scott, Scottish engineer and naval architect: b. Glasgow 8 May 1808; d. Ventnor, Isle of Wight, 8 June 1882. He was educated at the universities of Edinburgh, Saint Andrews, and Glasgow, graduating from the latter at 16. In 1832 he was professor of natural philosophy in Edinburgh University. During his researches into the nature of waves he discovered the existence of the wave of translation, on which he founded the wave-line system of construction of ships introduced into practice in 1835. In 1844 he removed to London, and was for many years a well-known shipbuilder on the Thames. He became joint-secretary of the Royal Commissioners for carrying out the Great Exhibition of 1851, and took a leading part in organizing it. He built the Great Eastern; was joint-designer of the first English sea-going armored frigate, the Warrior, and constructed the vast dome of the Vienna Exhibition of 1873. He published: 'The Modern System of Naval Architecture for Commerce and War' (1864-5); 'Systematic Technical Training for the English People' (1869); and 'The Wave of Translation in the Ocean of Water, Air, and Ether' (new ed. 1885).

Russell, Lillian (HELEN LOUISE LEONARD), American comic opera singer: b. Clinton, Iowa, December 1861. She sang in 'Pinafore' under E. E. Rice in 1879, and later appeared in New York at Tony Pastor's theatre. She soon became the star in the McCaull Opera Company and played leading parts in 'Snake Charmer,' 'Olivette,' 'Patience,' and 'The Sorcerer.' She sang in London in 1883 and returned to New York in 1885, from which date until 1891 she sang at the Casino in various roles. She retains

her hold as a popular favorite and in recent years has sung at Weber & Fields' music hall.

Russell, Sol Smith, American actor: b. Brunswick, Maine, 15 June 1848; d. Washington, D. C., 28 April 1902. He first appeared on the stage at Cairo, Ill., singing and playing small roles. Later he joined the Peake Family of Bellringers, and in 1866 played in Ben de Bar's stock company in Saint Louis. In 1871 he made his first New York appearance, and three years later joined Augustin Daly's company. In 1880 he appeared as a star in 'Edgewood Folks,' and adopted a style of acting that gained him wide popularity. To this natural and quiet style he adhered in his subsequent plays, such as 'A Poor Relation'; 'The Tale of a Coat'; 'Peaceful Valley'; 'A Bachelor's Romance.' His last play was the 'Hon. John Grigsby,' produced in 1899.

Russell, William, LORD, English statesman: b. 29 Sept. 1639; d. London 21 July 1683. He was educated at Cambridge, was elected to Parliament for Tavistock in 1661, and became one of the leaders of "the country party" in 1673, coming forward in opposition to the attempts of the king and his partisans to destroy English freedom through the aid of France. In 1678 he became Lord Russell, and heir apparent to the earldom of Bedford. On 14 March 1678 he seconded the motion to declare war against France, and spoke in support of it. In November 1678 he was chosen to move in the House of Commons that the Duke of York should be removed from the king's presence and councils. When the new council proposed by Sir William Temple was formed, Lord Russell was appointed one of the 30 members. He was not at first in favor of excluding the Duke of York from the succession, but finally supported the measure. He left the council at the beginning of 1680. On 26 October he spoke in favor of measures against "popery, and to prevent a popish successor" to the crown; and a week later seconded Colonel Titus' motion to disable the Duke of York from becoming King of England. When the reaction against the Whigs took place, the government of Charles II. resolved to destroy their leaders, proceeding to do so according to the forms of law. He was arrested on the charge of having been concerned in the Rye House plot, said to have been formed by Rumbold and others, for an attack on the king and the Duke of York, and after his examination was committed to the Tower. His trial took place at the Old Bailey 13 July 1683. The charge against him was "for conspiring the death of the king, and consulting and agreeing to stir up insurrection; and to that end to seize the guards (appointed) for the preservation of the king's person." No counsel was then allowed to the accused, except on points of law; his condemnation quickly followed and he was beheaded in Lincoln's Inn Fields. Consult 'Life of Lord Russell' by Lord John Russell (1819).

Russell, William Clark, English novelist: b. New York 24 Feb. 1844. Educated at Winchester and Boulogne, he was a midshipman in the merchant service 1857-65. His first sea-story, 'John Holdsworth, Chief Mate,' appeared in 1874 and was very successful; but he won still greater success with 'The Wreck of the

Grosvenor' in the following year. Among his numerous novels are: 'An Ocean Freeland' (1878); 'My Shipmate, Louise' (1882); 'A Sea Queen' (1883); 'An Ocean Tragedy' (1881); 'Alone on a Wide, Wide Sea' (1892); 'The Emigrant Ship' (1894); 'The Convict Ship' (1895); 'What Cheer!' (1895); 'List, Ye Landsmen!' (1897); 'The Two Captains' (1897); 'Romance of a Midshipman' (1898); 'A Voyage at Anchor' (1899); 'The Pretty Polly' (1900); 'The Ship's Adventure' (1899); 'His Island Princess' (1905); several collections of short stories, and lives of Nelson (1890) and Collingwood (1891). He was for some time connected with the Newcastle *Daily Chronicle*, but for several years, ending in 1887, was on the staff of the London *Daily Telegraph*.

Russell, William Eustis, American lawyer and political leader: b. Cambridge, Mass., 6 Jan. 1857; d. Little Palos, Quebec, Can., 16 July 1896. He was graduated from Harvard in 1877, and from the Boston University Law School in 1879, winning the Lawrence prize for the best legal essay. He was admitted to the Massachusetts bar in 1880 and began the practice of law with his father's firm. He also became an active member of the Democratic party; was elected to the common council of Cambridge in 1881, to the board of aldermen in 1883 and 1884; and was mayor of the city 1885-7. His efficient administration as mayor, and his effective campaign speeches during the Presidential campaign of 1884, had made him a prominent figure in State politics, and in 1888 he was the Democratic nominee for governor. He was defeated in that year and again in 1889, but in 1890 was elected and twice re-elected in 1891 and 1892. He took an active part in all his gubernatorial campaigns, making numerous speeches in all parts of the State. His election as governor for three successive years was an unusual testimony to his personal integrity and popularity, as the majority of the legislature and the State officials were Republicans. Several laws were passed on his recommendation, including a measure to regulate the lobby, and a law abolishing the property qualification for governor, and the poll tax. At the close of his term he resumed the practice of law, and in 1894 was appointed a member of the board of Indian commissioners. In 1896 he was one of the most active opponents of the adoption of the free silver platform at the Democratic National Convention, and distinguished himself by a remarkable speech pleading for a return to the original principles of the Democracy; he was prominently mentioned as a candidate for the presidency by those who favored the gold standard. His death occurred suddenly, shortly after the convention, and was thought to be due largely to the strain he had undergone at that time.

Russell, Sir William Howard, English journalist: b. near Dublin, Ireland, 28 March 1820; d. London, Eng., 10 Feb. 1907. He was educated at Trinity College, Dublin, and was called to the bar in 1852. His journalistic career began in 1843 on the staff of the London *Times*. He was its special correspondent during the Danish war of 1848-50, during the Crimean war, in 1854-6, reported the Indian mutiny in 1857-8, the Italian campaign 1859, the Civil War in the United States in 1861-2,

the Danish war of 1864, the Prusso-Austrian war 1866, and the Franco-German war of 1870. He accompanied the Prince of Wales to Egypt in 1868 and was his honorary private secretary on his visit to India in 1875. In 1879-80 he was again engaged as war correspondent in South Africa, and in 1883-4 was on that duty in Egypt. He was knighted in 1895 and was editor of the 'Army and Navy Gazette.' His publications include: 'British Expedition to Crimea'; 'Diary in India'; 'My Diary—North and South' (1863); 'The Prince of Wales Tour' (1877); 'Hesperothen' (1882); 'The Great War with Russia' (1895); 'Tolben's Sebastopol'; etc.

Russell, House of, English noble family presumed to have descended from Turstain, a Scandinavian jarl who settled in Normandy after its conquest by the Northmen, and became possessed of the Castle of Rozel, near Caen. The name of HUGH DE ROZEL appears in a charter of Matilda, the wife of William the Conqueror, dated 1066; and also with that of his elder brother, on the roll of Battle Abbey. Both accompanied Robert of Normandy in the first crusade. The elder died there, but Hugh returned and settled in England. A descendant of his, JOHN ROZEL or RUSSELL, as the name had now begun to be written, was constable of Corfe Castle about 1221; and another WILLIAM RUSSELL represented Southampton in the first Parliament of Edward II. SIR JOHN RUSSELL, a direct descendant of the last named, was speaker of the House of Commons in Henry VI.'s reign. His grandson, SIR JOHN, was in favor with Henry VIII. The lands of the Abbey at Tavistock, and of the dissolved monastery at Woburn, were conferred on him, and he was made 1st Earl of Bedford. His son, the 2d earl, died without issue, and the title passed into another branch of the Russell family. WILLIAM RUSSELL, 5th earl, was created Marquis of Tavistock and Duke of Bedford in 1694. A notable member of the family was ADMIRAL EDWARD RUSSELL, who distinguished himself by his victory over the French fleet at La Hogue in 1602. JOHN, 4th duke (b. 1710; d. 1771), held office in the Newcastle and Grenville ministries, and was lord-lieutenant of Ireland in 1756-62. FRANCIS, 5th duke (1765-1802), was distinguished for his services to agriculture. FRANCIS, 7th duke (b. 1788; d. 1861), was summoned to the House of Lords in 1832, before the death of his father. He held no political office, but like most members of the family gave staunch support to the Whigs. The 9th duke, FRANCIS, was succeeded by his son GEORGE, the 10th duke, in 1891, and he by his brother HERBRAND in 1893.

Russell's Viper, one of the largest and most venomous serpents (*Daboia russelli*) of the East Indian region; justly dreaded throughout southern and eastern India, Ceylon, Burma, and Siam. It may reach a length of five feet, and is yellowish-brown with three longitudinal series of black, light-edged rings, which sometimes encircle reddish spots. It is known also as chain-viper, tic-palonga (Ceylon), etc., and is regarded by experts as the most deadly in India, but fortunately it is neither as numerous nor as easily provoked as the cobra. According to Fayrer it is nocturnal in its habits, sluggish

and does not readily strike unless irritated, when it bites with great fury; moreover its loud hissing when disturbed is likely to give one sufficient warning to enable him to jump out of reach of its fangs. It is said to kill many grazing cattle. The action of its poison resembles that of the rattlesnake, but gives rise to hemorrhagic extravasations from the kidneys and various other organs. Consult: Fayrer, 'Thanatophidia of India' (1874); Gadow, 'Amphibia and Reptiles' (1901).

Rus'sellville, Ark., town, county-seat of Pope County; on the St. Louis, I. M. & S. and the Dardanelle & R. R.R.s; about 80 miles northwest of Little Rock. It is in an agricultural region in which the chief product is cotton. The lumber interests are quite important. The chief manufactures are cotton and lumber products, flour, dairy products, and agricultural implements. The two banks, one national and one state, have a combined capital of \$80,000. Pop. (1890) 1,321; (1900) 1,832.

Russellville, Ky., city, county-seat of Logan County; on the Louisville & Nashville railroad; about 25 miles west-southwest of Bowling Green and 52 miles north by west of Nashville. It is in an agricultural region in which tobacco is one of the chief products. The chief manufacturing establishments are flour mills, tobacco factories, wagon and carriage works, and furniture factories. It contains the Logan Female College (M. E. S.), established in 1867, the Bethel College (Baptist), founded in 1854, public schools and a public library. The three state banks have a combined capital of \$175,000. Pop. (1890) 2,253; (1900) 2,591.

Rus'sellville, Engagements at. After the defeat of Gen. W. E. Jones at Morristown, Tenn. (q.v.), 10 Dec. 1863 he was followed by a Union force under Col. Graham, and when near Russellville Graham ran into Gen. Morgan's cavalry division, which was foraging. He was attacked and driven back, leaving some dead, wounded, and prisoners in the hands of the Confederates. Late in October 1864 Col. J. B. Palmer, 58th North Carolina, with about 800 men and 3 guns, moved from North Carolina into East Tennessee to co-operate with the Confederate troops under Gen. Vaughn, and 28 October he was ordered by Vaughn to take position in rear of Russellville, on the Bull's Gap road. He had scarcely taken position when Vaughn's brigade, defeated at Morristown, swept past him in great disorder. He formed line, threw out skirmishers, and opened fire with his three guns upon Gillem's pursuing troops, checking them and enabling Vaughn to rally about 200 of his men. Gen. Gillem, who, with a brigade, was at Henderson's Depot on 8 Nov. 1864, hearing that Gen. Breckinridge was advancing to reconquer East Tennessee, fell back to Greeneville on the 9th and to Bull's Gap on the 10th, where he was attacked on the morning of the 11th by Gen. Duke's cavalry brigade, and held his own during the day. The attack was renewed by Breckinridge on the 12th with artillery; he next assaulted in front and in rear with cavalry, both being repulsed. Breckinridge again renewed the attack on the 13th, and kept it up all day. Gillem, being now almost out of ammunition, and without food for his men and forage for his horses, abandoned his position during the night and fell back toward

RUSSIA

Russellville. He took position on the road, at its intersection with the Knoxville and Greenville road, intending to hold that point until his trains had passed it. Nearly all his trains had passed, and were going through Russellville, when, on the 14th, his rear was attacked by Breckinridge with the brigades of Duke and Vaughn. His men were thrown into disorder, became panic-stricken, could not be rallied, and retreated through Russellville to Strawberry Plains. He had 41 killed and wounded, and lost six guns, 132 wagons and ambulances, and 300 horses. About 200 of his men were captured. Consult 'Official Records,' Vols. XXXI. and XXXIX.

E. A. CARMAN.

Russia, an extensive empire comprising the whole of eastern Europe from about 17° 40' east, and stretching continuously for about 170 degrees over the whole continent of Asia to Bering Strait, or nearly half of the circuit of the world. The boundaries are the Arctic Ocean on the north, Bering Strait and Bering Sea on the east, the Pacific Ocean, Chinese Empire, Afghanistan, Persia, Asiatic Turkey, and the Black Sea on the south, and Rumania, Austria-Hungary, Germany, the Baltic Sea, and Sweden on the west. The length east to west is estimated at about 7,000 miles; the average breadth north to south is about 1,500 miles. The whole area is officially given at 8,660,395 square miles, approximately twice the area of Europe, and one sixth of the land surface of the globe. The empire consists of several well defined parts; in Europe, Poland and Finland (qq.v.), besides European Russia, the latter although less than a fourth of the whole, including nearly three fourths of the entire population; in Asia—northern Caucasia, Transcaucasia, the Steppes, Turkestan, the Caspian and Transcaspian, and Siberia. The appended table gives the official divisions of the empire, their area, population, and the density per square mile of land; the areas occupied by water are included in the total, but the densities of the population are calculated on the land area.

Imperial expansion in Asia has been a marked feature of Russian policy since the 18th century. The first settlements on the Pacific slope were established on the Sea of Okhotsk, and by 1850 the boundaries were pushed so far south as the Amur River. In North America, Russia had extended its sovereignty over the Alaskan Peninsula, which, however, it sold in 1867 to the United States for \$7,200,000. (See ALASKA and ALASKAN BOUNDARY COMMISSION.) In 1872 it compelled Khiva (q.v.) to acknowledge the suzerainty of the Czar, and in the following year Bokhara (q.v.), on which pressure had been brought to bear since 1850, and which had been invaded in 1866, became practically a Russian dependency. In 1875, the island of Sakhalin in the Sea of Okhotsk, north of Japan, was ceded to Russia by the Japanese. In 1898, after Japan's successful war with China, Russia obtained from Japan a lease of the Liao-tung peninsula, with the important ports of Dalny and Port Arthur (qq.v.), and after the Boxer uprising of 1901, occupied Manchuria (q.v.). Meanwhile Armenia had been partly absorbed; Russian influence had been strongly established in the Mongolian steppes, and the military outposts in Turkestan had been extended southward in the Pamirs.

The largest cities of European Russia are the capital, Saint Petersburg, 1,267,023; Moscow, 988,614; Warsaw, 638,209; Odessa, 405,041; Lodz, 315,209; Riga, 256,197; Kiev, 247,432; Kharkov, 174,846; Vilna, 154,532; Saratov, 137,109; Kazan, 131,508; Ekaterinoslav, 121,216; Rostov-on-the-Don, 119,889; Astrakhan, 112,880; Tula, 111,048; Kishinev, 108,706; Nijni-Novgorod, 95,124. The cities of Asiatic Russia above 100,000 population are Tiflis, 160,645; Tashkend, 156,414; and Baku, 112,253.

The continuity of the empire might appear to demand a detailed description in a single article; but its immense magnitude, and the distinct names commonly used to designate the different portions, make it more convenient to consider them separately under the heads of European Russia, and Siberia and Asiatic Russia. See article SIBERIA AND ASIATIC RUSSIA.

EUROPEAN RUSSIA.

Various classifications, partly historical and partly geographical, of the numerous divisions of European Russia, besides Poland and Finland, include Great Russia, Little Russia, South Russia, West Russia, the Baltic Provinces, and Caucasus.

The boundaries of European Russia on the north and west are the same as those given above for the empire. Its southern boundaries also are the same as far east as the eastern shores of the Caspian Sea. The eastern boundary is not so well defined. In its northern part the Ural Mountains form such a definite natural barrier that their title to fix the frontiers of Europe and Asia, so far at least as the governments Archangel and Vologda extend, has been almost universally recognized. To the south of this the boundary may be said to be almost arbitrary, but is generally conceded to follow the Ural chain southward till it reaches the sources of the river Ural, and then follow the course of this river to its mouth in the Caspian. Parts of the governments of Perm and Orenburg, however, extend across the Ural Mountains, and are therefore in Asia. European Russia, as thus defined, is bounded northeast by the Ural Mountains, east by the government of Tobolsk, the steppes of the Kirghiz, and the Caspian Sea.

Topography.—The surface, in the most general view that can be taken of it, is two immense plains, the boundary between which is marked, though not very definitely, by a broad central ridge which stretches across it in an irregular waving line, mainly in a northeast direction, commencing on the frontiers of Poland, and terminating on the west side of the Ural Mountains, near lat. 62° N. This ridge forms the eastern continuation of the great watershed which divides the whole continent of Europe into a north and a south basin; but, unlike the west part, which is composed of lofty mountain chains or elevated plateaus, is only of moderate height, never exceeding 1,000 feet above sea-level. Even this height is attained only in the Valdai Hills, the far greater part of which, and of the remainder of the ridge, has an average height of not more than 500 feet. The only regions where the surface assumes a mountainous appearance are in the east, where the Ural chain, though nowhere much exceeding 5,000 feet, looks more elevated, at least in its northern part, from its high latitude and consequent covering of perpetual snow; and in the south, where the Mountains of the Yaila chain, lining the southern shores of the Crimea, have a height of about 4,000 feet. With these exceptions the only other parts of European Russia which, according to the limits above assigned to it, do not belong to its two immense plains, are those districts of Perm and Orenburg which are situated on the east side of the Urals, and slope toward the almost boundless steppes of Asia. The coast-

RUSSIA

line of European Russia was confined to the Arctic Ocean until the end of the 17th century, and it was only by conquest that Russia obtained a seaboard on the Baltic and the Black Sea; the latter, however, remains practically an inland sea, the entrance to which is in the hands of Turkey. The Arctic Ocean, affording excellent fishing grounds in the western portion, makes, with the White Sea, a deep indentation on the north coast, but its gulfs, Kandalaksha, Onega, and Dvina, are ice-bound for nine months every year. Archangel, the chief port, is comparatively unimportant. Farther east, Cheskaya and Pechora bays are surrounded by frozen deserts. The Kara Sea, between the crescent-shaped island of Nova Zembla and the coast of Siberia, is navigable for a few weeks only every year. The islands of Kolgueff, Vaigatch, Nova Zembla, and the islands of Siberia are uninhabited. The Baltic Sea, with the Gulfs of Bothnia, Finland, and Riga, is the chief sea of Russia; but it nowhere touches purely Russian territory, its coasts being peopled by Finns, Letts, Estonians, and Germans. Nevertheless, four out of the five chief ports of Russia—Saint Petersburg, Reval, Libau, and Riga—are situated on the Baltic Sea. Three of them are frozen during four to five months every year; and Libau is the only one which has its roadsteads open nearly all the year round. The chief islands of the Baltic are the Åland archipelago, belonging to Finland; Dagö, Osel, Mohn, and Worms at the entrance of the Gulf of Riga; Hochland and Kotlin (with the fortress of Cronstadt) in the Gulf of Finland.

The Black Sea acquires more and more importance every year. The fertile steppes of its littoral are being rapidly settled, and the centre of gravity of Russia's population is gradually shifting south. The Black Sea suffers, however, from a lack of good ports. Its great gulf, the Sea of Azov (ports Taganrog and Rostoff), is very shallow; the fine ports of the Crimea are too remote from the mainland; and the seaboard of Northern Caucasus is separated from the interior by a high chain of mountains. Odessa is the chief port of this sea; and it has no rival in Russia except Saint Petersburg. Nikolaiev is the principal naval arsenal; and Sebastopol remains a naval station. Batum, the chief port of Transcaucasia, is of great importance for the export of petroleum. The Caspian Sea, which receives the chief river of European Russia—the Volga—is a valuable medium of communication between the central Asian dominions of the empire and the Caucasus, as also for trade with Persia (to which the south coast belongs); but it has no outlet to the ocean, nor is there any probability of connecting it advantageously by canal with the Black Sea, its level being 70 feet below sea-level.

Hydrography.—The rivers are remarkable for their number and magnitude. The broad central ridge already referred to forms the great water-shed of the country, sending the waters on its north side either to the Arctic Ocean or Baltic Sea, and those on the south side to the Black Sea or the Caspian, thus forming four distinct basins. The Arctic Ocean receives directly the Pechora, which drains chiefly the western slopes of the Ural Mountains by a number of important affluents, accumulates them into one great flood, which then flows almost due north, and empties

itself into a wide estuary remarkable for the number of islands which the alluvial deposits of the river have formed within it. Through the White Sea, the Arctic Ocean receives the waters of the Mezen, Northern Dvina, and Onega. The most important of the three is the Dvina, which, receiving its supplies in nearly equal quantities from the east of the Vitchegda, and from the west by the Suchona, proceeds northwest in a circuitous course, continually augmented by large affluents, and falls into the Gulf of Archangel, a little below the well-known port of that name. The surface drained by the rivers of this basin is almost entirely confined to the two extensive governments of Archangel and Vologda. The basin next in order is that of the Baltic. Its principal rivers are the Kemi and Tornea (the latter common to both Russia and Sweden), which fall into the Gulf of Bothnia; the Kymmene, Neva, and Narva or Narowa, which fall into the Gulf of Finland; the Aa and Düna or Western Dvina, which fall into the Gulf of Riga; the Niemen or Memel, which enters Prussia before terminating its course; and the West Bug, an affluent of the Vistula. To the basin of the Black Sea belong the Dniester, South Bug, and Dnieper, which have all their mouths at a short distance from each other in the neighborhood of the rising seaport of Odessa; the Don, which falls into the northeast extremity of the Sea of Azov; and the Kuban, which derives its chief supplies from Circassia. The last basin, that of the Caspian, is in some respects the most remarkable of all, since, though Europe sends it only two large rivers, the Ural and the Volga, both supplied in part from Asiatic sources, the latter not only surpasses all other Russian rivers, but is one of the greatest of Europe. The lakes of Russia are on a scale of magnificence commensurate with that of the rivers. To say nothing of the Caspian, which, being wholly surrounded by land, and even incapable from the lowness of its level, of discharging itself into any other sea, is truly a lake—Russia has others of vast extent. To the basin of the Baltic belong Ladoga, the largest lake in Europe; Onega, Peipus, and Ilmen. Finland, too, which toward its south extremity is a mere network of lakes, sends all its waters to the Baltic. Almost all the other lakes of any size belong to the basin of the Volga; chief of these are the Bielo-Ozero, in the government of Novgorod, and the Koubinsköe, in the government of Vologda. In the south are several large salt lakes, among them the Elton and the Khaki Salt Marsh, in the government of Astrakhan.

Geology.—A vast tract of gneiss and other crystalline schists, penetrated by granite, extends west from the Gulf of Bothnia, and north from the Gulf of Finland over the whole principality of the latter name, the western part of the government of Olonets, and the extensive part of the government of Archangel which is isolated from its main body by the White Sea. The only other region where a similar development occurs is in the south, where a large granitic steppe stretches in a southeast direction. It commences near Ovrutch, in the northeast of the government of Volhynia, covers the far greater part of the government of Kiev, as much of the government of Podolsk as lies north of the Bug, the northern half of the government of Kherson, the west and south of Ekaterinoslav, and a part

RUSSIA

of Taurida, and terminates just before reaching the shores of the Sea of Azov, from which it is excluded by a narrow belt of Tertiary marls and limestone. In the east, however, and along the whole crest of the Ural Mountains, from their commencement on the shores of the Arctic Ocean, and almost continuously southward to their last ramifications, granite of more recent origin than that already mentioned occurs, in connection with other eruptive rocks of greenstone, porphyry, syenite, serpentine, etc. These rocks are overlain on both sides of the chain by metamorphic schists, forming long and narrow belts nearly parallel with its principal axis. Immediately to the west appears a similar belt of Silurian strata, which, where lowest in the series, are in the state of chloritic and talcose schists. The only other locality where the Silurian system receives a marked development is on the southern shores of the Gulf of Finland, where it stretches from its western extremity east along the governments of Esthonia and Saint Petersburg, and is then continued across the isthmus between the eastern extremity of the gulf and Lake Ladoga, and along the southern and south-eastern shores of that lake. In immediate contact with this Silurian formation on the south, but on a much more magnificent scale of development, appears the Devonian system, or Old Red Sandstone. The main body of this formation commences near the southeastern shores of the Baltic, and gradually widens out with its north-eastern and southeastern sides, so as to assume the shape of a wedge. It then forms a wide fork, sending one of its branches northeast across Lake Onega, and along Archangel Bay to the northwestern extremity of Mezen Bay, and the other southeast to the northwestern frontiers of Voronezh. It thus covers continuously the whole of the governments of Kurland, Livonia, Vitebsk, and Pskof, and parts of Vilna, Minsk, Mohilef, and Smolensk, on the one side, and of Petersburg and Novgorod on the other; while its northeast branch traverses Olonets, and penetrates into Archangel; and its south-east branch stretches over considerable parts of Kaluga, Orel, and Tula. The only other localities in which the same formation occurs is as a belt stretching south-southeast from the eastern coast of the Gulf of Tcheskaia in the Arctic Ocean, and in a longer but narrower belt on the western side of the Ural chain, where it immediately overlies the Silurian formation already mentioned. The formation next in order is the Carboniferous. The main body of it lies within the above fork of the Old Red Sandstone, and in immediate contact with it, and then keeping parallel with the northeast branch of the fork, is continued in the same direction to its termination in Mezen Bay. It occupies the whole of the government of Tver, the capital of which is situated near its centre; and large parts of Smolensk, Kaluga, Tula, and Riazan on the one side, and of Novgorod and Olonets on the other. The government of Moscow is situated in the very heart of it, and that of Vladimir on its eastern side. It is evidently continued beneath these governments, and covers part of their surface, the other and far greater part being covered by oolite or Jura limestone. The Carboniferous system occurs in other two distant and isolated localities; the one in the south, a little north of the Sea of Azov, where

it occupies the eastern part of the government of Ekaterinoslav, and the western extremity of that of Don Cossacks, and where, too, the coal forming the characteristic mineral of the system is partially worked by pits; the other locality is on the western side of the Ural chain, where, in the ascending series, it succeeds the Silurian and Devonian systems, and has a larger development than either of them. This development of the Carboniferous system on the side of the Ural chain, and the still larger development above described as existing in the governments of Smolensk, Kaluga, etc., form the opposite boundaries of a system which in European Russia is highly developed; and to which, from the large space which it covers in Perm and the contiguous governments, the name of the Permian system has been given. Its rocks belong to the upper part of the coal measures, and consist chiefly of magnesian limestone and new red sandstone. The latter name is still often applied to the whole system. The Permian system extends over the governments of Kostroma, Viatka, and Kazan, and large parts of Archangel, Vologda, Yaroslav, Nijni-Novgorod, Simbirsk, Orenburg, and Perm. In the north of the governments of Kostroma and Viatka, and more especially in the part of Vologda between the towns of Nikolsk and Ust-Sisolsk, it disappears for a time beneath strata belonging to the Jurassic or oolitic system. This system is developed partially in several other localities, and very largely in the northeast of the government of Archangel. Immediately above it in the geological series is the Cretaceous system, of which the principal localities are Chernigov, Orel, Kursk, Kharkov, and Voronezh, near the centre; Volhynia and a small part of Poland in the west; and a long tract along the northern base of the Caucasus. The rocks next in succession belong to the Tertiary formation, which in both its Eocene and Miocene periods is very largely developed. Strata of the Eocene period, commencing in the east in the government of Simbirsk, stretch west over the greater part of the governments of Penza and Tambov, then, after a considerable interruption, reappear on the frontiers of Kursk and Kharkov, cover the far greater part of the governments of Chernigov and Poltava, and are thence continued without interruption into the governments of Mohilev, Minsk, Grodno, and finally into Poland. The Miocene period has its chief developments in Volhynia, Podolsk, and Bessarabia. Beds of still more recent formation may be traced in the limestones, marls, and clays on the northwestern shores of the Black Sea, on the far greater part of the Peninsula of the Crimea, on the eastern and northern shores of the Sea of Azov, on the low flats along the western and northern shores of the Caspian, and the low, sandy steppes of Astrakhan. Mere alluvial deposits, of comparatively recent date, are to be found in a greater or less degree at the mouths of all the rivers, and are particularly discernible in the great estuary of the Pechora. Vast numbers of erratic blocks and similar drift are spread over the greater part of Northern Russia, evidently transported from Finland, Lapland, and Sweden.

Minerals.—These are numerous and valuable. Gold is obtained in large quantities, both by mining and washing, on the slopes of the

Ural Mountains. The richer deposits, however, with a few exceptions, are found on the east side of the chain, and therefore belong more properly to Asiatic than to European Russia. Gold has also been found in the northwest of Russian Lapland. Copper is found both in the Valdai and the Ural Mountains. To the west of the latter, in all the low country of Perm, are vast cupriferous deposits, from which large quantities of metal are annually obtained under the most favorable circumstances, the workings themselves being not only comparatively easy, but all the materials necessary for smelting existing in their immediate vicinity. The governments of Olonets, Viatka, Kazan, Vologda, and Orenburg have also their copper mines. Iron, the most widely diffused of all the Russian metals, is found not only among the mountains, but in the lowest marshy grounds of Finland and the northern governments, where extensive beds of bog iron ore have been formed. The principal seat of the iron manufacture is in the government of Perm, but important workings are carried on, and great numbers of blast-furnaces have been erected, in many other quarters. Near Zlatoust, to the west of the Urals, there are important limonite deposits; but east of the Urals, at Nijni Tagilsk, magnetite is worked. Lead is more sparingly diffused, and is worked chiefly in the Ural chain and some parts of Poland, particularly the vicinity of Cracow and Sandomir. It sometimes contains such a percentage of silver as to make it worth extracting. Platinum has long been worked in the Ural chain, in the most productive mines of that metal which are known to exist in the world. Zinc is worked in Poland, in the government of Piotrkov, and quicksilver is mined in the south, in the government of Ekaterinoslav. The latter government also yields a considerable amount of manganese. Salt is found in inexhaustible abundance, both in brine pits and mines. In almost every part of the vast extent of surface already described as belonging geologically to the Permian system it may easily be found, and in numerous localities is extensively and profitably worked. It is also very abundant in the southeastern steppes. Saltpeter is found chiefly in the government of Astrakhan. From the vast extent of country which has been shown to be occupied by the Carboniferous system it may be reasonably concluded that many extensive coal fields must exist. It would seem, however, that Russia in this respect bears a considerable resemblance to Ireland, where the large developments of the Carboniferous system are chiefly confined to its lower strata, and is much more remarkable for its immense masses of mountain-limestone than its productive seams of coal. The most important and most productive coal basin is that situated north of the Sea of Azov, and traversed by the river Donetz. It has an area of over 10,000 square miles, and yields bituminous coal in the west and anthracite in the south. Its production has greatly increased in recent years. Rostov and Mariupol are the ports of this region. Another valuable coal basin is that of Dombrovo, in southwestern Poland, and there is a less productive one in the south of the government of Moscow. The coal district to the west of the Urals is traversed by a line of railway. In the centre of the beet-root sugar producing country, about Kiev and Elizabethgrad,

is another vein of coal. With the increase and improvement of railway communication the output of coal has shown a marked increase. For 1868 the output for Russia (Poland excepted) was only 147,500 tons; in 1872 it reached 530,000 tons; and in 1899 it had increased to 13,705,000 tons. The chief obstacle to a more general use of coal throughout the empire is the expensiveness of transport by rail, which frequently even surpasses the price of the coal. For the smelting of metals the boundless forests furnish a more valuable and convenient material; and many years must elapse before these can be so much thinned as to make either the search for coal or the working of its objects of paramount importance. Naphtha springs are found in the province of Archangel, in that of Samara and elsewhere, but the better known and richer naphtha or petroleum springs are situated to the north and south of the Caucasus range, especially in the country around Baku. In this region there are immense underground stores of the valuable fluid, and the petroleum industry has developed enormously in recent years, so that since 1808 the output of Russian petroleum has exceeded that of the United States. In 1891 the United States produced 62 per cent, Russia 38 per cent of the total, while in 1901 the United States produced 38 per cent, and Russia 62 per cent, the situations being exactly reversed in ten years. The only other mineral products deserving of notice are quarries of granite and marble, both of which of excellent quality, are found near the shores and to the northeast of Lake Ladoga; and kaolin, which is worked in the governments of Kherson and Chernigov.

Climate.—As the country extends over 35 degrees of latitude, from the warmer regions of the temperate far into the regions of the frozen zone, it exhibits several marked diversities of climate, usually considered in four divisions—a polar region, including all the country north of latitude 67°; a cold region, extending from latitude 67° to 57° N.; a temperate region, from latitude 57° to 50° N.; and a warm region, from latitude 50° to 37° N. The characteristic features of the climate in general are a greater coldness and variableness than is common under the same latitudes in the more westerly parts of Europe. The mean annual temperature of the upper part of the Norwegian coast to its extremity at the North Cape is above the freezing point, whereas a considerable portion of Russia within the same, and even in a lower latitude, is below it. This is true of the whole of Russian Lapland as far south as 66°; and to the east of the White Sea the thermal line, indicating a mean annual temperature of freezing, descends so rapidly that on reaching the Ural Mountains it is found to be as low as 60°. The region to which the name of cold has been given has a mean annual temperature varying between 32° and 40°, but very unequally divided throughout the year, the cold in winter often sinking the thermometer to 30° below zero, or 62° below freezing, while the summer heat often raises it above 80°. At Saint Petersburg, considerably below the centre of this region, the mean annual temperature is rather above 40°; on the other hand, that of Kazan, situated at the very south extremity of the region, but much farther inland, is rather

below 36°. The temperate region, situated between lat. 57° and 50° N., has a mean annual temperature varying from 40° to 50°, and includes within it the far finest part of the Russian territory, though even there the thermometer has a very wide range, the summer heat, which suffices to grow melons and similar fruits in the open field, being often succeeded by very rigorous winters. The warm region, extending from 50° southward, well merits the name from its extreme summer heats, the thermometer in June and July standing commonly about 100°, and often considerably higher. It is not, however, free from the remarkable contrasts which a Russian summer and a Russian winter exhibit; for the Sea of Azov, situated almost in the heart of this region, usually freezes about the beginning of November, and is seldom open again before the beginning of April. In all the countries bordering on the shores of the Baltic Sea and the Arctic Ocean, and bounded on the west and north by the basin of the Volga, the air is charged with a superabundance of moisture, which descends in mists and frequent falls of rain or snow. Toward the centre, and still farther east, the superabundance of moisture disappears, though enough still remains to keep vegetation in full vigor even at the hottest season. Still farther south the want of rain is often felt, and long-continued droughts do frequent mischief. In general, however, the climates of all the regions are not unfavorable to health.

Forestry and Flora.—Forests are found chiefly in the more northern governments, particularly Archangel, Vologda, and Perm, and cover about 39 per cent of the total area of European Russia. In many of the central and southern governments a deficiency of timber is seriously felt, and many extraordinary expedients are resorted to in order to obtain adequate supplies of fuel. The governments most imperfectly provided with wood are Esthonia, Bessarabia, Kherson, Ekaterinoslav, and Astrakhan. The prevailing trees of the northern forests are fir, larch, alder, and birch. The oak is seldom found beyond lat. 61°. A considerable proportion of the surface still continues almost in a state of nature; and, where it is well wooded, it is a question whether any other mode of occupation would be equally productive. Russia possesses a vast number of phanerogamous plants, but the examination which botanists have made is incomplete and it is probable that many remain to be discovered.

Fauna.—Animals, both domestic and wild, are numerous in Russia. Among the latter are the bear, the wolf, wild hog, the desman, the mole-rat, the saiga, the bobak or Russian marmot, the elk, the bison, the lynx, and various animals which are hunted for their furs. Wild fowl abound, particularly near the mouths of rivers; among them the pelican frequents the shores of the Black Sea. Both on the coasts and in the rivers a great number of productive fisheries are carried on. In the Arctic Ocean whales are killed, and vast numbers of seals are taken. The rivers of the Caspian, particularly the Ural and Volga, and the Sea of Azov, are celebrated for their sturgeon. In the same quarters are also important salmon fisheries.

Land Tenure.—The political divisions of the Russian people comprise numerous grades of no-

bility, which are partly hereditary and partly acquired by military and civil service, especially the former, military rank being most highly prized in Russia. The clergy, both regular and secular, form a separate privileged order. The higher clergy were formerly possessed of great wealth, but much of their property was confiscated by Catharine II., who compensated them by state pensions. Previous to the year 1861 the mass of the people were serfs subject to the proprietors of the soil. The Emperors Alexander I. and Nicholas took the same initial steps toward the emancipation of this class; but a bold and complete scheme of emancipation was begun and carried out by Alexander II. The decree of emancipation was dated 3 March 1861, and began to come into execution within two years. There were about 22,000,000 of serfs belonging to private proprietors, and rather more than that number on the crown lands. By an imperial decree of 8 July 1863, lands were granted to the peasants on all the estates of the crown on a 49 years' rental equal to the former poll-tax, and as a freehold estate at the expiration of this period. A similar arrangement was made on behalf of the peasants on the lands of private proprietors. The redemption money of the serfs with their land was estimated at 16 $\frac{2}{3}$ years' purchase of their annual produce. Twenty per cent of this had to be paid by the serfs on procuring their emancipation, the remaining 80 per cent is guaranteed by the government, which levies it from the peasantry in a tax extending over 49 years. The emancipation of all the serfs on these terms was arranged for by July 1865, and from that date this form of servitude has ceased to exist in Russia. Since this change the cultivable land in Russia is mainly distributed among three classes. The crown holds nearly 35 per cent, the emancipated peasants about 20, while the remainder, with the exception of mines and town lands, is in the hands of the nobility and other landed proprietors.

Agriculture.—Russia is decidedly an agricultural country. Its progress in the science of agriculture has been slow, and the amount of produce obtained is due more to the natural fertility of the soil than to any ability displayed in extracting it; there being perhaps no country in Europe in which so much grain is obtained at so small an expense of skill and labor. In Livonia, however, and the Baltic provinces generally, and in some of the more celebrated wheat districts of the Ukraine, an improved husbandry has been introduced, and government, by the appointment of agricultural chairs in the universities, and the formation of model farms, is laudably endeavoring to extend the movement to other quarters. After deducting all the regions where the rigors of the climate, without making the growth and ripening of grain absolutely impossible, are incompatible with its culture as a regular branch of industry, vast tracts of land remain, where the soil is almost of inexhaustible fertility, and all the cereals are produced in such abundance as not only to meet the home consumption but leave a large surplus for export. The most important crops raised for food are rye, wheat, barley, oats, buckwheat, maize, and potatoes; and for other purposes, hemp, flax, hops, tobacco, and beet-root for sugar. The principal wheat districts are parts

of Poland, particularly the governments of Warsaw, Radom, and Lublin; the fertile alluvial tracts along the banks of northern rivers; and the governments of Volhynia, Podolsk, Kiev, and Poltava. Rye, from its natural adaptation to the soil, and its almost universal use as an article of food, is cultivated in every quarter up to lat. 65°. Barley ripens in lat. 67°, but is in far less general repute than rye. Oats are extensively grown in several governments, and more especially in the rich alluvial tracts of Archangel, where the peasants, after satisfying their own wants, grind the surplus into meal, and export it in considerable quantities to the coast of Norway. Maize forms one of the most important crops of Bessarabia, where a return of sixty-fold is said not to be uncommon. Potatoes are largely grown in Saratov, in Poland, and in the districts which border the Baltic; in the last partly for food, but much more for the supply of numerous distilleries, which are employed in converting them into brandy. Both hemp and flax are staple products. The former is grown to an immense extent in all the governments which border on the Ural chain, and on both sides of the upper course of the Volga, particularly in the governments of Tver, Yaroslavl, and Kostroma. Flax is also cultivated to a great extent in the same districts, but more especially in the governments of Olonets, Vologda, Livonia, and the southern parts of Finland. Both their fibre and their seed form most important articles of export from the ports of Riga, Saint Petersburg, and Archangel. Kitchen gardens, in many parts, attract considerable attention, and cabbages, turnips, carrots, and onions are occasionally cultivated on an extensive scale; in some of the districts bordering on the southern steppes the watermelon thrives amazingly, attaining immense size with little culture, and, while in season, forms a principal food of the lower classes. In Astrakhan, on the banks of the Volga, licorice grows with a luxuriance unknown elsewhere, and furnishes juice sufficient to form an important article of export. Few fruit trees are found beyond latitude 56° and their regular culture cannot be profitably carried on beyond latitude 53° N. There apples, pears, and plums become tolerably abundant; and farther south peaches, apricots, quinces, almonds, and pomegranates become common fruits. The vine and mulberry also are extensively cultivated, and considerable quantities both of wine and silk are obtained. In the Crimea extensive vineyards have been formed with plants selected with the utmost care, and several of the wines have already acquired a high name. Other governments have imitated the example, and the export of wine promises to become an object of great national importance. Among the principal districts in which the culture of the vine is regarded as an object of primary importance may be mentioned Bessarabia, Kherson, Kiev, Astrakhan, and the Don Cossacks. The last makes large quantities of a wine resembling champagne, which finds a ready sale in Saint Petersburg, Moscow, and many of the larger towns.

Stock-raising.—Horses of various breeds are raised, of which those in the north are generally small, but hardy; those of the central and south provinces large and well adapted for draft; and those of the Cossacks remarkable

for their spirit and endurance of fatigue, and their admirable adaptation for light cavalry. On several of the steppes horses still run wild. Cattle are much used, particularly in the south, for agricultural operations, and exist in such numbers that tallow and hides form very important articles of export. The best breeds are those of the Ukraine, Archangel, Bessarabia, and Grodno. In Livonia a great number of excellent cows are kept for the dairy, and much good cheese is made. The sheep are chiefly of three breeds—the original Russian, which is found in vast numbers in every part of the country, and though generally inferior, and producing a very indifferent wool, has been greatly improved by crossing with the merino and Saxon; the Kirghiz breed, remarkable for large size, a darkish-red color, long, but coarse wool, and more especially for their ponderous tails, from which from 30 pounds to 40 pounds of tallow are obtained, and existing in vast numbers on the steppes of the Volga; and the Circassian breed, not confined to the Caucasian provinces, but widely diffused in the Crimea, and among the Cossacks of the Black Sea and of the Don. The improved breeds of sheep are found especially in the Baltic governments of Livonia, Esthonia, and Kurland, but are rapidly spreading into other quarters. Goats are numerous in the south, where they are valued chiefly for their skins, which are used in making morocco leather. In some districts Angora goats are kept for their fleeces, which are remarkably fine, and manufactured into shawls. In the northern regions, bordering on the Arctic Ocean, large herds of reindeer are kept; and in the south, at the opposite extremity, among the Tartars of the Crimea and the inhabitants of the Caucasus, the camel is often seen.

Commerce.—Russian commerce is now very extensive. The chief trade is with Great Britain and Germany. Above a fifth of the exports go to the former, and the latter supplies about 40 per cent of the imports. The principal exports are timber, oats, flax, and tow, wheat, barley, eggs, and linseed. Raw cotton for manufacture is imported annually to the value of from \$30,000,000 to \$50,000,000. Wool and silk are also imported, as well as coal, machinery, iron, copper, lead, and ships. Besides Great Britain and Germany, a considerable trade is carried on with the United States, France, Austria-Hungary, Sweden and Norway, Egypt, Belgium, Italy, Turkey, and Denmark, as well as with China, Persia, and other eastern countries in tea, silk, etc., in exchange for furs, leather, and fabrics of European manufacture. The values of the general exports and imports (exclusive of specie) of European Russia for five recent years were:

| YEARS | Exports | Imports |
|------------|---------------|---------------|
| 1896 | \$413,180,000 | \$351,318,000 |
| 1897 | 435,972,000 | 316,000,000 |
| 1898 | 439,602,000 | 370,476,000 |
| 1899 | 376,188,000 | 390,288,000 |
| 1900 | 429,852,000 | 375,822,000 |

Manufactures.—In a country where so much land remains to be taken into cultivation, and population is very much scattered, manufactures cannot be expected to be carried on upon an extensive scale, except in a few leading towns. Considering the unfavorable circumstances the

progress of Russia in manufactures is much greater than could have been anticipated, and certainly much greater than it could have been had not the government done the utmost to promote it, both by the establishment of large model manufactories and various other modes of encouragement. The branches in which most progress has been made are leather, both ordinary and morocco, the latter particularly at Astrakhan, Torjok in the government of Tver, Kazan, and Taurida, in all of which the article produced is unsurpassed in any other country in Europe; cotton twist and cotton goods at Saint Petersburg, Moscow, and in the governments of Vladimir, Kostroma, and Piotrkov; woolen and linen goods in many parts of Poland, the governments of Kiev, Ekaterinoslav, Moscow, Kaluga, and most of the principal towns; silks, particularly in Saint Petersburg and Moscow; sail-cloth, at these two capitals, and also in the governments of Archangel, Riazan, and Novgorod; fine cashmere shawls, in the governments of Penza and Ekaterinoslav; fine carpets, at Kamenskoi, Smolensk, and Kursk; cordage at Archangel and in the government of Orel; metals, more especially iron and copper, in the government of Perm, and many other localities; firearms and cutlery, in the governments of Tula, Nijni-Novgorod, and Vladimir; swords and edged weapons near Zlato-ust, in the government of Ufa; plate-glass and crystal, at Saint Petersburg, Tula, Tver, and in the Donetz basin; paper, at Moscow, Saint Petersburg, Yaroslavl, Kaluga, and in Livonia; hosiery, at Sarepta and various other places; and oil, candles, soap, glue, tobacco, window glass, glass bottles, etc., in almost every important town. The total number of persons employed in manufactories, mines and other establishments as recently given was about 2,100,000, the yearly production being valued at \$925,000,000.

Shipping and Navigation.—The mercantile marine of Russia on 1 Jan. 1901 consisted of 3,038 vessels with an aggregate of 633,819 tons; this included 745 steamers of 364,360 tons, 715 sailing vessels aggregating 91,270 tons, and 126 steamers of 49,258 tons belonged to the Baltic; 416 sailing vessels of 24,100 tons, and 42 steamers of 8,396 tons belonged to the White Sea; 635 sailing vessels of 42,843 tons and 316 steamers of 186,774 tons belonged to the Black Sea and the Sea of Azov; while 527 sailing vessels of 111,246 tons and 261 steamers of 119,932 tons belonged to the Caspian Sea. In 1901, 1,109 Russian vessels of 727,000 tons aggregate and 3,987 foreign vessels of 3,049,000 tons aggregate, entered the ports of European Russia; and 1,349 Russian vessels aggregating 713,000 tons and 7,441 foreign vessels aggregating 6,823,000 tons cleared the same ports.

Canals and Railways.—Considering the vast extent of country, the seaports are numerous, being Archangel, in the Arctic Ocean; Saint Petersburg, Reval, Helsingfors, Libau, Riga in the Baltic; Odessa, Nicolaiev, Sebastopol, Theodosia, Batumi, Poti, Kertch, Mariopol, and some minor ones in the Black Sea; Taganrog and Rostov in the Sea of Azov; and Astrakhan, Baku, Petrovsk, Derbent, Krasnovodsk, Usun Ada in the Caspian. The great distances at which the seas containing these ports are situated from each other

and from the interior of the country must have confined the foreign trade within very narrow limits had not a remarkable number of internal feeders been provided, partly by nature and partly by art; by nature, in the magnificent streams which wind across the country in all directions, and owing to the general flatness of the surface are well adapted for navigation; and by art, first in the great system of canals by which the different basins to which these rivers belong have been made to communicate with each other, so as to give a continuous navigation from the Arctic Ocean to the Black Sea, and from the Baltic to the Caspian; together with a network of branch canals, by which all the great towns of the interior have ready access to their outports and to each other; and secondly in the system of railways, by which internal commerce will eventually be more thoroughly opened up. The railway system was begun by the Emperor Nicholas, and has been carried out more fully and comprehensively under his successors. Some of the lines are formed directly by the state, others by private companies under guarantees from government. The greatest railway undertaking in the empire is the Trans-Siberian line, now practically completed, from Chelyabinsk to Vladivostok and Port Arthur. The total length of railways open for traffic in the end of 1901 (including Asiatic Russia) was 36,526 miles, of which about 23,400 miles were state railways. European Russia had 27,500 miles of railway. Among the most important lines in operation are that which unites Saint Petersburg and Moscow with Warsaw, and through it with the railway system of Europe; the lines from Moscow to Nijni-Novgorod and Riazan, from Orel to Vitebsk, Voronezh to Rostov on Don, Dunaberg to Vitebsk, Kursk to Kiev and to Kharkov, Kharkov to Azov, and the line from Odessa to the interior.

Moneys, Weights and Measures.—The present currency system of Russia was fixed by laws passed in 1885 and 1897. The unit of account, represented by a silver coin, is the ruble of 100 kopecks, valued at 51.5 cents. There are three gold coins, the imperial (15 rubles and 10 rubles), 7.50 and 5 rubles. Besides the ruble the following are coined in silver: half-ruble or poltinnick (50 kopecks), quarter-ruble, and pieces of 20, 15, 10, and 5 kopecks. The copper coins are 5, 3, 2, 1, $\frac{1}{2}$, and $\frac{1}{4}$ kopeck. The law of 1897 fixed the currency on a gold basis. The ruble as the fifteenth part of the gold imperial is the unit in all payments and business transactions. The circulation of the silver pieces representing 1, $\frac{1}{2}$, and $\frac{1}{4}$ ruble is limited by a ukase of 1898 to three rubles per head of the population, and in ordinary transactions these coins are legal tender up to 25 rubles only. Notes of the value of 1, 3, 5, 10, 25, 50, 100 and 500 rubles are issued by the State Bank. By a ukase of 1897 the issue of paper money was restricted. Up to six hundred million rubles, the bank must secure its issue of notes by a gold reserve representing half the issue, and beyond that amount the gold reserve must be equal to the issue, ruble for ruble. Since 1877 the monetary unit of Finland has been the mark, equal to a franc. The coins in-

clude 20-mark and 10-mark gold pieces; 2-mark, 1-mark, $\frac{1}{2}$ -mark, and $\frac{1}{4}$ -mark silver pieces; and three smaller bronze pieces. One mark is equal to 100 pennia (singular, penni). Silver is a legal tender only up to ten marks. The Russian unit of length is the foot, equal to the British foot, and like it divided into 12 inches. Higher units are the arshin, equal to 28 inches; the sajene, equal to seven feet; and the verst, equal to 500 sajenes or 3,500 feet. A dessiatine is equal to 2,400 square sajenes, or nearly 2.7 acres. The standard of capacity for liquids is the shtof, equal to 2.7069 pints or 93.82 cubic inches. A vedro is equal to 10 shtofs. The unit of capacity for dry goods is the chetwert, equal to 5.774835 gallons. The pound, or unit of weight, is slightly greater than nine tenths of a pound avoirdupois. Forty pounds are equal to one pood. In 1886 the metric system of weights and measures was introduced into Finland.

Banking.—The continual fluctuations in the value of the paper ruble, and the troubles therewith, were ended in 1895 by the Ministry of Finance introducing a regular value for the paper currency, and by the law of 29 Aug. 1897, authorizing the issue of paper currency under certain conditions by the State Bank. (See MONEY, WEIGHTS, AND MEASURES.) The Bank of Russia acts in the double capacity of state bank and of a commercial bank, and has 113 branches throughout the empire. On 1 Jan. 1903 its assets were approximately \$907,516,000; its liabilities including a capital and reserve of \$27,500,000, were \$907,776,500. In 1902 there were 5,629 state, municipal, and postal savings banks with 3,935,773 depositors, and deposits amounting approximately to \$361,491,000. There were also 241 municipal banks, 133 societies of mutual credit, 42 banking companies, and 47 mortgage banks, the latter including state banks for mortgage loans to the nobility, and land banks for the purchase of land by the peasants.

Government.—The emperor (the *czar* or *tsar*) is an absolute ruler having entire control of the legislative, executive, and judicial functions of government, and being irresponsible for their exercise. Since the time of Peter I. the *czar* has been head of the church. The title *czar* was borne by the emperors until the time of Alexander II., who with his successors prefer to adopt the title of emperor. By a decree of Peter I. in 1722 the sovereign was authorized to elect his successor, without regard to the law of primogeniture. This was altered by Paul I., who in 1797 fixed the succession according to the law of primogeniture, with preference to the male line. Alexander I. recognized the duty of the emperor to govern according to law, and the right of the senate to remonstrate. It is a fundamental law of the realm, established by Peter I., that the sovereign and the royal family must be members of the orthodox Greek Church. By a decree of Alexander I. the issue of any member of the royal family marrying without the consent of the emperor forfeit the right of succession.

The administration is conducted under the control of the private cabinet of the empire by four great councils. The council of the empire, established on its present organization by Alex-

ander I. in 1810, consists of the ministers *ex officio*, the princes of the imperial house, and an unlimited number of members appointed by the emperor. It meets collectively under a president, and is also divided for administrative purposes into four sections, each of which has a separate president. The sections severally superintend the departments of legislation, civil and church administration, finance and industry.

The senate, established by Peter I. in 1711, is the high court of justice of the empire, and controls all the legal tribunals. It is divided into six sections, which administer the affairs of different provinces. All the sections now sit at Saint Petersburg. The senate consists of men of rank, not exclusively of the legal profession. Each section is presided over by a lawyer, who signs its decrees as the representative of the emperor. The minister of justice presides in the meetings of the whole senate. This court has the power to audit public accounts, the patronage of numerous offices, and the right to remonstrate with the emperor.

The Holy Synod, established by Peter I. in 1721, superintends the religious affairs of the empire. It comprises the metropolitans of Saint Petersburg, Moscow, and Kiev (president), the archbishops of Georgia and of Poland, and several bishops sitting in turn.

The committee of ministers is divided into eleven departments, each presided over by a principal minister and member of the council, who are assisted in the departmental work by subordinates. The various ministries are the imperial house, foreign affairs, war, navy, interior, public instruction, finance, justice, agriculture, public works, general control.

There are also imperial cabinets dealing with charitable affairs, public instruction of girls, petitions, and one dealing in sections with economy, mines, manufactures and legislation. Yielding to the popular demand for self-government, Nicholas II., 19 Aug. 1905, issued a manifesto granting a National Duma or Consultative Assembly (Gosoudarstvennaya Duma) of elected representatives from the whole of Russia, to take an active part in the elaboration of laws and discussion of measures for the welfare of the empire. See *History*.

Finance.—The chief sources of revenue are direct taxes, indirect taxes (customs, etc.), posts, telegraphs, mines, spirit monopoly, railways, and forests, and the principal items of expenditure are those represented by administration, public debt, army, navy, pensions, and railways. The total estimated revenue for 1902 was \$973,285,990, of which \$900,392,240 represented ordinary revenue. The total expenditure was made to amount to the same sum, and included \$887,956,740 of ordinary expenditure. The ordinary revenue thus exceeded the ordinary expenditure by about \$12,500,000. The total public debt on 1 Jan. 1901 amounted to \$3,105,280,000, much of it representing railway obligations. The debt charge included in the expenditure of 1902 amounted to \$143,230,000. The revenue and expenditure of Finland in 1901 were balanced at \$21,336,725, and the debt was \$22,289,775 almost all contracted since 1889.

Army.—The Russian army is recruited mainly by conscription, and its organization has been determined by laws passed in 1874, 1876, 1888, and 1893. All able-bodied males are liable

RUSSIA.

S. J. DE WITTE,

EX MINISTER OF FINANCE.

to military service from the age of 21 completed to the age of 43 completed, with the exception of doctors and teachers (in time of peace) and of the Christian clergy. The period of service comprises 18 years in the active army, of which four (five for the cavalry, horse-artillery, engineers, and some others) are passed with the colors, the rest in the reserve, while during the remaining four years required to complete his forty-third year the soldier belongs to the first section of the territorial army, which includes also those not drawn for active service during the whole 22 years of their liability. The second section of the territorial army includes all those drawn for service but not incorporated, for some reason, in the permanent army. The Cossack army is organized differently, and liability to service begins on the completion of the 18th year. The period of service is diminished in the case of those who possess certain educational qualifications. There are 25 army corps, namely, the guards (Saint Petersburg), the grenadiers (Moscow), 21 territorial corps having their respective headquarters at Saint Petersburg, Grodno, Vilna, Minsk, Warsaw (3), Simferopol, Odessa, Kiev (2), Kharkov, Kovno, Vinniza, Smolensk, Lublin, Vitebsk, Moscow, Dorpat, Brest-Litovski, and Riga, and the first and second corps of the Caucasus, with headquarters at Alexandropol and Tiflis respectively. Most of these corps are formed of two divisions of infantry, two brigades of field-artillery, one division of cavalry, and one section (two battalions) of horse-artillery, but the guards and the grenadiers have three divisions of infantry and three brigades of artillery, and the guards corps has two cavalry divisions and one brigade of horse-artillery, while the numbered corps also present some irregularities. There are also two cavalry corps, with two divisions each, having their headquarters at Warsaw. The total strength of the European army organized in the corps formations is therefore 52 divisions of infantry, 22 divisions and two brigades of cavalry, 52 brigades of field-artillery, and one brigade of horse-artillery. In time of war an army corps consists of two infantry divisions (each 18,000 men) and one cavalry division (4,000 men), comprising altogether 40,000 men. Each infantry division in war includes cavalry, artillery, etc., and each cavalry division includes artillery. The strength of a battalion is about 500 in peace and about 1,000 in war. The following table shows the approximate effective war strength of the Russian army in 1900:—

| | Infantry | Cavalry | Artillery | Engineers | Train |
|------------------|-----------|---------|-----------|-----------|--------|
| Field Troops... | 1,019,500 | 123,800 | 122,500 | 47,100 | 26,400 |
| Reserve Troops. | 691,500 | 99,300 | 46,670 | 10,300 | |
| Fortress Troops. | 162,600 | | 81,500 | 12,400 | |
| Reinforcements. | 285,000 | 48,900 | 38,600 | 7,840 | |
| National Defense | 695,600 | 22,350 | 28,450 | 4,100 | |
| Others..... | 41,000 | | | | |
| Total..... | 2,895,200 | 294,350 | 317,720 | 81,740 | 26,400 |

The grand total of all arms is 3,615,410, of whom 66,410 are officers. The fortresses of Russia are Alexandropol, Batumi, Brest-Litovski, Cronstadt, Dvinsk, Dünamunde, Ivangorod, Kars, Kertch, Kiev, Kovno, Libau, Novogeorgievsk, Odessa, Ossovietz, Ochakov, Poti, Saint Peters-

burg, Segri, Sevastopol, Sveaborg, Warsaw, Vladivostok, and Viborg.

Navy.—In 1901 the strength of the Russian navy was as follows, vessels in course of construction being included:— Battleships, 24 (7 first-class, 15 second, 2 third); coast-defense vessels, 9 (4 modern); armored cruisers, 3; first-class cruisers, 2; other cruisers (protected or belted), 16; torpedo gunboats, etc., 9; destroyers, 30; first-class torpedo boats, 43; other torpedo boats, 150; submarines, 1; and steam-yachts, training-ships, etc. The total personnel of the Russian navy is about 46,000.

Ethnology.—Ethnologically the peoples of Russia are comprised under two of the great divisions of the human race—the Caucasian and the Mongolian; but under each a considerable number of varieties are traced. The Mongolian stock in European Russia is represented by the Finns and their allies, and by the Kalmucks, who occupy some of the southeastern steppes, but have lost many of their distinctive features by intermarriage with Caucasians. Of the Caucasian stock the Slavonians, under the names of Russians, Poles, Lithuanians and Letts, Wallachians and Servians, form about nine tenths. Of these again, the Russians proper form the great body of the population, and are estimated at about 50,000,000. They occupy, with little intermixture, the central provinces between the Dnieper and Volga; form a vast majority in the north, between the Ural Mountains and the White Sea, and, in the south, between the Don and the Dniester; and are found, more or less intermingled with other varieties, in all other parts of the country. The Poles are found in the greatest number in their own country. In that part of it which in the dismemberment fell to the share of Russia they amount to about 9,000,000. The Lithuanians are found chiefly in northern Poland, and in the governments of Vilna and Minsk. They are estimated at about 1,500,000. Still farther north are the Letts, or as they are often called, the Kurs, from living chiefly in Courland. They are also the chief occupants of Livonia, are wholly devoted to agricultural pursuits, and may amount to 500,000. The Wallachians, and among them a few Servians, are found only in Bessarabia, between the Dniester and Pruth. Their language is a descendant of Latin mixed with foreign words. They, too, do not exceed 500,000. The Tchudes, or Finns, though they belong to the Mongolian race, have little or none of the characteristic Mongolian type of countenance. They are of middle size, fair complexion, and generally have light hair and blue eyes. They are settled on both sides of the Gulf of Finland, but on the north of the gulf form the two marked divisions of Finns proper and Laplanders, the former living south and the latter north of lat. 65°. To the south of the gulf the Finns occupy the far greater part of Esthonia and a small part of Livonia. Widely separated from the western Finns, though the mode of separation is not known, a great number of Tchudic or Finnish tribes are found occupying the western slopes of the Ural Mountains and the banks of the Middle Volga under the names of Syrienes, Permians, Voguls, Votiaks, Tchuvasses, Tcheremisses, Mordwins, and Teptiars. The most numerous are the Tchuvasses and Tcheremisses, who live together on both sides of the Volga,

in the neighborhood of Kazan, and are estimated at about 500,000. All the others do not exceed the same number. The second great branch of Mongolians inhabiting Russia are the Tartars, who here form four distinct tribes—the Tartars of Kazan, in some respects the most civilized nation in Russia, though the great majority of them still cling to Mohammedanism, and numbering about 230,000; the Bashkirs, occupying both sides of the Ural Mountains from lat. 56° to 54° N., still given to wandering life, and amounting to about 130,000; the Nogais, occupying a large part of the Crimea and the steppe to the north of it, dispersed over the country east of the Sea of Azov and the northern base of the Caucasus, and amounting in all to about 600,000; the Metcheriaks, forming a few small tribes, not exceeding 20,000 persons, live among the Bashkirs. The German or Teutonic race inhabiting Russia consist chiefly of Germans and Swedes, intermixed with a few Danes. The Germans are dispersed over the Baltic provinces south of the Gulf of Finland, among the Letts and Esthonians, where they constitute the greater part of the nobility. They are also numerous in Saint Petersburg, Moscow, and other mercantile towns and seaports, and a considerable number of German colonists are settled in the government of Saratov and other parts of the Middle Volga. The Swedes are numerous both along the eastern shores of the Gulf of Bothnia and the northern shores of the Gulf of Finland. Their number in these localities, and more particularly in Esthonia, is supposed to exceed 100,000. The Greeks, dispersed over all the southern provinces as merchants, and in the Crimea, where they are the sole occupants of several villages, are estimated at about 500,000. There are also the Jews, who are seldom found in the central and northern provinces, but are very numerous in ancient Poland, particularly in the governments of Vilna, Grodno, Volhynia, and Podolsk, where they form the far greater part of the urban population. Their number is supposed to exceed 2,900,000.

Population.—As given in the table of the official divisions of the empire, the total population according to the census of 1897 was 129,004,514, of which 106,264,136 were resident in European Russia. The average proportion of women to men is 99.8 women to 100 men, although in the Russian provinces and Finland it is respectively 102.8 and 102.2 women to 100 men. The natural annual increase is over 1,700,000.

Education.—About \$20,000,000 per annum are expended by the State on education. Including secondary and primary schools, the number of educational establishments maintained wholly or in part by government amounts, so far as can be ascertained, to about 50,000, the pupils numbering about 2,500,000. The country is divided into educational districts, but the organization of the means of education is as yet little more than adequate for the education of public officials, and the great mass of the population is wholly uneducated. There are universities at Moscow, Saint Petersburg, Kiev, Kharkov, Yuryev, or Dorpat, Warsaw, Kazan, Odessa, and Tomsk. In Finland, which has a separate system, education is nearly universal, and there is a university at Helsingfors.

Religion.—The established religion of Russia is that of the Eastern or Greek Church. (See GREEK CHURCH.) The Russian Church is established independently under the emperor as supreme and the Metropolitan of Novgorod as ecclesiastical head. It maintains friendly communion with the patriarchates of Constantinople, Jerusalem, Antioch, and Alexandria, and recognizes the authority of the joint patriarchate and of the councils of the whole Eastern Church in matters of doctrine. Religious toleration cannot be said to prevail in Russia, except in favor of foreigners. The members of the orthodox church are not allowed to change their creed. There are, however, considerable sects of schismatic Greek Churchmen. The Greek Church, all sects included, is estimated to number in European Russia 75,000,000; the Roman Catholics, 8,300,000; Protestants, 2,950,000; Jews, 3,000,000; Mohammedans, 2,600,000.

Judiciary and Local Government.—Various parts of the empire are governed by different codes, the laws and institutions of Finland and Poland being partly respected, the former having a quasi-independent form of government. The provinces are under general governors, who exercise a general control of the administration in the name of the emperor. Zemstvos or district and provincial assemblies since 1866 administer the economic affairs of their respective districts, and to them are due much of the reform inaugurated since that date. The country is subdivided into *mirs* or communes, which have the free administration of local affairs. Finland has nominally preserved its ancient constitution with a national parliament of four estates, but is really governed by a governor-general and senate appointed by the emperor. Poland was finally incorporated with Russia in 1868. A voluminous code, called the *Svod Zakonow* or *Corpus Juris*, has been drawn up for the empire, and declared to contain the law of Russia in so far as not modified by the laws and privileges of particular provinces. It contains an abstract of all the laws and ordinances issued by the different emperors from 1649 downward, and forms 15 large volumes. The laws and ordinances in full, but reaching only to 1832, are contained in 56 volumes; of this immense collection eight volumes belong to the first seven years of the reign of the Emperor Nicholas I.

Language.—The Russian is by far the most important of the Slavic languages and it stands in close connection with the other branches of that family. Its underlying element is Slavonic, but there are additions from Mongol, German, and French sources as well as from the ancient classic languages. It may be divided into two dialects, the Great Russian and the Little Russian, the first being the vernacular in the east and centre of the empire, the second in the Ukraine. The Russian is a highly inflected language, possessing seven cases, and a large number of modal modifications for the verb. It is especially rich in augmentatives and diminutives, which, upward or down, may be carried through several degrees of intensity. A still more copious source of word formation is the susceptibility of the roots to manifold development, so that according to Shishkof as many as 2,000 derivatives are often formed from a single root. Great freedom of construction is rendered pos-

THE CZAR REVIEWING A RUSSIAN REGIMENT.

sible by the free use of inflections. The standard dictionaries are Dahl, 'Dictionary of the Russian Language'; and the 'Dictionary of the Church Slavonic and Russian Languages' (1847), a new edition of which is now in the course of publication under the direction of the Imperial Academy of Science. The most important work on the grammar of the language is that of Bousslayeff (1881). In English there are: Alexandroff, 'Complete Russian-English and English-Russian Dictionary' (1897-9), and 'A Practical Method of the Russian Language' (1892); Riola, 'How to Learn Russian'; Motti, 'Russian Conversation Grammar.'

History.—The foundation of the Russian empire is assigned by the earliest chroniclers to Rurik (q.v.), a Scandinavian chief, who about the year 860 established himself in the city of Novgorod, summoned thither by the Slav inhabitants to bring peace to a country distracted by civil strife. A part of the Varangians, as the Northmen were known to the Slavs, advanced south and established themselves in Kiev. Rurik was succeeded in 879 by his infant son Igor, but the government was in the hands of his kinsman Oleg, who extended the Varangian power to the west and south and in 882 made himself master of Kiev, leading thence a victorious expedition against Constantinople. Igor (912-945) made an unsuccessful expedition against the Byzantines and fell in battle against one of the rebellious Russian tribes, being succeeded by his son Sviatoslaff (945-972). During half of his reign he remained under the tutelage of his mother Olga, who about 950 embraced the Christian faith. Sviatoslaff waged successful war against the Bulgarians, but met with defeat at the hands of the Byzantines and perished during a revolt of the Petchenegans. The empire was divided among his three sons, with resulting confusion, till unity was restored by Vladimir the Great or the Saint (980-1015), who, an ardent pagan in his early life, embraced Christianity about 988 on receiving in marriage Anna, sister of the Byzantine emperors, Basil II. and Constantine. Soon the nation followed the example of its ruler, who was zealous in the extension of the new faith, Kiev became the seat of a metropolitan, and Russia, in adopting the Greek confession, definitely submitted to the influence of the Byzantine civilization. Vladimir left a realm extending from the northern lakes to the Dnieper and from the Vistula to the Volga, for his eight sons to quarrel over. One of them, Sviatopolk, ruled in Kiev till 1019, but was overthrown by his brother Yaroslaff, whose power after 1034 was undisputed. Under him the process of assimilation between Varangians and Slavs attained fair completeness and we have the beginning of the modern Russian people. Yaroslav divided his dominions among his five sons who ruled at Kiev, Vladimir, Smolensk, Tchernigov, and Peryeslavl, with the ruler of the first as over-lord. This arrangement lasted but a short time and there followed 50 years of confusion, in the course of which the empire was torn up into numerous principalities whose strife prepared the way for a foreign conqueror. Noteworthy among the grand-princes of Kiev of this period are Sviatopolk (1003-1113), who waged long wars against the Polovtsees, and Vladimir

Monomachus (1113-25), who did much to improve the condition of the peasantry. Of the Russian principalities which arose about this time the most important were Kiev, which exercised an indefinite overlordship over the other states; Novgorod, extending from the southern Dvina and the upper Volga to the White Sea; Polotsk to the southwest of Novgorod; Smolensk to the south of Polotsk; Volhynia and Halicz in the west; Tchernigov between the Dnieper and the Oka; and Susdal on the upper and central Volga. Of these Novgorod (q.v.) was the most powerful under a government which was essentially republican. It was also the richest of the Russian cities and an influential member of the Hanseatic League. In 1222 the storm of Mongol invasion broke upon Russia and in the following year the princes of Kiev, Halicz, and Tchernigov were defeated in a great battle on the Kalka. The full force of invasion, however, did not come till 1237, when Batui-Khan (q.v.) with an immense army entered Russia, took Ryazan, Vladimir, and Moscow, and overthrew the army of the Prince of Vladimir on the river Siti in 1238. By 1240 all Russia with the exception of Novgorod had been reduced and in 1242 it was placed under the authority of the Golden Horde or Khanate of Kiptchak, whose rulers made and unmade princes at their will, though no attempt was made to intervene in the internal affairs of the various principalities. The country, which had suffered fearful devastation during the conquest, was now ground down by heavy impositions of tribute, and all attempts at throwing off the foreign yoke met with bloody retribution. Novgorod, the last of the Russian principalities to submit, fell toward the end of the 13th century. The effect of the Mongol conquest on the state of civilization in Russia was deplorable and may be said to have rendered that great empire what it still remains, the most backward country of Europe, after Turkey.

Kiev and Tchernigov had been destroyed during the wars of Batui-Khan and the centre of power now shifts to the north where Vladimir for a time was the most important of the Russian principalities; the most noted of its rulers was Alexander Nevski (1252-63), who won notable victories over the Swedes and the Livonian Sword Bearers. The succeeding period witnessed Russia's deepest degradation brought about by internal strife among the princes whose dissensions served only to fix the Mongol yoke more firmly on the people. Vladimir in the course of time yielded precedence to Tver and Moscow, between which a long contest ensued for supremacy, ending in the triumph of the latter, whose period of ascendancy begins with the Grand Prince Ivan Kalita in 1328. Ivan beautified Moscow, built the Kremlin, and by winning the favor of the Khans retained the succession in his family. His son Simeon the Proud (1340-53) extended the power of Moscow, and Simeon's grandson Dmitri (1362-83) thought himself strong enough to rise against the Mongols, over whom he gained a splendid victory on the Don in 1380, acquiring thereby the surname Donskoi. Moscow, however, was taken and burned and Dmitri was forced to renew his allegiance to the Khan. His son Vassili II. (1389-1425) raised the power of

RUSSIA

Moscow to a higher point than ever and under his successor Vassili III. (1425-62) great increases in territory were made by the annexation of neighboring principalities in spite of long years of civil confusion. The power of Moscow was still further increased by the disruption of the Khanate of Kiptchak into a number of independent hordes or khanates, among which the Khanate of Kazan was brought under the authority of Moscow by Ivan III. the Great (1462-1505), who in 1478 reduced Novgorod and in 1480 helped to overthrow the Khan of the Golden Horde, whereby Russia was freed from the Mongol yoke. In 1472 Ivan married Sophia, niece of the last Byzantine emperor, and, pretending to imperial honors, assumed the title of Grand-Prince and Autocrat of Russia. He made an attempt to introduce western civilization into Russia but proved less successful as a reformer than as a warrior. At his death he left a realm increased nearly fourfold by conquest in the east, the south, and the west. His son Vassili III. (1505-33) furthered the introduction of the European arts. He left an infant son Ivan IV. (1533-84), who grew up in the unfavorable atmosphere of a dissolute court and assumed personal power in 1547 at the age of 17, first making use of the title Czar. Ivan overthrew the Khanates of Kazan and Astrakhan and waged repeated wars with the Tartars of the Crimea, who in 1571 raided and burned Moscow and carried off an immense number of prisoners. He attempted to gain an outlet for Russia on the Baltic but failed against the hostility of Sweden and Poland. The establishment of commercial intercourse with England by way of the White Sea led to the coming of large numbers of western artists and mechanics who were welcomed by Ivan. In his reign, too, began the conquest of Siberia (q.v.) by the Cossack Yermak. Within the realm Ivan devoted himself to crushing out the privileges of the Boyars or nobility and to render his will absolute in every field. He succeeded in attaining his end by acts of the most fearful cruelty which earned for him the name of the Terrible. Novgorod, which attempted to make common cause with Poland, was stormed and subjected to massacre and plunder for five weeks, in the course of which 60,000 of the inhabitants are said to have perished. Ivan IV. was succeeded by the weak Feodor I. (1584-98), who left the affairs of government to his brother-in-law Boris Godunoff. The latter, aiming at the throne, brought about the death of Feodor's younger brother Dmitri, and on the death of the Czar (the last Rurik) was elected to succeed him. His rule (1598-1605) was unpopular and widespread dissatisfaction provided the opportunity for the appearance of a number of pretenders claiming to be the murdered Dmitri. The first of these, with the aid of the Polish king, overthrew Boris in 1604 and on the latter's death in the following year, was crowned at Moscow. He was dethroned and killed in the following year and Vassili Shiuski was chosen to the throne. A new pretender now appeared, Vassili was forced to abdicate, a faction of the Boyars chose Ladislas, crown prince of Poland, for their ruler, and a Polish army took possession of Moscow. There followed two years of anarchy till a national uprising headed by Minin and Pozharsky drove the Poles from the capital (1612), where-

upon Michael Romanoff, a youth of 17, was chosen to the throne by a representative assembly (1613).

The new Czar, who during the first part of his reign was under the influence of his father, the patriarch Feodor Philarete, devoted his energies to restoring order to the distracted country and concluded peace with Sweden and Poland at the cost of much Russian territory. Michael died in 1645 and was succeeded by his son Alexei Mikhailovitch (1645-76), under whom a popular revolt occasioned by the misgovernment of certain court favorites led to a thorough reform of the laws and the administration of justice, effected by the enactment of a new code, the *Uloshenic*. In the war between Sweden and Poland, which broke out in 1653, Russia, as the ally in turn of either party, met with final defeat at the hands of Sweden. From Poland, however, it obtained by the treaty of Andrussov in 1669, Little Russia east of the Dnieper, Kiev, and Smolensk. The changes effected at this time by Nekon, the patriarch of Moscow, in the dogma and ritual of the Church, though accepted by the majority of the nation, created the sect of Old Believers or Raskolniki (q.v.), who carried their hatred of innovation into the secular field and sought to combat the introduction of western civilization into the country. Alexei was succeeded by his eldest son Feodor Alexeievitch (1676-82), who continued the reform policy of his father by abolishing the old nobility of office and creating a new aristocracy in its place. Upon Feodor's death without issue, his half-brother Peter, a child of 10, was chosen Czar in accordance with the dead monarch's will. Ivan, a full brother of Feodor and a youth of 16, was passed over because of his mental infirmities. A revolt in his favor, however, led to the acknowledgment of both brothers as co-rulers under the regency of Ivan's sister Sophia, a woman of great ambition and power of will, who entered into an unsuccessful war with Turkey, repressed a rising of the Old Russian party, and the Raskolniki and, when Peter, with advancing years, began to assert his authority, plotted to bring about his death with the aid of the Streltsi, the body of royal troops first organized by Ivan the Terrible. Peter escaped from the power of the Regent and in the brief struggle which followed, Sophia was overthrown, the Streltsi were severely punished, and as Peter I. (1689-1725) the founder of Russia's greatness as a European power began his reign. Ivan retained the title of Czar till his death but exerted no influence in the government. Given in detail under his own name, Peter's services to his nation may here be closely summarized. Externally he made it his life's task to gain for Russia an outlet on the western and southern seas, the only seaport in the empire at that time being Archangel on the ice-covered White Sea in the north. The conquest of the Black Sea coast land began with the capture of Azov in 1696. A short period of peace during which the young Czar repressed a formidable uprising of the Streltsi, destroyed that famous corps and organized an army on the western model, was followed by Russia's entrance into the northern war as the ally of Poland against Sweden. Peter's army was badly beaten by Charles XII. at Narva, in 1700, but the Czar profited by ill-success, reorganized his forces, and at Pultova in 1709 over-

RUSSIA

threw Charles, who was forced to seek refuge with the Sultan. The latter was incited to war against Russia, and in 1711 Peter, caught with his army in a trap on the Pruth River, was forced to purchase peace by the surrender of Azov. In the north, however, the Russian fortunes had prospered. Shortly after Narva Peter had made himself master of parts of Esthonia, Livonia, and Ingria, and in 1703 had laid the foundation of his new capital, Saint Petersburg, on the banks of the Neva, in territory conquered from the Swedes. By the treaty of Nystadt, in 1721, Russia was confirmed in possession of these Baltic lands, and secured in addition parts of Carelia and Finland, succeeding thus to Sweden as the leading power in the north of Europe. A three years' war with Persia during the last part of Peter's reign resulted in the conquest of a portion of the southern coastland of the Caspian Sea. Internally Peter's efforts were directed to the introduction of western civilization into his dominions and to a very great degree he was successful. The industries, schools, and arts of western Europe were brought in and forced by the Czar upon an unwilling people for their good. Far less successful was his attempt to engraft western refinement and habits of thought on a nation whose ideals were half patriarchal and half Oriental. The anomalies of the Russian character, which at the present day present so much that is puzzling to the western mind, may be traced to this artificial amalgamation process pursued by Peter the Great. To enforce his will, the Czar must of needs be absolute within his dominions and Peter carried the centralization of power to the extent of abolishing the patriarchate and vesting the ultimate control of the Church in his own person.

Peter's only son Alexei had died during his father's lifetime, and the crown passed to the wife of the dead monarch, Catharine I., who was succeeded in 1727 by Peter II., a son of Alexei. On Peter's death in 1730, the Privy Council, in which the influence of the families of Galizyn and Dolgorouki was predominant, called to the throne Anna Ivanovna (1730-40), Duchess of Courland and a daughter of Peter the Great's half-witted brother Ivan. Defeating an attempt of the aristocracy to limit her powers, she left the affairs of government to her favorite Biron, a native of Courland, who soon aroused the hatred of the Russian party. A war with Turkey in 1735-9 resulted in the permanent acquisition of Azov, but at the same time Peter's conquests in Persia were abandoned. Anna Ivanovna died in 1740, leaving the throne to her infant grand-nephew Ivan (1740-1) under the regency of Biron. The latter, however, was speedily overthrown and Anna Leopoldovna, mother of the young Czar, became Regent with Marshal Münnich (q.v.) as her chief adviser. A conspiracy headed by the French ambassador at Saint Petersburg brought about, in the same year, the fall of Anna Leopoldovna and the entire German faction, and the elevation to the throne of Elizabeth (1741-62), the daughter of Peter the Great. Under the influence of England, Russia entered the war of the Austrian Succession as an ally of Austria and in the Seven Years' war, Elizabeth's hatred for Frederick the Great made her a bitter opponent of Prussia. The Russian armies gained victories over Frederick's generals at Gross jagersdorf

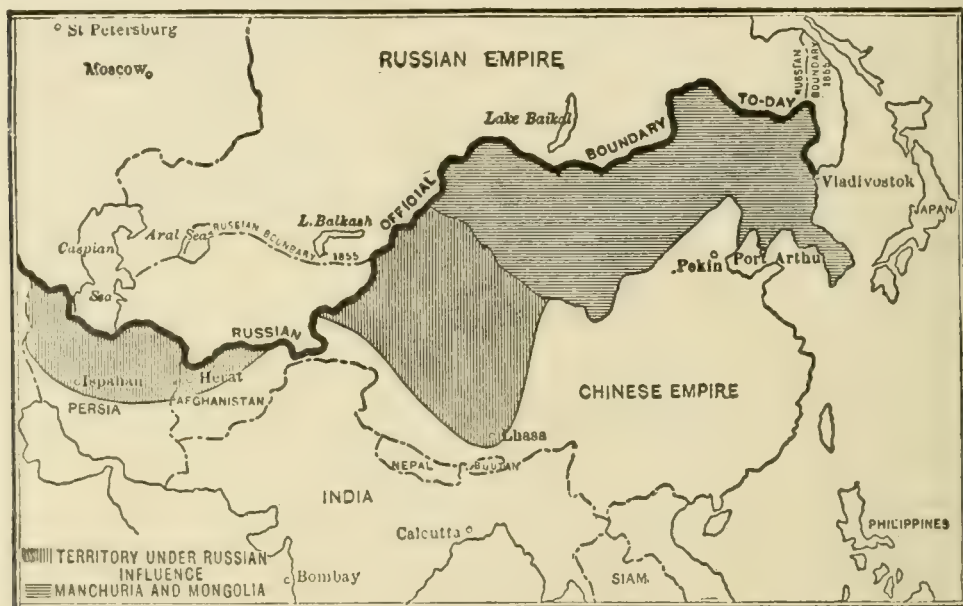

(1758), and Kunersdorf (1759), raided Berlin in the following year, and overran East Prussia. This reign is noted for the progress made in the spread of education and general culture. The University of Moscow, the first in Russia, was founded in 1755. Elizabeth was succeeded by Duke Peter of Holstein-Gottorp, a son of Peter the Great's second daughter Anna, who in less than a year fell a victim to a conspiracy of which his wife, Catharine, was the leading spirit. After Peter's death by violence, Catharine, the second of that name, ascended the throne, one of the most dissolute women of her time and one of the greatest rulers of all times. During her long reign (1762-06) Catharine II. labored incessantly for the internal development of the empire. Commerce and industry were encouraged, education was furthered, the laws and the systems of administration were reformed. Abroad the power of Russia was tremendously enhanced at the expense of Poland and Turkey. In the dismemberment of the former (see POLAND) Catharine was the leading spirit and by the threefold partition of that country, enormous territorial gains were made. In the first war with Turkey (1768-74) Russia acquired the land between the Dnieper and the Bug and the right of free navigation on the Black Sea. The Sultan renounced his overlordship over the Crimea, which soon after fell to Russia. In a second war (1787-92) Russia acquired the land between the Bug and the Dniester. Courland was annexed in 1795 on the death of its last duke. Catharine II. was succeeded by her son Paul I. (1796-1801), whose tyrannous acts, proceeding rather from a gloomy suspiciousness of character than innate cruelty, aroused general dissatisfaction. He was assassinated by a number of the highest dignitaries of the court and the crown passed to his son Alexander, who had been a party to the projected dethronement of his father, though possibly not to his murder.

Alexander I. (1801-25) devoted the first year of his reign to carrying into effect the lofty ideals of government implanted in him by his tutor La Harpe (q.v.). Reforms in administration and the laws were enacted, the finances were partially reorganized, education was encouraged, and the condition of the serfs ameliorated in part. In the Baltic provinces villeinage was abolished. Soon, however, the Czar found himself drawn into the vortex of the Napoleonic wars. Paul I. had entered the struggle against the French Republic and the victories of the Russians under Suvaroff in northern Italy (1799) had driven the French from that region. Later Paul had withdrawn from the coalition and with Sweden, Prussia, and Denmark had formed the armed neutrality of the North aimed against the pretensions of Great Britain. Alexander I., on his accession, had made peace with England and now, in 1805, he joined the third coalition against France. The Russians shared in the disastrous defeat at Austerlitz, and in 1807, as an ally of Prussia, suffered a crushing defeat at Friedland (q.v.). In the peace of Tilsit Alexander I. and Napoleon came to terms whereby the former, in return for abstaining from intervention in the affairs of western Europe, was permitted to work his will on Sweden and Turkey. Finland was wrested from Sweden. Turkey after a six-years' war (1806-12) was forced to cede the lands east of the Pruth.

RUSSIA

From Persia the Caspian coastland around Baku was acquired. The failure of Alexander I. to lend support to Napoleon's continental system brought on war between the two in 1812. There followed the invasion of Russia by the Grand Army of France, the disastrous campaign, and the pitiful retreat with its ultimate outcome in the total overthrow of the great emperor. (See NAPOLEON I.) In the rising of Europe against Napoleon in 1813 Alexander assumed the leadership. The Russian armies took a very important part in the final campaigns of 1813-14, and the terms of peace with France, the restoration of the Bourbons, and the rearrangement of the political system of Europe at the Congress of Vienna were largely the work of the Czar and of Metternich. The Congress of Vienna created the kingdom of Poland, which it bestowed on Alexander I. The Czar until his death was the most powerful monarch of Europe, whose destinies he controlled in considerable measure

of Nicholas I. was one of ruthless repression and intellectual gloom; Nicholas was an autocrat whose will was law and whose instruments were the army and the police. Abroad Russia's position was of the highest, until the very close of the reign. War with Persia (1826-8) resulted in the conquest of part of Armenia. War with Turkey (1827-9) brought about the acquisition of another portion of Armenia, and established the independence of Greece and the autonomy of the Danubian principalities. The national consciousness was stirred by the revolution of the Poles in 1830, the ancient enemies of Russia. The insurrection was suppressed with great severity and Poland was incorporated with Russia. (See POLAND.) In 1833 Nicholas I. came to the aid of the Sultan against Mehemet Ali and in 1848-9 the Russian armies aided the Austrian forces in suppressing the Hungarian revolution. In 1853 Nicholas, assuming the role of protector of the Orthodox Christians in Turkey, declared

Map showing Russian advances in Asia during the last fifty years.

through the Holy Alliance (q.v.). At home, the fair promise with which his reign had begun came to naught and the desire for a thorough reform of the state, stimulated by contact with the ideas of the French Revolution, remained unsatisfied.

Upon the death of Alexander I. without issue it became known that his brother Constantine, the next in the order of succession, had renounced his rights to the crown. Nicholas, the youngest brother of the dead monarch, refused to accept the crown until it became evident that Constantine was determined not to succeed. The uncertain condition of affairs was seized upon by a large number of officers as an opportunity for rising in arms with the purpose of liberalizing the state system. This revolution of the Decembrists, as the rebels were known, was repressed with energy by the new monarch, many of the leaders were executed and large numbers exiled to Siberia. Internally the reign

war against the Sultan, who was joined by England and France, alarmed at the growing influence of the Russian monarch. The Crimean war (q.v.) which followed destroyed the Russian ascendancy in Europe. Internally financial disorder and industrial depression did much to discredit the absolutist system under which the country had been ground down for 30 years. The demand for thorough reform became general and received answer early in the reign of Alexander II. (1855-81), who succeeded his father in the midst of the Crimean war. The series of reforms began with a reduction in taxation and the size of the standing army, the building of railways was begun, the censorship was relaxed and an influential press created; measures for the spread of education were taken. On 19 Feb. 1861 the emancipation of the serfs was decreed after three years of preliminary investigation. About 23,000,000 serfs thus obtained their freedom and with the aid of govern-

NICHOLAS II, CZAR OF RUSSIA.

ment loans were set on the way toward acquiring ultimate possession of the lands they cultivated. Naturally the act of emancipation was not unaccompanied by disorder and dissatisfaction consequent on the sudden change from servitude to the responsibilities of freedom on the part of the peasants and in a number of ways the results were not so beneficent as had been expected; yet the liberation of the serfs was a great step forward in the development of the Russian people. It was followed by judicial reforms comprising the establishment of jury courts and by the institution of district and provincial assemblies which were intended to prepare the way for a national parliament on which all hopes of a thorough reform in the state were based. In 1863 the Poles rose in insurrection and though the uprising assumed no very formidable proportions, the strength of Russia was tried in its suppression. Like the uprising of 1831 the Polish insurrection of 1863 was followed by a great awakening of the Russian national consciousness, which took the form of a demand for the development of Russia not on western lines but in accordance with its own ethnic genius. This outburst of patriotism threw the reform movement in the background and the problems of emancipation failed to receive sufficient attention from the bureaucracy with consequent dissatisfaction among considerable classes of the population. The Nihilists (q.v.) began to agitate ideals of radical individualism and the reorganization of the state, and when the government sought to repress their activity a faction among them resorted to terrorism to bring about constitutional reforms. In 1878 began a series of personal assaults on high officials of state which led to correspondingly severe measures on the part of the government. Military rule became general in the empire and the secret police hunted down the leaders of the Nihilists who were punished with death or exile. Yet Alexander II., under the guidance of Loris-Meleikoff (q.v.), was planning to meet the demands of the Liberals by summoning a national assembly, when he fell a victim to the anger of the Nihilists, 13 March 1881. The progress of the Russian arms during the reign of Alexander II. was of the utmost importance. The conquest of the Caucasus was completed in 1864, and central Asia came under the Russian authority (Tashkent, 1867; Samarkand, 1868; Khiva, 1873; Khokand, 1876). By the treaty of Aigun (1858) China ceded to Russia the territory of the Amur. In Europe the Czar, for services rendered Germany in 1870-1, succeeded in obtaining in return, the abolition of those provisions of the treaty of Paris (1856) which restricted the Russian power in the Black Sea. Revolts in Herzegovina and Bulgaria in 1875-6 led the Panslavists in Russia to demand intervention in behalf of the Christian population of the Balkans oppressed by the Turkish power. In 1877 Russia declared war against Turkey and a simultaneous attack was begun on the Turkish power in Europe and the Caucasus. On 27 June the Russians crossed the Danube and on 13 July Gen. Gurko crossed the Balkans and advanced to within two days' march of Adrianople. The Russian fortunes then suffered a reverse. Osman Pasha (q.v.) held out in Plevna for 20 weeks against repeated assaults until all hopes of successful resistance were gone (10 Dec. 1877).

Gurko, too, had been driven back, but in the end of December he recrossed the Balkans, and being joined by a second army which on 9 Jan. 1878 captured the Turkish forces at Shipka Pass, made an end of Turkish resistance at Philippopolis, 17 January, occupied Adrianople, and advanced on Constantinople. On 3 March Turkey concluded the Peace of San Stefano, by which Russia acquired a part of Armenia with Ardahan, Batum, and Kars. The independence of Rumania, Servia, and Montenegro was recognized by the Porte, and an autonomous Bulgarian state, extending to the Aegean Sea, erected. The terms of the treaty of San Stefano were radically modified, however, at the Congress of Berlin (q.v.) in the same year.

Alexander II. was succeeded by his son Alexander III. (1881-94), whose reign marked a sharp reaction from the liberal ideals of his father. The Czar was under the influence of the reactionaries Ignatieff, Pobiedonostseff, and Katkoff, the leader of the Old Russian party. The Nihilists were persecuted relentlessly and their repeated attempts on the life of the Czar only confirmed the monarch in his repressive course. The universities were placed under strict supervision and the policy of crushing out all nationalities within the empire but the Russian and all religions but the Orthodox was ruthlessly carried out. The censorship was re-established in all its severity. Within two or three years after the accession of Alexander III. terrorism had been well suppressed, but the subsequent development of a revolutionary labor movement took place in spite of the activity of the police. Under Nicholas II. (1894-) the policy of reaction was continued though in a somewhat modified form. The new ruler was still under the influence of Pobiedonostseff, head of the Holy Synod, and other advocates of repression against whose ascendancy his naturally enlightened impulses could but rarely assert themselves. We may find the Czar's initiative in the rescript of 1898 issued to the nations of the world and calling on them to take steps leading toward disarmament and the establishment of permanent international peace. This was followed by The Hague Peace Conference and the erection of an international court of arbitration at the Dutch capital. The policy of Russification begun under Alexander III. was steadfastly pursued under his successor, the chief field of activity being the Baltic province, Poland, and more prominently Finland (q.v.). In close connection with this policy stand the laws of exception against the Jews who, beginning with 1881, have been subjected to almost unrelenting persecution. When Finland passed to Russia in 1809 Alexander I. had guaranteed the preservation of its autonomy and its language and religion. But, though this guarantee has been renewed from time to time, it did not prevent the Russian government from beginning a determined attack on the liberties of the country. The process reached its height in 1902 when the authority of the Finnish Senate was rendered subordinate to the governor of the duchy appointed by the Czar, who at the same time was given control over the entire administration. Russian was made the official language and the destruction of the Finnish tongue was sought by the suppression of newspapers and periodicals on supposedly political grounds. All

attempts at resistance on the part of the Finns have been sternly repressed by Governor Bobrikov, and it is only a question of time when Finland shall have lost her liberties as Poland has lost hers. Milder methods of a similar nature have been pursued in the Baltic provinces where Russian has been made the language of the courts, the schools, and the universities, and even the ancient names of well known cities have been changed from German into Russian. In 1882 came the May laws, brought forward by Ignatieff, imposing numerous restrictions on the Jews in respect to rights of residence and occupation, admission to educational institutions, and eligibility to public office. Most oppressive of these provisions is the one forbidding them residence in the greater part of the empire and concentrating them within the Pale of Settlement (15 provinces) in the western provinces, where, crowded together in the towns, the great mass of them has sunk to an abject economic condition. The spirit of anti-Semitism has grown among the Russian population owing to conceived objectionable traits of Russian Hebrews, but it must be admitted that to the agitation of anti-Semitic journalists and the deliberate policy of the government must be ascribed such popular anti-Jewish outbreaks as occurred in May 1903 at Kisheneff, when more than 50 Jews and a number of Christians lost their lives.

The appointment of men like Bobrikov as governor of Finland and Sipiagin as minister of the interior had shown clearly that the government intended to pursue the old policy of repression of liberal movement, and the revolutionary party again resorted to their former and favored means of retaliating the despotic measures of the government. Within the short space of two years quite a number of political murders have been perpetrated. Minister of Public Instruction Bogolepoff was killed by a student Karpovitch, soon after Minister of the Interior Sipiagin was killed also by a student, Stepan Balmashiev. The revolutionary propaganda spread like fire throughout Russia and resulted in continuous strikes, riots and uprisings of peasants. In the provinces of Poltava, Kieff and Charkov peasants rose up against the landed proprietors, burned their estates and accompanied these acts by robbery and violence. Troops were sent against them and these insurrections were suppressed with ruthlessness and cruelty, reminding of the Dragonades under Louis XIV., whole villages having been given to the rapacity of soldiers. Finally the peasants were flogged into submission. In Zlatoust, Ufa province, on the Ural Mountains, the strikes assumed such proportions that the troops sent there had to kill and wound about 500 workmen. The cruelty in suppressing the strike cost the governor of the Ufa province, Bogdanovitch, his life, he having been murdered by the revolutionists in the public square of Ufa. In the beginning of 1904 the oppressive policy of General Bobrikov in Finland reached the point when patience ceased to be a virtue and he was shot dead within the walls of the Finnish Senate by the son of a general in the Russian army and a Finnish Senator, Schaumann, who, immediately after the deed, committed suicide. Only two months passed after the assassination of Bobrikov, when Minister of the Interior von

Plehve, who succeeded Sipiagin, was blown up by a dynamite bomb in the streets of Saint Petersburg. Numerous other attempts on the lives of the government officials took place within the last twelve months. Disturbances en masse occur every day and to this are now being added the riots of the reservists who are called to the army and who do not relish the prospect of being made food for powder. The tremendous expenditure of money necessitated by the war compels the government to resort to measures for increasing the revenue, which are not only burdensome upon the impoverished and almost starved population, but are enforced in the way which is repulsive, even to the materially better classes. The commercial depression, the unrest of the population, evident unpopularity of the war with Japan—no doubt had much to do with the selection from a different class of a successor to von Plehve.

The new minister of the interior, Prince Sviatopolk Mirski, is a man of liberal mind, kind hearted, of the highest honor and a scholar. After his appointment, all of a sudden, the press obtained fairer treatment, political exiles have been returned, and the arbitrary dealing with political suspects discontinued. The articles on the burning questions of the day, which now appear even in semi-official papers like 'Novoe Vremia,' are of such character that, under the regime of von Plehve, the writer would have been furnished with a free ticket to the remotest and most desolate part of Siberia and the paper suppressed. More than this, Prince Sviatopolk Mirski has arranged a meeting at Saint Petersburg of the presidents of the Zemstvos of all provinces for the discussion of different subjects with the ultimate purpose in view of putting an end to the present awful state of things in Russia. All the presidents presented their views in a memorial which is submitted to the Czar. The main demands of the Zemstvos are: freedom of the press, speech and conscience; equality of every subject before the law and discontinuance of the arbitrary actions of the officials by making them responsible for their actions before the people. This meeting of the representatives is a thing unprecedented in the annals of the Russian history. It reminds somewhat of the calling of the notables in France in the reign of Louis XVI. Should the Czar refuse to grant the reforms asked by the Zemstvos—the course adopted by Louis XVI.—something startling will take place in Russia. It is rumored that Sviatopolk Mirski declared he would resign should the request of the Zemstvos be ignored.

The foreign policy of Russia since 1881 has been of prime importance in the field of European and Asiatic politics. Alexander III. was a lover of peace and during his lifetime he remained a power for peace on the continent. Affairs in Bulgaria where the Russian schemes were frustrated by the influence of Austria and Germany, threatened war for some time after 1885, but led to no hostilities. The formation of the Triple Alliance was followed by a rapprochement between Russia and France which began to take on a more formal aspect after 1891 and resulted in the conclusion of a defensive alliance. In Asia, however, Russia's policy has been one of constant aggression. Its hold on Turkestan had been firmly fixed by 1881 and

RUSSIA

this was followed by the acquisition in 1884 of Merv, which brought the Russian power in close touch with the sphere of English influence in Afghanistan. In Persia, too, the Russian influence has been exerted toward gaining an outlet on the Asiatic waters. Conquest was consolidated by the building of railways of which the greatest is the Siberian railway planned to connect Saint Petersburg with the Pacific. The appearance of Japan as a factor in Asiatic affairs after her victory over China in 1894-5 aroused Russia to renewed efforts in the Far East. Through the intervention of Russia and Germany, Japan was deprived of its conquests in Manchuria, and in 1898 Russia by a lease from China secured possession for 26 years of the harbors of Port Arthur and Ta-lien-wan in the Liao-Tung peninsula, the very territory of which Japan had been forced to surrender possession. Port Arthur was very strongly fortified and the new port of Dalny built to take the place of Vladivostok as Russia's great ports on the Eastern seas, the last being ice bound during a considerable part of the year. The construction of the Manchurian railway connecting the newly acquired possessions with the main line of the Siberian railway was begun. During the Boxer uprising of 1900 the Chinese attacked the Russian town of Blagovyeshensk on the Amur River, in retaliation for which a Russian force invaded Manchuria, which, after sharp fighting, was overrun and occupied. By a convention between Russia and China, signed in April 1902, the former agreed to retire from Manchuria within 18 months. The sincerity of the Russian intentions, however, was open to doubt; the time was employed by them in increasing their forces in the country and strengthening the fortifications at Port Arthur and Dalny, and when the time for the evacuation of the country had arrived plausible reasons were brought forward for a continued occupation. At the same time Russia evinced a disposition to restrict the commercial rights of foreign nations in Manchuria. This aroused the jealousy of Japan, which deemed its paramount interests in Korea threatened by Russia's aggressive action. Negotiations between the two countries, relative to the situation in Korea and Manchuria, were begun in the fall of 1903 and were prolonged by repeated delays on the part of Russia, till the beginning of February 1904, when it became apparent that war was inevitable and that the purpose of Russia was probably to gain time for strengthening its position in Manchuria. In the first days of February Japan severed diplomatic relations with Russia and hostilities were begun on the night of 7-8 February. During the 18 months of war with Russia, the Japanese showed themselves to be the superior of the two, both on land and sea—on land defeating the Russians and compelling them to retreat as far north as Tie-Ling, and on sea by practically destroying the whole of the Russian fleet in the Eastern waters. The only resistance on the part of the Russian forces worth mentioning was the defense of Port Arthur, where the gallant General Stoessel (q.v.) won undying fame. The losses in men during these 18 months on both sides were enormous, in the battle of Liaoung alone where the number of combatants reached the

enormous figure of half a million, the losses in killed and wounded were counted to be over 100,000 men. The Russian government did not admit any other end of this war except complete victory for Russia, but the Japanese proved themselves superior to the Russians in every respect and, after decisively winning every important battle, concluded peace 5 Sept. 1905. See MANCHURIA; PORTSMOUTH, TREATY OF.

Meanwhile, the whole country was in a state of political ferment and almost anarchic disturbance. Strikes, mutinies, assassinations, mass meetings, demonstrations, and petitions asking for representative government, liberty of assembly, speech, and person, caused ceaseless agitation throughout the empire. The bureaucracy continued its policy of ruthless repression, imprisonment and exile, and manly peaceable demonstrations were turned into scenes of massacre, notably that in Saint Petersburg of 18 Jan. 1905, headed by Father Gapon (later, privately hanged for treachery, by his own party). In the provinces, at Moscow, Warsaw, Riga, Odessa, Reval, Lodz, Radom, and Kovno, disturbances broke out, the educated and professional classes joining with the industrial and agricultural masses in the demand for representative government. In the Caucasus a state of civil war existed between Armenians and Tartars. In Finland the diet refused to recognize the imperial decrees and the governor-general Bobrikoff and the procurator-general Johnsson, were assassinated. On 17 Feb. 1905, at Moscow, the governor-general, Grand Duke Serge, uncle of the Czar, was killed by an anarchist's bomb. A manifesto issued by the Czar on 3 March again ignored the popular demand for a National Assembly, and a general strike of workmen was ordered throughout the country, whereupon a rescript promising a Legislative Assembly was published the same day. At Easter the Czar conferred religious freedom on over 52,000,000 subjects of many faiths, giving equal rights with the orthodox, to Old Believers, Jews, Catholics, Protestants, Buddhists, and Mohammedans. In May and July, congresses representing the zemstvos or elective provincial assemblies, and the municipalities, had assembled at Moscow, and prepared a draft constitution for presentation to the Czar, urging upon him the imminence of a revolution and the desirability that the promise of a constitution should be at once fulfilled. On 19 Aug. the Czar issued a manifesto creating an elective state council (Gosoudarstvennaya Duma), and regulations for elections to the Duma were submitted. On 25 Sept. a Zemstvo Congress was again held at Moscow, which criticized the National Duma to be convoked according to the law of 19 Aug. as not national representation in the correct sense of the word, and declared that representation should be on a national and not a class basis, the election of the representatives being by universal and direct suffrage. In October, the whole country was in a state of passive revolt; an organized strike on railways, gas and electric lighting plants, and other large industries, to enforce purely political demands, compelled the government to accede to the desired reforms. On 30 Oct. the Czar signed a constitution and appointed Count Witte as Prime Minister of a responsible ministry.

The law as promulgated grants the popula-

tion the firm foundations of civic liberty, based on the principles of inviolability of the person, and of freedom of conscience, speech, assembly and association, and established as an immutable rule, that no law shall come into effect without the approval of the Duma, and that to the elected of the people shall be guaranteed the possibility of a real participation in the control of the legality of the acts of such authorities as are appointed by the Czar. Provision is also made that the members of the Duma representing the governments or provinces and the greatest cities (Saint Petersburg, Moscow, and 26 others), shall hold office for five years, unless the Duma is dissolved by the Czar. The Duma may elect a President and Vice-President annually, and conduct its proceedings in general session and in sections. Ministers and chiefs of Departments cannot become members, but may attend the sessions. Members receive 10 roubles per day and traveling expenses. The election of deputies was indirect, and made by electoral bodies of the chief towns of governments or provinces and of the greatest cities, composed of delegates chosen by the district or town elective assemblies.

The Council of the Empire was reorganized and changes made in the constitution of the Duma under a manifesto and ukases published 6 March 1906. The Council of the Empire as now established, consists of an equal number of elected members and members nominated by the Czar, and is convoked and prorogued annually by Imperial ukase. The Council of the Empire and the Duma have equal legislative powers, and the same right of initiative in legislation and of addressing questions to Ministers. Every measure before being submitted for the Imperial sanction must be passed by both the Duma and the Council of the Empire, and all such as are rejected by one of the two legislative institutions will not be laid before the Czar. Both the Duma and the Council have the right to annul the election of any of their members. The elective members of the Council will be eligible for nine years, a third of the number being elected every three years. Each Assembly of the Zemstvo of each government or province will elect one member. Six members will be returned by the Synod of the Orthodox Church, six by the representatives of the Academy of Sciences and the Universities, 12 by the representatives of the chambers of commerce and industry, 18 by the representatives of the nobility, and 6 by the representatives of the landed proprietors, assembled in Congress at Warsaw. In the provinces of European Russia which have no Zemstvo, a Congress of the representatives of the landed proprietors assembled in the chief towns of their province to elect one member for each province to the Council of the Empire.

All members of the Council must have attained their fortieth year and possess an academic degree. The President and Vice-president are appointed by the Czar. The elective members of the Council receive an honorarium of 25 roubles (\$12.50) a day during the sessions. The sittings of both the Duma and the Council of the Empire are public. The closure of a debate may be voted by a simple majority. Neither the Council of the Empire nor the Duma is empowered to receive deputations or

petitions. Ministers are eligible for the Duma, and, in the capacity of elected members, are qualified to vote.

Laws voted by the two Houses are submitted for the Imperial sanction by the President of the Council of the Empire. The members of both institutions have the privilege of personal immunity during the session. They are only liable to arrest with the permission of the Duma or the Council of the Empire, according to circumstances, except in cases of flagrant offenses or offenses committed in the exercise of their duties. The ukases further provide that bills rejected by one of the legislative bodies cannot be brought forward again without the Imperial consent.

Zemstvo representatives, however, refused to support the Witte cabinet, and their action was endorsed by a Zemstvo congress assembled at Moscow. The Czar appointed Prince Goremeykin to succeed Count Witte and the Russian Parliament was opened by the Czar, 10 May 1906, with gorgeous ceremony. The proceedings were marked by great distrust, which also characterized subsequent parliamentary proceedings, the strong opposition of the Court and bureaucratic party to all reform measures being confronted by the persistent tenacity of the national party. While universal suffrage was conceded, the Duma's solution of the agrarian problem was refused, and only a partial amnesty of political offenses granted. The policy of repression continued and the bureaucracy was openly charged with organizing and arming the baser elements of the nation, to incite them against the progressive elements of society, against intelligence, against students, workmen, and Jews. Instigated for reactionary purposes, it was alleged, pogroms or riots in which anti-Jewish outrages of the most horrible character were the chief features, were allowed to go unchecked by the authorities. The records of the massacres at Warsaw, Odessa, Kazan, Rostoff, Kherson, Kishineff, Kieff, Tiflis, Sevastopol excited universal reprobation, while the Bialystok massacre in June 1906 evoked a condemnatory message passed by the Congress of the United States.

On 22 July 1906 the Czar dissolved the Duma, placed Saint Petersburg under martial law, and appointed Peter Stolypin to succeed Goremeykin as Premier. The Duma members, meeting at Viborg, Finland, issued a manifesto to the Russian people urging them to refuse to pay taxes, or send conscripts to the army until the power of Parliament be restored. Mutinies of the Cronstadt and Sveaborg (Finland) garrisons were quickly suppressed and the general strike of the Workmen's Councils, declared on 3 August, was called off on the 7th owing to non-support.

Russian Literature. In the compilation of works on the subject of Russian literature it has been usual to adopt the division of the same into different periods and to go back to early Russian history in search of monuments that may be used in supporting the opinion that Russian literature had its beginning in translations of certain Byzantine church works into old Slavonic, which was the exclusive church language. The heroic traditions, such as 'The Word of Igor's Band' or 'The Don River Slaughter' or the eloquent 'Letter of Vassian to Ioann III.,' are cited in support of the assertions that these productions mark the origin of Russian literature. That such historical documents, folk lore and scholastic eloquence have no more relation to ours than the monuments of antediluvian literature, had such been discovered, have to the Sanskrit, Greek or Latin literatures, is too obvious to need a proof. Russian literature undoubtedly commenced in 1739 when Lomonosov, who earned the nickname of "father of Russian poetry and patriarch of Russian poets," sent from abroad his ode on the 'Capture of Khotin.' Therefore it would be a thankless task for anyone interested in the Russian literature to attempt to find anything approaching the definition of the word literature in all the documents which we possess from the so-called Byzantine Greek period down to the end of the period of Western European influence (1113-1608). There are many reasons for this, such as the Tartar invasion, which actually destroyed the Russian national life,

but mainly the despotic form of government which obtained in Russia from the time of the Tartar domination down to our own times, and the influence of the orthodox church which, as a supporter of the despotic government, was always opposed to the free egress of human thought. It is a notorious fact that printing was introduced in Russia about 100 years after its discovery. The history of the Russian censorship is one of the blackest pages in the history of the Russian people, and the assertion of a gifted contemporary writer, Menshikov, that we hardly have any national literature, does not seem to be paradoxical in the least to the persons acquainted with the Russian censorship. The writers who speak of the revival of literature in the sixteenth century and cite as an example the correspondence between Ivan the Terrible and Prince Kurbski have very poor conception of the word literature, because the letters which passed between the insane despot and one of his subjects, who ran away from his insane fury, and found a refuge in Lithuania, should no more be considered literary documents of a country than scribbles of a cannibal king inviting his victims to get cooked. Even Kurbski in his answers to the Czar accuses the latter of being a bad grammarian and fully devoid of knowledge of the proper use of words and expressions. No doubt Peter the Great was instrumental in advancing the progress of the Russian thought and his reign was the precursor of the birth of Russian literature, but the names of early workers in this field are few and far between and, with the exception of Lomonosov and probably Karamzin, cannot be placed among the writers of note. Yet we are accustomed to hear among the names of poets of this epoch that of Trediakovski (1703-68), who at the best was a poor rhymester, whose writings, as our immortal Belinski said, remind us of the senseless dream talk of a sick man. Even what to a certain degree was considered poetical talent in Derjavin (1743-1816) at his epoch, now, in a contemporary writer, we would call prose and a lack of genius. And Derjavin was considered a poet of high attainments, who perfected lyric poetry. We may mention the names of other writers of this epoch such as Sumarokov (1718-77) who imitated, and badly at that, the theatrical plays of Corneille, Racine, and Molière; Fonvisin (1744-92), who is considered to be a satirical writer, but whose satires produce rather the feeling of pity and regret than laughter; Kniainin (1742-91); Novikov (1744-1818), all of these are not above mediocrity; besides Lomonosov only one other name deserving notice is that of Karamzin (1766-1826) who in his 'History of Russia' gave us the first readable and connected story of our historical past. Generally speaking the Russian literature of the eighteenth century and up to the present time has been and continues to be an imitative one. There is marked absence of originality, though commencing with Pushkin our poetry is original. The writers of the reigns of Anna Ioannovna, Elizaveta Petrovna, and Catherine II. are noted for their obsequious, servile style, which is explained by their having been almost wholly dependent upon the bounty and mercy of the reigning heads. Catherine II. encouraged literature, being herself somewhat of a writer, whose productions, however, beyond the fact that they

came from under the pen of a crowned head, do not represent anything of ability or talent. She was acquainted with the encyclopædists, corresponded with Voltaire and even invited Diderot to St. Petersburg, yet it seems that she acquired but a superficial idea of the teachings of encyclopædists, for, when Radistshev (1749-1802), author of the celebrated 'Voyage from St. Petersburg to Moscow,' depicted in this book the terrible state of serfs under the tyranny of their owners and concluded by the almost identical words of Robbie Burns that "man's inhumanity to man makes countless thousands mourn," she declared him to be a rebel and instigator against the authorities and banished him to Siberia. And to this Radistshev the Russian literature owes more than to any other writer, on account of his having been the first to give the real basis to the philanthropic tendency pervading Russian literature through the whole of the nineteenth century. Later on Turgenev, Belinski, Herzen, and Count Tolstoi continued to carry high the banner of Radistshev. We should not pass unnoticed the name of Jukovski (1783-1852), who, though he did not leave to posterity anything original worthy of note, was one of the best translators of foreign literature, whose poetical translations, thanks to the richness and flexibility of the Russian language, are wonderfully close to the original in German, French, and English, both in the measure and correctness of the translation. He was the first to avoid the use in writing of stiff and affected Russian words and expressions, and to introduce language which is freer and closer to the colloquial form. In Alexander Pushkin (1799-1837) the Russian poetry had first true representative of humanitarian principles; he was the first Russian poet who did not imitate and who was conspicuous for originality of his writings. Of his poems the best known are: 'Ruslan and Ludmila,' 'The Prisoner of Caucasus,' 'Bakhtchisarai Fountain,' 'Robber Brothers,' 'Gypsies,' 'Poltava,' and 'Evgeni Onegin'; of his prose writings 'The Arab of Peter the Great,' 'Captain's Daughter,' and 'Dubrovski' are the most popular. As a writer of epigram he had no equal. Among his contemporaries we may mention Batiushkov, Baratynski, Delvig, and especially Koltzoff, who were his followers in the field of poetry. Koltzoff (1808-42) is best known by his idylls from peasants' life, which contain so much tenderness, so much faith in the patient force of labor that one wonders that such idylls could have been written during the worst time of serfdom. Kryloff (1768-1844) is famous as a fable writer, and Griboyedov (1794-1829), whose comedy-satire 'Grief from Mind,' written in verse, and giving real pictures of life of high society in the beginning of the nineteenth century, will not be forgotten as long as the Russian language exists. Lermontov (1814-41) is another star among the Russian poets; the best of his poems are 'Demon,' 'Mtsyri,' 'Izmail-Bey'; he also wrote a short novelette, 'The Hero of Our Own Time,' which is very popular. It is a noteworthy fact in the history of the Russian literature that but few of its most talented representatives escaped the persecution of the government. Many of them had to pass long periods in prison or exile. One of the most glaring instances of such persecution is that of Polejaev (1805-38), who, had he been

spared to literature, would have been placed by posterity among our greatest poets. The whim of Nicholas I. sent the unfortunate man to a regiment in the Caucasus, to serve as a soldier, for a trivial offense, if it can be called an offense, of writing a poem 'Sashka,' which, though not very savory, was extremely well written. The intercession of many influential people did not procure his return from the exile where, not being able to endure the rigor of the military discipline, he died of consumption. The reign of Nicholas I., despotic as it was, can boast of several noted writers of whom Gogol (1809-52) is the most remarkable. His prose-poem 'The Dead Souls' gave a complete picture of the officialdom, of traits and manners of persons of every class in Russia in the first quarter of last century. His historical novel 'Taras Bulba' is the most successful novel ever written in Russian; his comedy 'Revisor' is considered a masterpiece of that class of literature. He would have been the most idolized writer in Russia had he not published his 'Selections from the Correspondence with Friends,' which at once destroyed the pedestal upon which he stood so high in the eyes of all intelligent Russians: the only good effect of this publication was that it produced the now famous letter of our immortal Belinski (1811-48) to Gogol. After Nicolai Polevoy (1796-1846), who was a pioneer of the critical literature of Russia, Belinski occupies the foremost place as the most gifted, fearless, and elegant critic Russia ever produced. His followers in this branch of literature were Dobroliubov (1836-61) and Pisarev (1841-68), and later on Michailovski, all of whom were very popular. The last years of reign of Nicholas I. form the most sombre period in the history of Russian literature. The oppression of the censorship was distressing, and though Russian literature did not succumb, it had a hard struggle for existence. And probably this struggle developed quite a number of talented writers. Foremost among them are Count Leo Tolstoi, Turgenev (1818-83), and Dostoevski (1822-81). Count Tolstoi's name is known throughout the world as that of a philosopher, philanthropist, writer, and champion of freedom, both religious and political, for the Russian people. His writings are very numerous, and it is hard to select from them one in which his genius appears at its best. Of his early writings 'War and Peace,' 'Anna Karenina,' and those of recent time 'Kreutzer's Sonata,' 'The Power of Darkness,' and 'Resurrection' are fair exponents of his genius. Of Turgenev's writings the best are 'Memoirs of a Hunter,' written when he was only 27 years of age, 'Fathers and Sons,' 'Virgin Soil,' Dostoevski's 'Memoirs from the Dead House,' 'Crime and Punishment,' 'Idiot,' and 'Humiliated and Abused' breathe with a profound love for all the oppressed, despised, and humiliated. Goncharov (1812-91) is mainly known by his admirable novel 'Oblomov,' in which he very artistically brought together all the repulsive traits of a landowner, brought up in the demoralizing atmosphere of serfdom, with the best and most attractive sides of a real Russian. Grigorovitch (1822-99) and Pissemiski (1820-81), both of whom occupy honorable place in the literature, the former by his 'Anton Goremyka,' and the latter by his novel 'Thousand Souls'

and a realistic drama 'Sad Fate,' the most successful drama ever produced on the Russian stage. Another dramatist and playwright, Ostrovski (1823-86), presented to the public the unattractive character of the Russian merchant in all its nakedness. The best known of his plays are 'The Storm,' 'Poverty is no Vice,' and historical drama 'Vasilisa Melentieva.' The name of Alexander Herzen, a writer who did more than any other man in Russia for the liberation of the serfs, is now given an honorable place in the literature, though some 50 years ago, when he was editor of 'The Bell,' a Russian paper published in London, a letter from him, discovered by the police, was sufficient to have a man deported to Siberia. The most beloved poet of the epoch of great reforms, whose genuine poetry discloses such profound sympathy and love for the people, was Nekrassof (1821-77). Other poets who sang the sorrow of the peasant class were Nikitin (1824-61), Plestsheev (1825-93), Kurotekhin (1831-75), the latter, however, is better known as excellent translator of the songs of Béranger from the French. The Crimean war, exactly like the Russo-Japanese campaign, revealed a great mass of abuses in every department of the government, and produced the feeling of instability of the whole administrative organism. This feeling found vent in the peculiar expository literature which sprung up on the eve of great reforms, and which denounced the bribe-takers and government thieves in prose and poems, in small stories and in large novels. The most talented among such writers was undoubtedly Michail E. Saltykov (1826-89). His early 'Provincial Sketches' at once placed him in the front rank of Russian literary men. To the end of his days Saltykov continued to denounce the corruption and abuses of the Russian bureaucracy, which did not fail to bring down on him the wrath of the government. His 'Well Meaning Discourses,' 'Messieurs Golovlevs,' 'Pompadours, Male and Female,' and 'Memoirs of a Provincial in St. Petersburg' are the best of his voluminous works. Around Saltykov we see other young writers of the same tendencies, such as Pomialovsky (1835-63), Reshetnikov (1841-71), whose novel 'Podlipovtzy' is often quoted, Levitov (1842-77), and inimitable Gleb Uspensky (1840 or 1843, died a few years ago). Our poets of the second part of the nineteenth century were, so to speak, brought up upon the poetry of Pushkin and Lermontov, but their poetry is much nearer to the reality. Of them deserving note are Maikov (1821-97), Polonsky (1819-98), Shenshin (pseud. Fet) (1820-92), Tutchev (1803-73), May (1822-62) and Count Alexis Tolstoi, the latter besides his many songs and poems, wrote a remarkable historical novel, 'Prince Serebriannyi,' and three trilogies, 'Death of Ivan the Terrible,' 'Czar Feodor Ioannovitch,' and 'Czar Boris.' The epoch of great reforms produced the division of our fiction writers into two classes: conservative and liberal. To the former, who, disappointed in the liberal movement and its leaders and influenced by the Polish insurrection, commenced a crusade against the liberal movement, belong Leskov, Kliushnikov, Markevitch, and Krestovski, whose writings, not even always talented, have the stamp of having come out from a detective bureau, because they excited suspicion

in treason and contained libels even against persons occupying high official positions, accusing them of being nihilists and anarchists. To the liberal class belong Terpigorev (1841-95), Garshin (1855-88), whose untimely death deprived Russian literature of one of the most talented writers. Another name which occupies an honorary place in Russian literature is that of Nicolai Tchernyshevski (1828-1903), who is best known by his novel 'What is to be Done,' which at the time produced quite a sensation among the young Russia, being a sermon of communism, though it did not disclose anything new to the readers of Eugene Sue's novels, containing similar Utopias. He wrote a good deal on politico-economical questions, but these articles lost all their interest and grew old; and his notes on Mill's 'Political Economy,' which represent the system of Louis Blanc, will also appear childish from the point of view of modern socialism. Among the contemporary writers there is quite a number of talented followers of the humanitarian school, men who represent the best element of the Russian intelligent society. Of the writers of fiction Albov, Zsodimski, Ertel, Korolenko, Zlatovratski, Maria Krestovskaja, Mamin-Sibiriak, Salov, and Lugovoi are the most popular and the most sympathetic. The most talented writer, who is called Russian Maupassant, Anton Tchekhov, died on 15 July 1904. His best works are 'My Life' and 'Peasants.' The names of Maxim Gorki and Leonid Andreev are those the most quoted at the present time. Maxim Gorki, undoubtedly a talented writer, uses his talent in depicting the life of the dregs of human society, vagrants, thieves, and inhabitants of the dens of vice and, strange to say, has the tendency to idealize his heroes. The most powerful of his novels is 'Foma Gordeev,' the only one which probably will survive him. As to Leonid Andreev, his popularity is purely the result of the unbounded — sickening at times — naturalism of his stories. Of contemporary poets the following are of note: Nadson (1862-87), a very talented poet, yet his poetry is too pessimistic to please all. Jemtchujnikov, Korinsky, Slutchevski, and especially Mks Stchepkina-Kupernik. One of the grand dukes, Konstantin Konstantinovich, who writes under the pseudonym "K. R." is a poet of no mean degree. Among the followers of decadent school of poets are Merejkovski, Balmont, and Minski, but their poems, like those of Frug and Fofanov, serve mostly as subjects for comical reviews by our well known critic Burenin. Of the dramatists the best known are Potekhin, Krylov, and Shpajinski. Consult: Belinski, 'Russian Literature'; Polevoy, 'History of Russian Literature'; Sementkovski, 'Russian Literature on the Eve of the Twentieth Century'; Soloviev, 'Literary Movement of the Nineteenth Century in Russia.'

V. P. POLEVOY,

Ex-Officer of the Russian Artillery.

Russian Thistle, a naturalized annual (*Salsola tragus*) (one of the *Chenopodiaceæ*), becoming a dreaded pest in the northern and western United States. It is closely related to, and resembles, the prickly salt wort of the sea-beaches and in no way, except spininess, can be confounded with the true thistles. It is a glabrous, succulent, spreading bushy herb, with slender branches and small linear leaves, tipped

by a prickle, and usually bright red at maturity. Its small flowers are single in the axils, and are succeeded by hard little fruits surrounded by broad, five-parted horizontal wing of the calyx, which is conspicuously veined. Like many desert plants, at maturity, and in the dry season, its branches contract into a ball, enclosing its capsules full of ripe seeds, and it becomes a "tumble-weed," blown across the country by the wind, and scattering its seeds, to take root in favorable soils. Careful cultivation is the best way to exterminate the Russian thistle.

Russ'niaks. See RUTHENIANS.

Rust, peroxide of iron, formed by the gradual oxidation of iron when exposed to the air. To remove rust the usual mode is to rub the object with a piece of oiled rag or emery paper. More rapid and more satisfactory results are secured by using very pure petroleum, and wiping with a hempen or woolen rag. To prevent rust, dip iron or steel articles in a mixture of equal parts of carbolic acid and olive-oil, rubbing the surface with a rag. Others rub the metal with a mercurial ointment, leaving a thin layer over the entire surface. If iron be dipped in a solution of carbonate of potash or soda in water the surface will be protected against rust for a long time, and objects can be protected for any period by burying in quicklime. Rubbing the surface with plumbago has a similar effect.

Rustchuk, roos-chook', Bulgaria, a town on the right bank of the Danube, at the confluence of the Lom, opposite Giurgevo, 42 miles southwest of Bucharest. It has some woolen, silk, and other manufactures, and considerable trade. It is of strategic importance owing to its position on the Turkish frontier, and was almost destroyed by the Russian bombardment in the war of 1877-8. Pop. (1900) 32,661.

Rusts. See FUNGI.

Rutaba'ga. See TURNIP.

Rutaceæ, roo-tā'sē-ē, a widely dispersed order of polypetalous plants with about 880 species, most frequent in warm regions, and especially so in South Africa and Australia. They are generally shrubs or trees, bearing leaves in various forms, without stipules, dotted with glands and often heavy-scented. The four- or five-merous flowers are often in axillary cymes, and the fruits are various, being most conspicuous in the genus *Citrus*, which produces the orange and lemon. Two American genera are the *Ptelea* (hop-tree), and the *Xanthoxylum*, or prickly ashes. The latter is represented by small trees, prickly, with a powerfully stimulative and tonic bark. The common rue is a member of the typical genus *Ruta*.

Rutgers, rüt'gêrz, Henry, American philanthropist: b. New York 7 Oct. 1745; d. there 17 Feb. 1830. He was graduated from Columbia in 1766; served as captain and later as colonel of New York militia in the Revolutionary War, and entered the legislature in 1784 to which he was frequently re-elected. He was a member of the board of regents of New York University from 1802 to 1826. His gifts to public purposes were many, the chief being \$5,000 to Queen's

RUTGERS COLLEGE — RUTHENIUM

College of New Jersey, which thereupon took the name of Rutgers.

Rutgers College, located at New Brunswick, N. J. It was chartered in 1766 under the name of Queen's College, and the charter slightly altered in 1770. In 1771 the college was located at New Brunswick; during the Revolutionary War, when the British army occupied New Brunswick, the college exercises were continued at Millstone and at North Branch. The present site of the college was secured in 1808, and in 1825 a generous donation was received from Col. Henry Rutgers, and the name changed to Rutgers College in his honor. A theological school was at first affiliated with the college, but has since become an independent institution. There is a preparatory school established at the same time with the college. The organization of the collegiate department now includes two schools, the classical school and the Rutgers Scientific School. In 1864, the Legislature designated "The trustees of Rutgers College in New Jersey maintaining the Rutgers Scientific School" as the State College of Agriculture and Mechanic Arts; the Scientific School thus became the beneficiary of the Congressional land grant of 1862, and of the appropriation law of 1890. In the classical school the work of the freshman and sophomore years is required, two courses are elective for junior and senior years; the degrees of A.B. and B.L. are conferred. In the Scientific School the studies of the freshman year are the same for all courses, at the end of that year the student elects one of the six courses offered, certain subjects, such as English, history, political economy, etc., being required in all. The six courses are agriculture, civil engineering, and mechanics, chemistry, electricity, biology, clay-working and ceramics. All courses lead to the degree of B.S. There is also a special two years' course in ceramics. Military drill is required of all students in the Scientific School. The school conducts a university extension department, and the State agricultural experiment station is connected with it. The Scientific School is under control of the college board of trustees of which the governor, the chief justice, and the attorney-general are members *ex officio*; and is also under the supervision of a State board of visitors appointed by the governor. The college farm contains 100 acres and is well equipped with modern apparatus. The buildings on the campus include Queen's College, Fine Arts Building, Van Nest Hall, Geological Hall, Kirkpatrick Chapel and Library, State Laboratory, Ceramics Building, Winants Hall (dormitory) and the Ballantine Gymnasium. The library in 1904 contained 45,655 volumes; the students in the collegiate department numbered 226, and the faculty 28.

Rutgers Scientific School, a department of Rutgers College, New Brunswick, N. J., designated by law as the New Jersey State College of Agriculture and Mechanic Arts. See **RUTGERS COLLEGE**.

Ruth, Book of, a canonical book of the Old Testament, containing four chapters. The date of the little history contained in this book cannot be precisely fixed. Who the writer of the book was is also unknown. Some have ascribed it to Samuel; others have placed it as

late as the Babylonish captivity; whilst several of the best modern scholars regard it as post-exilic. On the one hand, the style of the narrative connects it with the period when the Hebrew language and literature were still in full vigor and freshness, not with the period of their decay. On the other hand, it is evident that it cannot be placed earlier than the time of the kings, first, from the way in which the judges are mentioned in chap. i.; secondly, from the change in the customs of the people that must have taken place between the date of the events and that of the narrative that records them (chap. iv. 7); and thirdly, from the mention of the name of David. In the Hebrew Bible the Book of Ruth now stands among the Hagiographa immediately after the Song of Solomon as one of the five Megilloth, or sacred rolls, read on occasion of the principal Jewish solemnities. But there can be no doubt that originally in the Hebrew Scriptures, as in the Septuagint and in the English Bible, it followed the Book of Judges, and was sometimes even reckoned part of it.

The story told in the Book of Ruth is a charming epic, relating the love of Ruth, a young widow of the tribe of Moabites, for Naomi, the mother of her dead husband. Ruth and her mother-in-law were very poor, and Ruth gleaned in the fields of Boaz, a rich husbandman of Bethel. Boaz, upon noticing the lovely Jewess, directed his harvesters to leave a generous supply of grain on the ground, thus enabling Ruth to glean a plenty. Subsequently Ruth married Boaz; she was the great-grandmother of David. Consult 'Popular Introduction to the Book of Ruth,' by R. W. Bush (London, 1883).

Ruthe'nians, Russniaks, or Red Russians, are the Slavonic tribes inhabiting eastern Galicia, Bukowina, and northeastern Hungary. The number of Ruthenians in the Austrian Empire amounts to 3,000,000, of whom about 500,000 are settled in Hungary. Very few can read or write. Their dwellings are wretched huts of boards and mud. Superstition is very rife. In the popular songs, which have a close connection with those of the other Slavonic nations, there is a prevalent strain of sadness both in the words and in the melodies. The occupations of the people are pasture, agriculture, and carrying (by means of conveyances drawn by animals). Of manufacturing industry there is no trace. The towns are inhabited by Poles and Jews; the nobility are Polonized. The Ruthenians belong for the most part to the United Greek Church, and pay a blind obedience to their clergy. They are bitterly hostile to the Poles, and latterly their efforts have been directed to the separation of Galicia into a Polish kingdom in the west and a Ruthenian in the east. They have likewise begun to attach themselves in their literature to Russia, allowing the Ruthenian dialect to drop out of existence as a literary tongue.

Ruthe'nium, a metal of the platinum group. It has the atomic weight 101.7, and the symbol Ru. Some specimens of platinum ore contain from 3 to 6 per cent of ruthenium. It is a whitish-gray metal, having a specific gravity of 11 to 11.4; is very infusible, more so than any other metal except osmium; is

scarcely attacked by nitromuriatic acid, but is more easily oxidized by fusion with nitre, chlorate of potassium, etc., than platinum. Ruthenium forms a series of salts which are analogous to those of platinum.

Rutherford, N. J., borough in Bergen County; on the Erie railroad; about nine miles from New York, seven miles southeast of Paterson, and eight miles north of Jersey City. It is a residential place, occupied chiefly by business men from New York. Several electric lines connect the borough with many of the cities and boroughs in the vicinity. Its principal public buildings are churches, schools, and a public library. Pop. (1890) 2,293; (1900) 4,411.

Rutherford, Ernest, Canadian physicist: b. Nelson, New Zealand, in 1871. He was educated at Nelson College and the University of New Zealand, and at Trinity College, Cambridge, England. He was awarded the 1851 Exhibition Science Scholarship in 1895 and from that time until 1898 worked at research in the Cavendish Laboratory, Cambridge, in the latter year being appointed professor of physics in McGill University, Montreal. In 1903 he was elected a Fellow of the Royal Society; in 1904 delivered the Bakerian lecture before the Royal Society and was awarded the Rumford Medal; in 1905 delivered the Silliman lectures at Yale University. He is the author of numerous papers on the conduction of electricity through gases and on radioactivity, and also published 'Radioactivity' (Cambridge University Press 1904).

Rutherford, rŭth'ér-fěrd, Lewis Morris, American astronomer: b. Morrisania, N. Y., 25 Nov. 1816; d. Tranquility, N. J., 30 May 1892. He was graduated from Williams College in 1834, admitted to the bar in 1837, and practised law in New York until 1849. He then devoted himself to the study of science, making valuable investigations in the departments of astronomical photography and spectral analysis. He made several instruments for use in his laboratory, among which were an object glass, a micrometer for measuring astronomical photographs and a dividing engine (q.v.) of great value. He was a trustee of Columbia University from 1858-84, when he resigned and presented his astronomical instruments to that institution where they are now mounted, and was also one of the original members of the Academy of Science.

Ruthven, ruth'vĕn (Scotch, rŭv'ĕn), **Raid of**, one of the strangest conspiracies in British history, and even as yet unexplained, in which an attempt was made on the life of James VI., then king of Scotland, and afterward, as James I., king of England, after being decoyed to Gowrie House, at Perth, in the month of August, 1600, by Alexander Ruthven, brother of the Earl of Gowrie. See GOWRIE CONSPIRACY.

Rutland, Vt., city, county-seat of Rutland County; on the Otter and East creeks, and on the Rutland, B. & R., and the Delaware & H. R.R.'s; about 56 miles south-south-west of Montpelier, the State capital, and about 62 miles south by east of Burlington. It was settled in 1770 by persons from the East and was incorporated in 1761, by New Hampshire. It was chartered as a city in 1892. Rutland was

in the battle region of the War of the Revolution. Two forts were erected here, as it was situated on the Great Northern Military Road. In 1781 it was made the capital of the county, and from 1784 to 1804 it was one of the State capitals. The old boundaries included an area of 26,000 acres with the Green Mountains on the east and the Taconic Range on the west. In 1886 the towns of Proctor and West Rutland were set off from Rutland. The area of the city (1903) is 8¼ square miles. The new towns have independent governments, but all are united commercially. Rutland is in an agricultural region, but is well-known for its extensive marble quarries and industries connected with the shipment of marble. Iron ore, fire-clay, and slate are found in the vicinity. The marble works have been of considerable importance since 1830. The quarries are now in the new towns, but the industries continue as formerly. The chief industrial establishments of Rutland are manufacturing in which are made machinery for quarrying, and channeling marble, machine shops, engine and boiler works, Howe's scale factory, sash, door, and blind factories, butter and cheese factory machinery, lumber and brick yards, sugar evaporator works, creameries, and flour and grist mills. The government census of 1900 gives the number of manufacturing establishments 186; the amount of capital invested, \$2,112,530; number of wage-earners in manufacturing, 1,791; annual amount of wages, \$773,304; value of product, \$2,456,677. The principal buildings are Memorial Hall, built in honor of the soldiers of Rutland who fell in the Civil War, Baxter Memorial Hall, the government building, the county court-house, city-hall, house of correction, opera house, bank buildings, churches, and schools. The material for the construction of Memorial Hall was donated by the marble quarry companies and the cost additional was \$60,000. The educational institutions are a high school, Saint Joseph's Academy, public and parish graded schools, the Rutland Free Library, and Baxter Memorial Library. The city is well equipped with banks, newspapers, and wholesale and retail business establishments. Pop. (1890) Rutland 11,760; West Rutland, 3,680; Proctor, 1,758; total, 17,198; Rutland (1900) 11,499. Consult: Hemingway, 'Gazetteer of Vermont'; Moore 'Churches of Rutland, Vermont.'

Rutledge, rŭt'lĕj, Edward, American soldier and legislator: b. Charleston, S. C., 23 Nov. 1749; d. there 23 Jan. 1800. He was admitted to the bar in 1773, established a practice in Charleston and in 1774 was elected to the Continental Congress. He was a signer of the Declaration of Independence in 1776 and a member of the first board of war. In this capacity he was delegated with John Adams and Benjamin Franklin to confer with Lord Howe on the subject of a reconciliation, but declined to treat with him excepting on the basis of American independence. As lieutenant-colonel of the Charleston artillery he assisted in expelling the British from Port Royal in 1779 and in 1780 was captured. After his release a year later he resided in Philadelphia, was a member of the Jacksonborough legislature in 1782, and after the war returned to Charleston where he resumed his law practice. He was for many years

JOHN RUTLEDGE.
CHIEF JUSTICE OF THE UNITED STATES SUPREME COURT, 1795.

a member of the State legislature, was elected United States Senator in 1794, and governor of South Carolina in 1798. Consult McCrady, 'South Carolina in the Revolution' (1901-2).

Rutledge, John, American jurist; brother of Edward Rutledge (q.v.): b. Charleston, S. C., 1739; d. there 23 July 1800. He studied law in England, returned to Charleston in 1761, and there established himself in law practice. From the outset of his career he was an ardent opponent of the oppressive laws governing the colonies and as delegate to the congress at New York in 1765 openly advocated the united resistance of the colonies. In 1774 he was a member of the South Carolina convention which carried a resolution that South Carolina should be represented in the Continental Congress. He served as delegate to the Congress of 1775 and in 1776 was chairman of the committee that framed the South Carolina constitution, was elected president of the State government and commander-in-chief of the militia. When the British forces arrived off Cape Fear he fortified Charleston and prevented the invasion of the State. He resigned his office in 1778 through dissatisfaction with changes in the constitution, but was recalled in the following year and invested with dictatorial authority. He at once set about preparations for defense and held the city until 1780. He then joined the forces of General Greene and upon the recapture of Charleston resumed his duties as governor. In 1782 he was elected to the Continental Congress, was re-elected in 1783 and in 1784 became chancellor of South Carolina. He was a member of the convention which framed the Constitution of the United States in 1787. He became chief justice of his State in 1791, and in 1795 was appointed chief justice of the Supreme Court. His mind failed in the following year and he held no further public office.

Ruwenzori, roo-wën-zō'rë, a group of mountains in Africa, north of the equator, discovered by Stanley in 1888, in his great journey from the west to the east coast, when he brought Emin Pasha away with him. It appears to be a chain of heights about 16,000 feet in elevation, and is clad with snow and traversed by large glaciers. It lies about 200 miles to the westward of the Victoria Nyanza, and between the Albert Nyanza and Albert Edward Nyanza. The river Semliki, which connects the two lakes, flows in a valley near the range. The snow-line is about 13,000 feet above sea-level. These mountains are sometimes identified with the Mountains of the Moon, spoken of by ancient writers.

Ruysbroeck, rois'brëk, or **Rusbroek**, roos'brök, **Jean de**, Dutch mystic: b. Ruysbroeck 1293; d. Grönendal 1381. He was educated at Brussels and for 26 years was vicar of the church of St. Gudula there. In 1353 he renounced the secular priesthood and entered the Augustinian monastery of Grönendal, in the forest of Soigny, where he became prior, lived a contemplative life and wrote his mystical works. His four principal works are 'Die Zierde der geistlichen Hochzeit'; 'Der Spiegel der Seligkeit'; 'Von dem funkelnden Stein'; and 'Samuel.' They were originally written in Dutch and are regarded by his countrymen as

among the best prose of the Netherlands during the Middle Ages. Translations were made into German, French and Latin. The four works cited were edited by Arnswaldt (1848); no collected edition has been made embracing his other works, which however, are mainly restatements of the main features of the foregoing. Consult: Engelhardt, 'Richard von S. Victor und Johann Ruysbroek' (1838); Ullmann, 'Reformatoren vor der Reformation.'

Ruysbroek, Willem van (GUILLAUME DE RUBRUQUIS), Franciscan friar and traveler: b. Brabant about 1215; d. some time after 1293. He was sent by Louis IX. of France to Central Asia to bring about an alliance with Sartach, a supposed Christian prince of Kiptohak, then at war with the Saracens. In May 1253 he set out from Constantinople upon his mission with two other Franciscan friars and an interpreter; crossed the steppes, now a part of the Russian province of Ekaterinoslav, reached the banks of the Don, and, after many hardships, the camp of Sartach near the Volga. Refused permission to preach Christianity in Tartary, he made his way across the Caucasus into Armenia, Persia and Asia Minor, reaching Tripoli in Syria in August 1255. An account of the countries and peoples visited by these missionaries was written by Ruysbroek and sent to the French king. The best modern translation is that of Michel and Wright in Vol. IV of 'Receuil de Voyages et Mémoires de la Société de Géographie' (1839).

Ruysdael, Jacob van. See RUISDAEL.

Ruyter, ri'tër (Dutch, roi'tër), **Michael Adriaanzoon de**, Dutch admiral: b. Flushing 24 March 1607; d. Syracuse, Italy, 29 April 1676. He early entered the navy and rose from cabin-boy to captain (in 1635). In 1641 he was placed as rear-admiral in command of a fleet sent to the assistance of the Portuguese, who had thrown off the yoke of Spain, and he was afterward employed against the Barbary corsairs. In the war between the Dutch and English, which commenced in 1652, Ruyter repeatedly distinguished himself, especially in the battle fought in February 1653, near the mouth of the Channel, in which Blake, commanding the English, defeated Tromp and Ruyter, who commanded the Dutch. He became vice-admiral of Holland after the death of Tromp in 1653 and afterward served against the Portuguese, the Swedes, and the Algerines. He commanded in the great battle fought in the Downs in June 1666, against Prince Rupert and the Duke of Albemarle, and in the following year made his memorable expedition up the Thames, when he destroyed Upnor Castle and burned some ships at Sheerness. He was made admiral-in-chief of the Dutch fleet and commanded at the battle of Solebay (Southwold Bay) in 1672, when the Dutch were defeated by the English under the Duke of York; but in the following year gained a victory over the combined English and French fleets. Consult 'Life' by Milne (1897).

Ryan, ri'an, Abram Joseph, American poet and Roman Catholic clergyman: b. Norfolk, Va., 15 Aug. 1839; d. Louisville, Ky., 22 April 1886. He became a chaplain in the Confederate army shortly after his ordination to the priesthood, and served until the close of the war, afterward engaging in clerical labors in New Or-

Jeans, where he edited the 'Star.' He subsequently removed to Knoxville, Tenn., and thence to Augusta, Ga., where he established the 'Banner of the South.' He was later in charge of a parish in Mobile, Ala., but in 1880 went North where he engaged in lecturing and also supervised the publication of his poems, subsequently returning to the South. His works include 'The Conquered Banner and other Poems' (1880); 'Poems' (1880); etc.

Ryan, Edward George, Chief Justice for more than six years of the Supreme Court of the State of Wisconsin: b. Newcastle House, near the village of Enfield, County Meath, Ireland, 13 Nov. 1810. His father, Edward, was a younger son of the family of Ryan, of Ballinakill; his mother, Abby, was the eldest daughter of John Keogh, chairman of the Catholic Committee of Mount Jerome. By means of an annuity, obtained from this Keogh, the ten children of Edward and Abby received an excellent education. Edward George was sent to Clongowes Wood College, where he remained from 1820 until 1827. He was always destined for the law and was nominally engaged in its pursuit in 1828 and 1829. Obtaining his father's consent, he removed to New York city in 1830, where he studied law, supporting himself by teaching. Admitted to practice in 1836, he removed in the same year to Chicago, Ill. In 1839 he became the editor, in that city, of a newspaper called the *Tribune*, Democratic in politics and closing its career in 1841. During a portion of this editorial period he was prosecuting attorney of Cook County. Mr. Ryan's health being poor in Chicago, he removed in 1842 to Racine, Wis., and in December 1848 to Milwaukee in the same State. While residing in Racine he was in 1846 a delegate to a convention at Madison, the capital of the then territory, which met to frame a State constitution. As chairman of the committee on banks and banking, and member of the committees on the judiciary and on education he wielded great influence in the deliberations of the convention. While the constitution which this convention framed was repudiated by the people, yet the reputation of Mr. Ryan as a lawyer and a publicist was established.

As a practitioner in Milwaukee he achieved great renown, especially in criminal causes. His most conspicuous effort was in 1853, when he was employed to assist the managers of the Assembly of Wisconsin in its impeachment before the State Senate of Levi Hubbell, Judge of the Second Judicial Circuit. This trial ran through many weeks and was characterized on Mr. Ryan's part by the most skilful treatment of witness and by the most powerful invective in denunciation of the defendant.

Although a Democrat of the States rights school, Mr. Ryan was always loyal to the Government of the United States. The "Ryan Address" issued by him in 1862 did much to uphold the hands of the Government in its struggle for existence.

On the 7th of June, 1874, Mr. Ryan stepped from active practice at the bar to the position of Chief Justice of the Supreme Court. This was by executive appointment. In April, 1875, he was elected by the people to the same office for a term to expire in January, 1882. He did

not survive to finish this term. He died in Madison on 19 Oct. 1880.

WILLIAM W. WIGHT.

Ryan, James, American Roman Catholic bishop: b. Thurles, County Tipperary, Ireland, 1848. He came to the United States when a child, studied for the priesthood at the seminaries of Saint Thomas and Saint Joseph, Bardstown, Ky., was professor at Saint Joseph's and after ordination served on the Kentucky mission for seven years. In 1878 he was appointed to a charge at Wataga, Ill., and afterward was for a time at Danville. He was rector of Ottawa from 1881-8, when he was consecrated bishop of Alton.

Ryan, Patrick John, American Roman Catholic prelate: b. Cloneyharp, Ireland, 20 Feb. 1831. He pursued his elementary studies at the Christian Brothers' school in Thurles and began his first classical course at Mr. Naughton's school in the parish of Rathmines. Determined to become a missionary in the United States, he entered Carlow College and after receiving sub-deaconship there, came to the diocese of Saint Louis, Mo. He was ordained to the priesthood in 1853, made rector of the cathedral and subsequently appointed pastor of the Church of Saint John the Evangelist and vicar-general of the Saint Louis diocese. In 1868 Father Ryan accompanied Archbishop Kenrick to Rome and while there preached a series of Lenten sermons that elicited great praise. On 14 April 1872, he was consecrated Titular Bishop of Tricomia and coadjutor to Archbishop Kenrick and on 11 Jan. 1894 was elevated to the titular archbishopric of Salamis, being transferred the same year to the archiepiscopal see of Philadelphia. In 1883 he was among the United States prelates chosen to visit Rome in the interest of the Catholic Church in America. He gave two annual inaugural addresses at the State University of Missouri, lectured twice before the representatives of the Missouri legislature and delivered discourses in nearly all the large cities of the United States, notable among these lectures being that on Modern Skepticism. He has published 'What Catholics Do Not Believe,' and 'The Causes of Modern Religious Skepticism.' In 1902 President Roosevelt appointed Archbishop Ryan a member of the Indian Commission and he is a member of the Executive Board of Catholic Indian Missions. The archdiocese of Philadelphia over which he now presides (1905) has a Catholic population of about 475,000; 503 priests; 234 churches; 115 parochial schools; 5 hospitals and 12 orphanages besides many benevolent and educational institutions.

Ryazan, rē-ā-zān'. See RIAZAN.

Rybinsk, rū'bĕnsk, or **Rubinsk**, Russia, in the government of Yaroslav, 52 miles northwest of Yaroslav, on the Volga, at the confluence of the Rybinsk. As the port of Saint Petersburg, it is one of the most important points of north central Russia. It became a centre of traffic when the three canal systems connecting Saint Petersburg with the Volga were opened. Its enormous business of transshipment and active trade in grain and hemp, during the season, increases the population by nearly 100,000 workers. Permanent pop. (1897) 25,233.

MOST REVEREND PATRICK JOHN RYAN.
ARCHBISHOP OF PHILADELPHIA.

Rydal, England, a picturesque village in the county of Westmoreland, two miles northwest of Ambleside. It is situated in a narrow gorge formed by the projection of two mountains near Rydal Lake. The lake, only half a mile in area, contains two beautiful islets, is encircled by meadows and dominated by rocky heights which add to the charm and calm beauty of the surroundings, so celebrated in English literature. Rydal Hall is a fine mansion in a park which contains many grand forest trees and a cascade immortalized in verse by Wordsworth, who lived for some years at Town End, near by, the residence also for a time of De Quincey.

Rydberg, rüd'bërg, **Abraham Victor**, Swedish writer: b. Jönköping 18 Dec. 1829; d. Stockholm 21 Sept. 1895. He studied at the University of Lund, and in 1855 entered journalism, contributing to the leading paper of Gothenburg. In 1868 he was sent to an assembly of the church where he was the champion of liberal ideas, and from 1870 to 1872 sat in the Riksdag. In 1882 he became professor of the history of civilization at Stockholm. He is the author of 'The Pirate of the Baltic' (1857); 'The Last of the Athenians' (1859), which has been translated into English, German, and Danish; 'The Doctrine of Christ According to the Bible' (1862); 'Magic of the Middle Ages' (1864); 'Romish Legends of the Apostles Peter and Paul' (1871); etc. His works include studies in æsthetics, philosophy and psychology, besides poetry and a translation of Goethe's 'Faust,' and he is regarded as one of the foremost Swedish men of letters.

Ryde, rid, England, a watering-place in the Isle of Wight, on the Spithead shore, seven miles east-northeast of Newport. It is regularly laid out on a sloping site, and is a picturesque, elegant, and well patronized summer-resort, having regular and frequent steamboat communication with Portsmouth, Portsea, Southsea, etc. Pop. (1901) 11,042.

Rydellius, Andrew, Swedish prelate and scholar, b. Linköping, in 1671; d. 1738. He studied under John Bilberg, and became instructor of philosophy and theology at Lund, where later he was appointed bishop. In 1718 he published a 'Course of Philosophy'; his other works include 'Grammatista Philosophans'; 'Sententiæ Philosophiæ Fundamentales'; 'Orationes Academicæ.'

Ryder, ri'der, **Albert Pinkham**, American artist: b. New Bedford, Mass., 19 March 1847. He studied his profession under William E. Marshall and in the art schools of the National Academy of New York. He has made a specialty of pastoral landscape and has been styled 'the last of the Romanticists.'

Ryder, William Henry, American Universalist clergyman: b. Provincetown, Mass., 13 July 1822; d. Chicago, Ill., 8 March 1888. He engaged in preaching when but 19 and at 21 became pastor of the First Universalist Society in Concord, N. H. He afterward preached at Nashua for two years and then traveled in the Holy Land. In 1850 he accepted the pastorate of the Universalist Church at Roxbury, Mass., from which he resigned in 1860 to become pastor of Saint Paul's Church, Chicago. At his death he bequeathed more than half a million dollars

to various charitable, educational, and religious organizations without regard to any difference in creed.

Rydgqvist, John Erik, Swedish author and critic, b. Gothenburg 20 Oct. 1800; d. 19 Dec. 1877. He abandoned trade in 1820 to study law and ancient languages, and in 1827 received a civil appointment in the central administration. He became known by his literary and critical works, joined the staff of the Royal Library at Stockholm, and in 1843 was appointed chief librarian. The same year he succeeded Berzelius as member of the Swedish Academy. Besides numerous translations of Greek and English works into Swedish, literary and critical essays published in various collections, notably in the 'Heimdal,' a critical review that he conducted from 1828 to 1832, his principal works include 'The Chief Literary Events of Past Ages' (1828); 'The Most Ancient Stage Works of the North' (1836); 'The Civil Service in Sweden' (1838); 'J. Olof Wallin' (1839), a biographical study; 'Travels in Germany, France and Italy' (1838); and 'The Laws of the Swedish Language' (2 vols. 1850-57), a philological work of great value.

Rye, N. Y., a town of Westchester County, on the New York, New Haven & Hartford R.R., eight miles northeast of New Rochelle. Rye was founded in 1660, and five years later was organized as a town of Connecticut, the border line not being settled until 1700. One of Rye's interesting features is the Jay homestead, where John Jay spent his youth. Port Chester, a manufacturing village is within the boundaries of Rye, and Rye Beach on Long Island Sound, with its picturesque colony of bungalows, cottages and shacks, is a favorite summer resort for bathing, boating and other recreations. Pop. 12,861.

Rye (*Secale cereale*), a plant of the grass family, and allied to wheat, which yields the fifth most important cereal crop in the United States. It is an erect hardy annual, with slender stiff culms from four to six feet high, flat leaves, and a terminal, compact, somewhat flattened, bearded spike from four to six inches long. The spikelets are usually two-flowered, sessile, compressed, alternate, convex on one side and flat on that next the rachis. The outer glume is keeled and often carries a short awn, while the flowering glume carries a long awn. Each floret has three stamens and two very short styles. The grain is oblong, furrowed on the inside, hairy at the apex and generally free from the flowering glume and palea. The plant is not found wild, but is believed to be indigenous to the country bordering the Black and the Caspian seas. The granules of rye-starch are larger than those of wheat or barley, some being .0016 of an inch in diameter. The form of the larger ones is that of a flattened disk with a depressed centre having cracks on its outer edge. The hilum is central with lines radiating almost to the circumference.

Rye is harder than wheat and is usually cultivated in cool regions on sandy or light soils, and in the Eastern States on medium loams which have become physically or chemically defective and will not produce satisfactory wheat crops. It will thrive on reclaimed peaty soils. In the rotation, rye occupies the same place that wheat would, and, like the latter, prefers a fine

RYE-GRASS — RYE-HOUSE PLOT

firm seed bed. For a grain crop, from $1\frac{1}{4}$ to 2 bushels per acre are usually sown in the autumn. Judicious rolling and harrowing in spring is often beneficial. The crop is harvested just before it is fully ripe, a good yield varying between 15 and 30 bushels of grain and from one to two tons of straw. The straw is particularly tough and pithy and of little feeding value. It takes a long time to rot in the manure heap when used as litter, unless it is chaffed.

Two types of rye are grown, the common or autumn-sown usually grown for grain, and the spring-sown usually sown in spring, but the former may be sown in spring and the latter in autumn. Midsummer or Saint John's Day rye and giant or Tyrolese rye are spring varieties and good for forage, the latter requiring a rich soil. When grown for forage, as a cover crop, or to be plowed in as green manure, three bushels of rye may be sown per acre at various seasons of the year, the only proviso being that there shall be sufficient moisture and warmth present to insure germination and growth. Green rye is an excellent feed, either for soiling or folding in the spring, being well suited for cows in milk or ewes with lambs. As soon as the ear appears the straw becomes tough and woody, so that stock refuse it, hence it should be grown in small areas and a succession put in. A bushel weighs about 56 pounds and each pound contains on an average about 21,000 kernels.

Feeding Value and Uses.—In northern Europe the grain is largely used for bread-making, but in this country it is chiefly employed either in the manufacture of malt and spirituous liquors, as rye whiskey, etc., or as food for stock. Holland's gin and the national Russian drink, kvass, are largely made from rye. The following table shows that rye does not differ materially from wheat in composition, nor are its by-products chemically dissimilar from those of the wheat grain:

| Average percentage composition of | Water | Ash | Protein | Crude fibre | Nitrogen-free extract | Ether extract |
|-----------------------------------|-------|-----|---------|-------------|-----------------------|---------------|
| Rye | 11.6 | 1.9 | 10.6 | 1.7 | 72.5 | 1.7 |
| Rye flour.... | 13.1 | 0.7 | 6.7 | 0.4 | 78.3 | 0.8 |
| Rye bran.... | 11.6 | 3.6 | 14.7 | 3.5 | 63.8 | 2.8 |
| Rye shorts... | 9.3 | 5.9 | 18.0 | 5.1 | 59.9 | 2.8 |

The percentage digestibility of rye meal with ruminants is dry matter 87, protein 84, nitrogen-free extract 92, ether extract 64; while that of rye bran with pigs is dry matter 67, protein 66, nitrogen-free extract 75, ether extract 58.

In milling the outer portion of the rye kernel constitutes the bran, the second layer the "middlings" or "shorts," and the inner portion the flour. For stock the whole kernel is ground. Rye flour is somewhat similar to corn meal as a source of protein and energy, but is more expensive. Ground rye and rye bran are fed to cows in Denmark. Not more than 3 pounds daily should be given, as they are said to have a deleterious effect upon the quality of the butter. Experiments show that for pig feeding rye is of equal value with barley, and that one pound of rye is equal to six pounds of separated milk or twelve pounds of whey; that rye shorts are inferior to rye, the pork from the former being softer and showing more shrinkage. Ground rye

may be safely fed to work horses to the extent of 8 or 10 pounds daily, together with other feeds, as bran or oats. Owing to the hollow stems of rye holding considerable air, this crop is not making much progress for silage purposes.

Rye straw is longer and more uniform in size than that of other grains and when unbroken it is used for packing pottery, horse collars, mattresses, etc., and in the manufacture of a variety of articles, as paper, hats, bonnets, mats, slippers, toys and fancy articles. For such purposes, it often commands a good price.

Diseases.—Ergot (*Claviceps purpurea*) is the chief disease and is common on other gramineæ. The elongated, curved, brownish or purplish spurs of ergot form on the head in place of a kernel and are sown with the seed unless it is carefully screened. If sown, they germinate and finally send out minute spores which, attaching themselves to the grass, live on it parasitically, send out small thread-like growths which finally reach the ovary, where they displace the rye grain and reproduce the cockscur or resting spore. Ergot should be removed before rye is used as feed, as it is dangerous to man and beast.

Statistics.—In 1902 the world's crop of rye was 1,678,714,000 bushels and the production of the United States, 33,630,592 bushels, both being the highest recorded. In 1902 the leading countries growing rye were Russia, 894,440,000 bushels; Germany, 373,768,000 bushels; Austro-Hungary, 140,476,000 bushels. The average yields per acre for the past eight years are Germany 22.6 bushels; Austro-Hungary 16.1 bushels; United States 15.0 bushels; Russia 11.6 bushels. In 1902 the average yield of the United States was 17 bushels per acre, valued at 50.8 cents per bushel, or \$8.63 per acre. In 1902 the leading States were Wisconsin and Pennsylvania, each producing over 6,000,000 bushels; Nebraska, 3,250,000 bushels; New York, Michigan and Minnesota with over 2,000,000 bushels.

SAMUEL FRASER,

Instructor in Agronomy, Cornell University.

Rye-grass. See GRASSES OF THE UNITED STATES.

Rye-house Plot, in English history, a conspiracy which took place in the reign of Charles II., and which became famous from the fact that its detection involved the death of Lord William Russell, Lord Essex, and Algernon Sidney, who were in no way connected with it. The immediate object of the Rye-house Plot, which was contrived in 1683 among a number of obscure persons belonging to the party of which those celebrated men were among the leaders, was to assassinate the king and his brother, the Duke of York (afterward James II.), as they returned from the Newmarket races. This plan was to have been executed at a convenient spot on the road from Newmarket to London, where there was a farm called Rye-house, belonging to one of the conspirators name Rumboldt; but the plan was frustrated by the king and his brother happening to return from Newmarket earlier than was expected. Soon after information of the matter was laid before one of the secretaries of state, and it was added that since this plot had been frustrated the plan of a general insurrection had been taken up by various eminent persons, among whom were those mentioned.

A general insurrection had indeed been talked of among the accused persons, and the details and probable success of such a scheme appear to have been considered by them; but there was no evidence whatever to show that the promoters of the wider scheme were in any way involved in the minor plot, which was got up, after the general insurrection had first been talked of, by a few of those who were already concerned in the larger plan. Yet from the way in which the revelations were made to the government the two schemes were completely confounded, and Russell, Essex, and Sidney were arrested on the charge of treason. Essex put an end to his own life in the Tower, and Russell and Sidney were condemned and beheaded. Lieutenant-colonel Walcot, one of the real contrivers of the Ryehouse Plot, was at the same time brought to the block.

Ryerson, rī'ēr-sōn, **Adolphus Egerton**, Canadian Methodist: b. Charlotteville 24 March 1803; d. Toronto 19 Feb. 1882. He entered the Methodist ministry in 1825; and became identified with the Methodist Episcopal Church of Canada at the organization of that body in 1828. In 1832 went to England to form a connection with the parent body. In 1842 he became first president of Victoria College and in 1845 was appointed superintendent of education for the province of Upper Canada, a position he retained for 30 years. Besides founding and editing 'The Christian Guardian,' he wrote 'A Manual of Agricultural Chemistry'; 'The Clergy Reserve Question'; 'Compulsory Education.' Consult: Egerton Ryerson, 'The Story of my Life' (1884).

Ryland, rī'land, **Henry**, English artist: b. Biggleswade, Bedfordshire. He was trained in art at the South Kensington schools and worked at Paris in the studio of Benjamin Constant, and at Julian's Academy under Boulanger and Lefebvre. His practical professional life was begun by him as a designer of stained glass and he contributed to the 'English Illustrated Magazine' in its early days. His first work as a painter was exhibited at the Grosvenor Gallery, but he has since exhibited, chiefly watercolors, at the other exhibitions of London, and many of his pictures have been engraved.

Ryle, rīl, **John Charles**, English Anglican bishop: b. Macclesfield, Cheshire, 10 May 1816; d. Lowestoft, Suffolk, 10 June 1900. He was educated at Oxford, took orders in the English church, and was successively curate at Exbury, rector of St. Thomas', Winchester (1843), of Helmingham, Suffolk (1844), and vicar of Stradbroke, Suffolk (1861). He was appointed honorary canon of Norwich, in 1872, and in 1880 was nominated Dean of Salisbury, but before he

had taken possession of this post was made bishop of the newly formed see of Liverpool. He was one of the most prominent members of the Evangelical party, and besides publishing numberless tracts which were widely popular, was author of such books as 'Coming Events and Present Duties' (1867); 'Bishops and Clergy of Other Days' (1868); 'The Christian Leaders of the Last Century' (1869); 'Expository Thoughts on the Gospels' (1856-69).

Rymer, rī'mēr, **Thomas**, English critic and antiquary: b. Yafforth, Yorkshire, 1641; d. London 14 Dec. 1713. He studied at Cambridge, subsequently kept terms at Gray's Inn, and was called to the bar in 1673. In 1678 he published 'Edgar, a Tragedy.' In 1692 he succeeded Shadwell as historiographer royal, and was entrusted with the preparation of a collection of public treaties, which he began to publish in 1704, under the title of 'Fœdera, Conventiones, et cujuscunque Generis Acta publica, inter Reges Angliæ et alios Principes.' Of this valuable and learned work he completed 15 volumes, and five more were afterward added by Robert Sanderson. The publication of the whole work was completed in 1735.

Rymer, **Thomas**, of Ercildoune. See RHYMER, THOMAS THE.

Ryotwar, rī'ōt-wār, in India, the lease of land by the government officers to the ryots or native cultivators at a fixed rent, a practice chiefly prevalent in the Madras Presidency.

Rysbrack, rūs'brāk, **John Michael**, German sculptor: b. Antwerp 1693 or 1694; d. 8 Jan. 1770. He went to England in 1720 and made a reputation by the exercise of his art, of which Westminster Abbey and several cathedral churches contain examples, among which may be mentioned the monuments of Sir Isaac Newton and the Duke of Marlborough. He also executed the equestrian statue of William III., at Bristol, and the statue of Locke at Oxford.

Ryswick, rīz'wīk (Rijswijk), Netherlands, a village between Delft and The Hague, famous for the celebrated treaty concluded in 1697, and known as the 'Peace of Ryswick,' signed by France, England, Spain, and Germany. It terminated a bloody war waged by England against France. Louis XIV. relinquished his recent conquests except Strasburg, which was taken in 1681. He also acknowledged William III. king of Great Britain and Ireland.

Rzheff, rzhěf, or **Rjev**, Russia, in the Tver government, occupies the heights on both banks of the Volga. It is a railway terminus, 89 miles southwest of Tver, and the centre of a great transit trade between the provinces of the lower Volga and the ports of Saint Petersburg and Riga. Pop. (1897) 39,584.

S

S the nineteenth letter and fifteenth consonant of the English and several other alphabets, is classed as a sibilant or hissing letter. The sibilant is of two kinds, one produced merely by emission of the breath while the end of the tongue is brought close to the front palate just behind the gums: this is the hard open sound; the corresponding soft open sound is represented in the alphabet by *z*, but in practice is often represented by *s*. The form *S* is the ancient Greek character ς with its angles rounded: in the existing Greek alphabet the *s* it represented by Σ . In some English words *s* is silent: island, aisle. The final *th* of verbs has changed to *s* because of the nearness of sound of *s* to *th*: loveth, loves; hath, has. There are several words in English — and the like can be said of Greek — which, beginning with *m* or *p* or *l*, take on an initial *s*; melt, smelt; pike, spike; lick, slick; Gr. mikros, smikros: compare Ger. niesen, Eng. sneeze. Sometimes the sound of *s* is changed to that of *st*: the verb hoise becomes hoist, whiles becomes whilst; and there is the mispronunciation of once, onst; and the plural of mouse is mice. The digraph *sh* stands usually for the ancient *sc* (*sk*): Old Eng. sceal, shall, fisk, fish.

S. P. Q. R., the initial letters of *Senatus Populusque Romanus* (the Senate and the Roman people), which was supposed to express the political character of the Latin nation. These initials were carried as a battle standard by the Roman armies.

Sa de Miranda, Francisco de, frän-thēs'kō dā sā dā mē-rän'dā, Portuguese poet: b. Coimbra, Portugal, 27 Oct. 1495; d. there 15 March 1558. He wrote much in Spanish, taking for his models Dante and Petrarch, but in sentiment remained entirely loyal to his native country. His fame rests chiefly upon his poetical epistles and eclogues, though his entire work is excellent, and characterized by sincerity and love of natural beauty. He is ranked as one of the six greatest Portuguese poets. An edition of his work edited by Carolina Michaëlis de Vasconcellos contains 189 of his pieces, 74 of which are in Castilian.

Saadja Gaon, sā-äd'yā gā-ôn' (SAADJA BEN JOSEPH, Arab SAID), Jewish Rabbī: b. Fayum, the Biblical Pithom, Egypt, 892; d. Babylonia 941. In 828 he was appointed Gaon or principal of the Jewish Academy at Sura, near Babylon, into which dwindling institution his zeal and learning infused new blood. His acquirements were many and varied, and he lived in a time when philosophy and reason were in danger of usurping the authority hitherto wielded by tradition, and especially were the Karaites inclined to

discard the latter. It was the work of Saadja to discover a common ground for the maintenance and support of Jewish dogma side by side with philosophical theory. This was the object of his great work, written in Arabic, 'Emunot w'deot' ('Faith and Ethics') which was translated into Hebrew by Juda ibn Tibbon (1160) and into German by Fürst (1845). Saadja wrote a commentary to some of the books of the Old Testament, treatises on grammar, and hymns for the synagogue. On the 1000th anniversary of his birth a complete edition of his works was published by Joseph Derenbourg. Consult Grätz, 'Geschichte der Juden' (1870); Guttman, 'Die Religionsphilosophie des Saadja' (1882).

Saale, zä'lē, Germany, the name of several rivers, flowing between Baireuth and Hof, in the northeast of Bavaria. The most important of these is the river rising in the north side of the Fichtelgebirge at an altitude of 2,390 feet. It is navigable from Naumburg and passes Kahla, Jena, Kainburg — it becomes very circuitous, passing Merseburg and Halle, and finally connects with the Elbe, near Leipsic, by canal. It flows through a fertile and picturesque valley for 200 miles, its romantic heights crowned by many castles. It is of great commercial value, having a wide and deep channel in the greater part of its length.

Saarbrücken, zär'brük-ën, or **Sankt-Johann Saarbrücken**, Germany, in the Rhine province, Prussia, is situated on the Saar, 39 miles southeast of Treves. Its sister-town across the river gives the town the double name. It is an important industrial centre, is well-built, and has a castle. There is a mining academy and a monument to Bismarck. The principal industries are wool-spinning, brewing, and the manufacture of tobacco, chemicals, tin, and stoneware. Trade is mainly dependent on the coal mines, the glass and iron works of the district. In 1870 the French and Prussian forces fought here the first engagement of the Franco-German war resulting in a partial victory to the French, which the Germans retrieved four days later by their first victory in the vicinity. Pop., including Sankt-Johann (1900) 44,499.

Saba, sā'ba, one of the Leeward Islands, Dutch West Indies, area five square miles. It is high and rocky, rising abruptly from the sea to a height of nearly 3,000 feet. A small proportion of the area is under cultivation; the chief products are tropical fruits and vegetables, especially cabbages, and cotton. Fishing is also an important industry, and fishing boats are built on the island. The inhabitants are the descendants of Dutch and Scandinavian pirates who occupied the island in the 17th century. The

island nominally belongs to Holland, but the people are practically independent, being exempt from taxes and electing their own governor. Pop. (1900) 2,177.

Sabadil'la, or **Cevadilla**, the pharmaceutical term for seeds of a liliaceous plant (*Schanocaulon officinale*), growing in Central America, with a bulbous root, grass-like leaves and a flower-stalk some six feet in height. The papery, tri-capsular fruits contain a few pointed, wrinkled, blackish seeds, persistently acrid and sternutatory, a powerful irritant and poisonous. They are employed for preparing veratrine, which in the form of a tincture or ointment, is used as an external application for neuralgia and rheumatism, but is likely to prove poisonous if the skin be broken, thus permitting absorption. Sabadilla has also been given as a dangerous vermifuge, and is used for killing vermin.

Sabæanism, sā-bē'an-izm, or **Sabianism**, a religion whose believers were once numerous in Arabia, Syria and Mesopotamia, which while it recognized only one supreme being, also worshipped, or paid high reverence to angels, or inferior divinities, supposed to reside in the stars. This part of the Sabæan creed virtually amounted in practice to star-worship.

Sabæans, sā-bē'an-z, the ancient name of the inhabitants of the modern Yemen, in Arabia. Ptolemy places them in the north and middle of what is now called Yemen, and earlier geographers to the south of that province; but the fact appears to be that they were a race dwelling on both sides of the Red Sea on its southern shores, in Arabia and Ethiopia. The names applied to the peoples dwelling on the different sides of the Red Sea were very like, Shebaïm being that of the Arabian section, and Sebaïm that of the Ethiopian. The country of the Shebaïm was probably the Sheba of the Bible, the land of the queen who came to visit Solomon. It was fertile and rich in spices and perfumes, and carried on an extensive trade with the East.

Sa'baism, the name derived from Hebrew and Arabic, given to the worship of the stars as deities. It extended through the countries of the Assyrian and Medo-Persian empires as far as Asia Minor, between the Caspian Sea, the Euxine, and the Mediterranean, from the Armenian Mountains as far as the banks of the Nile and southern Arabia; but it assumed different forms in different countries, appearing sometimes more sensual, sometimes more spiritual. The objects of worship were the sun, the moon, and the planets, or rather the planetary spirits of which the planets were believed to be the frame or the body. The worship of the sun was especially cultivated in Babylon and Phœnicia. The worshippers of the stars generally ascribed to them a great influence upon and a knowledge of terrestrial affairs; and astrology, the casting of nativities, and various systems of demonology, were therefore the natural result of Sabaism. The astrological system was most largely developed by the Egyptians, while Parseism was the purest and most perfect form of Sabaism. In the Koran the star worship of ancient Arabia is designated by the name Sabaism. In the town of Haran, in Mesopotamia, a kind of Sabaism maintained itself, surrounded on all sides by Christianity, until the Middle Ages. One sect of Sabæans believed in the migration of the

soul, and in great world-periods, constantly renewed in an everlasting revolution, a view sustained to a certain extent by modern philosophy.

Sa'bal, or **Cabbage Palmetto**, the most northern arborescent palm in the world. It is a tree attaining 80 feet in height. Until it is from 10 to 20 feet high, its straight, robust stem is surrounded by the dry fibrous sheaths, and the stubs of petioles, of leaves, projecting like spines, and giving a very picturesque and characteristic appearance. The leaves, massed at the top of the trunk are cordate, or fan-shaped, narrowly pinnatifid, each division cleft at its apex and recurved at the summit. The terminal bud, by which growth is continued, or "cabbage," is a favorite delicacy with the negroes, who cut it out of the young and healthy trees,—thereby causing the ultimate death of the palmetto—and cook it as a vegetable. Many palmettoes are killed by the removal of the tops of the young trees. These tops are sent to factories, where they are trimmed down to a disk some eight inches thick, the soft central parts are cut out, and the disk is then boiled to loosen the fibres of the sheaths and petioles, which are made into scrubbing brushes. These buds for brushes are worth only about 6 or 7 cents apiece, and yet the trees are being exterminated for so slight returns. The mature leaves are used for thatching, and the trunks resist teredos to such an extent that they are valuable for sub-marine pilings.

This palmetto has always been interwoven with the history of South Carolina, the "Palmetto State." A fortification, or stockade, on Sullivan's Island in Charleston Harbor, 1776, was composed of earth and palmetto logs, and succeeded in repulsing the attacking British fleet under Sir Peter Parker, whose shot had practically no effect on the wall, for they could not split the spongy trunks, but were imbedded in them. Therefore, in memory of this event, the palmetto tree appeared on the seal of South Carolina, over an uprooted branchless oak-tree representing the oaken ships of England; on a flag adopted after the Ordinance of Secession (1861) was passed; and also on a medal. At the signing of the secession ordinance, palmetto trees flanked the platform, and at the back was the banner of the convention, bearing among other curious devices, a most unnatural palmetto, with a gigantic rattlesnake wound about its trunk. Cockades, rosettes of blue ribbon with a palmetto imprinted on a button in the centre, were worn by Charlestonians in 1860-1.

Sab'alo, a name of the tarpon (q.v.), further known as savaile, savanilla, grande ecaille, silver-king, etc.; also of the Hawaiian milk-fish (*Chanos chanos*).

Sabaoth, sā-bā'ōth, or sa-bā'ōth, **Lord God** of, a term used in the Scripture, meaning "Lord God of Hosts." It has no connection with the word Sabbath.

Sabatier, sā-bā-tē-ā, **Paul**, French theologian and historian: b. Saint-Michel-de-Chabreilanoux, Ardèche, 3 Aug. 1858. He was educated in the theological faculty of Paris, and in 1885 became vicar of the French parish of Saint Nicolas at Strasburg. The German government offered him a superior appointment, involving his becoming a German citizen; he requested to be allowed to retain his post as vicar, but the request was viewed as a political manifestation, and he was banished the coun-

ery. For a brief time he was pastor of Saint Cierge la Serre; then he withdrew from the ministry to devote himself wholly to historical studies. His chief work is 'La Vie de Saint François d'Assise' (1893), based largely on previously unutilized documents discovered by him in various Italian archives. Within a year from the appearance of the first French edition, editions had appeared in almost all Continental languages, including Swedish and Polish. The Russian version was prepared under the direction of Tolstoi. Sabatier published also 'La Didaché ou l'Enseignement des Douze Apôtres' (1885), and editions of the 'Speculum Perfectionis' by Leo of Assisi (1898; translated into English by S. Evans as 'St. Francis of Assisi, the Mirror of Perfection' (1898), and of the 'Tractatus de Indulgentia' (1900), of Francis-cus Bartholus. Consult article by Rawnsley in 'Contemporary Review, V. 74, pp. 505-18 (1898).

Sabazius, sa-bā'zhi-ūs, a Phrygian divinity, identified by the Greeks in part with Zeus and in part with Dionysus. His symbol was a serpent. His worship extended to Greece, and was found also in Italy, especially in late pagan times. He was said to have been the first to employ oxen for plowing.

Sabbatai Zevi, sãb-bã-ti' zẽ-vẽ', whose name is also spelled "Sabtai Zefi" and Sabbathais Zevi, a pretended Messiah: b. Smyrna 1641. He was a man of great learning and magnetic presence, and he led thousands of followers, mainly in Smyrna, Salonica, Alexandria, and Jerusalem, to believe in him as the Messiah. In 1664 he had about 80,000 followers; in the following year the beginning of the Messianic reign within a few months and the rebuilding of the Temple in the next year were proclaimed in the streets of Alexandria by Sabbatai and six disciples, clad in white raiments, with garlands on their heads. Having excited serious alarm at Constantinople, he was apprehended at Smyrna, and terrified into a recantation of his mission. He was said to have declared that his sole object had been to embrace Islam, and to carry over all the Jews with him. The sultan declared himself satisfied, and honored him with the title of an effendi, giving him an honorary post at the same time. He again aroused the jealousy of the Turks, and was either poisoned in prison, or publicly executed.

Sabbata'rian Controversy, the dispute in various forms between those who urge and those who oppose a rigid observance of Sunday. It has been going on from the time of King James I., of England, who favored Sunday sports, and thereby offended many of his subjects, and it has in late years included proposals to throw open to the public museums, libraries, and galleries, and other places of recreation and instruction, on the first day of the week. Most of these changes have been generally adopted. The proposition to permit the sale of alcoholic liquors in saloons on Sunday is at present the chief feature of the Sabbatarian Controversy.

Sabbata'rians, a term applied to those who urge rigid observance of Sunday. It was applied also in earlier times to the sect now known as Seventh Day Baptists, who observe Saturday for Sunday, and who, for that reason, are permitted in Rhode Island, where they are comparatively numerous, to work on Sunday.

Sabbath, the ancient Hebrews' weekly day of rest. In Hebrew the word means week, and the expression of Josephus (Apion ii. 2), who explains it as meaning "a rest from all labor," is rather to be looked upon as a commentary than as a derivation etymologically correct.

The Sabbath was the seventh day of the Hebrew week and lasted from sunset on Friday to sunset on Saturday. It was celebrated as a holy day; a day of rest and rejoicing; by ceasing from all labor, and by causing servants, strangers, and cattle to cease also. Plants even were to rest; they were neither to be sown nor reaped on that day. The services of priests and Levites in and about the tabernacle and temple were, however, to be performed through the Sabbath-day. Circumcision, too, could take place on the Sabbath, when it fell on the eighth day after the birth of a male child.

Profanation of the Sabbath was punished by stoning to death. It was not until after the exile that the character of the work by which the Sabbath could be profaned was strictly defined. In the law only one act of labor was specifically prohibited, that of lighting a fire for the purpose of cooking. According to Josephus armies never proceeded on their march on the Sabbath. The Pharisees forbade even the plucking of grains of corn on that day; the healing of a sick man; or the walking of a cured patient bearing his bed. According to the Mishna even a broken bone was not to be set, nor dislocations poulticed or bound up on that day.

Origin of the Sabbath.—The Sabbath appears to have been an institution of religion long prior to Moses. It is sometimes said that it was borrowed by him from older nations, such as the Egyptians. Such Latin writers as Seneca and Ovid give intimations that the veneration for the seventh day had found some favor among the early Romans. It seems more natural to suppose that it had come down with the old traditions of theocratic religion which are found embalmed in the first chapter of Genesis. The poem of the creation, in which God is related to have created the world in six days and rested on the seventh day, embodies a tradition much earlier than the period of Mosaic legislation. There are several intimations in the patriarchal age that the followers of Jehovah, such as Abraham and Isaac, chose certain times for rest, meditation, prayer and sacrifice to God. In after times it would almost seem as if the poem or hymn of the creation was used as a special part of Sabbath-day devotions. On that day the people were called to reflect upon the fact that the whole universe, including themselves, had an origin in one personal and supreme Being; that He had exerted His Omnipotence for a definite period and then had ceased from His work. They were constantly to remind themselves of the work of God, once for all completed, by their own six days' round of labor; and as God had rested from His work so were they to rest from theirs and to turn their thoughts toward Jehovah "who had done so great things for them."

Mosaic Ordinances of the Sabbath.—The scope and meaning of the Sabbath-day was very much extended and amplified by the provisions of the law as contained in the Hexateuch. It was made to be a day on which not only the finished task of creation was to be commemorated, but on which the great providential deliv-

erances of the children of Israel were likewise to be recalled. But first of all the command is given by the law in various forms of speech, but with the same intent throughout the books of the law, Exodus, Deuteronomy, and Leviticus, to remember the seventh day, the Sabbath, to keep it holy; most specifically in Lev. xxiii. 3: "Six days shall work be done: but the seventh day is the sabbath of rest, an holy convocation; ye shall do no work therein: it is the sabbath of the Lord in all your dwellings."

First of all there are three specifications as to the manner in which the week is to be spent: (1) by labor—"Six days shalt thou labor, and do all thy work:" (Ex. xx. 9); (2) by rest on the seventh day; on this day the people are ordered to rest, literally to take breath, then are enumerated in detail those who are enjoined from work: "Thou, nor thy son, nor thy daughter, thy manservant, nor thy maidservant, nor thy cattle, nor the stranger that is within thy gates." The penalty of death is threatened against all who shall disobey this command. The reasons of this command are given: (1) as a counsel of mercy—"Six days thou shalt do thy work, and on the seventh day thou shalt rest, that thine ox and thine ass may rest, and the son of thine handmaid, and the stranger, may be refreshed" (Ex. xxiii. 12); (2) as a commemoration of the deliverance from Egypt—"And remember thou wast a servant in the land of Egypt, and that the Lord thy God brought thee out thence through a mighty hand and by a stretched out arm, therefore the Lord thy God commanded thee to keep the sabbath day" (Deut. v. 15); (3) as a commemoration of the finished creation "For in six days the Lord made heaven and earth, the sea, and all that in them is, and rested the seventh day: wherefore the Lord blessed the sabbath day, and hallowed it" (Ex. xx. 11); (4) as a sign of the covenant, just as circumcision was the sign of the Abrahamic covenant, and the rainbow the sign of the covenant with Noah—"Speak thou also unto the children of Israel saying, Verily my sabbaths ye shall keep, for it is a sign between me and you throughout your generations, that ye may know that I am the Lord that doth sanctify you. . . . It is a sign between me and the children of Israel for ever: for in six days the Lord made heaven and earth, and on the seventh day he rested, and was refreshed" (Ex. xxxi. 13, 17).

The Jews of to-day who profess to keep up the tradition of their fathers still keep the Sabbath as a joyful festival. The Sabbath is held from Friday evening to Saturday evening. It is among some of them considered a pious observance to begin the celebration half an hour before Friday's sunset and to continue it half an hour after sunset on Saturday for the benefit of the souls of those who are in torment, for they believe that the damned are allowed a mitigation of their suffering during the feast. On Friday afternoon all the food for the following day is prepared, and their festal array is laid out for the Sabbath. Some Jews have special raiment which they wear only on that day; on the morning of which the Sabbath lamp is lit and the Sabbath bread laid on the table. The master of the house at the close of the evening meal blesses the wine and passes it round. They eat three meals on the Sabbath-day and they

have a maxim that it is good to honor the day in the body, in dress, in eating, and in drinking.

The Lord's Day.—A careful consideration of early Church history and early Church writers leads to the conclusion that the day of Christ's resurrection, the first day of the week, grew up, coeval with the existence of Christianity itself, as the one distinctively Christian festival, which was made to fall in with the injunction to periodical rest, founded on the earliest traditions of biblical religion and provided for under Moses by special legislation for the observance of the Sabbath. Nevertheless the idea of the Lord's Day is wholly distinct from that of the Sabbath, which seems to have been likewise observed by the early Church, although sometimes as a fast. The Saturday half-holiday, which still survives in some countries or at some seasons of the year, is certainly derived from this double observance. The tendency to sabbatize the Lord's Day was perhaps due to certain imperial decrees of the Christian emperors beginning with Constantine, who closed the law courts, etc., on what Justin Martyr calls "the day of the sun," and what Constantine speaks of as "venerable Sunday."

Civil legislation on behalf of the observance of Sunday began in the Roman empire in an early part of the 4th century, as in the statute of Constantine (321), which runs as follows: "On the venerable day of the sun let all magistrates and people residing in the city rest, and let all workshops be closed. In the country persons engaged in agriculture may, however, according to their will and without violating this law, continue their toil, for often another day is not so suitable either for sowing grain or for planting vines; and if the proper opportunity for such operations be lost the bounty of heaven may be disappointed." While Constantine permitted the legal freeing of slaves and the visitation of captives on Sunday, he prohibited the prosecution of lawsuits. Theodosius (386) published a decree suspending the theatrical shows and circus races on Sunday. These historical facts are important as bearing on the present Sunday laws in England and America.

The Frank emperors kept up the observance of the Lord's Day by their capitularies or general statutes; and even during the French Revolution, when the Christian calendar was abolished, each tenth day was made a day of rest, and public offices, schools, workshops, and shops of merchandise, excepting those of food and medicine, were ordered to be closed. The Code Napoléon ordered the observance of Sunday.

In England the observance of the Lord's Day has been enjoined by statute from the earliest times. Canute (1028-35) prohibited marketing, hunting, and the holding of local courts on that day. After the Conquest the conduct of the people with regard to trade, sports, and the law courts was controlled by special statutes.

The most important legislation on the subject of Sunday usage is that which was promulgated in the reign of Charles II. (1676). By the law then passed a prohibition is imposed upon all worldly labor or business excepting works of necessity or charity, necessary traveling and the service of any legal writ excepting in case of high treason or treason, felony, or breaches of the peace; and it permits also the sale of food in inns and eating-shops.

The American colonists, especially in their early New England settlements, enforced the observance of the first day of the week by the most rigorous penalties. People were compelled by the laws of Massachusetts, Connecticut, Georgia, South Carolina and Virginia to attend public worship in a church or conventicle. It was only as time advanced that a distinction was made between the observance of Sunday as a civil and as a religious institution. (See SUNDAY.) Consult: Hessey, 'Bampton Lectures' (1860); Oehler, 'Theology of the Old Testament'; Proudhon, 'La Célébration du Dimanche'; Briggs, 'The Higher Criticism of the Hexateuch' (1893).

Sabbatia, a genus of *Gentianaceæ*, often growing in sand or salt marshes. These plants have verticillate leaves, handsome terminal flowers, with white or pink rotate corollas 5 to 12-merous; 4 to 12 stamens with thread-like filaments, and two-cleft styles, capsules more or less globose, coriaceous, and containing many small reticulated seeds. Several species have a tonic, although bitter, juice, and are used as febrifuges. Although named in honor of an early Italian botanist, Sabbati, the genus is said to be so called because the Pilgrim Fathers discovered the local *S. stellaris* on a Sabbath. This charming species, called the marsh pink, or Rose of Plymouth, bears a very delicate pink flower, with a star-shaped yellowish eye.

Sabbat'ians. See JEWISH SECTS.

Sabbatical Year, the seventh year which the law of Moses provided should be a year of rest for the land (Ex. xxiii. 10, 11; Lev. xxv. 1-7). The land was not to be sown and that which grew of its own accord was not to be reaped, but to be left for the poor to eat. Vineyards and oliveyards were also to be left uncultivated, and their produce ungathered; but the people were allowed to fish and hunt, and attend to their bees and flocks, and a triple produce was promised for every sixth year to make up for the deficiency of the seventh. The sabbatical year was also to be a year of release for Jewish debtors (Deut. xv. 1-6), but those who were able to lend were strictly enjoined not to refuse loans to poor and needy persons because the year of release was at hand (Deut. xv. 7-11). In this year also the law was to be read solemnly to all the people assembled at the feast of Tabernacles (Deut. xxxi. 10). This institution seems to have been almost entirely ignored during the period which preceded the captivity, and in 2 Chron. xxxvi. 21, the time of the captivity is represented as one in which the land was enabled, by the will of God, to enjoy the sabbaths or years of rest that the Israelites had omitted to allow it. After the captivity Nehemiah sought to secure the better observance of the septennial sabbath, as he did that of the weekly sabbath (Neh. x. 31), and he seems to have had some success in the former as well as in the latter effort. The historic fact that Alexander the Great remitted the Jewish tribute in the seventh year because the Jews were debarred by their religion from employing the means of raising it, shows that it was observed a hundred years after the time of Nehemiah.

Sabella, a genus of annelids dwelling on sandy shores in tubes formed solely of sand, the

particles of which are glued together by means of a natural cement secreted by the worms, and thus form a smooth regular tube, presenting a striking contrast in its uniformity to the rougher dwelling-tubes of allied genera, such as *Terebella*. The worm itself possesses a slender body, the hinder part of which may be doubled up within the tube. The head is provided with slender tentacles.

Sabellianism, the theological views of Sabellius (q.v.), which, though they had numerous advocates, were condemned by the Church as heretical. See MONARCHIANS.

Sabellius, sa-běl'ŭ-ŭs, Christian teacher: b. Pentapolis, Africa, or Italy. He taught at Ptolemais in Upper Egypt during the pontificate of Zephyrinus (199-217) and Calixtus I. (217-222), and is known as the founder of a sect who considered the Son and Holy Ghost only as different revelations or manifestations of the Godhead, but not as separate persons (see MONARCHIANS). The doctrines of Sabellius were opposed by Dionysius of Alexandria and Dionysius of Rome, by Epiphanius (who states that the Sabellians were very numerous around Rome and in Mesopotamia), and by Theodoret. Saint Augustine states that by the beginning of the 5th century they had entirely disappeared. Yet their views have always found adherents, and even now some theologians attempt to reconcile theology with reason by admitting conceptions of the Trinity coinciding with that of Sabellius.

Sa'bians. See SABEANS.

Sabin, sā'bĭn, Edwin Legrand, American writer: b. Rockford, Ill., 23 Dec. 1870. He was graduated from the University of Iowa in 1892, and has published: 'The Making of Iowa' (1900); 'The Magic Mashie' (1902); etc.

Sabin, Joseph, American bibliophile: b. Braunston, Northamptonshire, England, 9 Dec. 1821; d. Brooklyn, N. Y., 5 June 1881. After apprenticeship to Charles Richards, bookseller of Oxford, he set up a bookshop of his own there, but in 1848 came to this country, where he conducted establishments for the sale of old and rare works in New York 1850-6, in Philadelphia 1856-60, and New York 1860-81. His bibliographical knowledge was wide, and he is said to have crossed the Atlantic not less than 25 times for the purchase of unique specimens. From 1869 he published for a number of years 'The American Biblioplist.' He also prepared several compilations, among them 13 volumes of an uncompleted 'Dictionary of Books relating to America.'

Sabin, Oliver C., American Evangelical Christian Science bishop: b. Knox County, Ohio, 1840. His parents were members of the Christian Church, or Disciples of Christ. After the war he studied law and practised his profession for many years, was also engaged in journalism and publishing, and interested himself in politics. After being connected with business enterprises in Illinois, Nebraska, and elsewhere he settled in Washington, D. C., where, in 1899, after a thorough investigation of the Christian Science methods of healing, he with others organized the Evangelical Christian Science Church, the work of which has since prospered and spread rapidly. He relinquished his various business positions and began to

preach the Gospel with voice and pen most successfully.

Sabine, sǎb'ín, **SIR EDWARD**, English physicist: b. Dublin, Ireland, 14 Oct. 1788; d. Richmond, Surrey, 26 June 1883. He was educated at the military colleges of Marlow and Woolwich and in 1803 entered the army where he was commissioned 2d lieutenant of artillery. He served in the war with the United States in 1813-4 and accompanied Ross and Parry in their Arctic expedition in 1818 and that of Parry in 1819-20. While on these expeditions he engaged in researches in terrestrial magnetism and in 1821-5 conducted a series of voyages extending from the Arctic regions to the equator, gathering data concerning the magnetic needle, the figure of the earth and other points in meteorological and terrestrial physics. He was instrumental in the establishment of permanent magnetical and meteorological observatories, retaining directorship of those in the colonies for many years. In 1818 he was elected to the Royal Society, was its vice-president in 1850 and in 1861-71 acted as its president. He received rank as lieutenant-general in the army in 1859 and was retired with full rank as general in 1874. His works include: 'An Account of the Experiments to determine the Figure of the Earth' (1825); 'The Variability of the Intensity of Magnetism upon Many Parts of the Globe' (1838); etc.

Sabine, sǎb'ín, **LORENZO**, American historian: b. New Libson, N. H., 28 Feb. 1803; d. Boston, Mass., 14 April 1877. He sat in the New Hampshire legislature for three successive terms, but removed to Massachusetts in 1849, and was a Whig member of Congress in 1852-3. He is best known for his important work on 'The American Loyalists, or Biographical Sketches of Adherents to the British Crown in the War of the Revolution' (1847). He also published 'Life of Preble' (1847); 'Reports on the Principal Fisheries of the American Seas' (1853); 'Notes on Duels and Duelling, with a Preliminary Historical Essay' (1856); etc.

Sabine, sǎb'ín, **Mountains**, Italy, a branch of the Apennines, near the border of ancient Latium, east of Rome, is a lofty group in the upper valley of the Aternus; the highest summit reaches an altitude of about 4,200 feet.

Sabine, sǎ-bén', a river of the United States, which has its rise in the northeastern part of Texas, in Hunt County, flows southeast about 250 miles, then turns southward and forms the boundary between Texas and Louisiana, and enters the Gulf of Mexico through Sabine Lake and Sabine Pass. The mouth of the river is Sabine Pass, a narrow channel which is obstructed by a muddy bar. Considerable has been done to make this Pass safe for navigation; jetty-building and dredging was begun as soon as the interior of Texas, near the Sabine River, was settled. Sabine Lake is an expansion of the river, but the Neches River also enters the lake. The Sabine River is about 500 miles long and is navigable in its lower course.

Sabine Cross Roads, Battle of, and Banks' Retreat to Alexandria. Three miles southeast of Mansfield, De Soto Parish, La., one of the main roads from Alexandria to Shreveport is crossed by a road from Red River

to Sabine River. At this crossing was fought a battle which marked the culmination and failure of what is known as the Red River Expedition. On 23 Jan. 1864 Gen. Banks, then at New Orleans, received a despatch from Gen. Halleck, dated the 4th, proposing an expedition, to consist of the forces of Banks, Steele, and such as could be spared by Sherman, for the capture of Shreveport, La., on Red River, and the recovery of Texas, thus opening access to the cotton of that section and stimulating trade. Banks had, on a previous occasion, for sound reasons, objected to such a campaign, but now acquiesced and promised a cordial co-operation; but he set forth the difficulties in the way, and made suggestions to remove them, not one of which was regarded. Engrossed with duties concerning political affairs in Louisiana, which had specially been confided to him by the President, Banks could not immediately leave New Orleans, and he entrusted the arrangements of the expedition to Gen. W. B. Franklin, his second in command, who was to move from the Teche 5 March, reach Alexandria on the 17th, and co-operate with a strong fleet under command of Admiral Porter. Porter arrived at the mouth of Red River on 7 March, with a fleet of 15 ironclads and four light steamers, and there he was joined some days later by transports from Vicksburg, carrying four divisions of Sherman's army, under Gen. A. J. Smith, and the Marine brigade of Col. Ellet. A part of the plan of campaign was that Gen. Steele, with an army of 15,000 men, should move from Little Rock, Ark., directly on Shreveport; but Steele, after marching from Little Rock to Camden, was checked, fell back to Little Rock, and took no further part in the campaign. (See JENKINS' FERRY, BATTLE OF.) Smith's forces advanced, attacked and in conjunction with the navy, 14 March, captured Fort de Russy, up Red River, together with 283 prisoners, 10 guns, and many small arms, the Confederate covering force of 3,500 men, under Gen. Walker, after burning two steamboats and a considerable quantity of cotton, retreating up the river. It was not until the 19th that Franklin, with very little opposition, which was brushed aside by his cavalry, reached Alexandria; Banks joined him on the 24th, but his entire column did not close up until the 26th. Meanwhile Gen. Mower, with three brigades of Smith's division and a cavalry brigade of the Nineteenth corps, marched from Alexandria on the 21st for Henderson's Hill, 25 miles westward, surprised the 2d Louisiana cavalry, and with slight loss captured 250 men, nearly as many horses, and four guns, with their caissons. Near Alexandria the fleet came to a series of rapids, and the water was so low that the ironclads could not run up them, but after a week's hard labor the lighter ones were carried over. The transports, which could not pass, returned to Vicksburg, and with them Ellet's 3,000 men. The withdrawal of the transports made it necessary to establish a base at Alexandria and the use of a wagon-train to carry the supplies, and the further necessity of leaving a guard of nearly 4,000 men (under Gen. Grover) to protect the place. Gen. Franklin, with the main column, advanced on the road running west of and parallel to the river, to Natchitoches, about 80 miles above Alexandria, driving before him the Confederate cavalry, and reaching Natchitoches on 3 April, where he was

joined by A. J. Smith's column, which, accompanied by Porter's fleet, had come to Grand Ecote, four miles from Natchitoches. Porter had a fleet of 13 gunboats and 30 transports.

Banks' army, on the eve of march from Natchitoches for Shreveport, was composed of two divisions of the Thirteenth corps, under Gen. T. E. G. Ransom; five brigades of the Sixteenth corps, under Gen. A. J. Smith; Gen. W. H. Emory's division, three brigades, of the Nineteenth corps; and Col. Dickey's brigade of colored troops, under Gen. Franklin; Gen. A. L. Lee's division of cavalry and mounted infantry, four brigades; and a small artillery reserve, under Capt. Closson. These numbered 31 March 25,735 officers and men, with about 65 guns. Lee's cavalry force of 4,500 men had pushed out westward, 12 miles; on 2 April it ran across Confederate cavalry, drove it back eight miles, and then withdrew to wait for the general advance. The general advance began on the morning of the 6th, led by Lee's cavalry, followed by the two small divisions of the Thirteenth corps, under Ransom, and by Emory, with a division of the Nineteenth corps and Dickey's brigade of colored troops. On the morning of the 7th A. J. Smith followed with Mower's division of the Sixteenth corps. A division of the Seventeenth corps, 1,730 strong, under Gen. T. Kilby Smith, remained with the transports, under instructions to conduct them to Loggy Bayou, opposite Springfield, about midway between Natchitoches and Shreveport, 110 miles by the river, above Grand Ecote, where he was to halt and communicate with the army at Sabine Cross Roads, 54 miles from Grand Ecote. Porter, Smith, and the transports, with six gunboats carrying 17 guns, started on the 7th.

Lee's instructions from Gen. Franklin were to attack the enemy wherever found, but not to bring on a general engagement. On the 7th he drove a brigade of Gen. Green's beyond Pleasant Hill, and came upon a strong force under Green at Wilson's Farm. Lee attacked and after a hard engagement of two hours drove Green to Saint Patrice's Bayou, eight miles from Pleasant Hill. Here Lee bivouacked for the night, and sent back for infantry support. His loss had been 53 killed and wounded. Green's loss was greater, including about 100 prisoners. That night Franklin reached Pleasant Hill; A. J. Smith's division was still a day's march in rear of Franklin. At daybreak of the 8th Lee, having been reinforced by one of Landram's brigades of the Thirteenth corps, dropped his wagon-train, and, moving forward, drove the Confederates from Saint Patrice's Bayou and gradually pushed them to a wood beyond a clearing at Sabine Cross Roads, and found himself in the immediate front of Gen. R. Taylor's army of 10,000 men. Taylor, whose forces had been much scattered, in Arkansas, Louisiana, and Texas, had concentrated them, and near Mansfield had the three divisions of Gens. Green, Walker, and Mouton—10,000 men. On the morning of the 8th he moved three miles from Mansfield to Sabine Cross Roads and formed line in the edge of a wood, commanding, on both sides of the road, a clearing about 1,200 yards long, and 800 wide, through the middle of which was a deep ravine. He knew that Banks' column was stretched out on a single road for more than 20 miles, and was sanguine of success in

attacking the head of it. Lee threw out a strong skirmish-line and waited for Banks' main body to come up. At noon Ransom arrived with a brigade, and line was formed. Banks rode up a little past noon, and sent back repeated orders for Franklin to hurry forward. After heavy and continuous skirmishing, lasting until 4.30 p.m., Taylor threw his entire force of 10,000 men heavily upon the Union line; Mouton's division and two brigades of dismounted cavalry made an impetuous charge upon the Union right, in which Mouton was killed at the first onset, while Walker's division and a brigade on its right fell upon the centre and left of the line. For nearly an hour the men (not over 4,500) of Banks' command resisted this attack, and then were compelled to fall back to the woods in rear of the open space at the cross roads, with heavy loss, including three guns. Franklin had come up with Cameron's division of the Thirteenth corps, and a new line was formed, to be immediately broken by heavy attacks on both flanks and front. The Confederates were gaining the rear, and the Union line was pressed back along the narrow forest road filled with wagons and mules of the supply-train, stragglers, and camp-followers, which so blocked the way that an orderly retreat was impossible. Soon a panic set in, the cavalry train of 156 wagons was captured; Ransom's ten guns were taken, along with 1,000 of his men; Franklin and Ransom were wounded; some of the best officers were struck down; and in spite of the heroic efforts of Banks and others to rally them, nearly the whole army broke into a disorderly retreat, which was checked only at Pleasant Grove, three miles from the field of battle. Here Gen. Emory, with his division, had come up at 6 p.m., and formed line in the edge of a wood, on a ridge overlooking a small stream; and scarcely had his line been formed when the panic-stricken fugitives came rushing back through it to the rear. The Confederates were close on their heels, made an immediate assault upon Emory, and were met with a severe fire delivered at close quarters that instantly checked them. After an hour and a half of fierce battle, in which they made desperate efforts to turn Emory's right, the Confederates were everywhere repulsed with great loss, but held the shores of the stream. Banks' army, after having advanced to within two marches of Shreveport, had been saved from total destruction "by a triumph of valor and discipline on the part of a single division and of skill on the part of its intrepid commander." The action is known as the battle of Pleasant Grove. The Union loss at Sabine Cross Roads and Pleasant Grove was about 1,050 killed and wounded and nearly 1,800 missing; the Confederate loss, 1,500 killed and wounded.

Banks had been limited as to time in carrying out the objects of his campaign. Gen. Sherman was calling for A. J. Smith's troops, and Gen. Grant, who had set his heart on a movement by Banks from New Orleans on Mobile, had written him: "I had much rather that the Red River expedition had never been begun, than that you should be detained one day beyond the first day of May, in commencing the movement east of the Mississippi." The allotted time was fast expiring, and Banks concluded to abandon his expedition. The night of the 8th he fell back 15

SABINE PASS

miles to Pleasant Hill, which was reached by Emory's division, that brought up the rear about 9 o'clock next morning. A. J. Smith, with a part of his command, had halted at Pleasant Hill, on the evening of the 8th, and with less than 13,000 men Banks formed a double line; the first, of the Nineteenth corps, along a thickly wooded slope half a mile west of Pleasant Hill; the second, of A. J. Smith's command and the artillery, on a plateau in rear. The trains, preceded by Lee's cavalry and Dickey's brigade of colored troops, and followed by the remnants of Ransom's division, were put on the road to Grand Ecore. Gen. Taylor, reinforced by the divisions of Gens. Churchill and Parsons, had followed Banks very cautiously, and at noon his advance appeared and began skirmishing. Later artillery was brought up and opened fire, and a demonstration was made on the Union right. About 5 P.M. three Confederate divisions charged out of the woods upon the left flank of the Union line, which was steadily driven back up the hill to the cover of the second line. Here the Confederates were repulsed with great loss. Meanwhile the right of the Union line, though hard pressed, stood firm until, the left being driven back, it was nearly enveloped and gave ground, and the Confederates pressed on to an attack on A. J. Smith, who held the second line in reserve. After a short and sharp exchange of fire, Smith's and part of Emory's men made a charge and pushed back the Confederate line. All the reserves were now thrown into action, and the Confederates were routed, driven from the field, and pursued until dark. Gen. E. Kirby Smith, the Confederate department commander, says: "Our troops attacked with vigor and at first with success, but, exposing their right flank, were finally repulsed and thrown into confusion. The Missouri and Arkansas troops, with a brigade of Walker's division, were broken and scattered. The enemy recovered cannon which we had captured the day before, and two of our pieces with the dead and wounded were left on the field. Our troops were completely paralyzed and disorganized by the repulse. . . . Our repulse at Pleasant Hill was so complete and our command was so disorganized that had Banks followed up his success vigorously he would have met but feeble opposition to his advance on Shreveport."

Banks had engaged at Pleasant Hill 12,600 men, of whom 150 were killed, 844 wounded, and 375 missing. Taylor had 14,300 engaged, of whom about 1,000 were killed and wounded, and nearly 500 missing.

Encouraged by his success at Pleasant Hill, Banks gave orders for a forward movement next morning on Shreveport, and preparations were being made for the march, when Gen. Franklin and other officers dissuaded him from it, and it was decided to fall back to Grand Ecore and unite with the fleet. The retreat was resumed during the night and Grand Ecore reached on the 11th. E. Kirby Smith joined Taylor after the close of the battle of Pleasant Hill, and determined to move against Gen. Steele in Arkansas. Taylor withdrew his infantry to Mansfield on the 10th and 11th, leaving the cavalry, under Green, and Polignac's infantry division of 2,000 men to watch and harass Banks. Upon his arrival at Grand Ecore Banks intrenched, threw a pontoon-bridge across the

river, put part of his force on the other side, and waited for the fleet to come down. Porter, with the gunboats, and Kilby Smith, with the transports, had arrived at Loggy Bayou on the afternoon of the 10th, where, two hours later, they received news of Banks' misfortunes, and on the morning of the 11th received his orders to return to Grand Ecore. The fleet turned down stream, but it was not to reach Grand Ecore without opposition. On the evening of the 11th Green, who had been left at Pleasant Hill, started with 750 men and two batteries for Blair's Landing, and on the 12th, with about 500 men and three guns, attacked the fleet and transports as they were running down the river. A brisk fight followed, Gen. Green was killed by a discharge of grape from one of the gunboats, and his men were driven off, with small loss. The Union loss was 57 killed and wounded. By the 15th all the gunboats were back to Grand Ecore, and as fast as the vessels could pass the bar they made their way to Alexandria, one gunboat being lost. The fleet having passed down, Banks marched from Grand Ecore on the 22d for Alexandria, and that night bivouacked at Clouterville, 32 miles from Grand Ecore. The march was resumed on the 22d, and on the morning of the 23d, while marching along Cane River, a branch of the Red, the head of the column was checked at Monett's Ferry by Gen. Bee, with four brigades of 2,000 men and four batteries. Bee's position was a strong one on a bluff commanding the crossing, and on the only practicable road to Alexandria, 35 miles distant. At the same time the Confederate cavalry under Gen. Wharton and Polignac's infantry were harassing Banks' rear. Gen. Birge, with his own brigade and Cameron's division of the Thirteenth corps, in all about 5,000 men, crossed Cane River three miles above the ferry, and by a difficult flank march of several miles reached a hill, the occupation of which rendered Monett's Bluff untenable. Birge attacked at 2 P.M., after a contest of two hours carried the hill, and the Confederates retreated and left open the road Alexandria. The Union loss was 150 to 200 killed and wounded. Banks resumed his march on the 24th, and without further serious opposition entered Alexandria on the 25th. Banks reports that in the 24 days intervening between the march of the army from Alexandria and its return there his own army had marched 400 miles. He had fought several battles, and been successful in all but one, and his losses were 289 killed, 1,541 wounded, and 2,150 missing, an aggregate of 3,980. The difficulty of getting Porter's fleet over the shallow rapids near Alexandria detained Banks at that place until 13 May, when he continued his retreat. (See YELLOW BAYOU, ENGAGEMENT AT, AND BANKS' RETREAT FROM ALEXANDRIA.) Consult: 'Official Records,' Vol. XXXIV.; Taylor, 'Destruction and Reconstruction'; The Century Company's 'Battles and Leaders of the Civil War,' Vol. IV.

E. A. CARMAN.

Sabine Pass, Engagement at. On 6 Aug. 1863 Gen. Halleck informed Gen. Banks, in command at New Orleans, that there were important reasons why the United States flag should be restored at some point in Texas, with the least possible delay. Halleck's despatch was by direction of the Secretary of War, and it

was understood that the proposed movement was of diplomatic rather than a military character, and intended to prevent European complications. Banks was left to his own judgment to conduct the campaign, but it was suggested that the most feasible route would be by the Red River to Shreveport. Banks, deeming the Red River route impracticable at that season of the year, fitted out an expedition to make a lodgment in Texas at Sabine City, on Sabine Pass, the outlet from Sabine Lake into the Gulf of Mexico, and the terminus of a railroad penetrating eastern Texas, and making connection with Houston, the capital of the State. Gen. Franklin was put in charge of the advance of the expedition of 5,000 men, and was instructed to land a few miles below Sabine Pass, move upon the Confederate works commanding it, and, if practicable, to seize Beaumont, on the railroad to Houston. Four light-draft gunboats, under command of Lieut. Crocker, formed part of the expedition, which sailed from New Orleans on 4 September. Franklin disregarded his instructions to land 10 or 12 miles below Sabine Pass, and on Crocker's representation that he could silence the Confederate works in the pass, he and Crocker arranged for the gunboats to make a direct attack upon the works, drive out the garrison, seize or drive away two Confederate gunboats reported on the river, and then land the troops. From the army 150 sharpshooters were distributed on the four gunboats. Early in the forenoon of the 8th the gunboats and transports crossed the bar at Sabine Pass, and in the middle of the afternoon three of the gunboats opened fire upon the small fort, mounting eight heavy guns, and held by 44 officers and men. The fire was immediately returned, two of the gunboats were disabled and surrendered, and were taken in tow by two small Confederate craft. It was all over in less than an hour. Franklin made no serious attempt to land his troops, but immediately returned to New Orleans, having lost two gunboats, with their 15 heavy guns, nearly 50 killed and wounded, and over 200 prisoners, among them Lieut. Crocker, of the navy. Not a Confederate was hurt. Consult 'Official Records,' Vol. XXVI.

E. A. CARMAN.

Sabines, sā'bīnz (Latin, SABINI, sa-bī'nī), a people noted in the early history of Rome, whose territory they adjoined. As a people the Sabines were engaged in agriculture and grazing, and from the simplicity of their lives and their physical prowess they obtained a reputation like that of the Spartans for severity of discipline and sturdiness of character. The narrow limits of the Sabine territory made emigration necessary, and probably in this way they came in contact with the growing power of Rome. They fought the Romans with great courage, but were subdued about 290 B.C., and admitted to Roman citizenship, but not permitted to vote in civic affairs. They became merged in the republic and subsequent empire, and became lost to view as a separate people.

Sabinus, Masurius, Roman jurist. He flourished during the reign of Tiberius, and was a pupil of Capito. He was the founder of the school of Sabiniani, and was the author of several works much used and commented upon by

later jurists, the most important being 'Libri iii. Juris Civilis,' which is not now extant.

Sable, one of the fur-bearing animals (*Mustela zibellina*), found in Siberia, Asiatic Russia and Kamchatka, or its American representative (*M. americana*) which differs so little that it is doubtfully named as a separate species. The average length of the sable is about 18 inches, excluding the tail, which is somewhat bushy. The body partakes of the form of the weasels generally, in that it is elongated and vermiform. The fur is smooth, glossy, and may be pressed or smoothed in any direction, owing to the mode of attachment of the hairs to the skin. In color it is a rich deep brown, which near the head may exhibit white markings, and frequently assumes a gray tint about the neck. The fur is heaviest during winter, and the dangers experienced by the sable-hunters from sudden snow-storms obliterating the track, or from the inclement cold, can hardly be overestimated. Sables are for the most part captured in traps, but are cautious animals, and their pursuit is attended with much difficulty. They make their homes in dens or cavities in hollow trees, and produce from three to five young at a birth, the young being born in March or April; and their general habits are those of the marten and weasel, but they are more shy and retiring.

Skins of the Russian sable fetch prices in Liverpool ranging from three to ten guineas. The darkest skins are considered to be the finest. About 2,000 skins annually find their way to England. Most of these furs are used in Russia, where about 25,000 are said to be annually collected. When manufactured for linings sable furs may fetch prices so high as 1,000 guineas. The corporation robes of the London aldermen are lined with this expensive material, and the tails of sables are used in the manufacture of artists' brushes. See FUR-BEARING ANIMALS; FUR-TRADE.

Sable Antelope, one of the largest and most handsome of African antelopes (*Hippotragus niger*), of the same genus as the roan antelope, blaubok, and others, and like them rapidly approaching extinction, as civilization more and more encroaches upon the plains of southern and eastern Africa. Its coat is a deep glossy black, markings upon the face, the buttock and the under parts being white. The great-ringed horns sweep back from the forehead in a sabre-like curve, and the neck is adorned with a mane. These antelopes went about, in old times, in herds, and were prizes for the sportsmen, while their flesh was excellent to eat. Extensive descriptions may be found in the writings of Gordon-Cumming, Anderson, Baker, Selous, Bryden, and other African sportsmen-travelers.

Sable, Cape. See CAPE SABLE.

Sable Island, a low-lying island in the Atlantic, in lat. 44° N. and lon. 60° W., 85 miles east of Nova Scotia. It is a chain of sand-dunes enclosing a lagoon, and is such a menace to navigation that the government of Canada maintains two lighthouses here. It was formerly 40 miles long and is now but 20, gradually sinking. Upon its sandy ridges grow cranberries and wild grass, and attempts are being made to grow pines and other hardy ever-

greens. There are sandbanks in the vicinity. The only inhabitants are the lighthouse and lifeboat men attached to the establishment for the relief of shipwrecked persons. The island is known for its breed of hardy wild ponies.

Sabots, sa-bōz', shoes for women largely worn by the peasantry of France, Belgium, Holland, and some other parts of Europe. They are especially useful in wet weather, and in moist places generally, being well adapted to preserve the feet from damp. Great numbers of sabots are exported by France to Belgium. In some parts of England, as in Lancashire, shoes with thick wooden soles, but with leather vamps or "uppers," are worn by most of the artisan class. See **BOOTS AND SHOES**.

Sabre-Tache, sā-br-tāsh, a leathern case or pocket worn by cavalry officers at the left side, suspended by three straps from their sword-belt. It came into use when the jackets of cavalry soldiers were too short or too tight to admit of pockets being made in them, but is now rather ornamental than useful.

Sabre-toothed Tigers, extinct cats of the family *Macharodontidæ* (or *Nimravidæ*), a group whose remains occur as fossils from the Eocene up to the Pleistocene. They differ from ordinary cats (*Felidæ*) in several anatomical features, having some peculiarities which ally them to the bears, and others recalling existing viverrids, as the foussa (*Cryptoprocta*). They are remarkable for the character of the dentition, which in the earlier genera comes near showing the complete number of teeth, but displays a steady tendency as the family history is followed toward the reduced number possessed by existing cats. At the same time the dentition is often distinguished by the huge size of the upper canines, which in some cases were five or six times as long as the neighboring teeth, and have been justly called "sabre-teeth." These tushes reached their highest development in the genus *Macharodus*, whose species were of very wide distribution, occurring in both North and South America and in Europe. These carnivores were of various sizes, up to dimensions equal to those of modern tigers, and so little different in general from true cats that Cope places them within the *Felidæ*. It began in the Eocene and continued down almost or quite to the Glacial Period, when the type seems to have become extinct because the great canines had overgrown usefulness and become a hindrance instead of a help in getting a living. They finally became so large that the animal could not open its mouth wide enough to make use of them in biting, and the space between them would admit none but a very small piece of meat to enter, even if a large piece could be torn away. "Even when the mouth opens so far as to allow the mandible to pass behind the apices of the canines," remarks Cope, "there would appear to be some risk of the latter being caught on the point of one or the other canine, and forced to remain open, causing early starvation." Other prominent genera in the family are the plantigrade *Dinictis* (q.v.); *Nimravus* and *Pogonodon*, with species as large as panthers; and *Hoplophonus*, with dentition like modern cats. Consult: Flower and Lydekker, 'Mammals, Living and Extinct' (1891); Cope, 'Vertebrates of the Tertiary Formation of the West,' Rept.

U. S. Geol. Survey, Vol. III. (Washington, 1884); Woodward, 'Vertebrate Palæontology' (1898).

Sac (sāk) **City**, Iowa, county-seat of Sac County; on the North Fork of the Racoon River, and on the Chicago, M. & St. P. and the Chicago & N. W. R.R.'s; about 42 miles west by south of Fort Dodge. It is in an agricultural region where considerable attention is given to raising live stock. The chief manufacturing industries are connected with farm products. The trade is chiefly in farm and dairy products, flour, and agricultural implements. The educational institutions are the Sac City Institute (Baptist), a high school, public elementary schools, and a public library. Pop. (1890) 1,249; (1900) 2,079.

Sac Fungi. See **FUNGI**.

Sac-à-Lait, sāk'a-lā, a fish. See **CRAPPIE**.

Sac'but, or **Sackbut**, the word by which translators have rendered the *sabbeka* of the Hebrew Scriptures. The exact form of the sabbeka has been much disputed, but that it was a stringed instrument is certain, for the name passed over into Greek and Latin in the forms *sambukē*, *sambuca*, and the instrument so called is described by Athenæus as a harplike instrument of four or more strings, and of a triangular form. It is not unlikely that this instrument was introduced among the Jews from the East, since one of the musical instruments most frequently occurring in the Assyrian sculptures answers very closely to this description, and may perhaps be identified with the sabbeka, the name of which is, besides, Chaldaic. Nothing resembling this Assyrian instrument is to be found on the Egyptian monuments or in the sculptures of Greece and Rome. Since the sabbeka was a stringed instrument the rendering sacbut is altogether wrong, since that was, at the time when our translation of the Scriptures was made, the name of a wind-instrument now called the trombone. See **TROMBONE**.

Sac'caton Grass. See **GRASSES OF THE UNITED STATES**.

Saccharin, sāk'a-rīn, $C_6H_4\begin{smallmatrix} CO \\ SO_2 \end{smallmatrix}NH$, benzoic-sulphinid, a sweet substance discovered by Remsen and Fahlberg in 1879. It is prepared from toluene by a series of chemical processes. White crystals soluble in hot water, alcohol, and ether. Its characteristic and most valuable property is its intense sweet taste, being about 550 times sweeter than cane-sugar so that a solution of one part in ten thousand parts of water has a perceptible taste. It has an extensive use as a sweetening agent in the manufacture of various beverages, preserves, jellies, etc., and may be used by diabetic patients who cannot use sugar. It has not, however, the food value of cane-sugar.

Saccharine forms salts with bases, the sodium salt being frequently used in place of saccharin because of its greater solubility.

Saccharom'eter, or **Saccharimeter**, any instrument used to determine the strength of a sugar solution. One common form is a hydrometer with the stem so graduated as to read per cents of sugar content in solution examined. Another is a form of polariscope devised

by Mitscherlich with the scale on which the angle of deviation of the plane of polarized light is read so graduated as to show the percentage of sugar in the solution used.

Saccopharynx, a genus of *Muraenidae*, with a single species (*S. flagellum*), a deep-sea conger eel, of which only three specimens have been observed: muscular system very feebly developed; bones thin and soft, wanting in organic matter; head and gape enormous; stomach distensible in an extraordinary degree; vent at end of trunk. The specimens known have been found floating on the surface of the North Atlantic with their stomachs much distended, having swallowed some other fish many times their own weight. They attain a length of several feet. See DEEP SEA EXPLORATION.

Sacheverell, sǎ-shěv'ě-rĕl, **Henry**, English Anglican divine: b. Wiltshire about 1674; d. London 5 June 1724. He was educated at Oxford and in 1705 was appointed preacher of Saint Saviour's, Southwark. While in this station he, in 1709, preached two famous sermons, the object of which was to rouse apprehensions for the safety of the Church, and to excite hostility against the Dissenters. Being impeached in the House of Commons he was brought to trial in February 1710, and on 23 March, when the trial was concluded, was suspended from preaching for three years. This prosecution, however, excited such a spirit in the High Church party that it helped to overthrow the ministry of Godolphin, and established the fortune of Sacheverell, who, during his suspension, made a kind of triumphal progress through the kingdom. The same month that his suspension terminated (1713) he was appointed to the valuable rectory of Saint Andrew's, Holborn, by Queen Anne. Of the offending sermons 40,000 copies at least were sold, and of the record of the trial 30,000. Little was heard of Sacheverell after this party ebullition subsided, except through his numerous squabbles with his parishioners. His abilities, even according to writers on his own side, were very slight. Consult Stanhope, 'History of Queen Anne's Reign' (1872).

Sachs, säks, **Bernard**, American neurologist: b. Baltimore, Md., 2 June 1858. He was graduated from the University of Strasburg, Germany, in 1882, and engaged as a medical practitioner in New York. He has made a specialty of the study of nervous diseases, regarding which he is a recognized authority. Besides numerous medical monographs he has published 'Mental and Nervous Diseases of Children' (1894).

Sachs, Edwin O., English architect: b. London 5 April 1870. He was educated at University College School, London, and at the University of Berlin, and engaged as an architect in London in 1892. He has established a wide practice in connection with theatres and public buildings and in 1898 applied electrical power to the working of the stage for the first time in England. He founded the British Fire Prevention Committee in 1897 and organized the first International Fire Prevention Congress in London in 1903. He has published: 'Modern Opera Houses and Theatres' (3 vols., 1896-8); 'Facts on Fire Prevention' (1902); 'Stage Con-

struction' (1898); 'Fires and Public Entertainments' (1897).

Sachs, Hans, hänts zäks, German master-singer: b. Nuremberg 5 Nov. 1494; d. there 20 Jan. 1576. He was by trade a shoemaker, and followed his business and made verses with equal assiduity. From 1510 to 1515 he traveled over different parts of Germany, practising his craft, according to the custom of German workmen, in all the towns he visited. In the latter year he returned to his native town, where he was admitted as master in his guild. He early attached himself to the Reformation movement, to the spread of which among the *bourgeoisie* he contributed not a little by a poem written in 1523, 'Die Wittenbergisch Nachtigall, die man jetzt höret überall,' in which he hailed with approval the cause of Luther. In 1544 he was with the army of Charles V. in France. The productions of Hans Sachs are extremely numerous. In 1536 he estimated the number of his poems at 5,000 or more. Three volumes of his poems were published during his lifetime, and two more after his death. In the 17th century, after the introduction of a more artificial style into German poetry, Hans Sachs fell into neglect, from which he was not withdrawn till Goethe, who had become acquainted with him in his studies for 'Faust,' drew attention to his merit in a poem (Erklärung eines alten Holzschnitts vorstellend Hans Sachsens Poetische Sendung) which appeared in the 'Deutscher Merkur' (April 1776). The best edition of his works is that of Keller and Goetze, and the best selection that of Gödeke and Tittmann in 'Deutsche Dichter des sechzehnten Jahrhunderts' (2d ed., 1883-5). He possessed a fruitful genius, and, notwithstanding the rudeness of his language, his poems are distinguished for naïveté, feeling, invention, wit, and striking description. Consult: Schweitzer's 'Etude' (1889); Goetze's 'Hans Sachs' (1894); Genée's 'Hans Sachs und seine Zeit' (1893); and Drescher, 'Studien zu Hans Sachs' (1891).

Sachs, Julius, German botanist: b. Breslau 2 Oct. 1832; d. Würzburg 29 May 1897. He studied at Prague where he became assistant in botany, and in 1867 became professor of botany at Freiburg. The following year he removed to Würzburg, where in his own laboratory he made extremely important experiments in the physiology of plants. He published 'Handbuch der Experimental-Physiologie der Pflanzen' (1865); 'Lehrbuch der Botanik' (1868-74); 'Vorlesungen über Pflanzenphysiologie' (1882-7); 'Geschichte der Botanik vom 16. Jahrh. bis 1860' (1875); 'Gesammelte Abhandlungen über Pflanzenphysiologie' (1892-3).

Sachse, säks, **Julius Friedrich**, American author: b. Philadelphia, Pa., 22 Nov. 1842. He engaged in journalism and has written extensively, his publications including: 'The German Pietists of Provincial Pennsylvania, 1694-1708'; 'Horologium Achaz-Christophorus Schissler, Artifex'; 'Justus Falckner, Mystic and Scholar' (1903); 'Pennsylvania: the German Influence in its Settlement and Development'; 'The German Separatists of Pennsylvania, 1708-1743.'

Sachsenhausen, zāk'sĕn - how - zĕn. See FRANKFORT-ON-THE-MAIN.

Sachsenspiegel, zāk'sēn-spē'gēl, a private collection of legal precepts and legal customs which had the force of law in the Middle Ages in Germany, especially in the north of Germany. One of the six prefaces to the collection mentions one Eyke von Repgow as its author, and this account is generally accepted as true. Its date is supposed to be earlier than 1235. The study of it has been revived in Germany. The best edition is by Homeyer (Berlin, 1835-44).

Sack, a general name for the different sorts of dry wine, more especially the Spanish, which were first extensively used in England in the 16th century.

Sack'but. See SACBUT.

Sacketts (sāk'čets) Harbor, N. Y., village, in Jefferson County; on Black River Bay, the inlet through which Black River discharges its waters into Lake Ontario; and on the Rome & Watertown railroad, which is a branch of the New York Central & Hudson River railroad. The village is about 10 miles from Watertown, eight miles from Lake Ontario, and 170 miles west-northwest of Albany. It has a good harbor, large enough to accommodate vessels of the largest size, and it has steamer connections with several of the lake ports. Sacketts Harbor is one of the oldest places on the northern frontier; in 1809, the Oneida, the first United States war vessel, was built here. In the War of 1812 the village was the scene of several engagements, and was an important United States naval station. The frigates Madison and Superior, war vessels, were made here in 40 and 80 days respectively, from the time the timber was cut. A third warship was nearly completed when peace was restored; the hulk remained in the yard for a number of years. The United States military station, Madison Barracks, is located here. Sacketts Harbor is in an agricultural region, and although it has good water power, there is but little manufacturing. Pop., exclusive of garrison (1890), 787; (1900) 1,266.

Sackville, sāk'vīl, **Charles**, 6TH EARL OF DORSET, English courtier and poet: b. 24 Jan. 1637; d. Bath 29 Jan. 1706. He became a wit and roisterer in the company of Charles II., served under the Duke of York in the sea fight with the Dutch in 1663 and is said to have written or retouched on the night before the engagement of 3 June his famous song, "To all you ladies now on land." He succeeded to his title in 1677, but did not stand well in the favor of James II., and later became an ardent supporter of William of Orange, under whom he was lord chamberlain of the household from 1689 to 1697, and three times one of the regents during the king's absence. He was a patron of poets like Prior, Wycherley and Dryden, and from the last named received the dedication of the "Essay on Satire."

Sackville, **Lionel Sackville Sackville-West**, **Baron**, English diplomatist: b. Cambridgeshire 19 July 1827. After a private education, he entered the diplomatic service in 1847, was made secretary of legation at Turin (1858), Madrid (1864), Berlin (1867), and Paris (1868), and was envoy extraordinary and minister plenipotentiary successively to the Argentine Confederation (1872-8) and to Spain

(1878-81). In 1881 he was appointed minister to the United States, and in 1888 with Joseph Chamberlain and Sir Charles Tupper negotiated the fisheries treaty of that year. In October 1888 he received a letter from one C. F. Murchison, who, representing himself as an Englishman naturalized in the United States, asked for which party he should vote in the ensuing Presidential election. The minister in reply advised his correspondent to vote the Democratic ticket as favorable to English interests. The Murchison letter was generally regarded as a trap set for the embarrassment of the minister. His recall was at once asked for, and in default of a prompt compliance with the request the Department of State sent him his passports 30 October. The incident, occurring as it did during a Presidential canvass, was the subject of much discussion.

Sackville, **Thomas**, EARL OF DORSET and **Baron Buckhurst**, English statesman and poet: b. Withyham parish, Sussex, 1536; d. London 19 April 1608. He was a member of the University of Oxford, but removed to Cambridge, and afterward became a student of the Inner Temple. At both universities he was distinguished for his performances in Latin and English poetry, and in the Temple wrote the last two acts of the tragedy of 'Gorboduc, or Ferrex and Porrex' (1565). Of a poem intended to comprehend a view of the illustrious but unfortunate characters in English history, entitled the 'Mirror for Magistrates,' he finished only a poetical preface (the 'Induction') and one legend on the life of the Duke of Buckingham. The work was completed by George Ferrers and Richard Baldwin (1559-63). He sat in the Parliament assembling 20 Jan. 1558, and in the first two Parliaments of Elizabeth (1559-63) after which he traveled. In 1586 he was made a member of the court appointed by Elizabeth to try Mary Queen of Scots. In 1598 he was joined with Burleigh in negotiations for peace with Spain, and renewed a treaty with the United Provinces. On the death of Burleigh, he became lord high treasurer. In January 1601 he was appointed lord high steward, and presided at the trial of the Earl of Essex. On the accession of James I. his post of treasurer was confirmed to him, and in 1604 he was created Earl of Dorset. He ranks among the most prudent and able of the ministers of Elizabeth, was a good speaker and a still better writer. The tragedy of 'Gorboduc,' the subject of which is a sanguinary story from early British history, is the first example in English of regular tragedy in blank verse. Sackville's share is inferior in literary value to his 'Induction,' called by Sidney Lee the greatest English poem between the 'Canterbury Tales' and the 'Faerie Queene.'

Saco, **José Antonio**, hō-sā' ān-tō'nē-ō sāk'kō, Cuban historian and publicist: b. Bayamo, Cuba, 7 May 1797; d. Madrid, Spain, 26 Sept. 1879. He was educated in Havana and in 1821 was appointed professor of philosophy in the Seminary of San Carlos. In 1832-4 he lived in Havana and edited the 'Revista Bimestre Cubana,' but his liberal and anti-slavery principles caused his banishment, though he was afterward allowed to return. He traveled in Europe and in 1840 settled in Paris where he resided for many years. He was elected a dele-

gate to Madrid in 1866 to advocate political reforms for Cuba and in 1878 was elected to the Spanish cortes. He wrote: 'Paralelo entre Cuba y algunas colonias inglesas' (1838); 'Supresión del tráfico de enclavos en Cuba' (1845); 'Ideas sobre la incorporación de Cuba á los E. U.' (1848); 'Historia de la esclavitud desde dos tiempos mas remotos' (1876 et seq.); etc.

Saco, sâ'kô, Maine, city in York County; on the Saco River, and on the Boston & Maine railroad; about 15 miles west-southwest of Portland and four miles from the ocean. Four bridges span the river connecting the city with Biddeford and other localities. A fall in the river of about 40 feet furnishes extensive water-power. The tide-water extends to the falls. The chief manufacturing establishments are cotton mills, boot and shoe factories, lumber mills, manufactories of belting, brushes, and cotton-mill machinery. The city has an extensive coast trade in cotton goods and other manufactures, and it ships considerable farm products. Old Orchard, a popular seaside resort, is in the vicinity. The principal public institutions are Thornton Academy; York Institute, founded in 1866; a public high school and elementary schools, two libraries, one home for the aged, several fine churches, and a number of good business blocks. Pop. (1890) 6,075; (1900) 6,122.

Saco, a river which has its rise in the White Mountains in New Hampshire, and flows southeast through New Hampshire and Maine, and enters the Atlantic Ocean. It is about 165 miles long and drains an area of 1,750 square miles. It is a swiftly flowing stream having a number of rapids and falls, which furnish abundant water-power for manufacturing. Great Falls is 72 feet high.

Sacramentarians, a religious term which at present is applied almost solely to members of the Protestant Episcopal Church in America, and the Anglican Church in England and elsewhere, who sustain a "high" view of the efficacy of the sacraments. In past ecclesiastical history it has had a wholly different meaning, and was applied to those Reformers who refused to agree to Luther's doctrine of the real presence of the body and blood of Christ in the bread and wine. The Sacramentarian party were the authors of the Tetrapolitan Confession, so called from the four cities of Strasburg, Constance, Lindau, and Memmingen, which supported the Sacramentarian doctrines. This confession excluded all idea of a physical presence of Christ's body. The Swiss reformer Zwingli took a similar position on the question of Christ's presence in the Eucharist, and an article prepared by him declaring against the real presence was embodied in the confession of the Helvetic Church. The German Sacramentarians joined the general body of Protestants in resisting Charles V., and became merged with the Lutherans.

Sacramento, Cal., city, port of entry, county-seat of Sacramento County, and capital of the State, on the Sacramento River, and on the Southern P. and Central P. R.R.'s; 90 miles northeast of San Francisco. The city is situated in lat. 38° 33' N., and lon. 121° 20' W.; and is built on a broad, low plain, 30 feet above sea level. The streets are wide and straight and

cross each other at right angles. Shade trees are abundant. The shops and stores are built of brick and the dwellings mostly of wood. The city is noted for its beauty of environment, is the centre of an extensive agricultural and horticultural section; and has a warm, almost semi-tropical climate.

Public Buildings.—The State capitol building, completed in 1869, at a cost of \$2,500,000, stands in a plaza covering 30 acres. There is a United States government building here, the Crocker Art Gallery, building of the Foresters, Odd Fellows, and Masons, and Fort Sutter (re-built). California State Bank, Sacramento Institute, College of the Christian Brothers; California State Library (113,000 volumes), Public Library (28,000 volumes), Howe's Academy, Saint Joseph's Academy, City Dispensary, Railroad Hospital, and numerous churches, schools, and charitable institutions. The city has three daily newspapers and numerous weekly and monthly periodicals.

Manufactures.—Sacramento is the second manufacturing city in California, and has a variety of industries, including flouring and grist mills, foundries and machine shops, lumber mills, breweries, manufactories for saddlery, harness, furniture, carriage, soap, and crackers. The repair shops of the Southern Pacific railroad are located here, giving employment to 3,000 men. The industries of Sacramento represent a capital invested of \$7,300,013, with an annual output valued at \$11,141,896. The city exports immense quantities of flour and grist mill products, to China, Japan, and Australia.

Government.—The city is governed by a mayor and city council elected every two years by a popular vote. There are well equipped fire and police departments. The waterworks are owned and operated by the municipality. The assessed property valuation of the city is about \$18,000,000. The streets are lighted by electricity. An annual State fair is held here, and an exhibition building, park, and race course are maintained by the State Agricultural Society.

History.—The first white settlement on the site of Sacramento City was made in 1839, by Captain John A. Sutter, a Swiss by birth, but a naturalized American citizen, who obtained a grant of 11 square leagues of land from the Mexican government. In 1841 Captain Sutter built a fort which he called New Helvetia. He took many of the neighboring Indians into his service, collected a few white trappers, and by virtue of his isolated position and the number of his adherents, secured influence and importance in the territory. Sutter's Fort, as it was popularly called, was the first point in California settled by immigrants crossing the continent; with the increase of the population the trade and importance of New Helvetia kept apace, and in October 1848 there was an auction sale of lots in the town of "Sacramento," which was first named in the advertisement of the sale. In January 1849 the first frame house was built on the banks of the Sacramento River, and here the settlement was moved from the fort. The site of the town was originally only about 15 feet above low-water mark, and as the river frequently rose to 20 feet, the town was subjected to overflows. In January 1850, in March 1852, and again in January 1853, the city was flooded so

SACRAMENTO—SACRAMENTS

that boats were used in going from house to house; after this the lower streets were raised five feet, and a levee was built which saved the city from subsequent floods. On 3 Nov. 1852 a conflagration destroyed 600 houses and other property, entailing a loss of \$5,000,000. In July 1854 another fire destroyed property valued at \$650,000. The State capital was established here by an act of the Legislature on 25 Feb. 1854, but not until 1861 was a capitol building erected. On 3 Feb. 1856, the first railroad was opened between Sacramento and Folsom. In the gold days of 1849-50 Sacramento was the great mart of the mines, the base of supplies and the metropolitan centre of various mining camps. Steamers ran daily to San Francisco and up the river to Red Bluff. The California Stage Company with a capitalization of \$1,000,000 ran daily stages to Maryville, Nevada, Downieville, Stockton, Jackson, Mokelumne Hill, and other leading towns in the mining district. The city was first incorporated as a town in 1849, and was chartered as a city in 1863.

Population.—Sacramento in 1860 had a population of 13,788; (1880) 21,420; (1890) 26,386; (1900) 29,282; (1904) 31,300.

H. WEINSTOCK,
of Weinstock, Lubin & Co.

Sacramento, a river in California which rises in the northern part of the State, flows south in the valley between the Sierra Nevada and the Coast Range, and uniting with the San Joaquin River (q.v.); both break through the Coast Range, and enter the Suisun Bay, from which the waters pass through a strait into the Bay of San Pablo, and to the Pacific through San Francisco Bay and the Golden Gate. The chief tributaries are the Pitt River, from the northeastern part of the State, and Feather River, which enters the Sacramento about 15 miles above the city of Sacramento. The Sacramento is about 400 miles long, from the source of the Pitt to the mouth of the Sacramento is about 600 miles. The river is navigable for about 270 miles from its mouth, and the Feather River for about 30 miles from the Sacramento. The debris from placer mining has been a hindrance to navigation; large sums have been expended to improve navigation. The Sacramento Valley is a fertile region, in which are raised large quantities of grain and fruits.

Sacramento Salmon, Perch, Pike, etc., local names in California for various fishes caught in the Sacramento River, and more or less widely elsewhere. The salmon is the quinnat (q.v.). The Sacramento sturgeon is the white sturgeon (see STURGEON). The Sacramento perch is a fish (*Archeoplitis interruptus*) closely related to the eastern rock-bass (see BASS). It reaches from one to two feet in length, is blackish above, sides silvery, with about seven vertical blackish bars, more or less interrupted. It is an excellent food-fish. The Sacramento pike is a big minnow (see SQUAW-FISH). The sucker is a species (*Catostomus occidentalis*) formerly of great importance to the Indian population, but little esteemed in civilized markets.

Sacraments. The Latin word *Sacramentum* was in the classical period a judicial and military technical term. The underlying concept seems to be consecration to a divinity,

something set apart for that purpose as sacred and inviolable. Thus the term was applied in jurisprudence to the specified sum of money deposited with the judicial authorities by the parties to a suit, and was so designated either because the place of deposit was sacred, or because the sum forfeited by the losing party was used for religious purposes. In military parlance the word signified originally the preliminary engagement entered into by newly enlisted recruits, and afterward the military oath of allegiance which became obligatory after the second Punic war (Liv. xxii. 38). Later on the term was used to designate any oath or solemn engagement whatever.

Among ecclesiastical writers the word has had various significations. In earlier usage, represented for instance, by the ancient Latin version of the Scriptures, and maintained even in many passages of the Vulgate (for example, Eph. v. 32, Rev. i. 20, etc.) it was a synonym of *arcanum*, and corresponded in sense to the Greek word *μυστήριον*, the notion embodied being that of something secret or mysterious, whence also, by extension, it came to denote the sign or symbol whereby hidden things were signified, especially in matters referring to religion. Thus Augustine says: "Symbols when pertaining to things divine are called sacraments." As certain religious rites of paganism were called mysteries on account of their occult signification known only to the initiated, the equivalent word "sacrament" was naturally adopted by the early Christians to designate their own religious rites and ceremonies, and was used at first more or less indiscriminately with reference to any or all of them. There seems to have been no attempt on the part of early Christian writers to define the sacraments accurately or enumerate them. Thus they speak vaguely now of two, now of more sacraments, at times even restricting the term to the Eucharist as *the* sacrament, and opposing it to Baptism. Nor do we find in their writings any definition of a sacrament more explicit than the rather general notion formulated by Augustine, "a sign of something sacred." In the literary treatment of this as well as other doctrinal topics analytic precision and systematic classification came gradually with the development of theological thought.

Roman Catholic theologians of the mediæval and subsequent periods understand by sacraments in the strict specific sense of the word, a definite category of sacred rites or symbols of divine institution, and which in virtue of this institution have the power of conferring instrumentally the grace or sanctity which they symbolically represent. Of these a certain number are allowed to have belonged to the Old Dispensation, being typical of the sacraments of the New Law, but the intrinsic efficiency attributed to them is limited (with however certain reserves in favor of the rite or circumcision taken to be the Old Testament type of Christian baptism) to the bestowal, not of internal, but external sanctity, that is, legal purifications, etc. With regard to the sacraments of the New Law, Roman Catholic theologians hold that they are seven in number instituted by Christ (namely, Baptism, Confirmation, Eucharist, Penance, Extreme Unction, Holy

Orders, and Matrimony), and this enumeration, together with the main points of doctrine concerning the sacraments collectively and individually has been fixed by the dogmatic definitions of the Council of Trent.

The Reformers of the 16th century who professed to retain only such beliefs as were clearly demonstrable from Scripture, rejected the doctrine of the seven sacraments, but did not at once agree as to the number to be admitted, some recognizing besides Baptism and the Eucharist, Confirmation, Penance and Orders, while others rejected one or the other or all of these last. As regards the present status of opinion, if we except the High Church section of the Anglican communion, Protestant denominations as a rule, recognize only two sacraments: Baptism and the Eucharist.

That the existence of seven sacraments instituted by Christ cannot be proved from the New Testament alone must, of course, be granted, even by Roman Catholic theologians, but they claim that such proof is not necessary, since according to the fundamental Catholic contention, the New Testament writings do not furnish a complete record of Christ's actions—they are not, unless supplemented by tradition and the voice of the living Church, an adequate criterion of Christian belief and practice. They contend, moreover, that if the Scripture alone is to be held as decisive in the matter, consistency would require that the ceremony of the washing of the feet (John xiii.) be counted among the sacraments, since it seems to fulfil all the requisite conditions. (Sc. permanent divine institution, v. 4 seqq. cf. 12-18. Signification and production of grace, v. 8.)

Be that as it may, it must furthermore be conceded in connection with the appeal to tradition, that no positive proof of the recognition in the early church of seven sacraments neither less nor more, can be gathered from the writings of the Fathers. An explanation of this silence has been sought in the heretofore widely assumed influence of the so-called *Lex Arcani*, or Discipline of the Secret, whereby the early Christians were, it was claimed, bound to secrecy with regard to their beliefs and mysteries for fear of profanation on the part of the pagans. But apart from the obvious consideration that there could have been no sufficient reason to make a secret of the number seven, especially when we find that things so sacred as Baptism and the Eucharist are currently mentioned, the most competent authorities of the present day, Roman Catholic as well as Protestant, deny the existence of the *Lex Arcani* as a general prohibitive measure. As such it is chiefly a creation of the 17th and 18th century theologians (consult: Batiffol, 'Études d'Histoire et de Théologie Positive,' Paris, Lecoffre, 1902).^{*} Consequently, others endeavor to explain the silence of antiquity regarding the explicit mention of seven sacraments on the ground that no systematic, synthetic treatment of the subject was attempted by the early writers. Whatever may be the value of this consideration, it is certainly rather strange to find that so late as the 12th century Saint

Bernard enumerates no less than 12 sacraments. Roman Catholic theologians therefore rely chiefly on the so-called argument of prescription which is formulated as follows. At the time of the Reformation the entire Christian Church, East and West, was in peaceful, undisturbed possession of the doctrine of the seven sacraments. From the fact that then, as now, it was common to both the Greek and Latin Communion, is inferred that it must have been held in the Church at a period anterior to the separation of the Greeks in the 9th century. For apart from the antecedent improbability that any doctrinal growth peculiar to the Latin Church would have been adopted by her hostile rival, we do not find, as a matter of fact, that in the various discussions relative to the reunion of the two churches there was ever any difference to be adjusted relative to the number of the sacraments, though matters of seemingly less consequence were often made the object of protracted dispute. A similar line of argument, though less cogent, is pursued with reference to the Oriental sects—Nestorians and Monophysites—who separated from the Church in the 5th century. Whence, it is argued: if this doctrine was that of the Christian Church in the 5th century, it cannot be of other than apostolic origin, for the spirit of the early Church was hostile to all doctrinal innovations, as is proved by the history of the great controversies, and she would doubtless have resented any alteration of the original belief in a matter so important and of such a practical character as that referring to the number of the sacraments. It will be noticed that this argument is partly *a priori*, involving the contested assumption, that with regard to the point at issue it was impossible for the Church to have undergone any change of belief.

In the synthesis of theological speculation elaborated by the scholastics, the sacramental system was conceived as an extended application and a consistent carrying out of the great principle embodied in the Incarnation. In this mystery, according to the belief of most Christians, the invisible Godhead, the author of life and grace, was made flesh and dwelt among us, imparting to men through his tangible, human life and ministry that life of the spirit without which salvation is impossible. Hence the idea of conferring and developing the spiritual life through the instrumentality of visible material things ordained to that purpose was recognized as a principle underlying the entire economy of external means of grace in the Church. As regards the seven sacraments the theory is thus systematically worked out in the theology of Thomas Aquinas (1226-74). There is an analogy between the natural and the spiritual life in man. In the natural order man is born; he attains strength and maturity through growth; he is nourished by food; should illness occur he needs medicine; the common good requires the propagation of the race, and the supervision of legitimate authority; and finally, man needs to be prepared for his departure from this world. Now the parallel needs in the spiritual order are provided for through the seven sacraments. Thus, man is born in baptism, strengthened in confirmation, nourished by the Eucharist, and cured

^{*}For a well meant but quite ineffectual defense of the old view concerning the Discipline of the Secret, consult McDonald, 'The Apostles' Creed.'

from illness by penance; the Christian Church is propagated through matrimony, and by holy orders proper guides are provided in things spiritual; and lastly by extreme unction the believer is prepared for his passage into eternity.

While this comparison is ingenious, and instructive as a part of a logical coherent system, it cannot, of course, be adduced as a proof that there are precisely seven sacraments, for obviously it was excogitated to fit the case, and had the number of sacraments then admitted been six or eight or more, the analogy would doubtless have been worked out just as satisfactorily. It proves at most that in the 13th century the doctrine of the seven sacraments had been definitely recognized. As regards the effects of the sacraments, it may be remarked that Catholic theology claims for three of them (Baptism, Confirmation, and Orders), besides the conferring of grace common to all, the impression upon the soul of an indelible mark or "character." This effect is produced even when through a lack of disposition on the part of the subject no grace is bestowed, whence these three sacraments, when validly administered, are never repeated. If sometimes in the case of baptized converts, baptism is again administered conditionally, it is only on account of some doubt as to the validity of the rite previously conferred. The proof for the existence of this "character," which Protestants unanimously reject, is based chiefly on the ancient practice of the Church with regard to the non-repetition of these sacraments, and on certain texts from the works of early writers who express more or less vaguely the doctrine formulated later on by the theologians and the Council of Trent.

The views of the early Reformers concerning the mode of efficiency proper to the sacraments were, no less than those concerning their number, a radical departure from the received Catholic doctrine. According to the latter the sacraments produce their effects *ex opere operato*, by which formula is meant, that whenever the rite is properly administered and no obstacle or indisposition exists on the part of the subject, saving grace is imparted to the soul, by virtue of the rite itself as an instrumental cause, and independently of the dispositions of the minister or subject—at least so far as the essential effect is concerned. This mode of efficiency is sometimes expressed by saying that the sacraments contain the grace which they signify. Not that grace can be inherent in the physical symbols, but that through a divine ordinance it is infallibly connected with their administration.

While Protestant authorities are generally agreed in rejecting this doctrine, there is among them much divergence of opinion when it is a question of determining the nature of sacramental causality. Thus according to the Zwinglian and Remonstrant doctrine the sacraments are not properly a means of grace. "They were not ordained to signify, seal, and apply to believers the benefits of Christ's Redemption, but simply to be significant emblems of the great truths of the Gospel." The Reformed Church holds the sacraments to be a means whereby grace is conferred, but "their efficacy is due solely to the blessing of Christ and the working of His

Spirit, and this efficacy is experienced only by believers." According to the Lutherans the sacraments confer grace in virtue of their own inherent power, but their efficacy resembles that of a sermon; it can act with saving effect only upon believers, and the beneficial efficiency of the rite consists chiefly in animating the faith of the receiver and strengthening his confidence in the divine promises.

To substantiate the *ex opere operato* or direct, independent causality, Roman Catholic theologians adduce certain passages of the New Testament referring to sacramental efficiency, and in which the saving effect is attributed directly to the rite itself as the secondary instrumental cause. Thus in John iii. 5 spiritual regeneration is expressed as a birth of water and the spirit. Similarly Paul asserts that we have been saved "through the washing of regeneration" (Tit. iii. 5) and he admonishes Timothy to stir up the gift of God which is in him through the laying on of hands.

Another argument is based on the very ancient custom of infant baptism, one that was retained by several of the Protestant denominations. If infants are really born again to a new life by means of the ceremony of Baptism, we can scarcely conceive such an effect otherwise than as due to the immediate efficiency of the rite itself. Obviously it is not because the faith of the subject has been stimulated. Neither can the faith of the minister be the efficient cause, since, apart from other reasons, the Church has always maintained the validity of Baptism even when conferred by heretics and schismatics—the sacramental rite when properly administered was supposed to possess its own efficiency.

Consistently with this view it has been the constant teaching of the Church ever since the controversy between Pope Stephen and Cyprian in the 3d century, that neither faith nor righteousness is required in the minister of the sacraments for their valid administration. A certain intention, however, is postulated, namely, that of doing what the Church intends to effect by the rite in question. In other words, it is required that the minister intend to perform the rite not in his own name, but, implicitly at least, as a representative of Christ and of the Church. This intention can be extremely vague—in fact, reduced to a minimum—provided the effect intended by the Church be not positively excluded. As is well known, this question of the requisite intention is one of the main points at issue in the controversy concerning the validity of Anglican orders.

Other questions pertaining to the sacraments are of less importance and belong rather to a complete detailed treatment of the subject as found in the ordinary handbooks of theology.

SACRED HEART — SACRIFICE

Sacred Heart, League of, or Apostleship of Prayer in League with the Sacred Heart of Jesus, a pious association whose object, the glory of God and the salvation of souls, is expressed by its motto, "Thy Kingdom Come." The association was founded at Vals, France, on 3 Dec. 1844, the feast of Saint Francis Xavier, by Father Francis Xavier Gautrelet. The director-general of the League is the father-general of the Society of Jesus, and the principal seat or centre of the association is established at Toulouse. There are also diocesan directors and local directors for every centre. Promoters, who assist in extending the work of the association, are appointed by the local directors. The names and addresses of all the members of the association are kept on record. The number is so great in many centres that the card catalogue system is used. The number of local centres in the world, in October 1903, was 60,904, and in these centres there were registered over 20,000,000 associates or members. The directors of these 60,904 local centres are in communication through their diocesan directors and 37 periodicals, called 'Messengers of the Sacred Heart,' with the general director now (1904) living at Tournai, Belgium. The 'Messenger of the Sacred Heart' is published in 22 languages; 6 of the 37 are in English and 6 in Spanish. Other languages in which it is published are German, French, Albanian, Breton, Bohemian, Chinese, Catalanian, Croatian, Flemish, Dutch, Hungarian, Italian, Malabar, Indian, Polish, Portuguese, Slavonic, Hindustani, Arabian, and Greek. In January 1904, there were about 5,000,000 members in the United States. In addition to the league periodicals, another most important means of communication are the leaflets distributed each month by the promoters to all the members. The leaflets give the "General Intention" for which all are to pray and work during the month, and supplement the 'Messenger' in suggesting ways and means of uniting with the efforts of the missionaries throughout the world for the conversion of souls. Consult: 'Handbook of the Apostleship of Prayer'; 'Messenger of the Sacred Heart' (magazine, February 1904, New York); Ramière, 'Apostleship of Prayer.'

Sacred Heart of Jesus, Feast of the, a feast celebrated by the Roman Catholic Church the first Friday after the feast of Corpus Christi. This feast originated in the latter part of the 17th century, as the special and formal devotion to the Heart of Jesus, owes its origin to Margaret Mary Alacoque, a French nun of the Visitation Order. Her biographers relate that the Lord Himself appeared to her and gave her instructions regarding the devotion. Many in the Church had practised devotion to the Sacred Heart of Jesus from the time of the Crucifixion, as Cyril, Cyprian, Tertullian, Basil, Ambrose, Saint Francis of Assisi, and others, but the devotion was not general nor popularly advocated until the time of Margaret Mary Alacoque. Consult: Gallifet, 'The Adorable Heart of Jesus'; Tickell, 'Life of Blessed Margaret Mary Alacoque'; Nilles, 'De Rationibus Festorum Sacratissimi Cordis Jesu et Purissimi Cordis Marie.'

Sacred Monkey, any of several apes, monkeys and baboons regarded as venerable by bar-

barous people in various periods and regions. See APE; BABOON; HANUMAN; LANGUR; etc.

Sacrifice, the offering of anything to God or to a god; also the thing so offered. Sacrifice is common to all religions. In the lowest state of inculture the sacrifice is an offering of some article of food to the god, who is believed actually to eat the flesh of the victim or the fruits of the earth, which his worshippers deposit at his customary haunts—in some cave, at some fountain, or some sacred tree. But more usually a sacrifice is a feast of which the god and his worshippers both partake. In the best times of the Roman commonwealth this idea of a meal common to the gods and men had recognition in every household; for the Roman family never rose from table at the end of the principal daily meal till a portion of the food had been consumed on the hearth as an offering to the household gods. Of like significance is the fact that the slaughter of an animal for food and the offering of one in sacrifice are expressed by the same word in Hebrew; and that the Arabians pronounce over every animal they slaughter for food the name of Allah. In all sacrifices, whether of the pagan nations or of the people of Israel, certain portions of the victim were reserved for the deity—the blood, the fat, the head, shoulders, viscera, etc.; the rest was eaten by the worshippers. Usually the portions reserved for the god were consumed by fire, whereby, for the imagination of primitive peoples, the material offerings were etherealized, ascending to heaven in savory clouds of smoke and vapor. In many religions, too, as in that of Egypt, certain sacred animals are regarded as related to the tribal god, and as such are reserved wholly for sacrificial uses. The object of the sacrificial feast is always to renew and strengthen the ties of kinship and friendship between the god and his worshippers, and so to secure the continuance of material prosperity. This primitive sacrificial system is not without religious value; at least it is genuine; the ideas which it embodies are for every worshipper realities. And it has considerable ethical value, too, as binding the worshippers not only to the god, but to one another. The goods it seeks are material, but they are always public and social; it gives the individual no place except as a member of the tribe or gens. A new and radically different conception of sacrifice is formed when the tribal system begins to break up. Before a sacrifice can now take place an animal has first to be surrendered by its owner and consecrated. Dedication takes the place of natural sanctity. It is this new and important element that changes the character of sacrifice. The act of surrender, which is at first a mere preliminary, comes to be regarded as the essential feature. A sacrifice begins to be spoken of as a gift or tribute from the worshipper to the deity, and the original sacramental idea is gradually lost sight of. Is this a forward or a backward movement of thought? Two interpretations are possible. If the sacrificial gift is simply an expression of the truth that all private property is

a trust from God and ought to be devoted to His service, the new conception is an advance and can do nothing but good. But if it be supposed that God stands in need of gifts, and that the more numerous and costly the oblations the greater their efficacy, the tribute-idea is a backward movement. Sacrifice then becomes nothing but a method of conjuring. The historical outcome of the gift or tribute theory is holocausts, hecatombs, and human sacrifices. These last are a strange instance of reversion to barbaric practice. Human sacrifice is natural among cannibals; the food that is most grateful to man is always presented to the gods. Its revival among civilized peoples is the result of a very different train of thought. Those who begin to measure the atoning power of a sacrifice by its magnitude, splendor, or cost cannot forget that they have possessions more precious than flocks and herds. Hence in times of great distress they begin to conjure the displeasure of their gods with offerings of their own flesh and blood.

In primitive Israel the central feature of sacrifice is always the common meal, provided for by the slaughter of the sacred animal and by various kinds of cereal oblation. Time gradually robs the meal of its sacred character, and then the holocaust becomes common. After the exile the great sacrifice is the sin-offering, which culminates in the solemn ritual of the day of atonement. It is generally supposed that the central idea of the sin-offering is that of substitution—Jehovah accepting the life of the victim for that of the sinner. That is probably a mistake. Just as in the earlier sacrificial meal, so here, the significant part of the rite is not the shedding, but the application of the life blood, followed by the burning of certain portions of the flesh and eating of others.

The thinkers of Greece and the prophets of Israel wage a constant polemic against the popular superstitions connected with the sacrificial system. Some of the latter seem to break away entirely from ritual, others do much to give it an ethical and spiritual meaning. Christianity embraces whatever is true both in the sacramental and in the dedicatory idea of sacrifice. The former idea receives its perfect expression in the first Christian rite, the latter in the first rule of Christian ethics, which transfigures sacrifice into self-sacrifice. But the followers of Christ are slow to rise to the height of His teaching. Material sacrifice is always easier than spiritual. See OFFERINGS AND SACRIFICES.

Sac'rilege, the act of violating or profaning any sacred thing or any place that has been dedicated to the service of God, as a church or a chapel; in popular usage it means breaking into a place of worship and stealing therefrom. Another meaning of sacrilege is the alienating to laymen or to common uses, of what has been dedicated, appropriated or consecrated to religious persons or purposes; as thus understood, sacrilege is an offense triable by ecclesiastical courts. In the Roman law robbery of churches was, under the Justinian Code, punishable with death. It was formerly a capital crime in English common law also, but by the statutes 24 and 25 Victoria burglary of churches is treated simply as burglary, and theft of sacred things from sacred places as larceny. Neither in the stat-

utes of the United States nor in those of any of the individual States of the Union is sacrilege treated as a crime in any way different from common burglary or larceny. Consult: Spellman, 'The History and Fate of Sacrilege.'

Sac'ristan, the original of the name "sexton," which is an abbreviation of sacristan, the former title being still retained in some churches. The sacristan is an officer in a church whose duty it is to take care of the church and all belonging to it, the sacred vestments and utensils, etc., and prepare whatever may be required for the sacred offices.

Sacristy, in the ancient Church a building attached to the basilica and consisting of three parts: (1) The reception room, in which the bishop was received by the clergy and also gave audiences. It was in this room at Milan that the Emperor Theodosius asked absolution of Saint Ambrose. (2) The sacristy proper in which the sacred vessels and vestments were kept for immediate use; here the officiating ministers robed themselves for divine service. (3) The chamber in which office books, vestments, and church plate not in present use were kept. In many modern churches the sacristy is called the vestry, and consists of but one room.

Sacrobosco, sāk-rō-bōs'kō, **Joannes de** (John of Holybush, Holywood, or Halifax), English mathematician and astronomer: b. Halifax, Yorkshire; d. Paris 1256. He entered the University of Paris in 1221, afterward becoming a professor there. His most celebrated work is a treatise, 'De Sphæra Mundi,' a paraphrase of a portion of the *Almagest* (q.v.), of Ptolemy (q.v.). It was printed in 1472, and was afterward frequently reprinted, with the additions of able mathematicians. He was also the author of a treatise, 'De Ratione Anni, seu de Computo Ecclesiastico'; a work on arithmetic, bearing the title 'De Algorismo,' which is one of the earliest treatises on the subject in which the Arabic numerals are used. It was printed at Paris in 1498, with the 'Commentary of Petrus Cirvillus.'

Sa'crum, the sacred bone (*os sacrum*), a compound triangular bone situated at the lower part of the vertebral column (of which it is a natural continuation), and wedged between the two innominate bones so as to form the keystone to the pelvic arch. In man it consists of several vertebrae with their bodies and processes consolidated into a single bone. Its anterior surface is concave from above downward and from side to side. The posterior surface is convex, and presents in the middle vertical line a crest, formed by the fusion of the spines of the vertebrae, of which the bone is composed. The last sacral vertebra has, however, no spine, and the termination of the vertebral canal is here very slightly protected. In the female the sacrum is broader than in the male. The sacrum of man differs from that of the lower animals by its greater breadth in comparison with its length. See ANATOMY; OSTEOLOGY; PELVIS; SPINE.

Sacy, sā-sē, **Antoine Isaac**, **BARON SILVESTRE DE**, French Orientalist: b. Paris 21 Sept. 1758; d. there 21 Feb. 1838. Obtaining a thorough acquaintance with the Greek and Latin classics, he studied Hebrew, Syriac, Chaldee,

Samaritan, and then Arabic and Ethiopic. To these he added a knowledge of the principal European languages, including Turkish. Later he mastered Persian. During the Revolution he withdrew to a short distance from Paris, and lived unmolested, though his attachment to monarchy was well known. In 1795, when the Convention established a school of Oriental languages, De Sacy was appointed professor of Arabic, and was allowed to retain this situation notwithstanding his refusal to take the oath to the new constitution. Bonaparte made him professor of Persian in the College of France (1806), and afterward bestowed upon him the title of baron (1813). In 1808 he was elected by the department of the Seine into the legislative body; but took no part in the debates till 1814, when he voted for Napoleon's deposition. In 1815 he was appointed rector of the University of Paris, and shortly after member of the commission for public education. While officiating in these capacities he formed around him a circle of scholars, by which he became indirectly the teacher of all Europe. He took a prominent part in founding (1822) the Asiatic Society of Paris, of which he was president; and it was by his recommendation that professorships of Chinese, Sanskrit, Manchu, and Hindustani were established in the capital. In 1832 Louis Philippe raised him to the peerage and made him, after Remusat's death, which took place in this year, conservator of the Oriental MSS. in the royal library. Among his works may be mentioned: 'Principes de Grammaire générale' (1799); 'Grammaire Arabe' (1810); and 'Chrestomathie Arabe' (1806); 'Exposé de la Religion des Druses' (1838); 'Calila et Dimna' (1816).

Saddle, a seat for a horse's back, contrived for the safety and comfort of the rider. In early ages the rider sat on the bare back of his horse, but in course of time some kind of covering was placed over the back of the animal. The modern riding saddle consists of the tree, generally of beech, the seat, the skirts, and the flaps, of tanned pig's skin, and the construction and weight vary according to the purposes for which it is to be used. Among the varieties are racing saddles, military saddles, hunting saddles, and side saddles for ladies. The name saddle is also given to a part of the harness of an animal yoked to a vehicle, being generally a padded structure by means of which the shafts are directly or indirectly supported.

Sad'lerock Oyster, a large and favorite kind of oyster originally obtained from a reef known as Saddle Rock near Norwalk Harbor, Connecticut. The supply was exhausted early in the last century, but in the first attempts at artificial cultivation of oysters (q.v.) in the eastern part of Long Island Sound many small "seed-oysters" were derived from that district, and so the name continued until it became a market term about New York for large and well-shaped oysters mostly sold to be eaten raw.

Sadducees, sād'ū-sēz, a sect of the Jews well known in religious history on account of being mentioned in the New Testament. Beyond their name, however, very little is known regarding them. Even the origin of their name is undecided, though there seems plausibility in the argument that it is derived from the high-

priest Zadok, who anointed Solomon as the successor of David, and whose descendants appear to have been prominent many ages after in the Jewish community. It is conjectured that the Sadducees may have been members and adherents of the house of Zadok. The Sadducees denied that the oral law, handed down by tradition as the utterances of Moses, had equal authority with the written law, and they rejected the doctrine of the resurrection, and also denied, according to the New Testament, the existence of angels and spirits. According to Josephus the Sadducees also disbelieved that there was such a thing as fate, whereas the Pharisees, the other great Jewish sect, while not denying nor questioning liberty of will, held that all actions and events were fixed by unalterable decree. The Sadducees seem to have disappeared as a separate body after the first century of the Christian era, although an existing Jewish sect, the Karaites, agrees with them in the rejection of oral law. See JEWISH SECTS.

Sadhs, sād's, or Saadhs, sā'āds, a Hindu sect which believes in one God, and teaches a pure morality. The sect was founded 1658 A.D. by a man called Birbhan. They have no temples, but assemble at stated periods in houses, or courts adjoining to them. They are found chiefly in Farukhabad, Delhi, Mirzapore, etc.

Sadi, sā-dē', or Saadi (MOSLEHEDIN SHIRAZI), Persian poet: b. Shiraz about 1184; d. there 1291 or 1292. After completing his studies and spending many years in travel, he settled in the neighborhood of Shiraz, where he enjoyed the favor of several Persian rulers. The Persians esteemed him exceedingly on account of his golden maxims, which they consider as a treasure of true wisdom; and also on account of his pure, elegant, and simple style. Of his works (1) a collection (Divan) of lyric poems in the Arabic and Persian languages; (2) 'Gulistan' ('Garden of Roses'), a didactic work composed both of prose and verse, in eight books; (3) a work in verse, called 'Bustan' ('The Orchard'), containing a collection of histories, fables, and moral instructions. The complete works of Sadi were published in Persian at Calcutta (1791-5). Graf has published translations from the 'Divan' in the 'Zeitschrift der morgenländischen Gesellschaft,' and there is a German translation of the political poems by Rückert (with life of Sadi, 1894). There are editions of the 'Gulistan' by Sprenger (1851) and others, and among English translations are those by Eastwick (1880) and Ross (1823). The 'Bustan' has been edited by Graf (1858) and Rogers (1891), and translated into English by Davies (1883), and in part by Sir Edwin Arnold ('With Saadi in the Garden,' 1888). Consult Ouseley, 'Biographical Notices of Persian Poets' (1846).

Sadi-Carnot, sā-dē kār-nō. See CARNOT.

Sadler, sād'lēr, Anna Teresa, Canadian writer: b. Montreal, P. Q., 1856. She has written much for the Roman Catholic press, and her published books include: 'Ethel Hamilton, and Other Tales' (1877); 'The King's Page' (1877); 'Seven Years and Mair' (1878); 'Women of Catholicity' (1885); 'The Silent Woman of Alood' (1887); 'Gems of Catholic Thought,' compilation (1882); etc.

Sadler, or Sadleir, Sir Ralph, English diplomatist: b. Hackney 1507; d. Standon, Hertfordshire, 30 Marsh 1587. He became the ward of Thomas Cromwell, was one of Henry VIII.'s principal secretaries of state, and was appointed by Henry's will one of the council to assist the executors upon whom was laid the government of the country and the guardianship of young Edward VI. He went into retirement during Mary's reign, but emerged after the accession of Elizabeth, and became one of Cecil's agents, especially charged with negotiating Scottish affairs. In 1568 he became chancellor of the duchy of Lancaster and thereafter he was mainly occupied as one of the English commissioners to treat of matters relating to the Queen of Scots. In 1580 he was for a time one of her guardians at Sheffield and Wingfield. His last mission was to James VI. of Scotland in 1587 to endeavor to reconcile him to the execution of his mother. Consult Sadler's State Papers, with memoir and historical notes by Sir Walter Scott (1809).

Sadler, Reinhold, American legislator: b. Prussia 10 Jan. 1848. He came to the United States when young, and has been for many years a resident of Nevada. He was elected lieutenant-governor of Nevada in 1895, and on the death of Governor Jones in 1896 became governor. He was regularly elected to the office in 1898, which he occupied until 1903.

Sadler, Walter Dendy, English painter: b. Dorking, Surrey, 12 May 1854. He studied art in London and Düsseldorf, and has exhibited at the Royal Academy since 1873. Among his best known pictures are: 'Thursday'; 'Darby and Joan'; 'The Widow's Birthday'; 'The New Will'; and 'For Weal or Woe.'

Sado, sã-dõ, Japan, an island off the west coast of Hondo, opposite and 32 miles from Nigata, with an area of 336 square miles, and a coast line of 135 miles. It has a diversified surface culminating in Kimpokusan, 3,820 feet high. South of Kimpokusan is the town of Aikawa, near the east coast, with the ancient and still productive gold and silver mines in its vicinity, to which Sado owes its celebrity. On the west coast 18 miles distant from Aikawa is Ebisuminato, the port of the island. Pop. of island 113,000.

Sadoletto, sã-dõ-lã'tõ, Jacopo, Italian theologian: b. Modena 1477; d. Rome 18 Oct. 1547. He was consecrated bishop of Carpentras, near Avignon, in 1517; belonged to the Contarini Reform Party, and was a member of the commission appointed by Paul III. to take steps toward effecting a church reformation. He immediately opened a correspondence with Erasmus, Bucer, Sturm, and Melancthon, but when in 1539 he invited the Genevans to return to the Roman Catholic Church, he received a harsh rebuff from Calvin. After that he confined himself largely to his own diocese. He had been appointed cardinal in 1536, but while he was frequently summoned to Rome he preferred Carpentras, and his study well stocked with books of the new learning, in which he was an adept, being one of the best Latinists of his day. He wrote commentaries on the Psalms, and on the Epistles of Saint Paul, and so excellent was their style that Erasmus made the somewhat invidious remark

that "their very polish of expression will take off the edge of their pious suggestiveness." His works were published in four volumes in 1734. He was a diplomat in whom successive popes had confidence and acted as ambassador to Francis I. in the interests of peace in 1544. Consult Joly, 'Etude sur J. Sadolet' (1856).

Sadowa, sã-dõ-vã (Czech *Sádová*), Austria, in Bohemia, near Königgrätz, on the Bistritz, a village remarkable as one of the hotly contested Prussian positions in the decisive battle of 3 July 1866, in which the crown prince of Prussia and Prince Frederick Charles commanding the Prussians, defeated the Austrian forces under Benedek. This battle is known also as the battle of Königgrätz.

Sæmund (sã'moond) the Wise, Icelandic scholar: b. Iceland about 1155; d. Oddi 1233. He undertook a course of foreign travel in pursuit of learning, and visited Paris and Rome; then, returning to Iceland, he became priest at Oddi (1176). He was unknown to scholars till about 1643, when the newly discovered 'Elder Edda' and other writings were falsely ascribed to him.

Safe, a receptacle for money, important papers, and valuables, usually of iron or steel, or of both combined. A safe, to justify its name, should be proof against fire, explosives, acids, drills, wedges, and the other implements and opening devices resorted to by burglars. The history of safe-making is mainly a record of struggles between the burglar and the safe-manufacturer; the result is, that safes can now be obtained which are all but impregnable. With the modern safe of the best kind the lock may be said to be the only vulnerable point; hence much care and ingenuity have been expended on its mechanism. Numerous patents, mostly of American origin, have been introduced in recent years. Of these, the keyless permutation locks deserve particular mention, as they obviate the danger which arises from lost or false keys. Such locks allow of opening only after an indicator has been moved in accordance with a certain combination of numbers arranged before closing the safe. Some safe-locks are so constructed that to be freed they require different keys on different days, some can only be opened at a certain hour, this being fixed on before the door is closed; while others again require two or more keys in charge of different persons; in fact, the arrangements contrived to render the plundering of safes next to impossible are too numerous even to mention. The connection of safes with electric alarms in a variety of ways forms another safeguard.

Safe-conduct, a security granted by the sovereign authority, or persons delegated by it, to strangers or other persons to enable them to repair to and return from a certain place undisturbed. In most of these cases passports have now taken the place of special safe-conducts. Sometimes the safe-conduct is given to persons accused, to secure them against harm when summoned to an examination.

Safe Industry in America. Various methods for the safe-keeping of treasure, jewels and other valuables have been in use since the earliest periods in history, and the advancement in this line has necessarily kept

apace of the times, the increase in the volume of wealth throughout the world of course rendering it imperative that more improved facilities for guarding this accumulated wealth be put into use. Thus we have witnessed the evolution from the old-fashioned strong-box to the massive chilled-iron and steel vaults, absolutely fire-proof and burglar-proof, till they have reached the highest degree of efficiency and perfection that science and skill can make them. Locks of rude construction were in use by the ancient Egyptians, and during the Middle Ages by the Romans. The Chinese also used a lock similar in construction to the famous Bramah lock, invented in England in 1784. These were made of wood, the tumblers being of different lengths to fit the sizes of the wards in the keys. Beginning with the Middle Ages the inventive genius of man was turned toward providing something more substantial than a lock as a method of warding off the burglar, who at that time had not attained to the remarkable skill and cunning of the modern "cracksman," and indeed the professional thief of modern times would look back with envy on his predecessor who had nothing more than a mere wooden box, sometimes bound with iron, with which to cope. The first means of securing valuables was by placing them in some secret cavity in a wall, the door of which was opened by a spring or other device, but more often articles of household furniture were used, such as desks with secret drawers, or tables and chairs with false bottoms. These constituted the chests of the wealthy for some time and some of them were furnished with locks and bound with strips of iron, the whole very artistically made so as to ward off suspicion of their contents. The oaken-chest or strong-box, reinforced with iron bands and knees, was in the beginning of the 18th century considered to be the best means of security. Such a chest was used in 1707 to guard the crown jewels of Scotland, but when they were to be examined by the Royal Commissioners, the locks of the chest had to be broken and the lid forced up because there was no other manner in which the chest could be opened, an operation which the modern blacksmith would consider an easy task to perform.

Prior to the beginning of the 19th century practically no attempt was made to make these strong-boxes of a material which would withstand heat or which would in any way render them impervious to the ravages of fire. The first improvement along this line was made in France about 1820, the safes then constructed consisting of a metal box built within double walls, the space between being filled with a composition of non-conducting substances. A little later a so-called fire-proof safe was constructed in New England, considered to be a vast improvement over the existing types. This safe had a body of solid oak plank from three to four inches thick, which, after being thoroughly saturated with an alkali, was covered with sheets of thin iron. To make this more surely fire-proof bands of iron were crossed and recrossed over these plates and nailed down with large round-headed iron spikes,

the whole affair being a very gruesome and formidable looking object. The great fire in New York in 1835 proved the worthlessness of these, several hundred of them being then destroyed. The idea of filling in the walls of a safe with a nonconducting substance was first put into use in this country in 1843 by Daniel Fitzgerald. His idea was to fill the walls of the safe with plaster of paris because of its tendency to throw off heat, and having secured a patent on his invention he immediately began to manufacture a safe known as the "Salamander." His patent was later assigned to B. J. Wildey, who made a safe called "Wildey's Patent," the principle of these being to leave the space between the walls empty, trusting that the contents of the inner portion of the safe would be protected from heat by the nonconducting properties of the air. Other mixtures such as asbestos, mixed with plaster of paris, clay, alum, fire-clay, mica, chalk, etc., were then used to fill the vacant space but none of these have proven absolutely safe. To-day the modern safe is filled either with a substance, alum or some other salt, which when heated gives off a quantity of water; or by placing in the walls a receptacle, either glass or metal, containing water so as to give off steam when the outside walls become overheated. The idea of using steam as a nonconductor originated with Prof. A. K. Eaton, of New York, who learned by experiment that the contents of a safe could not be injured by fire so long as steam at 212° F. surrounded the inner chamber, but the main objection to the use of water as a nonconductor lay in the fact that this subjected the contents of the safe to constant dampness. The use of substances which contain water in their chemical composition has, however, largely done away with this objection.

Outside of the fire element, the most important part of the safe to be considered is the lock, for with our modern methods of fire protection the danger of burglary is more imminent than the loss by fire. The first supposedly nonpickable lock was the Bramah, but this was finally proven to be valueless and easily picked, this being done in 1851 by a Mr. Hobbs, by the "tentative process." Three other locks then came into use, the Chubb, also picked by Mr. Hobbs, the Pye lock, invented in 1851, but picked by Linus Yale, Jr., of Philadelphia, by the "impression process," and the Yale lock. Since then many new forms of locks have been invented, and the modern lock-combinations are constructed in a manner which has made the trade of burglary extremely difficult while they are otherwise absolutely fire-proof. There are three ways of procuring security against burglary, first, by the laminated construction; second, by the use of blocks of chilled iron, this method being more useful in the construction of large vaults than in the making of portable safes; and third, by the spherical chilled-iron safe. In the first method of construction the chamber is made of alternate layers of hard and soft plates of iron and of plates of hardened steel, the two laid alternately over each other in the walls of the chamber in such a way that they form a single mass. Thus the

SAFED — SAFETY-VALVE

body of the safe being constructed of alternate plates of iron, welded iron and steel, carbonized and decarbonized steel, and crystal steel, fastened together by means of bolts from the inside has made safes practically impregnable to the appliances used by the modern burglar, such as sledge-hammers, jimmies, jackscrews and other devices. Another method of making safes, in common use by manufacturers, is to roll down together while hot into one solid sheet of tempered steel three layers of soft iron or steel alternated with two intermediate layers of hard steel. These composite sheets, when they have been rolled till about one-half of an inch thick, are then built into the walls of the safe and alternated with plates of heavy steel about one-half inch thick. The doors are generally the weak point in the construction of a safe, for it is these which a burglar first attacks to see if there is any crevice into which a wedge might be inserted, or any crack into which nitro-glycerine or any other high explosive might be introduced. In some safes the plates comprising the door are dovetailed, engaging with the corresponding parts of the jamb; in some an air-tight packing is used between the jambs and their abutments; while in others a screw door is used.

One solid mass of metal is used in the second and third types of safes, the tough and hard qualities of the metal being obtained by modification. The metal used is a soft, malleable iron, the surface of which can be hardened by cooling. In the construction of many vaults, blocks of this "chilled-iron," weighing from three-quarters to several tons, are bolted together on the inside, the sides being dovetailed together, and the outside surface is chilled to the highest degree of hardness. The door is a single casting of iron, two inches thick, and also chilled on the outside.

In the third type, the spherical, invented by William Corliss, the shell, constructed of steel from four to seven inches thick and chilled to a depth of about two inches, sometimes contains a "bugging" made from Franklinite ore found in Sussex County, N. J. This material, which possesses a hardness exceeding that of the best tempered steel, and is in appearance somewhat like crystallized silver, is so interwoven with wrought-iron rods that it can be battered with the greatest degree of force but will only bend, not break. The purpose of this construction of wrought and crystallized iron is to hamper a burglar in his work, it being supposed that in an attempt to drill through the walls of the safe, the drill will penetrate the soft metal more readily than the hard, and, consequently, working sideways, will be broken off when it strikes the hard metal. The "bugging" may, however, be used in precisely the opposite manner, the rods being made of the hardest tool-steel and the body of the filling composed of cast-iron segments, but the principle of turning the point of the "cracksman's" drill is the same.

In our large banks and safe-deposit vaults there is no room sufficiently large to contain the number of individual safes which would

be required to hold the enormous masses of money and other valuable securities with which these institutions are intrusted. This has turned the attention of the manufacturer in recent years to the building of large vaults which would be absolutely fire and burglar-proof. The interior of these vaults may be constructed to suit the tastes and requirements of the owner, but the walls are now made much thicker than formerly and the builder has made more use of fire-proofing materials. The most important feature of the modern vault is the lock, which has now reached the acme of perfection. The first form of lock used was the combination-lock, an outgrowth of the "tumbler" lock, and the mechanism of these is very ingenious. These locks are not limited in the number of combinations upon which they may be set, and may be changed at any time should the combination become known to undesirable persons. The most valuable asset of the modern vault, however, is the chronometer, or time-lock, the mechanism of which is as intricate and as complicated as the best watch but at the same time it runs as true and as smoothly. To offset any possible disarrangement in the mechanism of a single clock, which would, of course, prevent the opening of the safe, three movements are usually inclosed in a single case. As these safes cannot be opened by any human agency until the time set for the clock to operate the mechanism which swings back the ponderous doors, it is obvious that the chronometer combination is the greatest safeguard against robbery which the bank can employ.

In 1900 there were 35 establishments engaged in the manufacture of safes and vaults, capitalized at \$5,479,879. There were 222 officials and salaried clerks, with yearly salaries of \$283,111; wage-earners, 2,038; wages, \$1,017,237; miscellaneous expenses, \$200,620; cost of materials used, \$1,689,148; and producing goods annually to the value of \$3,927,867. The value of the American safe has been recognized in foreign countries, and to-day may be found throughout Great Britain, Europe, Asia, Africa, Australia, South America, etc. See **LOCK**; **FIREPROOFING**; **BUILDING**; **BUILDING: Fireproofing**; **VAULT**, ETC.

Safed, sā'fēd, Palestine, occupies the summit of a hill 2,700 feet high, on the shores of the Mediterranean, six miles northwest of the Sea of Galilee. Safed was a fortified place of importance during the Crusades, and is one of the four holy cities of the modern Jews in Palestine, their settlement dating from the 16th century. Pop. (estimated) 19,000.

Safety-Lamp. See **LAMPS**.

Safety-valve, a device used upon steam boilers and other vessels subject to an internal pressure, for the purpose of automatically preventing that pressure from rising to a dangerous intensity. It consists essentially of an opening in the boiler (or other vessel), over which a suitable lid or "valve-disk" is fitted. The valve-disk is pressed against its opening with a definite, constant pressure, whose magnitude is regulated according to the pressure that the boiler is intended to carry. So long as the pressure that the steam within the boiler exerts upon the under side of the valve disk is less

than the constant force with which the disk is pressed down upon the opening, the valve remains closed, and no steam escapes. If the pressure within the boiler rises, however, so that the steam exerts upon the disk a total pressure that is greater than the external force that tends to hold the disk in place, the valve opens and permits steam to escape until the pressure in the boiler is sufficiently reduced for the external force to again close the opening. There are three general types of safety-valve in use, which are respectively known as "dead-weight," "lever," and "pop" valves. The fundamental principle of operation is the same in all, and the classification relates merely to the means that are employed to hold the valve-disk against the opening in the boiler. In the "dead-weight" valve, this is accomplished by placing weights directly upon the valve-disk. Safety-valves of this type can be recommended for low pressure boilers, and they are greatly used, in England, upon heating boilers, and also upon kitchen boilers. They are not adapted for use in connection with high pressures, however, for the load resting upon the valve-disk must then be very great, in order to prevent the valve from opening at the ordinary running pressure. It is common, therefore, to use the "lever" type for high pressure service. In this type the valve-disk is held against its seat by the action of a weight, but the weight does not rest directly upon the disk. A horizontal lever two or three feet long is provided, and this is pivoted at one end, while the weight is attached near its free end. The centre of the valve disk comes directly under the lever, a few inches from the pivoted end, and the lever is supported by means of a stout vertical rod whose lower end rests upon the centre of the valve-disk. By this means the total downward force acting upon the disk and tending to keep it in position may easily be made to be eight or ten times as great as that which would be realized if the weight rested upon the valve-disk directly; and the pressure at which the valve will open can be nicely regulated by shifting the position of the weight upon the lever arm. In the "pop" valve, the disk is forced against its seat by means of a stout spiral spring, which is held in position by a framework, or casing, which is securely attached to the boiler. The compression on the spring is regulated by means of a screw that acts upon its upper end, and which can be turned by a wrench. It is now customary, however, to have the adjusting screw entirely within the casing of the valve, so that the attendant in charge of the boiler cannot tamper with it; the casing being provided with a lock, the key to which remains in the possession of the owner of the boiler. The name "pop" refers to the sound that these spring valves make when they open and close. Lever valves and dead-weight valves open and close gradually, and before they open they give warning by a hissing sound. "Pop" valves, on the contrary, open without any such premonitory signal, and when they close they do so with corresponding quickness. "Pop" valves are used exclusively upon railroad locomotives, as the violent swaying and vibration to which these are subject would render weighted valves undesirable.

Safflower, a large thistle-like composite plant (*Carthamus tinctorius*) with orange-colored flowers, said to have been originally brought from the East, but now naturalized in many parts of Europe, and extensively cultivated. The tubular flowerets are collected, dried, and somewhat used as a feeble laxative medicine, in place of, or as an adulterant of, saffron. They are, however, chiefly important as the source of carthamin, a dyeing principle originally much employed by the Chinese, and later by occidental silk manufacturers, as it gives brilliant, although fugitive red tints; mixed with French chalk, it forms the cosmetic rouge. In Spain the flowers are used to color soups, and other dishes. The Jews in Poland are remarkably fond of the flowers, and mix them with their bread and most of their viands. Oil, in India, is expressed from safflower seeds, for culinary and lighting purposes.

Safford, säfförd, **Truman Henry**, American mathematician: b. Royalton, Vt., 6 Jan. 1836; d. Newark, N. J., 13 June 1901. He was early known as a calculator of great skill; in 1845 prepared an almanac; by a method of his own abridged by one fourth the task of computing the rising and setting of the moon; and after his graduation from Harvard was officially connected with the observatory there in 1854-66, acting in 1866 as director. In 1865 he was appointed professor of astronomy in the University of Chicago and director of the Dearborn observatory, in 1874-6 was a member of the United States coast-survey, and in 1876-1901 professor of astronomy in Williams College. He was a fellow of the American Academy of Arts and Sciences, of the American Association for the Advancement of Science, and an associate of the Royal Astronomical Society of England. He studied the nebulae, discovering many new ones, computed cometary and planetary orbits, and for some time devoted his attention to latitude and longitude work for the United States corps of engineers, for which he prepared a star-catalogue. Among his further published writings were a catalogue of polar-stars, 'Mathematical Teaching and its Modern Methods,' and numerous contributions to astronomical journals, to the 'Proceedings' of the American Academy, and to the notices of the Royal Society.

Safford, James Merrill, American geologist: b. Zanesville, Ohio, 13 Aug. 1822. He was graduated from the Ohio State University in 1844 and in 1848-72 occupied the chair of natural science at Cumberland University, Lebanon, Tenn. He was professor of chemistry at the University of Nashville and at Vanderbilt University in 1874-94, and of natural sciences at the latter in 1875-1900, where he now occupies the chair of geology. He was State geologist of Tennessee in 1854-60 and 1871-1900. His publications include many papers on geological subjects, beside: 'Geological Reconnaissance of Tennessee' (1856); 'Geology of Tennessee' (1869); 'Elements of the Geology of Tennessee' (1900); etc.

Saffron, a bulbous autumnal plant (*Crocus sativus*) and a commercial dye-stuff obtained from it. The cultivated saffron originated probably in the Levant, and was grown in early times about the town of Corycus, Cilicia (from which the *Crocus* genus may have taken its name),

SAG HARBOR—SAGASTA

The Arabs cultivated it in Spain, about the 10th century, and it was an important crop in England, especially about Saffron Walden, in the 15th century, bringing the highest market price. It is now raised about the Mediterranean, and in Asia. The saffron is low, with the grass-like leaves, and long-tubed, funnel-shaped flowers, springing directly from the ground, which are characteristic of the crocuses. Its flower is purple, with a style tipped with three orange-colored stigmas, each more than an inch long, depending from one side of the perianth. These stigmas are picked off in the early morning, and dried on a kiln, either loosely or between layers of paper, and under the pressure of a thick board which forms the mass into cakes, about 4,000 of these stigmas being necessary to give an ounce of saffron. In either case the commercial saffron is liable to suffer from adulteration. This adulteration was so prevalent at one time that those guilty of it (when caught) were killed.

Saffron stigmas, when genuine, have a characteristic orange red color, and an aromatic, bitter odor and taste. The substance has faint carminative and narcotic properties, but is seldom used medicinally, except for coloring tinctures. In the 'Song of Solomon' the saffron is mentioned among the sweet-smelling herbs, and it was much in demand among the Greeks and Latins for its perfume. A fragrant essence was made from it with water and wine for sprinkling in theatres and other places, even in the streets, for anointing the hair, and for the bath. Saffron was also much employed in culinary operations, chiefly for its aromatic taste and for coloring, as the clown in the 'Winter's Tale' says he "must have saffron, to color the warden pies."

Saffron, however, is most commonly used as a dye, giving a yellow hue to cloth, but is being displaced by cheaper colors. This tint was in very early times the royal color in Greece, and was that of some of the women's court robes, but afterward was appropriated by the hetairæ. In Ireland and the Hebrides it was also the color of the king's mantle, and of the shirts of persons of rank. Saffron enters largely into the composition of the sacred spot on the forehead of a Hindu Pandit. An extract made from saffron, used as a glaze on tinfoil, imitated gold in mediæval illuminations, and was also employed by painters.

HELEN INGERSOLL.

Sag Harbor, N. Y., village in Suffolk County; on Gardiner's Bay, an inlet from the Atlantic Ocean, and on the Long Island railroad; about 100 miles east of New York. It has a good harbor, regular steamer connections with New York and several of the Long Island coast towns. It has several manufactories, chief of which are a watch-case and silverware factory, flour and cotton mills, a tannery, and machine shops. The Sacred Heart Academy (R.C.), opened in 1877, a Union school, public and parish schools, and a library constitute the educational institutions. There are three banks with a combined capital of \$100,000. The village is a favorite summer resort.

At one time Sag Harbor was noted for its interests in whaling; its income from that industry amounting to \$1,000,000 some years. In those days its tonnage equaled that of New York. The Indian relics found in and near the

village show it was once an important Indian settlement. Pop. (1900) 1,969.

Saga, sã'gã, from the word meaning "to say," is a narrative of the past handed down by word of mouth. The name is applied to a large collection of mythical, semi-mythical, and historical works written mainly in Iceland chiefly in the 12th and three following centuries. The most conspicuous and important of the historical sagas are Snorre Sturlason's *Heimskringla*, the *Njals Saga*, the *Egla*, and the *Sturlunga Saga*. Consult Horn's 'History of the Literature of the Scandinavian North,' translated by Anderson. In Scandinavian mythology the name of the goddess who presides over history. She dwells in Sökkvabeg, where she and Odin sit drinking joy from golden goblets.

Saga, sã'gã, Japan, capital of the province of Fizen, on the island of Kiu-siu, 74 miles northeast of Nagasaki. It is an important seaport and commercial centre. The town is intersected by numerous streams, chief of which is the channel of Sentonofutsi, 50 miles long. It unites the Gulf of Simabara with the Northern Sea, and is of considerable commercial importance. Pop. 32,753.

Sagard, sã-gär, **Theodat Gabriel**, French Roman Catholic missionary. He labored in converting the Huron Indians to Christianity during the 17th century, and contributed, in an important degree, to a knowledge of Canada in its early colonial days as "New France." His principal works are: 'Travels to the Huron Country, towards the Freshwater Sea and the Uttermost Limits of New France, called Canada; Wherein is Treated of all Matters touching the Country, the Manners and Character of the Savages; their Government and their Ways, as Well in their Own Country as when Roaming; of their Faith and Belief; with a Dictionary of the Huron Language' (1632); also, 'History of Canada and the Journey made by the Friars Minor Recollects Thither, for the Conversion of Unbelievers.' An edition of his works was published at Paris in 1866.

Sagasta, sã-gäs'tã, **Praxedes Mateo**, Spanish statesman: b. Torrecilla en Cameros 21 July 1827; d. 5 Jan. 1903. He studied at the College of Engineers in Madrid, practised as an engineer in Valladolid and Zamora, in 1854 was elected from Zamora province to the Cortes, where his attitude was a radical one, and in 1856 for participation in an unsuccessful revolt was compelled to escape to France. Upon the proclamation of amnesty, he returned, became professor in the Madrid College of Engineering, re-entered the Cortes, was identified with the Progressive minority, and edited its journal, 'La Iberia.' After the outbreak of 22 June 1866 he again fled to France, but at the beginning of the revolution of 1868 was once more in Spain, where he became minister of the interior in the provisional government. In October 1871 he was chosen to the presidency of the Cortes, in December entered the Malcampo cabinet as minister of the interior, in February 1872 was commissioned to form a new ministry, but in May was forced to resign. In 1874 he appeared anew in office as minister for foreign affairs in the Serrano cabinet, shortly afterward ex-

changed his portfolio for that of the interior, and in August became president of the ministry. He retired from office at the accession of Alfonso XII., for a time was a leader without a party, as a member of the Cortes was finally associated with Martinez Campos (1881) in the organization of the new Liberal party, and upon the overthrow of the Conservatives became president of the ministry. He was forced from power in 1883. Subsequently he was president of the Cortes in 1883-4, and of the ministry in 1885-90 and 1892-5. In September 1897 he was again summoned to form a cabinet. He recalled Weyler from Cuba, appointed Blanco captain-general, and drafted a plan for Cuban autonomy. Although opposed to the war with the United States, he waged it with such efficiency as his limited resources would permit, and was loudly denounced for signing the treaty of peace. On 4 March 1899 he resigned with his entire cabinet, though on 6 March 1901 he again took the helm, and, after averting a Carlist insurrection, remained in office until 3 Dec. 1902. He has been characterized as "singularly devoid of the blind arrogance which has been the bane of so many Spanish statesmen." After Canovas' death, he was conceded to be the greatest political figure of Spain.

Sage, sāj, Henry William, American philanthropist: b. Middletown, Conn., 13 Jan. 1814; d. Ithaca, N. Y., 17 Sept. 1897. In 1832 he engaged in the lumber business which he conducted until 1854, and settling at Ithaca, N. Y., entered the New York Assembly in 1847. His earlier benefactions were the endowment of various schools and churches, the West Bay City, Mich., public library, and the Lyman Beecher lectureship at Yale College. In 1870 he became a trustee of Cornell University and his various gifts to that institution were \$266,000 for the Sage College for Women; \$200,000 for the Sage School of Philosophy; \$50,000 for the Susan Lynn Sage chair of philosophy; \$260,000 with an additional endowment fund of \$300,000 for the University Library Building; \$20,000 for the Museum of Classical Archaeology; \$11,000 for the Sage professorship of philosophy; \$300,000 for floating indebtedness. His careful management of timber lands owned by the institution realized for it about \$6,000,000.

Sage, Russell, American capitalist: b. Verona Township, Oneida County, N. Y., 4 Aug. 1816; d. Lawrence Beach, L. I., 22 July 1906. He began life as clerk in his brother's grocery store; entered the retail grocery business for himself in 1837, and during 1839-57 was a wholesale grocer at Troy, N. Y. He was alderman of Troy in 1847; treasurer of Rensselaer County, and a Whig member of Congress during 1853-7. In 1863 he removed to New York and shortly began large operations in railroad and other securities. He accumulated one of the largest fortunes in America and was a director in many large corporations.

Sage, William, American novelist, son of Abby Sage Richardson (q.v.): b. Manchester 8 May 1864. He was educated in France and Germany, was engaged in railway and banking business 1881-96, and since then has given his attention to literature. He has published 'Robert Tournay' (1900); 'The Claybornes' (1902); 'Frenchy—The Story of a Gentleman.'

Sage, a name covering both the common garden herb (*Salvia officinalis*) and other plants of diverse families, somewhat resembling it in color or odor. The cultivated sage is a labiate, and the genus differs from the majority of *Labiate*, in having two stamens instead of four. It is a native of southern Europe, is a shrubby perennial of hoary aspect, bearing rough, wrinkled, gray-green, opposite leaves, on the decumbent stems, and pale-blue, streaked flowers in verticillate spikes at the extremities of the branches. It has been widely cultivated, for at least three centuries, on account of its aromatic odor, and bitter, pungent taste. It was formerly used in medicine, having slight tonic, stimulant, and astringent properties. An infusion of the plant, or "sage-tea," was drunk in England before the advent of Chinese *Thea*, was a favorite remedy for colds, and is even now employed as a gargle. An old English proverb states that "He that would live for aye must eat sage in May." See HERBS, CULINARY.

Many *salvias*, or sages, are frequently cultivated for their brilliant flowers. The most common, perhaps, are the scarlet sage or *salvia* (*Salvia splendens*) with racemes, perhaps a foot long, of slender flowers two inches long, arranged in whorls, both calyx and corolla being of a most brilliant scarlet hue; and the equally large-flowered but blue-tinted *S. patens*. The woolly white foliage of *S. argentea* has caused it to be included in gardens, and there are a score of others quite worthy of cultivation for ornament.

Several genera of the *Chenopodiaceæ*, a family which takes kindly to alkaline soils, and which inhabit the desert regions of western North America, are called salt, sweet or silvery sages. Bitter sages are *Compositæ*, and are more commonly known as sage-brush (q.v.). The salt sages are species of *Atriplex*, living on thousands of acres of waste lands, which are strongly impregnated with alkali, and so dry that little other vegetation can exist. Since water is so scarce in certain of these alkali deserts, stock can not be taken into them in summer, and the sages make a good growth, the fruits, valuable for their nutritive qualities, become ripened and the leaves "sun-cured," which, together with the tender spring shoots, make excellent forage, particularly for sheep. The flocks are taken in in winter, when the snow furnishes water for them, and eat the salt-bushes greedily, Nuttall's sage (*A. nuttallii*) being the most valuable, as it is perennial with a deep, woody root, and although cropped, seeds and all, quite down to the ground, survives and starts up again, during the summer, when it is undisturbed. In fact, the constant cropping of these pastures, and the constant manuring, are improving the winter ranges, which are thus becoming nearly as valuable as the summer ones. The sweet-sage or winter-fat (*Eurotia lanata*) is another highly prized winter forage plant, a foot or more high from a shrubby base, whitened with long hairs, perennial, and with abundant fruit, that contributes largely toward the great fattening qualities attributed to this sage, which is also supposed to have a beneficial effect on the grazing stock. The shad-scale, a spiny, shrubby salt-sage (*Atriplex confertifolia*) produces in the spring tender shoots and thick succulent leaves, and enormous quantities of flat, winged seeds. These are eag-

SAGE-BRUSH — SAGINAW BAY

erly sought at the time, and, in the autumn, when leaves and fruit have dropped, and been blown into hollows of the plain, the sheep seek them out, and devour them utterly.

HELEN INGERSOLL.

Sage-brush, any one of the species of the genus *Artemisia*—composites very abundant in the arid, alkaline regions of the Western United States, where the soil is not too saline, and, with other desert vegetation, covering immense areas. The best known sage-brush is the common shrub, or bitter-sage (*A. tridentata*), which is found growing on the plains, and ascending to the sub-alpine parks of the mountains. It varies in different situations from a dwarfed shrub to almost tree-like proportions, when its trunk near the ground will measure nearly a foot through, being twisted and knotty, and loosely enveloped in a light-gray, shreddy bark.

Sage-brush State, or **Sage-hen State**, a nickname for the State of Nevada, from the large amount of sage-brush growing there.

Saginaw, Mich., a city, and county-seat of Saginaw County, on the Saginaw River, 16 miles from Saginaw Bay, 97 miles northwest of Detroit, and 65 miles northeast of the capital at Lansing. The railroads entering the city are 6 divisions of the Pere Marquette, 3 divisions of the Michigan Central and 1 division of the Grand Trunk.

History.—The City of Saginaw is a consolidation of old Saginaw City, East Saginaw and the Village of Salina or South Saginaw. The latter was incorporated as a village in 1866 and became a part of East Saginaw in March 1873. East Saginaw was incorporated as a village in 1855 and as a city in 1859. Saginaw City was never incorporated as a village, its first incorporation being as a city in 1857. The two municipalities, East Saginaw and Saginaw City, were consolidated by act of the legislature of 1889 into the City of Saginaw, and the first meeting of the common council of the consolidated city was held March 12, 1890. The site upon which this prosperous community is located was first settled in 1815 by men of French origin and half breeds. The city comprises about seven square miles, the east side being 27 feet above the river and the west side 35 feet.

Government.—The form of government is by a mayor elected every two years and a council of 20 members, one from each of 20 wards, to serve for two years. Various city boards are appointed by the mayor subject to confirmation by the council.

Manufactures, Industries, Buildings, etc.—Saginaw was at one time the centre of the white pine industry, and millions of dollars worth of logs have been floated on the bosom of her river. This vast industry has of late years given way, in a measure, to manufacturing, and the city is now (1904) distinctively a manufacturing and jobbing centre. Some of the manufactures are beet sugar, plate glass, salt, iron and steel products, furniture, pianos and musical instruments, vehicles, baskets and a great variety of wood products, malt liquor and flour. It has planing mills, lumber assorting yards, brick yards, tanneries, graphite works and a variety of foundry and machine shops, in addition to the big shops of the Pere Marquette R.R. Co. The bituminous coal fields of Saginaw and vicinity employ 1,500 miners from the

city alone, and the pay roll is \$100,000 a month. The total number of wage earners in Saginaw is 26,000. According to the 1900 census, the number of manufacturing institutions in the city was 480, with a capital of \$7,558,806; number of employes, 4,866; annual wages paid, \$1,936,558; value of output, \$10,034,499. The assessed valuation of Saginaw for 1904 was \$23,971,068, and the net debt of the city was \$1,524,022, but this includes water bonds of \$500,000 on a water plant valued at \$1,000,000, which the city owns. The total expense for running the city for the year was \$420,861. The city has 58 miles of water mains and uses the Holly system of water supply, from two pumping stations, one on each side of the river. It has a fine sewerage system with 70 miles of sewers; 10 small parks; 54 miles of finely paved and beautifully kept streets, many of them laid with asphalt. The streets of the city are for the most part notable for their width. They are traversed by an excellent electric street railway system, and two interurban roads reach out into the surrounding country. The city has 46 church edifices and 5 missions. The hospitals are the Saginaw General Hospital, Saint Mary's Hospital, and the Woman's Hospital. Other charitable institutions are the Home for the Friendless, and Saint Vincent's Orphan Home. Fiduciary institutions are represented by 6 national and State banks, with a capitalization of \$700,000 and \$900,000 surplus and deposits of over \$10,000,000. Besides these, there are 2 private banks. Saginaw possesses a \$200,000 Manual Training School, and is also the seat of the Michigan Employment Institution for the Blind. It has the Hoyt Reference Library of 27,000 volumes, besides 2 other public circulating libraries. The educational system has at its head 2 finely equipped High Schools and the graded schools require 26 buildings, nearly all of the most modern character. There are in addition several private business colleges, the German Lutheran Theological Seminary, and 16 parish and parochial schools and academies. The city has one of the finest Masonic Temples in the State, a handsome Federal Building, 2 theatres and numerous capacious public halls. The east and west sides are connected by a number of fine bridges over the river, so that access is easily obtained from the business centre to the most remote parts of the city. In addition to the numerous small parks, the city has a large suburban resort, operated in connection with the street railway system. The population of Saginaw is cosmopolitan in character, the German possibly predominating, as attested by their numerous large and prosperous societies of an educational and social character. The Irish, French, and Bohemian are also conspicuous elements of the city's population, which, according to the census of 1900, was 42,345.

JOHN T. WINSHIP,
Editor 'Saginaw Evening News.'

Saginaw, a river in Michigan which is formed by the junction of the Flint and Shiawassee, and flows nearly due north into Saginaw Bay. The main stream is only about 30 miles long, but with its branches it drains a large portion of the Lower Peninsula. It is navigable to the city of Saginaw, 24 miles.

Saginaw Bay, the largest inlet of Lake Huron on the coast of the United States. It

indents the east coast of the Lower Peninsula of Michigan. It is about 60 miles long and 30 miles wide. It is a safe harbor and never dangerously rough, although it is sometimes subject to storms. The color of the water is different from that of the open lake; it is a brownish-green.

Sagittaria, sāj-i-tā'ri-a, a genus of the water-plantain family (*Alismæ*). It is a widely distributed genus, wholly or partly aquatic, native to the temperate zones and the tropics. The species are handsome, with lance-like, elliptical or arrow-shaped leaves, erect or floating; the flowers are verticillate in trios around the upper part of the scapes, that carry them well above the water, and are 3-merous, with beautiful white and crinkled fugacious petals. The common arrow-head (*S. variabilis*), grows in the mud along rivers and ditches, and is very ornamental with its charming whorls of flowers rising from the centre of a cluster of large, erect sagittate leaves, varying surprisingly in different plants in respect to size and shape. It is a perennial, with thick fibrous rootstocks, which produce oval, fleshy tubers, often as large as a hen's egg, abounding in starch, and a staple and nutritious article of food with many Indian tribes. The squaws sometimes waded into the mud where the arrowheads grew thickly, loosened the tubers with their toes, and when the plants floated to the surface, captured them and flung them into canoes, to be boiled or roasted. *S. climensis* is cultivated in China for food.

Sagittarius, sāj-i-tā'ri-ūs, in astronomy, the ninth sign of the zodiac, into which the sun enters 22 November. The constellation consists of eight visible stars. It is represented on celestial globes and charts by the figure of a centaur in the act of shooting an arrow from his bow.

Sago, a farinaceous food, obtained from the central portion of various species of tropical palms, principally, however, from *Metroxylon rumphii*, or *M. levis*. The sago-palms flourish in wet soil, and are cultivated in the East Indies, and particularly in Sarawak. They are rarely over 30 feet high and have stout stems, with an outer rind about two inches thick, as hard as bamboo, but filled with spongy pith, containing a large proportion of starch.

The preparation of sago is one of the industries of the East Indies. The trees flower only once, and if allowed to do so, and to fruit, would exhaust the mass of starch stored in their stems, and then die, after propagating themselves either by seeds or by offshoots. To prevent this, the trees are felled when they are about 15 years old, and on the point of flowering. The starchy tissue, then most productive, is extracted, and pounded or grated to a powder. This is kneaded in water, in a cloth or sieve, the escaping water carrying the starch into a trough, where it is washed and settled out, until fit for use. The water is then drawn off, and the caked residue is ready for native cookery. This cake, or meal, when made into a paste and pressed through a sieve, forms fine pearly grains, which are left either in their original brownish hue, or are bleached, and compose the commercial product "pearl-sago."

Sago-meal is eaten by the natives as potage, or as biscuits, partially baked in earthen molds. It is not entirely soluble in hot water, as is ordinary starch, and can therefore be employed in making puddings, etc., forming a valuable article of food, as it is cheap, nutritious and easy of digestion. In Europe it is used for feeding stock, making starch, and by cocoa manufacturers for their beverages. Inferior qualities of sago are produced by *Phoenix farinifera*, *Corypha* of various species, *Caryota urens*, *Raphia flabelliformis*, and two South American palms.

Portland sago is a delicate farina extracted from the corm of the European wake-robin (*Arum maculatum*). Wild sago is the product of the coontie-root (*Zamia integrifolia*), a cycadaceous plant of Florida, well known as an article of food among the Seminoles; and other cycads, incorrectly called "sago-palms," furnish a coarse kind of sago.

Sagoin, sa-goin', or **Sagouin**, a French form of the native South American name of a genus (*Calithrix*) of Brazilian monkeys, of small size and remarkably light, active, and graceful in their movements.

Sa'goyewath'a. See RED JACKET.

Sagua la Grande, sǎ'gwǎ lä grǎn'dā, Cuba, town, province of Santa Clara; on the Sagua la Grande River; 150 miles east of Havana. It is connected by railroad with La Isabela, its port on the north coast, with Cienfuegos, Havana, and Matanzas, and with towns to the east; and carries on a considerable trade, sugar and molasses being the chief exports. Formerly gold was mined in the vicinity to some extent. It is well built, with wide and regular streets; among its public buildings are a hospital, a town hall, and a large church; it has also several schools. Pop. (1899) 12,728.

Saguenay, sǎg-ě-nā, Canada, a large river in the province of Quebec, emptying into the Saint Lawrence at Tadousac Harbor. It is about 100 miles long with a remarkable depth—17 to 500 fathoms. It drains Lake Saint John and flows with almost unparalleled impetuosity, between high rocky walls and over deep precipices, forming numerous falls and cataracts in its upper course. Its magnificent scenery attracts many tourists. It is navigable for large vessels as far as Ha Ha Bay, 10 miles south of Chicoutimi.

Saguntum, sa-gūn'tūm, or **Murviedro**, Spain (*Hispania Tarraconensis*), situated near the mouth of the Palantias, three miles from the coast and 18 miles by rail from Valencia; was a rich commercial town in early times, especially famous for its figs and manufacture of a certain kind of pottery. The town was founded by Greek and Italian colonists. In the interval between the first and second Punic wars, it formed an alliance with the Romans, and became celebrated for the resistance it made to Hannibal in the siege of 219-18 B.C. The city was nearly destroyed at this time, but the Romans rebuilt it and made it a colony. The ancient city is now replaced by the modern Murviedro, and the only important ruins are those of the theatre. Pop. (1900) 6,784.

Sahara, sa-hä'ra, Africa, the great desert region in the north of the continent, extending from the Atlantic eastward as far as the Nile, and from the Mediterranean provinces to the Niger and Lake Tchad. Its area contains 3,459,500 square miles,—a region equal to the whole of Europe. The configuration is irregular and the surface highly diversified, reaching from 100 feet below the sea-level to an altitude of from 5,000 to 8,000 feet in Mount Tusidde. Some of the highest summits are those of the Ahaggar, a great mountain plateau. Air or Asben is an isolated mountain, midway between Tibesti and the Niger. Farther south is the extensive plateau of Adghagh. At the northeast in Fezzan are the dark mountains of Jebel Sôda. The rest of the Sahara consists generally of undulating rocky surfaces and sand dunes interspersed with occasional oases. The date-palm flourishes on these green spots, also the olive tree. Apples, peaches, oranges, grapes, etc., grow and wheat, barley, rice, durra and other tropical crops are raised, and there is a considerable variety of flora. Mammals consist, outside of the domestic animals, such as camels, asses, black cattle, etc., of 15 species, comprising the jerboa, fox, jackal baboons, hyenas, mountain sheep, etc.; about 80 species of birds, among which is the ostrich. There are also tortoises, lizards, chameleons, serpents, such as the python, horned viper, etc. The edible frog and fish also occur. There is an important trade in silk tissues and mixed goods, ivory, ostrich feathers, gums, spices, musk, hides, gold dust, indigo, cotton, palm oil, kola nuts, silver, dates, salt, and alum. The exports are textiles, weapons, gunpowder, etc. Many thousand tons of phosphate are extracted. The range of temperature is very great. The chief centres of population are the oases. The inhabitants consist of Moors, Tuareg, Tibbu, Negroes, Arabs, and Jews; the former occupy the region between Fezzan and Lake Tchad. The tribes south of Algeria and Tunis. The Tuareg control the principal caravan routes. The Tibbu, who number about 200,000, live in the oases between Fezzan and Lake Tchad. The tribes of the desert are, generally speaking, camel drivers, slave and salt dealers, guides, and robbers. A few possess date-groves, but they usually subsist on the milk of their herds, bartering for fruits or grain. The principal caravan routes lead from Timbuktu to the Wady Draha, and to the oasis of Twat; from Haussa by Air or Asben and Ghat to Ghadames and Murzuk; from Bornu by Bilma and Murzuk to Tripoli; from Waday by Ojariga, Kufara, and Aujilah to Benghazi, and from Darfur to Siut. Pop. about 2,000,000.

Saháranpur, sa-här-an-poor', or **Seharun-poor**, sê-här-ün-poor', India, (1) capital of a district of the same name, in the United Provinces, 90 miles northeast of Delhi. It is an important railway junction. Among the buildings the most noteworthy are an old Rohilla fort (used as a court-house), and a fine Mohammedan mosque. The residential part is substantial and modern. There is a church, an American Presbyterian mission and a fine botanical garden for experiments in tea and cinchona. Commerce in grain, sugar, molasses

and country cloth is considerable. Pop. (1901) 63,850.

(2) The district in the Meerut division has an area of 2,242 square miles, and occupies an alluvial table-land between the Ganges and the Jumna. It consists partly of wild, picturesque broken ground, but the larger portion is tillable. Cereals form the chief products, and its commercial importance is considerable. Pop. (1901) 1,046,412.

Sahib, sä'ib, the term of native address in India toward a respectable European. It is an Arabic word, signifying companion or lord. The feminine form is *Sahibâ*.

Sai, sä'i, a Brazilian native name of indefinite application for a local monkey, most often, perhaps, designating the capuchin (*Cebus capucinus*).

Said Pasha, sä-äd päsh'a, Turkish statesman. He was premier 1879-82, was appointed grand vizier 3 Dec. 1882, was twice dismissed and reinstated by the sultan in 1883, his foreign policy and his reformatory measures concerning internal affairs first arousing displeasure against him, and a suspected complicity in a plot for the sultan's assassination caused the second dismissal, which was revoked two days later. In 1885-95 he was minister of foreign affairs.

Saiga, sä'ga, an antelope (*Saiga tatarica*) found on the steppes of Russia and in western Asia. It is about 2½ feet high at the shoulders, pale bluish gray in color, and is remarkable for the greatly swollen appearance of the nose, due to the thick cartilaginous coverings of the nostrils. It once had a far wider habitat in Europe, and is steadily diminishing in range and numbers.

Saigon, sä-gôn (Fr. si-gôn), or **Sai-gun**, Indo-China, the capital of Lower Cochinchina before the French conquest, is on the right bank of the Saigon or Dou-nai River, 34 miles from the sea. The town was nearly destroyed by the French, and the present city dates practically from 1861. It has fine public buildings, modern shaded streets, and zoological and botanical gardens; of educational institutions, the colleges of Chasseloup-Laubat and d'Adran are the most important. There is a large floating dock. The majority of the population is Asiatic, the Chinese element predominating. The town has an active trade with China, Siam, Singapore, and Java. Considerable French and English goods are imported. The main exports are rice, cotton, silk and hides. The great market is Cholon, 3½ miles from Saigon. Pop. (1901) 80,000; Cholon, 127,000.

Sail, or **Sail-tailed Lizard**, a large agamoid lizard (*Lophurus amboinensis*) of the Philippines, Celebes, Java, and neighboring islands, which takes its name from the tall sail-like crest bone upon the upper surface of the tail of the adult, which is supported by a great lengthening of the spines of the vertebræ of that region; the tail otherwise is highly compressed, long and powerful. This lizard frequently exceeds three in feet in length, is olive-green spotted and marbled with black, and has many curious folds of skin about the neck. It is strong and active and spends much of its time in trees, but when alarmed or chased

rushes for water, dives to the bottom and endeavors to hide among the stones. It is defenseless and harmless, and its flesh, which is white and tender, is much liked by the islanders.

Sail. See SHIP.

Sailcloth, a coarse, strong linen, cotton or hempen cloth used in making sails. The best is made of flax, and combines flexibility with lightness and strength. See SHIP.

Sailfish, a large predaceous fish (*Istiophorus nigricans*) of the West Indian and neighboring waters, which is closely allied to the sword-fishes and of the same family as the spear-fishes (*Tetrapturus*). It reaches a length of six feet, has an elongated, much compressed body, covered with elongate scutes, and a powerful, deeply forked tail; while the dorsal fin is, relatively, of huge size and deeply notched outline, well simulating the appearance of a ship under sail as it appears above the water when the fish glides along the surface as it frequently does. The bones of the nose are prolonged into a "sword," not so long as that of the swordfish, but sharper, and an effective weapon in a school of small fish.

Sailing. See NAVIGATION; SHIPS; SAIL AND STEAM.

Sailing Vessels. The first vessel of which history gives any description is the Ark, as built by Noah. Its proportions possess some interest, because, though not intended for a voyage, it may be inferred that it was constructed to float with as little motion as possible, considering that it "went upon the face of the waters" for about five months. Assuming a cubit to be about 21 inches, its length was 525 feet, its breadth 87 feet 6 inches, and its depth 52 feet 6 inches. Its length is thus seen to have been six times its breadth, which proportion is about an average of all types of vessels. Its draft of water must have varied greatly during the period of its occupation, as 12 months' provisions must have formed a very large proportion of the original weight, and these must have been gradually consumed. It had three decks; but was fitted with neither masts, sails, nor rudder.

Ancient History.—The paintings and sculptures, as the early records of Egypt, show regularly formed boats constructed of sawn planks of timber, propelled by numerous rowers, and also by sails. These vessels were long galleys with one mast and a large square sail, which was sometimes of linen and sometimes of papyrus. The Hebrews in the time of Solomon must have possessed vessels of considerable size, as mention is made in the sacred writings of that date of stately ships, and of voyages made to bring trees of considerable size to be used in the building of the temple. The Phœnicians were connected with the Hebrews in their maritime expeditions, and this people appear to have been the most enterprising in navigation of all the nations of antiquity. Herodotus tells us of their feat of circumnavigating the continent of Africa in 604 B.C. They started from the Red Sea, passing Ophir on east coast of Africa, then rounded the Cape, and keeping by the west shore they entered the Mediterranean Sea through the Straits of Gibraltar, and arrived in Egypt in the third

year of their expedition. Little doubt exists of the Phœnicians having been the discoverers of the art of sailing, as their skill in evading Nebuchadnezzar at the siege of Tyre for 13 years, shows that they possessed more than a superficial knowledge of navigation. They were also engaged in concert with other nations in wars with the Greeks: and it was from them the latter nation learned in their conflicts what they knew of ships and navigation. The fact of the Grecian mariners making use of the screw pump to discharge water from their vessels' holds, would lead to the conclusion that their vessels were no mere sloops. An evidence of the want of strength in the construction of these ancient vessels, is the fact of their being bound around the outside with heavy ropes. They were sometimes carried as part of the vessel's outfit, and used as necessity required. Out at sea and in heavy weather, there they were made use of. There were sometimes as many as 8 or 10 bands running fore and aft of the vessel.

Roman Galleys.—The Romans in the early stage of their history paid little attention to navigation, until it was forced upon them by the necessity of competing with their rivals, the Carthaginians. The galleys of this period ranged from a single bank up to five banks of oars. The oars in these large galleys were arranged in sets or banks, the number of these could be increased to any extent by giving increased length to the galley. The trireme, or three-bank galley, appears to have been generally open, in the waist where the rowers sat, with decks or platforms at both ends for the soldiers. The galleys of greater size than the three tiers, appear to have been always decked vessels. At the time of the first Punic war the Roman fleet is said to have consisted of 330 vessels, each containing 300 rowers and 120 soldiers. The triremes were each 105 feet long and 11 feet wide, and the quadriremes were 125 feet by 13 feet.

Merchant Ships.—It is generally supposed that ships intended only for merchant purposes were first built by the Genoese, and that not until the beginning of the 14th century were sails first used by that people. The fishing boats were the small beginning from which sprang the sailers and the larger sail vessels of a later period. In England, as early as 1344, many vessels of this character were in service. In the middle of the 15th century many large vessels were built in England. Prior to this the compass had come into more general use, and it was now possible to engage in longer voyages. The discovery of America and the passage around the Cape of Good Hope were early fruits of these improvements. The Portuguese employed vessels of small size in their voyages of discovery, but the Spaniards built larger vessels and long maintained a superiority in this respect. England was far behind the Peninsular nations in commercial enterprise at the opening of the 16th century; and at the close of the century the merchant marine was in a very depressed condition. Internal discords had put a damper on the enterprise of the merchants, and as the island was not yet famed for its manufactures, commerce drooped with every disaster to trade. The Dutch had monop-

SAILING VESSELS

olized the East Indies trade and Holland bid fair to enrich herself at the expense of her neighbor. The British East Indies Company was formed, vessels built for the trade, and the merchants again prospered. (See SHIP.)

The First American Ships.—This continent having been fitted by nature in supplying it with an abundance of good timber, vessels have been built upon our shores from the first year of actual settlement. The first ship constructed was for the purpose of carrying a small band of settlers back to England, who were discouraged with their prospects after the first winter. The vessel was built at the mouth of the Kennebec River in Maine. It was a staunch and excellent little vessel, a two-master, named *Virginia*. She is believed to have been about 60 feet long and 17 feet beam and 10½ feet deep. The next vessel built was at New York in 1614 or 1615 by Captain Adrien Blok, who had lost his ship *Tiger* by fire while lying at Manhattan River. His new vessel was named *Onrust*, or *Restless*, and was 38 feet keel, 44½ feet long over all, and 11 feet beam. This vessel was employed for several years in exploring the Atlantic coast from the 38th to the 42d degree of latitude. Block Island was visited during one of the excursions, and took its name from Adrien Blok. With the exception of fishing boats and shallops, there is no record of the construction of any other boats until 1631. In that year the bark *Blessing of the Bay* was launched at Medford, Mass., for the use of the Massachusetts colony. In the course of the season this vessel made several coasting trips, and soon after visited Manhattan Island and Long Island. It is thought the vessel was lost with a load of furs and fish in 1633 off the capes of Virginia.

Early Shipbuilding.—Shipbuilding at this time appears to have received its first impulse from the same cause which threw the colonists upon their own resources for the supply of many of the necessities of life. They had been hitherto supplied with all but their corn and fish, by the many emigrant ships which had yearly added to their numbers. A suspension of this emigration was brought about by the civil wars in England, and the diminished intercourse caused thereby left them dependent on mercantile enterprise alone, which the state of navigation then rendered precarious in the extreme. Governor Winthrop then said, "The general fear, of the want of foreign commodities, now our money was gone, and things were like to go well in England, set us on work to provide shipping of our own: for which end Mr. Peter, being a man of very public spirit and singular activity for all occasions, procured some to join for building a ship at Salem of 300 tons, and the inhabitants of Boston, stirred up by his example, set upon the building of another at Boston of 150 tons. The work was hard to accomplish for want of money, etc., but our shipwrights were content to take such pay as the country could make." He speaks in another place of the *Trial* of 160 tons, as the first ship built at Boston. She sailed for Bilbao on 4 June 1642, laden with fish, "which she sold there at good rate, and from thence freighted to Malaga." Thus

early began the profitable trade to distant ports from New England. An early and successful prosecution of the business of shipbuilding could have been more reasonably expected of none of the first colonists of America, than of the settlers of Manhattan. Holland was at that period, and long after, in the enjoyment of the carrying trade of the world. Though not possessed of a foot of timber, she built and armed more ships than all the rest of Europe. Planted by this commercial people, and by merchants and capitalists of Amsterdam, then the mercantile metropolis of Europe, exclusively for the purposes of trade, it appears somewhat surprising that the facilities afforded by the new territory for shipbuilding were not made available to a greater extent by the parent nation. But the administration of a privileged mercantile association, such as the West India Company, which, in 1621, was invested with a monopoly of its trade, was unfavorable to the development of the resources of the colony. About 1630 the carrying trade between Holland and America, and the trade with Brazil, where the company had sustained losses equivalent to "one hundred tons of gold," were thrown open to the colonists, and private ships were for the first time entered at Amsterdam, and publicly advertised for New Netherlands. Other restrictions, which had fettered commerce, were soon after removed, and the trade of the world with the exception of that to the East Indies, and the trade in furs, were open to the colonists. In 1678 the shipping owned in the port consisted of three ships and fifteen sloops, and other small sailing vessels. In 1694 the shipping had increased to 60 ships and 102 sloops. This was on account of a monopoly of exporting flour and biscuits from the province. South of New York during colonial times, there was little or no construction of vessels. New England developed her large shipping interests through the fisheries, that were at her door, and the coasting trade maintained by the latter extended as far south as the West Indies during these early days. It might be said the fisheries were the cause of the large merchant marine of New England.

The Schooner.—In 1745 Andrew Robinson of Gloucester, Mass., built a vessel with a square stern, which was fitted with two masts, bearing a sloop sail on each, and a bowsprit with jib. She was sharp on the bottom, and on being launched, sped over the water so fast from the impetus gained by descending from the ways as to elicit from a bystander the remark, "See how she scoons." Scoon was a word used by plain people to express the skipping of a flat stone over the surface of the water when skillfully thrown; and the builder of the vessel, having been somewhat at a loss for a name for the new rig, seized upon the trifling incident and replied, "A scooner let her be," and two-masted vessels, with jibs, and fore and aft sails, have since been called by that name. This vessel was probably used in the fisheries. The largest schooners were those sent to the Grand Banks, and for many years after 1800 about 70 sail vessels were sent annually to the Grand Banks, chiefly from Cape Ann. These early vessels were from 20 to 40 tons.

Colonial Merchant Marine.—Before the Revolutionary War our merchant marine was

SAILING VESSELS

in a prosperous condition, and took nearly first rank with us. By 1760 from 300 to 400 trading vessels were being built annually in the different provinces. During the War of the Revolution the whaling and fishing fleets were almost annihilated by raids on the coast towns, by English cruisers. Foreign trade in our vessels suffered the same fate. A large part of the merchant and fishing fleet was employed during the war in privateering, and it became a profitable field for them at times, as small armed sloops frequently captured a large merchantman with the British flag. The larger privateers built during the war, when the conflict was over, were converted into merchantmen, and sent to the East Indies to trade. The Baltimore built schooner took high rank as a privateer during the war. The 16 years that followed ending with the War of 1812 were perilous times for American shipping. England excluded us from a profitable trade with the British West Indies, and the same interests led to the searching of our merchant vessels for British subjects, the capture and confiscation of our vessels and cargoes, and a detention of a large number of them for evasions of the British law. Then came on the War of 1812 that lasted for nearly three years, during which many privateers were constructed that subsequently pursued the peaceful pursuit of trade. A change in the form of our sailing vessels now began to appear, giving them better entrance lines, and cutting off those high poop decks that had been such a fixture on large vessels for many years, being among several changes that were made.

The Carrying Trade.—Prior to the War of 1812 our coastwise trade was carried on by no larger sailing vessels than those that were schooner rigged, while our foreign trade was most largely carried on in foreign bottoms. Before 1812 a few sailing packets, or vessels carrying both passengers and freight, were brought into the transportation business, and cleared from port on regular days in each month, and were operated between special points only. When the war ended there were only a few small British ships in the packet service between England and America, and very few between America and other parts of the world. Soon after the peace, however, a large number of lines came into existence as a natural outgrowth of the rush of emigration from Europe to America, and the general expansion of ocean travel and trade. The carrying of passengers was a profitable business, and there was considerable competition among shipping merchants to get the most business for their vessels. None but the best and finest vessels could be used in this trade, and the old-fashioned freighting vessels with their small cabins and houses, and poop decks, were subjected to many changes to adapt them to the passenger business. The merchants at most all our coastwise ports, from Portland, Maine, to New Orleans, La., soon saw the advantage of these packets for our coastwise trade, and regular established lines were soon in operation that remained as carriers until the coastwise steamship lines began operations in 1847, when these lines of sailing vessels gradually withdrew from business. In this trade brigs, schooners, and barks were used, while in the foreign service ships and barks only were placed in service.

Packet Lines.—It was at New York the packet business between Europe and America mainly centred. There were lines from other ports, but New York was the pioneer, always kept the lead, and had the largest number and finest vessels for the service. In 1816 Isaac Wright & Co., of New York, founded the famous Black Ball Line, so called from the round black dot in a white field, which was adopted as the pennant of the ships. There were at first four vessels in this line, each of 400 to 500 tons, and named "Pacific," "Amity," "James Cropper," and "William Thompson." This line was subsequently owned by Goodhue & Co., Charles H. Marshall, and others. They were placed in the Liverpool trade, and sailed once a month at first, and during the first nine years the average time in voyages to Liverpool was 23 days, and for returning home 40 days, but one of the later ships, the *Canada*, once made the outward voyage in 15 days and 18 hours. A London line followed the Black Ball line, and then a Havre line was started. In 1821 a second Liverpool line was established from New York by Byrnes, Trimble & Co., known as the Red Star line, consisting of the *Manhattan*, *Hercules*, *Panther*, and *Meteor*, sailing once a month, and soon after Fish, Grinnell & Co., afterward Grinnell, Minturn & Co., founded the Swallow Tail line with four packets, making from New York at this time one sailing for Liverpool each week. In 1830 the passenger fare in the cabin from Liverpool was \$180, including beds, bedding, wines and stores of every description. The London packets now sailed twice a month, and the Havre line had three sailings a month. There were also at this time sailing packets to South America and Mexican ports. In 1830 there were 1,510 arrivals at New York from foreign ports, of which 382 were ships, 28 barks, 714 brigs, 376 schooners, 8 sloops, 1 ketch, and 1 felucca. Of these 1,366 were American, 92 British, 7 Spanish, 12 Swedish, 2 Hamburg, 5 French, 8 Bremen, 6 Haitian, 9 Danish, 2 Brazilian, 2 Dutch, and 1 Portuguese. The number of arrivals in 1829 was 1,310, and passengers, 16,064. In 1823 John Griswold established a London line of four vessels, that had been increased by 1837 to 12 vessels. These vessels down to 1845 were one- or two-decked vessels, and had increased in size to 900 or 1,000 tons. The between deck space, aft, was divided into cabins for the passengers, the middle portion was fitted up with kitchens, pantries, etc. The steerage passengers and crew were placed forward. After 1830 there were frequent sailings of rival packets, transient, but all American, from Boston, New York, and Philadelphia to Great Britain and other parts of Europe. All the ships sailed with great speed, and made the run across the Atlantic in excellent time. The Red Jacket once ran from New York to Liverpool in 13 days 11½ hours. The *Mary Whiteidge* made the voyage from Baltimore in 13 days 7 hours; but the usual time was 19, 20, or 21 days to Liverpool, and from 30 to 35 days homeward. English steamers were sent out in 1838 and 1840 to compete with these packet lines; but the steamers did not at first make much better average time on a voyage than the packets, but in the course of a few years the increase in speed and their additional carrying capacity

SAILING VESSELS

gave them an advantage, and the packets could no longer successfully compete with them.

Clipper Ships.—After the packets came the clipper ships, vessels intended primarily for freighting, and built to secure the highest possible speed when laden with cargo. The packets were the fast sailers from 1816 to 1845, but after the latter date there grew up various branches of trade in which a quick delivery was as important for commercial purposes as it was for the passenger trade. For instance there was the tea trade from China to the United States, in which speed has always been considered essential. The cargoes consisted of teas, spices, coffee, dried fruits, etc., which were liable to deteriorate in a long voyage of four months to the home port, and to shorten the voyage as much as possible was desirable for many reasons. There were no telegraph lines and ocean cables in those days, and the uncertainty of the markets made fast trips home from the East Indies very important. Merchants had repeatedly suffered heavy loss, sometimes business ruin by the decline in eastern goods brought home by ships during their absence on the voyage out and back, and good ships were therefore always required in that trade. The first clippers were built at New York. The pioneer was the *Helena*, built by William H. Webb, whose dimensions were 135 feet length on deck, 30 feet 6 inches beam, and 20 feet depth of hold. She came out in 1841, and was constructed for A. and N. Griswold for the China trade. She was a good sea boat and a very fast sailer for her day, making many fast voyages between China and other East Indian countries, and New York. Following the *Helena* came the *Rainbow* of 750 tons, built by Smith and Dimon in 1843 for Howland and Aspinwall. This vessel made the voyage to Canton and return home in six months and 14 days, having spent three weeks of the time in loading and discharging cargo. The *Helena* and the *Rainbow* brought about a great change in this type of vessel. They commanded better prices for freights than slow ships, and in every way proved desirable. Then in 1844 followed the *Montauk* of 540 tons for William S. Wetmore, built by William H. Webb. Then A. A. Low & Co. had Brown & Bell construct for them the *Howqua* of 706 tons, a very fast and fine vessel, which made a voyage from Shanghai to New York in 87 days. The owners of the *Rainbow* then had the noted clipper *Sea Witch* built of 907 tons by Smith & Dimon, with the intention to have the fastest vessel of the type afloat. This vessel had finer under water lines than her predecessors, and may be said to have been the first of that advanced type of fast clipper ships. She made one voyage to California in 97 days. The era of fast clipper ships was now fairly inaugurated, and many of this class were now built not only at New York, but at Boston, Philadelphia, and Baltimore. Nearly all the early ones did not exceed 1,000 tons register, or about 165 feet long, but competition led to a great increase in size, and every year saw vessels launched that spread more and more canvas, longer, larger, and faster than ever, and expressly intended to excel everything that had preceded them in the merchant shipping of the world. In 10 years after the first clipper ship

the size of 2,400 tons was reached, and there were many built of 2,000 tons each.

British Rivalry.—Foreign merchants were by no means idle spectators of what was going on in this country, and in 1846 England began to awake to the new and dangerous rivalry from America. Alex. Hall & Co. of Aberdeen made a specialty of clipper ships, and there were launched from their yard many superior and famous vessels. But the Americans, though hard pressed, were able to maintain the lead, and entitled to the best record ever made by ships sailing under canvas. There were several famous races home from China. Once the British clippers *Chrysolite* and *Stornaway*, and the American clippers *Race Horse*, *Surprise*, and *Challenge* engaged in a race from Canton to Liverpool and Deal, and arrived at the home ports as follows: At Liverpool, *Chrysolite* in 106 days; at Deal, *Stornaway* in 109 days; *Challenge* in 105 days; *Surprise* in 106 days. The British ship *Challenge* ran from Shanghai to Deal in 113 days, and the American clipper *Nightingale* in 110 days. These races were claimed by both parties; but the Americans kept the reputation of superiority, and several ships were ordered at our ship yards for foreign account. Then shortly after the gold fever broke out in California, and the John Bertram of 1,100 tons was built at Boston, Mass., and sent to the Pacific coast in 1850 by Boston parties. This was the first clipper ship built for the California trade. The *Witch of the Wave* and four others of 1,500 tons each, were immediately after built for the same parties.

Sailing Speed.—The speed of the clippers was remarkable. Six miles an hour was a good average rate of speed for long voyages, and nine miles an hour excellent time, especially for a ship loaded with a full cargo of merchandise. Clippers ran across the Atlantic to Liverpool at an average speed of nine miles an hour, spurring at the rate of from 10 to 13 miles with a favorable wind, and on voyages that gave them the advantage of the trade winds they ran for days and weeks in succession at an average speed of from 12 to 15 miles an hour. To sail 300 miles a day was not exceptional. The largest of them all was the *Great Republic*, built by Donald McKay in 1853 at East Boston. The length on load line was 314 feet, beam molded 49¼ feet, molded depth 32 feet. One of the noted clippers of the day was the *Dreadnought* built in 1853 at Newburyport, Mass. In 1859 she made the voyage from Sandy Hook to Liverpool in 13 days and 8 hours, and in 1860 from Sandy Hook to Queens-town in 9 days and 17 hours. After 1860 there was no longer any necessity for great size and speed in this type of vessel. Too many ships had been built, and a reaction set in that lasted for many years. By 1857 there were from 80 to 100 large ships in the California trade, and the rates of freight fell off one half, and the ships were thrown into the general trade of the world. In the next place, steam vessels, about 1852, had been built to run on all the principal ocean routes, and there was no longer any need for sailing vessels to be fitted out with large cabins and roomy passenger accommodations. This ended the career of those fast clipper ships that had such a world-wide reputation from

SAILOR'S CHOICE—SAILOR'S CREEK

1850 to 1860. Then the Civil War came on, and our foreign trade was cut off for four years. After 1865 the grain trade attracted the larger sailing vessels. This type of vessel was no longer an extreme clipper of the former period, but a handsome, medium clipper, of about 2,000 tons register, capable of carrying a large cargo at a fair rate of speed. These vessels continued in the Atlantic-Pacific trade until the American Hawaiian Steamship Line commenced operations, in 1900.

Modern Schooners.—The schooner, as previously mentioned, was the product of a comparatively early date. It was largely used in the coastwise trade, to the West Indies, to South America, and later to Africa, and it may be said has not fallen from favor even to this day. The early vessels were not over on an average, 75 tons. When it became necessary to increase the tonnage of the vessel it was thought to be advantageous to increase the power, so three masts were adopted. The earliest date of the building of a three-masted schooner in this country is thought to be about 1831. There were a few more built about 1845, and in 1847 the *Midas* was converted into a three-masted schooner, the *Zachary Taylor* was built at Philadelphia in 1849, and the *Spray* at Wilmington, Del., the same year. The period when this type of sailing vessel had passed the experimental stage appears to have been in 1853 when there were built the *Gardner Pike*, the *James H. Chadbourne*, the *Kate Brigham*, and the *E. R. Bennett*; and in 1855 the *Eckford Webb*, and the *William L. Burroughs*; and in 1856 the *Hartstein* and the *Cordelia*. The two latter were two-deck vessels, and were the largest of the type built for some years. These vessels were used mainly in our coasting trade, as far south as the Gulf of Mexico ports. There were a few more built prior to 1860; the Civil War came on when but few, if any, were built. It was 1868 before three-masted schooners were again constructed, and by 1873 they were the most popular type of our coastwise sailing vessels. The first four-masted schooner was the *William L. White* built at Bath, Maine, and completed in June 1880. The Northern lakes also had four-masters immediately after the *William L. White*. Then it was some years before the pioneer five-master was constructed in 1888 at Waldoboro, Maine, as the Governor Ames. The latter was the largest schooner for 12 years, until the *George W. Wells* was built in 1900 as a six-masted schooner. The largest of them all is the *Thomas W. Lawson*, built of steel in 1902, as a seven-masted schooner.

Iron Hull Ships.—The first iron hull sailing vessel constructed in the United States was the schooner *Mahlon Betts* of 275 tons, built in 1854 at Wilmington, Del. Then there were none but wooden sailing vessels until the brig *Novelty* was built at Boston, Mass., in 1868, and the bark *Iron Age* constructed in 1869 for *Tupper & Beattie* of New York. The sloop yacht *Vindex* was then built in 1871 at Chester, Pa., by *Reanie Son and Archbold*; and in 1879 the yacht *Mischief* was built at Wilmington, Del. The three-masted schooner *Josephine* followed in 1880, being built by *William Cramp & Sons Co.* Then there came much larger vessels in

the *Tillie E. Starbuck*, built in 1883 by *John Roach & Son* at Chester, Pa.; and in the same year by *Gorringe & Co.*, as the American Ship-building Company, the *T. F. Oakes*. These vessels were about 2,000 tons register each. See also NAVAL CONSTRUCTION; SHIP-BUILDING.

J. H. MORRISON,
Author of 'History of American Steam Navigation.'

Sailor's Choice, the name of several excellent food fishes taken on the eastern and south-eastern coasts of the United States, which are of small size and belong to the family of grunts. The best known, probably, is *Orthopristis chrysopterus*, also called pigfish, and especially common in the Gulf of Mexico, which is regarded as the best pan-fish of the region.

Sailor's Creek, Battle of, the last great battle of the Civil War in the East. Sheridan says that it was "one of the severest conflicts of the war . . . so overshadowed by the stirring events of the surrender, three days later, that the battle has never been accorded the prominence it deserves." When Gen. Lee abandoned Richmond and Petersburg on the night of 2 April 1865, he ordered the concentration of his army at *Amelia Court House*, about 30 miles west of Petersburg, and it had collected at that point by noon of the 5th. On the night of the 5th Sheridan's cavalry and the Second, Fifth, and Sixth corps of the Army of the Potomac were at or near *Jetersville*, under orders to march early next morning on *Amelia Court House*. Gen. Meade began the advance at 8:30 A.M., and when four miles out of *Jetersville*, *Humphreys' Second corps*, on the left, discovered that Lee was moving westward, passing by the flank of the Union army. The advance on *Amelia Court House* was suspended, and the army faced about; the Second corps was ordered to move on *Deatonville*; the Fifth through *Painesville*, on the right of the Second; and the Sixth through *Jetersville* to the left of the Second. Sheridan's cavalry moved on the extreme left parallel to the Confederate line of retreat, impeding the march of the column wherever practicable, but *Longstreet's corps* succeeded in reaching *Rice's Station*, on the *Lynchburg road*, where he awaited the corps of *R. H. Anderson*, *Ewell*, and *John B. Gordon*, the last-named commanding the rear-guard. The Second corps was checked at *Flat Creek* by the destruction of the bridge, but, soon repairing it, overtook *Gordon* and kept up a running fight with him for 14 miles, carrying several lightly entrenched positions, and capturing prisoners, colors, and wagons. The pursuit continued to *Parkinson's Mill*, on *Sailor's Creek*, where *Gordon* made a stand, but was soon driven across the creek, losing three guns, 13 colors, several hundred prisoners, and a large part of the trains of Lee's army. He attempted another stand beyond the creek, but fell back as *Humphreys* crossed, and marched for *High Bridge*. Pursuit ended at night. During the day the Second corps had captured 1,700 prisoners, four guns, 13 colors, and several hundred wagons and ambulances. While the Second corps was engaging *Gordon*, the Sixth corps, with the cavalry commands of *Merritt* and *Crook*, had come up some three miles to the left and overthrown the corps of *R. H. Anderson* and *Ewell*. *Custer's division* had interposed between *Ewell* and

THE FIRST SEVEN-MASTED STEEL SCHOONER.

Length, 395 feet; Beam, 50 feet; Molded Depth, 34 feet 5 inches; Displacement, 10,000 tons; Cargo Capacity, 7,500 tons; Total Sail Area, 40,617 square feet.

SAILOR'S SNUG HARBOR—SAINT

Gordon, destroying 400 wagons and taking prisoners and 16 guns; and Crook, moving rapidly to the left, found R. H. Anderson's command posted on high ground behind breastworks running across the Rice's Station road, and sent a dismounted brigade to take possession of and form across the road, thus cutting Anderson off from Longstreet. Ewell now proposed to Anderson that they make their way through the woods, around Sheridan's left, and get to Longstreet; but before anything could be done both were attacked. The Sixth corps had opened its artillery upon Ewell's 3,600 men, to which there was no reply, as Ewell was without artillery; and about 5 P.M. two divisions advanced, crossed Sailor's Creek, and attacked Ewell, who made a most determined resistance and, massing his troops, broke the centre of the Union line, but was checked by the artillery-fire from beyond the creek. The two divisions of the Sixth corps—Seymour's and Wheaton's—wheeled to the left and right respectively, enveloping Ewell's flanks; Stagg's cavalry brigade charged his right; and at the same time Merritt's and Crook's cavalry charged and routed R. H. Anderson's 6,300 men, killing, wounding, and capturing about 2,600. Ewell, now completely cut off and surrounded, surrendered his entire command. About 250 men of Kershaw's division, serving with him, escaped. Seven general officers were included in the surrender. The total loss of Lee's army was not less than 8,000 men. The Union loss did not exceed 900. Longstreet, who had remained at Rice's Station during the day, waiting for Anderson, Ewell, and Gordon, to unite with him, marched as soon as night set in, with Fields', Heth's, and Wilcox's divisions, for Farmville. (See FARMVILLE AND HIGH BRIDGE.) E. A. CARMAN.

Sailors' Snug Harbor, a home for aged sailors on Staten Island, N. Y., established by Captain Richard Randall in 1800. The home is under government supervision and is in charge of a naval commander.

Sainfoin, *sân'foin*, or **Asperset**, a leguminous plant (*Onobrychis sativa*), originating in the Mediterranean countries, but which has been cultivated for centuries. The stem is about two feet high, with pinnate leaves, composed of small leaflets; the pea-like flowers are rather large and of a showy pink color, and are disposed in short spikes, on long axillary peduncles. It is a nutritious fodder, well liked by live-stock, especially sheep, makes good hay, and will grow on light, warm, chalky soils, where other pasturage does not thrive; the roots are long-lived and are useful for binding light soils, while the foliage not only shades the pastures, but makes a good crop for plowing under. It is also recommended as a honey-producing plant for bee pastures.

Saint, a person eminent for piety and other virtues. In the books of Scripture, both the Old and the New Testament, the whole body of the faithful people are called saints (2 Chron. vi. 41; Ps. xxxi. 3; Hebr. xiii. 14, "Salute all the saints"; Eph. i. 1, "the saints at Ephesus.") It is customary to give the title

saint to all the apostles, evangelists and other holy persons, men and women, named in the New Testament, to most of the Fathers of the Church, to all the martyrs. In the Church of Rome the title of saint is formally and authoritatively bestowed on servants of God who in their lifetime were eminent for their Christian virtues and graces, and whose sanctity has been proved by miracles after their death (see CANONIZATION; BEATIFICATION); but thousands of saints are honored by that church, who lived in early times before the process of canonization was thought of. Intercession by the saints in heaven and Invocation of the Saints are articles of belief in the Catholic Church, Eastern and Western, as also in the schismatical eastern churches; but that doctrine is repudiated by all the Protestant churches. The teaching of the Church of Rome, as proclaimed by the Council of Trent, is that the saints reigning with Christ "offer to God their prayers on behalf of men"; that it is good and useful "to call upon them with supplication," and, in order to obtain benefits from God through Jesus Christ, "to have recourse to their prayers, help and aid"; here the church's doctrine regarding both intercession and invocation of saints is defined. Catholic divines find full warrant for this belief in the Christian sacred books; for the doctrine of intercession, in 1 Cor. xii. 12, where the unity of the Christian society is enforced; in James v. 16, where the prayer of the righteous is lauded; in Eph. vi. 18, and 1 Tim. ii. 1, where Saint Paul sets such store on the prayers of his fellow Christians; and it is asked, Can it be that the souls which have gone to God no longer exercise this kind of charity for their brethren on earth? If Scripture were silent on this question, the practice of the Church in all ages would suffice to remove all doubt as to the Apostolic origin of the belief in the intercession of saints. For the doctrine of the invocation of saints, theologians quote the word of Jesus Christ, that the angels in heaven rejoice when a sinner repents of his sin (Luke xv. 7): it were superfluous to cite the usage of the Catholic Church regarding invocation of saints; it began with the beginning of Christianity itself.

Saint Albans, al'banz, England, in Hertfordshire, 20 miles northwest of London, an ancient borough and market-town, standing on a height above the river Ver. Its abbey is one of the most remarkable Christian temples in England. Only a gateway remains of the original abbey, built in 796, in honor of Saint Alban, the first British Christian martyr. The present abbey has been so often extended and altered that it represents in its architecture many styles and various epochs of history, from the time of the Romans to that of Henry VII. It has the form of a Latin cross, with a length of 547 feet, and breadth of 206 feet. Its tower has an elevation of 146 feet, crowned with battlements. Other churches are Saint Michael's 10th century; Saint Stephen's, with some good Norman features, and Saint Peter's, whose nave is of the Early Perpendicular. There is an Edward VI. grammar school, and of modern buildings those deserving notice are the corn exchange, court-house, prison, baths, and public library, besides benevolent institutions, including hospital and almshouses. The chief industries are silk manufacture, straw-plaiting, and there are breweries and iron foundries. Two battles were fought between the houses of York and Lancaster, near Saint Albans; in that of 1455 Richard, Duke of York, defeated Henry VI., and in 1461, Margaret of Anjou, defeated the army of York, commanded by Warwick. Southwest of the present city stood the ancient Verulamium, one of the oldest towns in Britain, on Watling Street. In the abbey the printing press was set up on which the first English translation of the Bible was printed. Nicholas Breakspear, the only English pope, was born near Saint Albans. Pop. (1901) 16,019.

Saint Albans, Vt., city, county-seat of Franklin County; on the Central Vermont railroad; in the northwestern part of the State, about 60 miles north-northwest of Montpelier, the State capital, and three miles from Lake Champlain. It was settled in 1763 and chartered as a city in 1897. In 1864 the town was raided by a band of Confederates who entered the United States from Canada. In 1866 a number of Fenians who were planning an invasion of Canada, made Saint Albans their headquarters.

The city is on a plain about 390 feet above sea-level and 373 feet above lake-level. The scenery is most pleasing; to the east are the Green Mountains, and on the west may be seen the Adirondacks. The city is in an agricultural region in which considerable attention is given to dairying. The chief manufacturing establishments are creameries, railroad shops,

machine shops, and flour and grist mills. There are large shipments of farm and dairy products. Saint Albans contains the Warner Hospital, the Warner Home, Villa Barlow Convent, an academy; Saint Mary's Academy, public and parish elementary schools, and a public library. Pop. (1890) 7,771; (1900) 6,239. Since 1890 a part only of the town has been chartered as a city. The population of the same area included in the Federal census of 1890 is over 8,000.

Saint Albans (Vt.), Confederate Raid on, a foray made 19 Oct. 1864, when Lieut. Bennett H. Young, with about 25 Confederates, nearly all of them escaped prisoners, armed with revolvers and carrying chemical preparations with which to set fire to town and farm-houses, crossed the Canada line into the town intending to burn it and rob the banks. Several citizens were killed or wounded, and three banks robbed of \$150,000. An attempt to burn the town failed because of the defective character of the chemical preparations. Young and his party remained in town less than an hour, when they rode back to Canada on horses they had seized. Pursuit was made by United States troops, who captured some of the men on Canadian soil and turned them over to the authorities, by whom they were released on the technical ground of want of jurisdiction.

Saint Andrews, ăn'drooz, Scotland, an ancient city of Fifeshire, on the North Sea, 11 miles southeast of Dundee and 31 miles north-east of Edinburgh. It was created a royal burgh by David I. in 1140, and after having been an episcopal see became an archiepiscopal see in 1472; it was long the ecclesiastical capital of Scotland. The ruined cathedral was begun in 1160 and took 157 years to finish. The old castle, also in ruins, was founded about 1200, and rebuilt in the 14th century; in it James III. was born, Cardinal Beaton assassinated, and in front of it George Wishart was burned. Saint Andrews was a celebrated educational centre as early as 1120; its university, the first in Scotland, dates from 1411; it consists of the united colleges of Saint Salvator and Saint Leonard and the college of Saint Mary, both at Saint Andrews, and embraces also University College, Dundee, founded in 1880. The united college of Saint Salvator and Saint Leonard has a principal (also principal of the university) and 11 professors, and the college of Saint Mary has a principal and three professors. Degrees, open to women as well as men, are conferred in arts, divinity, science, medicine, and law, much as in the other Scottish universities; and the university also confers the diploma and title of L.L.A. (Lady Literate in Arts). The number of students is about 250. In connection with the university is a library containing about 100,000 printed volumes and 150 MSS. The university unites with that of Edinburgh in sending a member to Parliament. Madras College or Academy, founded by Dr. Bell of Madras, the principal secondary school of the place, provides accommodation for upward of 1,500 scholars. Saint Andrews is a popular watering place and summer resort, and the headquarters of Scottish golf, its links being famous. The manufacture of golf clubs and balls is a thriving industry. Pop. (1901) 7,640.

Saint Andrew's Cross. See CROSS.

Saint Angelo Castle, Rome, Italy, a famous fortress situated on the right bank of the Tiber in the northwestern part of the city, opposite the bridge of Saint Angelo, and a short distance from the main buildings of the Vatican. It was built by the Emperor Hadrian as a tomb for himself and his family. Originally it was a round stone tower covered with marble and surmounted by a number of statues, which, together with the marble covering, have disappeared, leaving the bare stone structure. When the Goths besieged Rome it was used as a fortress, and has served this purpose ever since, being held and garrisoned by the party in power in the city. Since the time of Innocent III. it has belonged to the popes, who strengthened the fortifications with outworks, and connected the castle with the Vatican by an underground passage.

Saint Arnaud, sǎn-tār-nō, **Jacques Leroy de,** French soldier: b. Bordeaux, France, 20 Aug. 1796; d. at sea 29 Sept. 1854. He entered the French army in 1813, but in 1822-31 was engaged with the Greeks in their struggle for independence. He returned to the French army in 1831, and in 1837 he went to Algeria, where he rose to the rank of *maréchal-de-camp* in 1847, and general of division in 1851, in recognition of his successful warfare against the Kabyle tribes. He was appointed minister of war 26 Oct. 1851, was active in promoting the *coup d'état* of 2 December, and was made a marshal of France in that month. He was placed in command of the French forces in the Crimean war and co-operated with Lord Raglan at the battle of Alma, 20 Sept. 1854. Consult Duperré Sainte-Marie, 'M. le Général Leroy de Saint-Arnaud' (1852).

Saint Asaph, ǎz'af, Wales, an episcopal city in the County of Flint, six miles southeast of Rhyl, occupies an eminence in the Vale of Clwyd, near the confluence of the Clwyd and Elwy. It is built irregularly and has a venerable appearance. The encampment, Bron-y-Wylva, on the brow of the hill, is supposed to have been occupied by Roman forces. The cathedral, a small plain structure, dating from 1284, has been restored several times. Its library contains some rare and valuable books. The bishop's palace is modern. The town has a grammar school, founded 1600, county offices, a union workhouse and almshouses. Pop. (1901) 16,372.

Saint Aubain, sǎn-tō-bǎn, **Nicolai de,** Danish author, known largely by his pseudonym, 'KARL BERNHARD': b. Copenhagen 18 Nov. 1798; d. there 25 Nov. 1865. He first appeared in literature as a contributor to the 'Flyvende Post,' and finally obtained a large measure of success by his works of fiction, of which several dealt with higher Danish circles in modern times, while others were drawn from events of Danish history. Among the titles are: 'Lykkens Yndling' ('Fortune's Favorite'); 'Krøniker fra Christian den Andens Tid' ('Chronicles from the Time of Christian II.,' 1847), and 'Krøniker fra Erik of Pomerens Tid' ('Chronicles from the Time of Erik of Pomerania,' 1850). A collection of his writings appeared at Copenhagen in 1856-66 (2d ed. 1869-71).

Saint Aubyn, ô'bin, **Alan,** pseudonym of FRANCES MARSHALL BRIDGES, English novelist: b. Surrey. She was the daughter of G. B. Bridges, a dramatist, and was married to Matthew Marshall of Saint Aubyns, Tiverton, Devonshire. Among her very numerous novels may be named 'The Master of St. Benedicts'; 'Broken Lights'; 'A Prick of Conscience'; 'The Junior Dean.' She has also written many juvenile tales such as 'Joseph and His Little Coat'; 'The Dean's Little Daughter'; 'Wapping Old Stairs.'

Saint Augustine, â'gūs-tên or â-gūs'tên, Fla., city, port of entry, county-seat of Saint Johns County; on the Atlantic coast, about 38 miles south of the mouth of the Saint Johns River. The city is in lat. 29° 48' 30" N., and lon. 81° 35' W. It is on a peninsula formed by the Saint Sebastian River on the south and west and the Matanzas River on the east. It is on the Florida East Coast railroad. The city has many evidences of its ancient fortifications. The residence of the old Spanish governors is now a custom-house and post-office. The principal streets extend north and south. The main thoroughfare, Saint George Street, only 17 feet wide, extends through the centre of the city to the city gateway; but beyond this point it is called San Marco Avenue. Treasury Street, which crosses Saint George, is only seven feet wide at the east end. Of the modern buildings, the hotels are the most beautiful. The Ponce de Leon is of the style of the Spanish Renaissance; the buildings and furnishings cost about \$2,100,000. A pictorial history of Spanish adventure in the New World, especially relating to the history of Florida, is given in the mural decorations of the dining room and loggia.

Saint Augustine was settled 8 Sept. 1565 by Spaniards under Pedro Menendez de Aviles; but the place had been visited as early as 1512 by Ponce de Leon. For two centuries it remained under Spanish rule, although in 1586 it was plundered by Drake. The population in 1763 was 3,000, besides the garrison of 2,500. It became a British possession in 1763 which it remained until 1783. During the Revolution it was an important military depot. It became again a Spanish possession in 1783 and in 1821 it was ceded to the United States (see FLORIDA). Some of the old buildings of the first Spanish régime are still in existence. The houses were then built chiefly of coquina, a formation found on Anastasia Island, a concrete made of broken shells cemented with shell-lime. The sea-wall, the city walls, and the fort were made of the same material. San Marco, now Fort Marion, is a fine specimen of the knowledge of military engineering of that age. The Government added a water battery in 1842-3, and has made occasional repairs, but it stands to-day about as when built by the Spaniards. It is said to have been built by Mexican convicts and Indian prisoners, and to have been in process of erection for about 100 years. The shaft of marble in the Plaza was erected in 1812-13 to commemorate the adoption of a Spanish constitution which was more liberal than the one under which the city had been governed. The inhabitants were ordered to destroy the shaft when the project failed, but the authorities only removed the tablets which have since been restored. A Roman Catholic Church begun in 1793 and used later as a cathedral, was burned in 1887; but the façade remained almost unin-

jured. In rebuilding, this front wall was incorporated into the new structure; and the bell bearing the date of 1682 is also preserved. The only part of the old wall which now remains is the city gateway with about 30 feet of the wall on each side. The wall extended south along San Sebastian River, and from the river to the castle of San Marco (Fort Marion) where were a wall and moat. The old city extended nearly a mile, from the Castle of San Marco to the Franciscan Convent, now Saint Francis barracks, and the old sea-wall, built to protect the city from the sea, was also limited by the castle and the convent. The Government rebuilt the sea-wall in 1837-43, and there is now a granite coping three feet in width. For many years, until 1817, the entrance to the city from the mainland was by means of a drawbridge.

There are a number of manufacturing industries; chief among the establishments are the Florida East Coast railroad shops, which have about 200 employees; printing plant, 75 employees; lumber and wood works, 60. There are engaged in oyster canning and in fishing fully 250 persons. Saint Augustine is a famous winter resort; about 25,000 persons visit the city annually. Two fine hospitals, the Alicia and the Florida East Coast, several churches, and the municipal buildings are among the principal buildings. The educational institutions are Saint Joseph's Academy, Warden Academy (colored), three public schools (white), two parish schools (white), one parish school (colored), one kindergarten, and one of the 17 best libraries in the United States, entitled to all Government publications free, and a museum of natural history. The one bank has a capital of \$100,000; the annual amount of business is \$1,100,000. The government is vested in a mayor and a council of 10 members, five of whom are elected each year. Pop. (1890) 4,742; (1900) 4,272.

D. E. THOMPSON,

General Manager (*The Evening Record*.)

Saint Bartholomew, bār-thōl'ō-mū, or **Saint Barthélemy**, sãn bār-tâl-mê, West Indies, an island 190 miles east of Porto Rico. It is about eight square miles in extent, of irregular form, and mountainous. Although nearly treeless it is fertile; vegetables are cultivated in some of the valleys, and bananas, cassia, tamarinds, and sassafras are exported. Rocks and shallows make access to the island difficult for any but the larger coasting craft. Lead and zinc ores have been found in the island but are not worked. The principal town is Gustavia, near the port. The island belonged to Sweden, but in 1877 was sold to the French who had previously held it from 1648 to 1748; the people, who had retained French language and customs, desiring it. Slavery was abolished in 1848. Pop. 2,942.

Saint Bartholomew, Massacre of. See BARTHOLOMEW, SAINT, MASSACRE OF.

Saint Bede College, a Roman Catholic institution, in Peru, Ill., opened in 1891, and in charge of the Order of Saint Benedict. In 1902-3 there were connected with the school 18 professors and instructors, 194 students, of whom 174 were in the collegiate department. The courses are preparatory, commercial, and classical. The classical course is intended for those studying for the priesthood or for the professions.

Saint Benedict's College, located at Atchison, Kan. It was founded in 1858 by the Benedictine Fathers. There are two distinct courses offered, the classical and the commercial; the classical course leads to the degree of bachelor of arts, the degree of master of arts is conferred for two years' post-graduate study. The commercial course leads to the degree of master of accounts. There is also a preparatory course provided. There are two scholarships for those who enter the classical course. The college has two distinct libraries, one for the free use of the students, numbering 4,000 volumes in 1904, and one for the special use of the professors, numbering 15,000 volumes in 1904. The number of students in 1903-4 was 172, of members of the faculty, 24; the total number of graduates from the opening of the college to 1903 was 305.

Saint Bernard of Clairvaux. See BERNARD, SAINT.

Saint Bernard' Dog, a race of large dogs which gets its name from the Hospice of Saint Bernard, where it has long been kept by the monks to aid them in rescuing perishing travelers. This dog is very valuable in assisting the monks to keep to the line of the road and in finding their way back. They are seldom burdened. Dogs of other races are used for the same purpose in other parts of the Alps. The Saint Bernard dog is of two varieties: the first, which has long white hair with black or tawny spots being few in number. This famous dog, according to the traditions of the monastery, is the result of a cross between a Danish bull-bitch and a mastiff, a native hill dog, though at what time effected it is impossible to say. After the breed was once established it was kept pure till 1812. About 1860 these dogs first attracted the attention of English travelers, who imported them to Great Britain, where they were exhibited and at once excited much notice on account of their size and beauty. Others were introduced, and the Saint Bernard was soon established as the most popular big dog, a popularity which has gone on increasing. The Saint Bernard, as bred to modern English ideas, is an immense red or orange colored dog, marked with white on muzzle, neck, chest, feet, and tip of tail. The head should be massive and imposing, with a strong square muzzle, a point of great importance. Legs should be straight, with large feet, and double or, at least, single dew claws. Hind feet should turn out, though not sufficiently to hinder the dog's movements. The coat of the rough variety is of medium length; it should not be too curly. In the smooth variety the coat should be short and wiry. Many of the finest Saint Bernards measure over 30 inches high at the shoulder and weigh over 150 pounds. While most of these dogs are good-tempered, strangers should be cautious in dealing with them; they are very likely to attack and kill small pet dogs, especially fox-terriers.

Saint Bran'dan's Isle, a legendary island supposed to have existed to the southwest of the Canary Islands and to have been discovered by the Irish monk, Saint Brandan, and 75 brother monks in the 6th century, after seven years spent in search for the land of saints. This legend is traceable as far back as the 11th century. Each of the various early geographers gives it a different location. The legend had some influence upon the discovery of America.

ST. AUGUSTINE.

1. The Old City Gate.

2. The Plaza.

SAINT CATHARINES—SAINT CHRISTOPHER

Saint Catharines, Canada, county town of Lincoln County, Ontario, on the Welland Canal and on the Grand Trunk and Niagara, Saint C., and Tor. railways; 12 miles northwest of Niagara Falls, 32 miles east of Hamilton. Saint Catharines is noted for its mineral wells, has large hotels, and is in a picturesque and fertile region. It has important manufactures of agricultural implements, sewing machines, foundry products, saws, edge tools, furniture; flour, saw, and planing mills, ship yards, tanneries, woolen factories, and breweries. Saint Catharines also carries on an extensive fruit trade. It has good water and sewerage systems, gas and electric lights, banks, and newspapers. The more noted local institutions are Bishop Ridley College, a marine hospital, and a commercial college. Pop. (1901) 9,946.

Saint Chamond, *sañ shā-môn*, France, in the department of Loire, eight miles northeast of Saint Etienne by rail, at the confluence of the Gier and Janon, is a well-built manufacturing city. There are large coal mines in the vicinity, famous dye-works, and extensive metallurgical manufactures, and various other industrial works, including large mills for the manufacture of silk, lace, etc. The remains of a Roman aqueduct are found at Saint Chamond. Pop. (1901) 15,469.

Saint Charles (Ark.), **Engagement at**, a battle of the Civil War, fought in Arkansas County on the White River, 17 June 1862. On 10 June Capt. C. H. Davis, then in command of the Federal Mississippi flotilla, received a request from Gen. Halleck to open up the White River for communication; he accordingly despatched a force under Commander Kilty, consisting of the ironclads Mound City and Saint Louis, and the wooden gunboats Lexington and Conestoga. Meanwhile the Confederates had fortified the bluffs at Saint Charles and, on learning of the approach of the Union vessels, had sunk their gunboat Maurepas across the channel and transferred her guns to the shore-battery. On 17 June a detachment of Federal troops landed below the bluffs, and the gunboats opened the attack upon the Confederate position, the Mound City leading; when she was within 600 yards of the shore a 42-pound shell entered her casemate and exploded her steam-drum; badly crippled she was towed out of action by the Conestoga, and the other boats continued the attack. The commanding officer of the land forces very shortly signaled them to stop firing, and the troops successfully stormed the Confederate battery. The Confederate loss was 6 killed, 1 wounded, and 8 missing; the most serious Federal loss was on the Mound City, the majority of her crew being killed by the escaping steam, or in consequence of jumping into the river. Of 175, only 3 officers and 22 men were saved. As there were no Confederate works farther up the river, this action gave control of the White River to the Federals. Consult: Mahan, 'The Gulf and Inland Waters,' p. 50; 'Battles and Leaders of the Civil War,' Vol. III., pp. 552-3.

Saint Charles, Mo., city, county-seat of Saint Charles County; on the Missouri River, 20 miles from its mouth, and on the Wabash, the Missouri, K. & T. R.R.'s; about 18 miles

northwest of Saint Louis. It was settled in 1765 by Blanchette "Chasseur," incorporated in 1795, and chartered as a city in 1805. There is an electric road connecting Saint Charles with Saint Louis. The city is in an agricultural region, in which the chief products are wheat and corn. The principal manufacturing establishments are car works in which there are 1,800 persons employed and flour mills. The city has large grain elevators, tobacco factories, and a foundry and machine shop. The principal public buildings are a court-house, 10 churches, the schools, and Saint Joseph's Hospital. The educational institutions are Sacred Heart Academy, opened in 1818; Saint Charles Military College, opened in 1838; Lindenwood College, opened in 1830; a high school, public and parish elementary schools, private schools, and four libraries. The three banks have a combined capital of \$150,000, and the annual amount of business is about \$1,400,000. The government is vested in a mayor and a council of eight members, elected biennially. Pop. (1890) 6,161; (1900) 7,982; (1904, est.) 10,112.

PERCY ALEXANDER,
Editor 'Banner News.'

Saint Charles College, at Ellicott City, Md.; founded 11 July 1831, under the auspices of the Roman Catholic Church. The funds for the institution were donated by Charles Carroll of Carrollton, one of the signers of the Declaration of Independence, who gave 253 acres of land from his own domain, and \$5,349 in money. The charter of the school as agreed upon by Archbishop Maréchal of Baltimore and Charles Carroll, stipulated that the purpose of the school was "the education of pious young men of the Catholic persuasion for the ministry of the gospel," and that the legal administration of the college should be entrusted to five trustees, who must be citizens of the United States. The founder also requested that the trustees be members of the Society of Saint Sulpice. The school was not opened until October 1848. The faculty then consisted of the president, one assistant and four students. At the present date (1903) the faculty numbers 15, the students 230. The total number that have matriculated is 3,367; and about 1,167 have been ordained priests. The grounds have been improved and a number of fine buildings supply all needful space. Saint Charles College forms the classical department of Saint Mary's University and Theological Seminary of Saint Sulpice, at Baltimore. The course including the preparatory work is six years. The college has power to grant degrees. There are three libraries; the main one has about 16,000 volumes; the library connected with the reading room has 5,000 volumes, and the library for the Juniors is in their own part of the college. Several scholarships are available on competitive examination.

Saint Chris'topher, popularly **Saint Kitts**, West Indies, 45 miles northwest of Guadeloupe, is an island belonging to the Leeward group, and a British possession. Its area is 68 square miles; its length 23 miles, breadth five miles. It is traversed by a rugged range whose highest summit, Mount Misery, has an altitude of 4,100 feet. Basse-Terre, the capital, on the coast, has a population of about 7,000. It is united administratively with Nevis, and the small island Anguila. The chief products are sugar, mo-

SAINT CLAIR—SAINT CLOUD

Jasses, rum, salt, some coffee, tobacco, and cattle. The island was discovered in 1493 by Columbus; colonized by the French and British simultaneously in 1625, and held by those nations alternately for some time, passing over entirely to England in 1713. Pop. (1901) 29,782.

Saint Clair, Arthur, American soldier: b. Edinburgh, Scotland, 1734; d. Greensburg, Pa., 31 Aug. 1818. He was a grandson of the Earl of Roslyn and was educated at the University of Edinburgh, after which he studied medicine. He came to America with the fleet of Admiral Boscawin and took part in the capture of Louisville and of Quebec. In 1762 he resigned his commission of lieutenant and two years later established a home and a manufacturing industry in Ligonier Valley, Pa. He became prominent in his vicinity and held several civil offices. In 1775 he was made colonel of militia; and on 9 Aug. 1776 was appointed brigadier-general and was ordered by Washington to organize the New Jersey militia. He fought at Trenton and Princeton, and having been appointed major-general in 1777, succeeded General Gates in command at Ticonderoga. At the approach of Burgoyne, with a force more than three times outnumbering his, he evacuated the fort on account of his inability to protect all the exposed points. A part of his force was attacked and defeated at Hubbardton. For this disaster he was tried in court-martial in 1778, but acquitted of the charges brought against him. He commanded a body of troops in 1781-2 under General Greene in the South; was a delegate to the Continental Congress in 1785-7 and its president in 1787. He was appointed first governor of the Northwest Territory in 1789, and was appointed commander-in-chief of the forces engaged in warfare with the Indians in 1791, but was defeated on 4 November, near the Miami villages. In March of the following year he resigned his commission and in 1802 President Jefferson relieved him of the governorship of the territory. He published a narrative of the manner in which the campaign against the Indians in the year 1791 was conducted under the command of Maj.-Gen. St. Clair with his observations on the statements of the Secretary of War (1812). Consult: W. H. Smith, 'The Life and Public Services of Arthur St. Clair' (1882).

Saint Clair, Mich., city in Saint Clair County; on Saint Clair River at the mouth of the Pine River, and on the Michigan Central railroad; about 43 miles northeast of Detroit and 12 miles south of Port Huron. A ferry connects the city with Courtwright on the Canadian side of the river. It is in an agricultural region and has considerable manufacturing interests. The chief industrial establishments are lumber mills, sash, door, and blind factories, ship-yards, salt works, brick works, iron works, foundry, tannery, and brewery. There is a good system of waterworks, several well built churches and schools. Pop. (1890) 2,353; (1900) 2,543.

Saint Clair, Pa., borough in Schuylkill County; on Mill Creek, and on the Philadelphia & Reading railroad; five miles north of Pottsville. An electric railroad connects the borough with Pottsville. It is in an anthracite region, and the chief industries are connected

with mining and shipping coal. It has machine shops, a foundry, a tool factory, large coal and brick yards, and a large mining implement works. There are a high school, public and parish schools, a private school, and a library. There is a large trade in coal. Pop. (1890) 3,680; (1900) 4,638.

Saint Clair, a lake on the boundary between Michigan and Canada, and between Lake Huron and Lake Erie. It receives the waters of Lake Huron through Saint Clair River and discharges its waters into Lake Erie through Detroit River. It is about 30 miles long, from north to south; its maximum width is 24 miles and the average width 12 miles; area, 396 square miles. It is about 3 feet higher than Lake Erie and 5.4 feet lower than Lake Huron. The northern part is shallow, owing to the sediment from Saint Clair River; the average depth of the central part is 19 feet. The bed is covered with a blue mud, with sand and gravel in some parts, all supporting a dense growth of low vegetation in which are many forms of animal life. The lake is noted for the large number of steamers and the enormous tonnage which it carries each year.

Saint Clair, a river called originally Sinclair, in honor of Patrick Sinclair, a British officer, who in 1765 purchased from the Indians, a tract of land along the river. The river is the outlet of Lake Huron, and discharges its waters by several channels into Lake Saint Clair. The delta at the mouth is known as the Saint Clair Flats. A number of summer cottages and hotels have been built on the Flats. One of the channels has been improved for navigation; a canal about one and one half miles long has been built at such an angle as to shorten the course, and of such a width and depth as to admit large lake steamers. A railroad tunnel under the river connects Port Huron (q.v.) in the United States with Sarnia (q.v.) in Canada. It is nearly two miles long, including approaches, and was opened for travel in 1891. The river is about 41 miles long.

Saint Cloud, sän-kloo, France, in the department of Seine-et-Oise, on a height near the Seine, seven miles west of Paris, is charmingly situated and especially interesting for its historical associations. It commands a superb view of Paris, and the beautiful shady park, with its chateau and elegant fountains, is a favorite resort of Parisians. Within the precincts of Saint Cloud are situated the new national Sèvres porcelain manufactory. The chateau was built by Gondi in 1572, purchased by the Duke of Orléans, the brother of Louis XIV. in 1658, and by Louis XVI. for Marie Antoinette in 1782. Henry III. was murdered in the old mansion by Clement 21 Aug. 1589. Peter the Great was received there in 1717. It was the scene of Napoleon's coup of 18th Brumaire, and his favorite residence; here he caused himself to be declared first consul, and here Blücher had his headquarters (1815). At Saint Cloud, Charles X. (1830) affixed his signature to the ordinances which doomed him. Napoleon III. signed here the declaration of war against Prussia (1870). Pop. (1900) 8,663.

Saint Cloud, klowd, Minn., city, county-seat of Stearns County; on the Mississippi River, and on the Northern P. and the Great

SAINT CROIX — SAINT DIZIER

N. R.R.s; about 65 miles north of Minneapolis, two miles below the mouth of the Sauk River. It was settled in 1852 by Ole Bergeson, incorporated in March 1856, and became a city in 1868. In the vicinity are extensive granite quarries. The city has good water-power and a number of manufactories. There is a large surrounding region in which are productive farms. The chief manufacturing establishments are flour mills, foundries, machine shops, wood working factories and railroad shops. There are large grain elevators, stock yards, and several well built business houses. There is considerable trade in granite, farm products, flour and wood work.

Saint Cloud has the Minnesota State Reformatory Prison, Saint Raphael's Hospital, and Saint Joseph's Home for the Aged. The educational institutions are a State normal school, Saint Clotilde's Academy of Music, five public schools, three Roman Catholic parish schools, and a library. The five banks have a capital of \$300,000. The government is vested in a mayor and a council of 15 members, three of whom are elected each year. Pop. (1890) 7,686; (1900) 8,663.

C. F. MACDONALD,
Editor *'Daily Times.'*

Saint Croix (sometimes called **SCHOODIC**), (1) a river, the outlet of Grand Lake, flows south, east-southeast, and forms part of the boundary between Maine and New Brunswick. It flows into Passamaquoddy Bay. It is 75 miles long; navigable as far as Calais, Maine, above which there is extensive waterpower. (2) A river which has its rise in Douglas County, Wis., flows southwest to the Minnesota border, then south, forming the boundary between Wisconsin and Minnesota for a distance of about 100 miles, entering Mississippi River at Prescott, Wis. It is about 150 miles long and navigable to the Falls or the Dalles, a distance of 54 miles from its mouth. At the Falls there is a descent of 50 feet in 900 feet, and below there is a cañon.

Saint-Cyr, Laurent Gouvion, lă-rôn goo-vê-ôn sãn sêr. MARQUIS DE, marshal of France; b. Toul, France, 13 April 1764; d. Hyères, France, 17 March 1830. In 1792 he entered the army and attached to the staff of General Custine. He was rapidly promoted and in 1796 commanded the centre division in the army on the Rhine under Moreau. He was appointed to the command of the army of Italy in 1798 where he re-established discipline, the army having been on the verge of revolt against their general, Masséna. He returned to the army of Moreau in 1799, was victorious at Biberach in 1800, and in 1801 was sent to Spain to command the army which was to invade Portugal. After the treaty of peace was signed he became ambassador at Madrid. He participated in the Prussian and Polish campaigns of 1807, and in 1808 was in command in Catalonia, where he relieved Barcelona. In 1811 he was assigned to the command of a corps in the Russian campaign. He was victorious at Polosk in 1812 and was created marshal of France in recognition of his services. He made a brilliant fight at Dresden, but was forced to capitulate and remained a prisoner in Hungary for some time. After the Restoration he was created a peer of France, was appointed minister of war in 1815, minister of marine in 1817 and a few months

later minister of war again, retiring in 1819. He wrote: 'Journal des Operations de l'Armée de Catalogne en 1808 et 1809' (1821); 'Mémoires' (1829-31); etc. Consult De Vernon, 'Vie de Maréchal Gouvion Saint-Cyr' (1857).

Saint Cyr, or **Saint Cyr-l'Ecole**, lă-kol, France, a village near Paris, west of Versailles, at the end of the old park of Louis XIV., celebrated for its military school. Madame de Maintenon founded here (1686) a seminary for the education of the daughters of families of high rank in reduced circumstances. The convent chapel contained the tomb of Madame de Maintenon, and Racine's 'Esther' and 'Athalie' were written for the pupils of the school and first acted there. During the Revolution this institution was abolished, and in 1806 Napoleon transferred to Saint Cyr the famous military academy which he had founded at Fontainebleau. Two advanced forts of the new enceinte around Paris are situated at Saint Cyr. Pop. 2,835.

Saint Denis, sãn dê-nê, France, in the department of Seine, 4½ miles north of Paris, is an important junction on the Northern railroad. The town is especially celebrated for its venerable abbey, from which it derives its name; the two high towers are respectively Romanesque and Gothic; the rose window dates from the 13th century. The abbey was the burial place of the kings of France and in the chapels of the nave are the tombs of Louis XII., and Anne of Brittany (1591); of Henry II.; Catharine de' Medicis; of Louis of Orleans; of Francis I.; and Claude of France—one of the splendid tombs of the Renaissance; and that of Dagobert, one of the most curious of mediæval (13th century) works of art. The crypt dates partly from the time of Charlemagne. In the centre is the vault, where the last king reposes—Louis XVIII., the only one whose ashes have been respected. The crypt also contains the Bourbon vault, where repose Louis XVI. and Marie Antoinette. Modern features deserving notice are an orphanage (1886), the monument commemorative of the Revolution and other public statues, and the railway station. In 1888 the old Hotel Dieu was converted into a hospital for old men. Pop. (1901) 60,808.

Saint-Denis, the capital of the French island of Réunion in the Indian Ocean, on the north coast of the island. It is built on a long, narrow beach shut off on the land side by a range of high volcanic mountains. In the city are a cathedral, a palace for the governor, a theatre, and a large number of educational institutions, including a lyceum, several large schools, a library, a museum, and a botanical garden. The harbor is an open roadstead exposed to frequent severe storms, but a new, protected harbor has been constructed at Pointe des Gallets, a few miles to the west, which is connected with the city by a railroad. Pop. (1899) 32,850, chiefly French creoles.

Saint Dizier, sãn dê-zê-ă (ancient **DESIDERII FANUM**), France, department of Haute-Marne, on the Marne, 35 miles southeast of Châlons. Part of the old castle is standing and the church has some peculiar Gothic windows. There is a library and a museum. It is an important centre of the iron trade, with foundries of iron, steel, copper and bronze, engineering works,

etc. It is a railway station. In 1544 Saint Dizier was besieged and taken by Charles V., although strongly fortified. In 1814 there was severe fighting nearby, between Napoleon and the Allies. The walls have been razed and the site now constitutes the promenade of the town. Pop. (1900) 14,601.

Saint Eli'as, Mount, in Alaska, in the southeastern part of the Territory; lon. $140^{\circ} 55' 47.3''$ W.; lat. $60^{\circ} 17' 35.1''$ N. The United States Coast and Geodetic Survey report the height 18,100 feet above sea-level. It rises from an elevation of considerable height, and the foot-hills on the south side are covered with trees. The timber line is from 2,000 to 2,500 feet above sea-level. The mountain itself is covered with snow and ice and has many glaciers. The south side is almost perpendicular: the storms of ages and the avalanches have removed many of its rugged features. The north side is more accessible, and has been explored to some extent. The Malaspina Glacier (area 1,500 square miles) is at the foot of Mount Saint Elias, near Yakutat Bay.

Saint Elmo Castle, Naples, Italy, a fortress crowning a rocky hill on the western outskirts of the city. It was built by Robert the Wise in 1343. It has massive walls surrounded by fosses cut out of the solid rock, and was long held to be impregnable. It is now used as a military prison.

Saint Elmo's Fire. See ELMO'S FIRE, SAINT.

Saint Etienne, sǎn tǎ-tē-ēn, France, a manufacturing town in the department of the Loire, on the Furens, 32 miles southwest of Lyons. It is located amid some of the richest coal fields of France. The important buildings include the old abbey of Valbenoite, dating partly from the 13th century, a Protestant church, a synagogue, a town house, a school of mines with fine collections, and an art palace, with a museum and library, rich in old MSS., collections of natural history, and of ancient artillery. The enormous metallurgical establishments yield one third of the whole French production of steel, manufactured according to the Bessemer and Martin processes, the national gun factory and other metal works; the manufacture of hemp cables, pottery and lime, the weaving of ribbon, laces, trimmings, etc., and conditioning of silk are among the varied and active industries of the town, giving employment to thousands of men and women. The collieries are very extensive, employing alone 15,000 miners, while 80,000 work in the ribbon factories, 16,000 work in heavy iron goods, hardware 7,000, military and naval material, etc., 6,000. Pop. (1901) 139,350.

Saint Eustatius, ū-stǎ'sh'ŭs, or **Saint Eustache**, sǎn-tē-stǎsh, an island of the Dutch West Indies, lying south-southeast of Porto Rico, 12 miles northwest of Saint Christopher. It consists of two volcanoes with an intervening valley, and covers an area of eight square miles. Sugar, cotton, maize, yams, potatoes, and above all tobacco are cultivated. Yarns and sweet potatoes are exported. The only landing is protected by two forts. The Dutch acquired the island in 1600, colonizing it in 1635. It suffered many vicissitudes at various periods under English and French occupation, but in 1814 was finally restored to the Dutch. Orange-

town is the only town. Earthquakes are frequent. It has a salubrious climate. Pop. (1900) 1,334, mostly negroes.

Saint-Evremond, sǎn-tǎvr-môn, **Charles de Marguetel de Saint Denis**, French courtier and author: b. Saint Denis du Guast 1 April 1613; d. England 20 Sept. 1703. He was educated by the Jesuits, entered the army about 1629 and served in the Thirty Years' war. He was a witty and accomplished courtier, and was for a time a favorite with Condé and also with the king; but incurred their displeasure by his sarcastic rallery and especially by his letter on the Peace of the Pyrenees. In 1662 he went to England, where he became a favorite at court and received a pension of £300 (\$1,500) from Charles II. He wrote dramas, essays and letters, his collected works being published in 1705. These include 'Sir Politics,' written with Buckingham.

Saint Francis, a river which rises in eastern Missouri and flows into the Mississippi River in Arkansas, lat. $34^{\circ} 45'$ N. It is a large river, and was formerly navigable 300 miles for large keel boats; but the earthquakes of 1811-12 raised its channel so much, and so irregularly, as to cause the waters to overflow the banks and form a vast number of lakes and swamps along its former course. At high water the river is still navigable at some seasons of the year for about 150 miles; and there are several settlements about 70 miles from its mouth. Its waters abound with excellent fish. Length, about 450 miles.

Saint Francis Xavier College, located in New York. It was founded in 1847 by the Jesuits, and was granted the powers of a university in 1861 by the State board of regents. Its organization includes a collegiate and a preparatory department. The regular college course leads to the degree of A.B.; it includes instruction in logic, metaphysics, and theodicy, English and the classics, mathematics and science, and history. Post-graduate work in literature, history, sociology and psychology is provided for, and leads to the degree of A.M. There are 46 scholarships. The college is well equipped; the library in 1904 contained 101,000 volumes, and the grounds and buildings were valued at over \$750,000. The students in 1903-4 numbered 562, a large majority being in the preparatory department, and the faculty 33.

Saint Gall, gâl, Switzerland, (1) capital of the Canton of Saint Gall, on the Steinach, in a high, narrow valley, about 50 miles from Zürich. It is the see of a bishop, and has besides the cathedral, several churches, a monastery, now containing public offices, a large town-house, library, and orphan asylum. The town library is rich in works relating to the Reformation. The ancient Benedictine Abbey was famous as an asylum of learning during the Dark Ages, and was one of the most celebrated educational institutions of Europe. Several of the classics, namely, Quintilian, Silicius, Italicus, and Ammianus Marcellinus, were solely preserved among its MSS. Notker and Ekkehard were among its pupils. Saint Gall is an important manufacturing centre, celebrated for its fine laces and embroideries. Pop. (1900) 33,116.

(2) The Canton covers an area of about 780

THE PURITAN, by *Saint-Gaudens*

square miles. It has a diversified surface; the southern and central portions are covered by lofty Alpine ranges. Its principal lake is the Wallenstadersee. The climate of the valley is mild, but in the mountainous district is rigorous. There are important stone quarries, much wood and good pastures; on the lower slopes vineyards and orchards, and some arable lands. Manufactures consist of cotton and linen goods. The constitution is preeminently democratic. German is the language spoken. Pop. (1900) 250,285.

Saint Gaudens, gá'děnz, **Augustus**, American sculptor; b. Dublin, Ireland, 1 March 1848; d. Cornish, N. H., 3 Aug. 1907. He was brought to the United States in infancy and at 13 was bound in apprenticeship to learn cameo-cutting and spent several years at this art. Six years later (1867) he went to Paris and studied under the sculptor Joffroy at the Ecole des Beaux Arts. While at Rome in 1871 he produced his first figure, 'Hiawatha,' and the following year returned to the United States. The Sherman equestrian statue which was unveiled at the southeast entrance of Central Park in 1904 is the last of a series of five in which are commemorated heroes of the Civil War, among the most notable of which is the remarkable statue of Farragut in Madison Square, New York. Saint Gaudens was a sculptor of originality and freshness, who had adopted the best standards of French taste and method of execution without being hidebound by tradition; he had a style at once polished and free. Among his other works are the 'President Lincoln' statue in Lincoln Park, Chicago; the bas-relief 'Adoration of the Cross by Angels'; the 'Shaw Monument' at Boston; and the 'Diana' on the tower of Madison Square Garden, New York. He also took part in executing the 'Parnell Memorial' monument in 1901, designed several medals of presentation authorized by Congress, and assisted John La Farge in decorating Trinity Church, Boston.

What perhaps is the most striking characteristic of all his ideal statues is that of 'The Puritan' (at Springfield, Mass.). This is the puritan of earlier New England in all his aggressive and unbending strength—soldier, theologian, statesman. There is nothing winning or conciliating in his air. He is come to conquer the wilderness as Cromwell conquered the aristocracy of England and wiped out for the brief period of the Commonwealth the haughtiest of European dynasties. The puritan, as Saint Gaudens has portrayed him, carries the Bible next his heart in one hand and a stout cudgel of oak in the other. He personifies those unswerving, and sometimes fanatic principles on which the ancient commonwealths of New England were established. Of the Sherman monument, executed by Gaudens, a critic had said: "The composition of the Sherman is his own, and it has the spontaneity and the balance of a work evolved straight from a powerful imagination and an original mind. The Victory is exactly where it belongs, and bears a relation as true, as unforced, as anything in nature itself to the horseman pressing close upon its flying robe. Once more a word on the sculptor's discretion is inevitable. He wanted to express movement in this monument, to give to Vic-

tory almost aerial lightness in her carriage, to embody in the horse a type of great strength, pushing its way to the front, and to make Sherman himself the very ideal of a leader, who spurns the miles behind him. The bronze seems almost sentient. The group quivers with vitality. But the rhythm of this dramatic conception is held so well in hand, it is so majestic, that classic art itself could not produce a more nobly monumental effect."

Saint George and the Dragon. See DRAGON.

Saint George, Cape, Newfoundland, the westernmost projection of the island, forming the northwestern extremity of Saint George Bay, on the Gulf of Saint Lawrence.

Saint George's Channel, an arm of the Atlantic which separates Ireland from England. At the north it unites with the Irish Sea. Its entire length from southwest to northeast is about 210 miles. The tide rises in this channel about the same time as in the English Channel, so that there is high water simultaneously at Brest in France, Falmouth in England, and Cape Clear in Ireland.

Saint George's Chapel, Windsor, England. See WINDSOR CASTLE.

Saint Germain, sǎn-zhër-mǎn, **COUNT OF**, adventurer of the 18th century; b. perhaps 1710; d. Eckernförde, Schleswig, 1784. A mystery enveloped his birth and origin, of which he took every advantage. He spoke English, German, Italian, Spanish, and Portuguese to perfection, and French with a slight Piedmontese accent; and was variously thought to be the son of a tax collector at San Germano, Savoy, an Alsatian Jew, a Portuguese marquis named Betmar, or the illicit offspring of a Spanish princess. After sojourning in various cities of Italy under as many pseudonyms, he lived from 1750 to 1760 at the French court under the patronage of Marshal de Belle-Isle, and, having a fine personal appearance and address, considerable erudition, and a wonderful memory, became a favorite of Mme. de Pompadour and the king. He was reported to be from 2,000 to 3,000 years old. Frederick the Great, having asked Voltaire for some particulars respecting this mysterious person, was told that he was "a man who never dies and who knows every thing." He passed the last years of his life at the court of the prince of Hesse-Cassel, and is supposed to have been employed during the greater part of his life as a spy at the courts at which he resided. Cagliostro owned himself a pupil of the Count of Saint Germain. Consult: Oettinger, 'Graf Saint Germain' (1846).

Saint Germain-en-Laye, ǎn lâ, France, a town in the department of Seine-et-Oise, on a height bordering the Seine, nine miles west of Paris. At the edge of a forest, 200 feet above the river, the air is bracing and salubrious. It is a favorite summer resort and residence of Parisians. The terrace of Saint Germain is one of the finest promenades in Europe and commands an extensive view of the valley of the Seine and surrounding hills. The ancient castle of the town now serves as a museum of antiquities; it was destroyed and restored at various epochs. In the Henry IV. pavilion Thiers died (1877). The old castle was first built by Charles V.

(1370), and reconstructed and embellished by many succeeding sovereigns, especially Louis XIV. Here were born Charles IX., Margaret of Navarre, Henry II., and Louis XIV. James II. of England and most of his family here lived and died as exiles. It now serves as barracks and a military prison. Saint Germain is the seat of one of the cavalry garrisons which surround Paris; at a short distance is the Convent des Loges, connected with the Legion of Honor (Saint Denis). Pop. (1900) 14,262.

Saint Germain de Rimouski. See RIMOUSKI.

Saint Gotthard, göth'ard, Switzerland, a mountain group on the confines of the cantons Uri, Grisons, Ticino, and Valais, belonging to the Lepontine or Helvetian Alps, which it connects with the Bernese Alps. It forms a kind of central nucleus in the great watershed of Europe; each of its slopes giving rise to an important river — the north to the Reuss, the south to the Ticino, the west to the Rhône, and the east to the Rhine; all these rivers rise within a circuit of 10 miles from its centre. The culminating point has a height of 10,600 feet, and three other summits are beyond the limit of perpetual snow. The Col of Saint Gotthard, at its summit level, where the Hospice stands, is 6,808 feet high. A bridle path over the pass had existed since the 6th century and over it an excellent carriage road was completed in 1832, in which, particularly on the Italian side, formidable difficulties were surmounted, and much engineering skill displayed. A railway tunnel pierces this mountain group between Göschenen on the north and Airolo on the south, thus directly connecting the railway system of North Italy with those of Switzerland and Western and Central Germany. This tunnel is the longest in the world, being 16,295 yards, or rather more than 9¼ miles long. Its construction, begun in 1872, was completed in 1881, and it was opened for traffic early in 1882. Its total cost was about \$45,400,000, defrayed by Swiss, German, and Italian state subventions, by mortgages and shares. The excavation was carried on simultaneously on the Italian and the Swiss side, the workmen finally meeting in the middle, where the height above sea-level is 3,785 feet.

Saint Gregory. See GREGORY, SAINT.

Saint Helena, hě-lě'na, an island in the Atlantic, belonging to Great Britain, 700 miles southeast of the island of Ascension, the nearest land. The area is about 47 square miles. Although isolated as relates to its contiguity to the mainland, it is in the direct line of ocean communication via the Cape of Good Hope, many vessels making it a halting station. It is an extinct volcano whose crater forms the main ridge. Many gorges, some of which are 1,000 feet deep, converge from the walls of the crater in all direct ones and numerous caves have been formed. High cliffs extend all around its shores to the water's edge, and there is a good harbor.

The fauna and flora are deeply interesting, many specimens being peculiar to the island. Farm and garden produce constitute the entire wealth of the colony; Jamestown (3,000 inhabitants) is the only town. Longwood, where Napoleon died, is a farm-house, standing on a high plain. The Portuguese discovered the is-

land, subsequently the Dutch took possession, and later it was ceded to Great Britain. Its chief interest consists in its being the scene of Napoleon's captivity. Pop. (1900) 5,316.

Saint Hel'ens, England, Lancashire, 11 miles northeast of Liverpool, a municipal county and parliamentary borough, and market town. A town hall (1875-6), a technical institute (1896), churches, schools, library and baths, an asylum and hospitals, besides numerous parks and recreation grounds are the main modern features. The town owes its importance to the coal-beds in the environs, and to its glass-works, copper-smelting, the manufacture of iron and steel, chemical and lead works, potteries, breweries and other industries. Pop. (1901) 84,410.

Saint Helens, a volcanic peak of the Cascade Range, in the State of Washington; lat. 46° 12' N., lon. 122° 4' W. The volcanic débris at the base and beyond is of ancient origin; the mountain has all the appearance of an extinct volcano. Height, 9,750 feet. It resembles Mount Rainier in its treeless sides and ice-covered summit, but it is smaller. On the north side, at the base, is Spirit Lake.

Saint Helier, hě'l'yèr, Channel Islands, capital of the Island of Jersey, and a favorite European summer resort, on the east side of Saint Aubin's Bay, on the south coast. It is strongly fortified and defended by Elizabeth Castle (1551-86), on a rocky island connected with the mainland by a causeway, and by Fort Regent, an imposing citadel dominating the town. The principal buildings are Victoria College; the Maison Saint Louis or Jesuit College; the courthouse; public library, town hall, hospital, Norman parish church, and the French Roman Catholic cathedral. Fine markets, an esplanade and marine drive four miles long encircling the bay, and extensive and well built harbors, are prominent features. There is considerable trade with England, France, and India, in fruit, potatoes, and cattle. Pop. 29,100.

Saint Henri, or **Tannery West**, Canada, an incorporated city of Hochelaga County, Quebec, suburban to Montreal on the southwest. It is a busy industrial centre on the Lachine Canal, and has a station on the Grand Trunk Railway. Cotton, leather, confectionery, sewing machines, and machinery are among its principal manufactures. Pop. (1901) 21,192.

Saint Hilaire, sǎn-tě-lār, **Auguste François César**, called **Auguste Prouvençal de**, French naturalist and traveler: b. Orléans 4 Oct. 1779; d. there 30 Sept. 1853. A botanical expert, he set out in 1816 on a long journey through Brazil, carrying his explorations to regions then unknown, and returning in 1822 with valuable collections. In 1830 he was admitted to the Paris Academy of Sciences; subsequently he was made professor of botany in the faculty of sciences at Paris. He made several discoveries of scientific value, and published three narratives of travel, 'Voyage dans la Province de Rio de Janeiro et Minās Gerães' (1830); 'Voyage dans le District des Diamants et sur le Littoral du Brésil' (1833); 'Voyage aux Sources de San Francisco et dans la Province de Goyaz' (1847-8); besides 'Flora Brasiliæ Meridionalis' (with Jussieu and Cambessèdes 1825), and 'Leçons de Botanique' (1840-1).

Saint-Hilaire, Marco de, pseudonym of EMILE MARC HILAIRE, French writer; b. Versailles about 1796; d. 5 Dec. 1887. He was educated as a page at the court of Napoleon I., and finding himself without means of support after the Restoration, turned his attention to literature. Though not important as a writer, his continued glorification of Napoleon was popular and undoubtedly did much to pave the way for the Second Empire. His work includes: 'Mémoires d'un Page de la Cour impériale' (1830); 'Souvenirs de la Vie privée de Napoléon' (1838); 'Souvenirs intimes du Temps de l'Empire' (6 vols., 1838-46); 'Histoire de Napoleon III.' (1853); etc.

Saint Hubert, Order of, a Bavarian order founded by Gerhardt V. in 1444, and which was originally named the Order of the Horn, so called from the hunting horns of which the links of chain were made. The membership was composed of the nobility, the number being unrestricted, while the number of members of lower rank was limited to 12. A white cross with eight points, on each of which is a small golden ball, constitutes the decoration. A crown surmounts the cross, while the arms of the cross are divided by three rays of gold representing Light from Heaven. On the medallion is pictured Saint Hubert's conversion, under which, on a red ribbon, is the inscription "*In trav vasi*" (Firm in Faith).

Saint Hyacinthe, hi'a-sinth (Fr. *Saint é-à-saint*), Canada, city and port of entry, county-seat of Saint Hyacinthe County, Quebec; on the Yamaska and Black rivers, and on the Grand Trunk, Canadian Pacific, Intercolonial, and Quebec Southern railways; 35 miles northeast of Montreal. It is the seat of a Roman Catholic bishop, and among its more notable institutions are Saint Hyacinthe College (Jesuit), occupying a handsome stone building, a nunnery with a seminary for young ladies, a hospital in charge of the Sisters of Charity, and monasteries of the Precious Blood and Dominican Fathers. The principal manufactures of the city are woolen goods, lace, linens, hosiery, corsets, boots and shoes, leather, flour, lumber, woodenware, organs, agricultural implements, and casting and machinery. Pop. (1901) 9,210.

Saint Ignatius College, a Roman Catholic institution located at Chicago, Ill. It was chartered in 1870, and is under the control of the Jesuits. It has a collegiate or classical, a commercial, and an academic department; religious instruction is a part of all courses. In the collegiate department the degrees of A.B., B.S., and Ph.B. are conferred; and the degrees A.M. and Ph.D. for graduate work. Though the College is designed especially for Roman Catholic students, non-Catholics are admitted. The library contained over 30,000 volumes in 1903, including a select library for the special use of undergraduates; there are also a good scientific laboratory equipment and valuable mineralogical and zoological museums. There are no dormitories. The College has no endowment, and is dependent mainly upon its tuition fees for income; in 1903 the income was over \$13,100; the students numbered 500, and the faculty 36.

Saint Ives, ivz, England, seaport and watering resort, in Cornwall on Saint Ives Bay, 57 miles southwest of Plymouth. The parish

church of Saint Andrew is in the Early Perpendicular style of the 15th century. The town-hall, a free library and a new pier, are, besides the harbor, the chief features of interest. Pop. (1901) 6,697.

Saint Jacob, or **Sankt Jakob**, sänkt yä'köp, Switzerland, a small village on the Birs in the canton of Basel, two miles southeast of Basel. It is noted for the important battle fought there on 26 Aug. 1444, between the Swiss Confederates and the Armagnacs, in which the latter were totally defeated.

Saint James' Coffee-house, a famous Whig coffee-house of London which flourished from the time of Queen Anne until late in the reign of George III. It stood on Saint James' Street in the neighborhood of Saint James' Palace, and was much frequented by Swift and Harley in its early days. It was here that Goldsmith's poem 'Retaliation' originated. The poet, a member of a group of men of talent who met here, was proverbially late in his arrivals. On one such occasion those present wrote in jest epitaphs "on the late Dr. Goldsmith." None is preserved save Garrick's, which became famous:

Here lies poet Goldsmith, for shortness called Noll;
He wrote like an angel, but talked like poor Poll.

The retort above mentioned dealt in a satirical vein with the club members who had exercised their wit upon him.

Saint James' Palace, England, a royal palace in London, between Saint James and Green Parks. It was built originally for a hospital, reconstructed by Henry VIII., enlarged by Charles I., and up to the time of George IV. was the permanent royal residence. It is still known as the Court of Saint James, being occupied by the royal family. Henry VIII. annexed to the palace a park enclosed by a brick wall, connecting it with Whitehall. Queen Mary died here in 1558; Charles I. spent his last night in this palace; and here were born Charles II., the Old Pretender, and George IV. After Whitehall burned down in 1697, Saint James became the London residence of the sovereigns up to the time of Queen Victoria. In 1837 Buckingham Palace became the royal home. The park covers 58 acres.

Saint Jean d'Acre, sän zhö'n däk'r, Palestine. See ACRE.

Saint John, one of the 12 Apostles of Jesus Christ. He and his brother James are often spoken of as sons of Zebedee. It is commonly accepted (cf. Mark xv. 40 and Matt. xxvii. 56) that his mother's name was Salome and it is still further conjectured by many (see John xix. 25) that she was a sister of Mary, the mother of Jesus—a relation which would render more natural the committing by Jesus of his mother to the care of John. The family seems to have possessed some means, as Zebedee employed hired servants in his fishing business, Salome is mentioned among the pious women who aided in the support of Jesus and his associates during his ministry, and John himself was personally known to the high priest.

Of his early life we know nothing. Presumably he had the ordinary training of the Jewish boy of his time, and no more. In the order

SAINT JOHN

of narration, he first appears, according to an obvious inference, as an unnamed disciple of John the Baptist, who with Andrew follows Jesus (John i. 35-39). After some association with Jesus, John returned to his occupation as a fisherman, from which Jesus summoned him and his brother, together with Simon and Andrew, to discipleship, which was the basis of his appointment as one of the 12 apostles. In this company he was one of the three who were admitted to the closest intimacy with their Master and, indeed, is understood to be "the disciple whom Jesus loved." Little in particular is noted, however, in reference to him while Jesus lived. He and his brother are said to have been called "Boanerges," defined as "Sons of Thunder" (Mark iii. 17). While the meaning is somewhat obscure, it seems most probable that this hints at great stores of emotional power and passion. He, with his brother, is rebuked for proposing to summon fire from heaven to destroy the inhospitable Samaritan village, and he alone confesses attempting to check the activity of a healer who was not of their company. He alone of the apostolic company is mentioned as present at the trial of his Master and at his crucifixion, where he received the commission to care for Mary, the mother of Jesus, which he faithfully carried out, making a home for her till her death.

It appears from the statements in Acts and of Paul in his Epistle to the Galatians that for some time John remained in Jerusalem. Beyond this we are dependent upon tradition, which consistently associated the latest years of his life with the city of Ephesus. To be sure, on the basis of uncertain inferences from an obscure passage possibly incorrectly quoted by Eusebius from Papias, it has been argued that all the tradition that John was at Ephesus was due to the confusion of the Apostle with a supposed presbyter and original disciple of Jesus bearing the same name. But all the positive evidence tends toward the association of John in his latest years with Ephesus. There is a fragmentary tradition that he went to Rome and was there plunged into a cauldron of boiling oil, from which he miraculously escaped unharmed, and that he was then banished to an island. John, the author of the Apocalypse, speaks of himself as being "in the isle that is called Patmos," and the date which is given by Irenæus and others for the exile of John the apostle is late in the reign of Domitian, and for his return the year 96, early in the reign of Nerva. There is no tradition as to the date of his death. Many legends are current as to his life at Ephesus. Irenæus tells of his hostility to the tenets of the Gnostic Cerinthus, such that John even refused to remain under the same roof with the heretic. Clement of Alexandria exalts his pastoral fidelity by a story how he journeyed into the forest to reclaim a young man who had fallen into evil ways and joined a band of robbers. Cassian relates that when he was censured for spending time in play with a tame partridge, he answered that the bow cannot always be bent. The story, however, which is most familiar, is due to Jerome, who tells that, when so aged that he must be carried into

church and was unable to speak at any length, John would continually repeat, "Little children, love one another." Perhaps partly based on this story, partly perhaps on an impression gained from a superficial reading of his letters, the notion has widely prevailed that John was a weak sentimentalist. But this is unjust. It has been profoundly said of his epistles that their words are thunderpeals, and it is plain that in his soul burned the fires of passion and power which made him in his youth one of the "Sons of Thunder," although in his age he had learned repression and self-mastery.

DAVID FOSTER ESTES,
*Professor of New Testament Interpretation,
Colgate University.*

Saint John, Charles Edward, American physicist: b. Allen, Mich., 15 March 1857. He was graduated at the Michigan Normal College in 1876, and studied physics at Harvard and at the University of Berlin. He became instructor of physics at Michigan Normal College in 1888; was made associate professor at Oberlin College in 1897, and in 1899 became professor of physics and astronomy at that institution. He has written 'Wave-Lengths of Electricity on Iron Wires' (1894); 'A Study of Silphium Perfoliatum and Dipsacus Laciniatus in Regard to Insects' (1887).

Saint John, Frederick Edward Molyneux, Canadian journalist and author: b. Newcastle, England, 28 Nov. 1838. His father was one of Wellington's veterans at the battle of Waterloo, and the son followed him in a military career, on 23 April 1855 entering the Royal Marines (Light Infantry) as second lieutenant. He served under General Van Straubenzie throughout the operations against Canton in 1857-8, and acted with such gallantry under fire during the storming of the fort that in August 1858 he was promoted first lieutenant. In 1868 he came to Canada and being a member of the staff of the Toronto 'Globe' was appointed in 1870 to accompany Col. Wolseley's Red River expedition, and later served with Lord Dufferin on his tour of British Columbia. Upon the forming of the Northwest Territories, he became the first clerk of the Legislature, the first secretary of the Protestant Board of Education and later was appointed sheriff and Indian commissioner. In 1879 he returned to England, where in 1884 he became the first emigration agent and London secretary to the Canadian Pacific Railway. He was at different times editor of the Winnipeg *Standard*, the Montreal *Herald*, and the Manitoba *Free Press*, and in 1888 was president of the Ottawa Press Gallery. He has published: 'A Sea of Mountains,' an account of Lord Dufferin's tour (1877); and 'Under the Mistletoe,' a society play.

Saint John, Henry. See BOLINGBROKE, VIS-COUNT.

Saint John, James Augustus, English author and traveler: b. Carmarthenshire, Wales, 24 Sept. 1801; d. London 22 Sept. 1875. At 16 he went to London and engaged in newspaper work, and in 1827 started the 'Weekly Review.' He lived much of his life abroad, in France, Switzerland, Egypt, and elsewhere, and found material in his travels for many of his works. He contributed to 'Constable's Miscellany' in

SAINT JOHN—SAINT JOHN RIVER

1830 a 'Journal of a Residence in Normandy' and wrote 'Egypt and Mohammed Ali' (1834); 'Anatomy of Society' (1831); 'Manners and Customs of Ancient Greece' (1842); 'Egypt and Nubia' (1845); 'Views in the Eastern Archipelago' (1847); 'Isis, an Egyptian Pilgrimage' (1853); 'Philosophy at the Foot of the Cross' (1854); 'Nemesis of Power' (1854); 'Preaching of Christ' (1856). He also wrote 'Lives of Celebrated Travelers' (1831), a biography of 'Louis Napoleon' (1857), an elaborate 'Life of Sir Walter Raleigh' (1868-9); etc.

Saint John, Sir Spencer, English diplomat, son of J. A. Saint John (q.v.): b. London, 22 Dec. 1825. In 1848 he was appointed secretary to Sir James Brooke in Borneo, in 1850 became secretary to the mission to Siam, and during 1855-61 was consul-general in Borneo. During the years 1861-96 he was consul successively in Haiti, Lima, Bolivia, Mexico, and Stockholm. He was knighted in 1881. He has published 'Life in the Forests of the Far East' (1862); 'Life of Sir James Brooke, Rajah of Sarawak' (1878); 'Hayti, or the Black Republic' (1885); 'Rajah Brooke' (1899).

Saint John, one of the Virgin Islands, Danish West Indies, lying east of Saint Thomas (q.v.); area, 21 square miles. It is of volcanic origin and hilly; only a small portion of the land is cultivated; sugar is the chief agricultural product. Cattle are raised and exported, and bay rum is also exported. Coral Bay, on the east coast, is one of the best sheltered and safest harbors of refuge during hurricanes in the Antilles. The Island was included in the treaty of 1902 for the purchase of the Danish West Indies by the United States, which was rejected by the Danish Folkething. Pop. 925. See WEST INDIES, DANISH.

Saint John, West Indies, the capital of Antigua; situated on the northwest coast, stands at the head of a safe but small bay. The residence of the English governor-in-chief is the principal building. The staple of the island is sugar, which, together with pineapples, forms the chief export trade. Pop. (1901) 9,262.

Saint John, Canada, city and county-seat of Saint John County, New Brunswick, situated at the mouth of the Saint John River on the shores of the Bay of Fundy; on the Canadian P., the Intercolonial, and the Shore Line R.R.'s.; 450 miles from Boston, 480 from Montreal and 275 from Halifax. It is the Atlantic terminus of the Canadian Pacific Railway.

Shipping Interests.—The harbor of Saint John can be entered by ships of any size and has ample accommodations for a very large number. It has always been the principal port in New Brunswick for the shipment of lumber, for it naturally commands the trade of the Saint John River and its tributaries, which flow through one of the great forest regions of the continent. The port is becoming the great winter port of Canada and there are now three elevators, and connected with them berths for seven large steamships which can all be loading or discharging at the same time. Other wharves are being built for the growing trade of the port, the exports of which now amount to \$25,000,000 annually and which are likely every year to increase. The development of the West is making Saint John a very important shipping port and the outlet for

a large proportion of the products of the great prairie region beyond Lake Superior. During the year 1903, 2,724 vessels measuring 1,299,299 tons entered or cleared at Saint John in the foreign trade, and 1,236 vessels measuring 687,742 in the coasting trade. Seven lines of steamships run from St. John to Great Britain during the winter. There is also a line of steamships to Bermuda, Barbadoes, Trinidad, and Demarara.

Saint John has a steamboat connection with Portland, Me., Boston, Digby, Yarmouth, Grand Manan and other points on the sea coast, and with Fredericton and other points on the river.

Business Interests.—Saint John has become a considerable manufacturing centre, and has cotton mills, iron and brass foundries, nail factories, rolling mills, a broom and brush factory, flour mills, and many other industries. The saw-mills at Saint John and vicinity employ about 2,000 persons and form its leading industry. Seven chartered banks and three private banks do business in Saint John.

Public Works, Buildings, etc.—Saint John has an electric railway system, electric lights and a splendid water and sewerage system. It has a large public hospital, fine modern school houses, exhibition buildings, free public library, and other public buildings of a similar character. Its custom house is said to be one of the finest in the world. The city has about 40 churches.

History, Population, etc.—The Saint John River received its name from Champlain, who visited it in the year 1604, and it was at that time the site of an Indian town. The French held possession of the country until the year 1713, when Acadia was ceded to Great Britain, under the Treaty of Utrecht. A fort was built in 1630 by Charles LaTour on the west side of the harbour, which was afterwards from time to time occupied by garrisons until the year 1700, when it was allowed to fall into ruin for about half a century, when, about the year 1758, it was taken possession of by the English and named Fort Frederick. The first English settlement at Saint John was in 1762 when Messrs. Simonds, Hazen, and White began business at what is now called Portland Point and engaged in the fisheries and in the manufacture of lime. In 1783, Saint John received a large accession to its population by the coming of the Loyalists, who had left the old Thirteen Colonies which had become independent. Saint John received a charter and became a city in 1785, and now has a population of 50,000. Pop. (census of 1901) 40,711.

JAMES HANNAY,

Author of 'New Brunswick: Its Resources and Advantages.'

Saint John, Knights of. See JOHN (SAINT).

Saint John, Lake, Canada, in the Chicoutimi district, Quebec, 200 miles by rail north of Quebec, a circular body of water, about 28 miles long and 25 miles broad, drained by the Saguenay River (q.v.). It receives the waters of the Metabetchouan, the Mistassini, the Peribonca, the Ashuapmouchouan, the Ouatichouan, and several smaller streams.

Saint John River, Canada, the largest river of the province of New Brunswick, has its source in the highlands of northern Maine. After a course of 446 miles, it empties into the Bay of Fundy through a rocky gorge about 600 feet wide.

SAINT JOHNS

It enters the harbor through a rocky and sharply defined gorge, having a total fall of about 17 feet. Throughout most of its upper course it forms the boundary between Maine and Canada. Near the sea it is navigable for large steamers and for 75 or 80 miles for smaller craft.

Saint Johns, Mich., village, county-seat of Clinton County; on the Detroit, Grand Haven & Milwaukee railroad; about 20 miles north of Lansing and 100 miles west-northwest of Detroit. It is in an agricultural region and it has considerable manufacturing interests. The chief manufactures are a large table factory, grist mills, lumber mills, carriage work, machine shop, and foundry. There is considerable trade in manufactures and farm products. The three banks have a combined capital of \$185,000. The educational institutions are a high school, public graded school, and a library, which is under the auspices of the Ladies' Library Association. Pop. (1900) 3,388; (1905) 3,768.

Saint John's, Newfoundland, the capital of the colony, situated on the east side of the Island, opposite to the Atlantic, midway between Cape Race and Cape Bonavista, in N. Lat. 47° 33' 54", and W. Long. 52° 40' 18". It is distant 1,601 miles from Cape Clear (Ireland), 1,213 from New York, 885 from Boston, and 488 from Halifax, N. S. The harbor is completely landlocked, with good holding ground, and is entered by a short passage, known as the "Narrows," between high beetling cliffs. The town is situated on the north side of the harbor.

Communication—Saint John's is the terminus of the Newfoundland Railway, which runs across the Island to Port Aux Basques, from whence the palace steamer "Bruce" connects three times a week with Sidney, C. B. It is expected that the Reid Newfoundland Company will soon convert this into a daily service each way. There is a steamship line to Liverpool, England, carried on throughout the year by the Furness Line; to Glasgow, from April to January, by the Allan Line; to New York, by the Red Cross Line; to Philadelphia and Halifax, N. S., by the Allan, Red Cross, and Furness Lines; to Montreal, Prince Edward Island, and Sydney, C. B., by the Black Diamond Line, and freighting steamers. Constant communication is maintained with all parts of Newfoundland and Labrador by the fine steamers of the Bowring and Reid Lines. Each bay has also a local steamer running in connection with the railway.

Shipping Interests.—Saint John's is not only the capital of the colony but the centre of all the business and financial interests of the Island and Labrador. Three Canadian banks, Bank of Montreal, Bank of Nova Scotia, and Royal Bank, have their headquarters in the city. All the principal merchants reside here, all the supplies for the chief business, the fishery, are bought in Saint John's, and the great bulk of the exports shipped from the capital, 90 per cent. of the duties being paid and the revenue collected in Saint John's; 991 vessels of 720,332 tons entered and cleared during the year 1905.

At the head of Saint John's harbor there is a splendid dry dock, built by the government, but now leased to the Reid Newfoundland Com-

pany. It is capable of taking up the largest ships. There is ample warehouse room and the Reid repairing shops are equipped with all the best modern machinery.

Manufactures.—There are several important factories, one of the largest being a rope walk, also biscuit factories, oleomargarine factories, tanneries, breweries, lumber factories, foundries, a large tobacco factory, and an extensive boot and shoe factory, with several minor establishments. The most extensive business is connected with the curing and drying of codfish for foreign markets, about \$8,000,000 worth of fishery products being shipped every year. Seal, cod, and whale oil are manufactured and guano from the whale refuse. Between 300,000 and 400,000 skins of the hair seal are sold to be manufactured into leather and fur abroad.

Public Works, Buildings, Etc.—The Capital of Newfoundland has an electric railway, electric light, and owing to recent improvements one of the finest water services of any town in America. There are very complete telephone and telegraph lines, one belonging to the Anglo-American Telegraph Company, the other to the local government. The town possesses a large public hospital, convalescent home, lunatic asylum, poorhouse, a large Roman Catholic Cathedral, and an Anglican Cathedral, one of the most beautiful of churches, a masterpiece of the late Gilbert Scott, which has lately been restored after being destroyed by fire in 1892. The Customs-house and Courthouse are commodious, but not picturesque. Government House has fine grounds, but the building is very plain. There is no Public Library in the Capital, the town having refused a most liberal offer from Mr. Carnegie.

Education.—The education is strictly denominational, even the Salvation Army having separate schools. The Anglican, Roman Catholic, and Wesleyan bodies have very fine Colleges and good Schools, but no University.

History.—Owing to its unrivalled position in the centre of the great cod-fishing grounds, Saint John's became, from the date of the discovery of North America, in 1497, the centre and metropolis of this great industry. The date of its foundation cannot be exactly determined. Its first inhabitants were part of the fishing ship's crews left behind to build boats, houses, stages, etc., for the fishery. There were 20 houses in Saint John's in 1540. In 1583, Hayes, the survivor of Gilbert's ill-fated expedition, speaks of the town as a "place very populous and much frequented." A large barter trade was carried on between the French, Portuguese, Spanish Basques, and the English fishermen, the principal traffic consisting in selling for cash, or bartering for fish and oil. Mediterranean products, salt, olive oil, fruits, wines, etc., were exchanged for the then as now famous West of England cloth, cordage, cloth caps, and hosiery, and the well-known Sheffield cutlery. There were 20,000 men engaged in this early transatlantic fishery, and the trade was one of the most important of the Tudor age. The American colonists began trading with Newfoundland as early as 1641. By the time of the Revolution, Saint John's did a business of \$4,000,000 with the United States, mainly through Boston and New England.

1. Parliament House, St. John's, N. F.
2. The Governor's Residence.

SAINT JOHNS—SAINT JOHN'S COLLEGE

The town was twice invaded by the French and destroyed by them and their Indian allies. It was recaptured in 1762, by Colonel William Amherst, with the Highlanders and Royal Americans, the last and most gallant fight of the great Seven Years' War. Saint John's was built entirely of wood and has been several times utterly destroyed by fire, once in 1817, again in 1846, and partially in 1892. It has been greatly improved of late years and is now built chiefly of stone and brick and is a well-laid-out city with Roman Catholic and Anglican Cathedrals, numerous other places of worship, Colleges, Schools, Town Hall and Courthouse combined, Parliament House, and other buildings.

Government and Population.—Saint John's is governed by an elected mayor and an elected municipal council of six members. As usual the city debt is large, amounting to \$1,187,222. The total amount of the revenue of the city is \$150,000. The population by the last census (1901) was 29,594, for the city; with the districts of Saint John's East and West, 39,995, divided as follows: Roman Catholic, 21,576; Anglican, 9,556; Wesleyan, 6,737 and other denominations about 2,000.

D. W. PROWSE,

Author of 'The History of Newfoundland, from the Records.'

Saint Johns, Quebec, a town, the county-seat of Saint Johns County, situated on the Richelieu River, 27 miles southeast of Montreal. It is a port of entry and a station on the Grand Trunk, Canadian Pacific, and Central Vermont R.R.'s. The principal manufactures are earthenware and silk goods. Large quantities of lumber and agricultural products from the lower Champlain region are exported through Saint Johns, the exports amounting to nearly \$3,000,000 annually. Pop. (1901) 4,030.

Saint Johns, a river in Florida; the source, Lake Poinsett in Orange County, is about 12 miles from the Atlantic Ocean. The river flows north, nearly parallel with the coast, and enters the Atlantic about 15 miles northeast of Jacksonville. The total length is about 350 miles. It flows through swamps, ponds, and lakes; luxuriant vegetation is along its banks the greater part of the course. In some places are large trees, their green foliage intermingled with feathery brown and gray mosses which hang down to the ground. Reptiles are numerous in the marshes. In the north part of its course the land is higher and dryer. It is navigable to Enterprise in Volusia County. See FLORIDA.

Saint John's Bread. See CAROB-TREE.

Saint John's College, an institution located at Toledo, Ohio, under the direction of the Fathers of the Society of Jesus. The college was opened in September 1898, was incorporated on 22 May 1900 and on 29 Aug. 1903 the power to grant degrees, under an amended charter, was ratified by the Secretary of State. The college is divided into academic and collegiate departments. The academic department consists of a four years' course in the study of English composition and literature, Latin and Greek, algebra, history, German, elocution, and the principal business courses. The collegiate course is known as the college course of liberal arts, which, including mathematics, natural

science, a higher course in religion, a study of history from the Catholic viewpoint, and a course in mental philosophy, leads to the degree of B.A. French and Spanish, drawing and typewriting, are also taught. There is also a meteorological observatory connected with the college. In 1904-5 the students numbered 157; the faculty, 15; volumes in the library, over 2,000.

Saint John's College, Cambridge, England, was founded by Margaret, countess of Richmond and Derby, mother of King Henry VII., in 1511, mainly through the exertions of Fisher, bishop of Rochester, then chancellor of the university, who raised sufficient funds to endow 32 fellowships. The college replaced Saint John's Hospital founded in the 12th century, and now consists of a master, at least 56 fellows, 60 foundation scholars, and nine sizars; both fellowships and scholarships being open to all British subjects. Five fellowships are professorial fellowships to be held by professors of the university. There are three divinity studentships of the value of about \$400, tenable for three years, and open to the competition of Bachelors of Arts not of sufficient standing to take the degree of M.A.; also four law studentships of the value of \$450, tenable for four years; and a Hebrew scholarship of the value of \$160, tenable for three years. Some \$33,500 are expended annually in assisting deserving students of the college, and there are a number of prizes which are awarded on the results of the annual examinations. The college has the patronage of 52 church livings. The buildings include four courts chiefly of brick; the new court (1826) across the Cam, built of stone, is united by an ornamental covered bridge, commonly called the "bridge of sighs," with the third court. The chapel (1869) is by Sir Gilbert Scott, and is a fine specimen of the Early Decorated style. The combination-room, 93 feet long, and the library (1623), are curious and striking. Ascham, Ben Jonson, Bentley, Rowland Hill, Wilberforce, Wordsworth, and Lord Palmerston were members of the college.

Saint John's College, Oxford, England, a college founded in 1555 by Sir Thomas White, a London alderman, for a president, 50 fellows and scholars, a chaplain, an organist, six singing men, eight choristers, and two sextons. Some of the buildings belong to the earlier college or Saint Bernard dating from about the middle of the 15th century. With buildings added at subsequent dates the whole form a picturesque group. Under the present statutes the college consists of: (1) Not less than 14 nor more than 18 fellowships, of which seven may be official fellowships, the rest tenable for seven years. To these may at future times be added two *ex-officio* fellowships to be held by the Laudian professor of Arabic and the professor of civil engineering. (2) Not less than 28 scholarships, of which six shall be open, 15 appropriated to Merchant Tailors' School, two to Coventry School, two to Bristol School, two to Reading School, and one to Tunbridge School. (3) Four senior scholarships confined to former pupils of Merchant Tailors' School. There are also the Holmes Scholarship, tenable for five years; the Lambe Scholarship, tenable for four years; the four Casberd scholarships of \$400 each per

SAINT JOHN'S COLLEGE—SAINT JOHN'S-WORT

annum, and certain exhibitions for undergraduates not on any foundation, and of at least one year's standing in the college. There are also four fellowships, tenable for 14 years, open with certain limitations and under certain conditions in respect of literary proficiency, first to the kindred of the founder, Dudley Fereday of Ettingshall Park, Stafford, secondly to natives of Staffordshire, and then to any other person whatsoever. Thirty-three church livings are in the patronage of the college.

Saint John's College, located at Annapolis, Md. It was chartered in 1784, and opened to students in 1789, but is the direct successor of King William's School (founded 1696), which in 1784 was merged into the college, thus being one of the oldest institutions of collegiate grade in the United States. The work of the collegiate department is arranged in four courses, classical, Latin-scientific, scientific, and mechanical engineering; in each course certain studies are required and others are elective. The degree of A.B. is conferred for the completion of the classical and Latin-scientific courses; the degree of B.S. for the scientific and mechanical engineering courses. Graduate work is provided for, leading to the degree of A.M., and there is a preparatory school. Instruction in military science and military drill are a part of the curriculum, required of all students. The State provides one full State scholarship for each senatorial district, and in addition 26 scholarships for tuition only, to be distributed among the counties in order of priority of application; there are also other scholarships. In 1904, the grounds and buildings were valued at over \$250,000; Henry Williams Woodward Hall, the new science building, was erected in 1900; the library in 1904 contained 8,200 volumes. The annual income of the year 1903-4 was \$55,000; the students numbered 163, and the faculty 13.

Saint John's College, an institution in New York, opened 24 July 1841, under the auspices of the Roman Catholic Church. The land upon which the college stands is a part of the old Dutch village of Fordham, and is of historic interest. In 1639 the land between the Harlem and Bronx rivers was purchased by the Dutch West India Company, from three Indian sachems. In 1694 the land which is now the college property came into possession of the Corsa family. The farm was known as "Rose Hill," a name which still clings to the place and by which the college was known in earlier years. In 1787 the "Rose Hill" farm was purchased by John Watts and later it passed through several owners to Horatio Shepherd Moat. In 1838 Moat built the stone house which is now the central college building, and which contains the principal offices and the reception room. In 1839 the new house and a farm of 80 acres was purchased by John Hughes (q.v.), the coadjutor bishop of New York, for \$29,750. John McCloskey (q.v.) was first president, and for the five years the college was in charge of secular priests, four clergymen, who afterward became bishops, three who became archbishops, and one a cardinal, were associated with its government or were members of the faculty. On 10 April 1846 the Act of Incorporation was passed which made the school a university with power to grant all degrees usually granted by a

university. In 1846 and 1860 the Fathers of the Society of Jesus bought the buildings and a portion of the 80-acre tract and took charge of the college. It still (1904) remains one of the Jesuit schools. The area of the college grounds is (1904) 70 acres, bounded east and south by Bronx Park (q.v.). The group of gray stone buildings presents an attractive and imposing appearance; the 1904 addition to the buildings, a hall built on the site of the "Rose Hill Manor House" (1690), cost about \$130,000.

The college includes four departments under the same management; the college department furnishes the usual four-year course leading to the degree of B.A.; the academic furnishes a four-year course and prepares for college; the commercial, and the preparatory departments. There are seven scholarships, which have been endowed by friends of the school who designed to aid worthy students. Social life as well as intellectual is fostered by the various college societies. The number of pupils in attendance, in 1904, was 442. Some of the noted alumni are Archbishop Farley, of New York, Mgr. J. F. Mooney, vicar-general of New York, Bishop Hendricks, of Cebu, Philippine Islands, Morgan J. O'Brien, New York, and John T. McDonough, supreme court justice, Philippine Islands.

Saint John's College, located at Washington, D. C. It is the outgrowth of Saint Matthew's Institute, founded in 1870 by the Brothers of the Christian Schools (Roman Catholic); its name was changed to Saint John's Collegiate Institute in 1880, and to Saint John's College in 1887. The ideal of the college is to give a scientific and business education. There are three departments—collegiate, academic (secondary), and preparatory (elementary). The collegiate department offers two courses, English-science, leading to the degree of B.S., and commercial course, for completion of which a commercial diploma is granted. The English-science course includes instruction in French and German; drawing is taught in all three departments. The grounds and buildings in 1904 were valued at over \$150,000; the library contained 5,000 volumes. The students in 1903-4 numbered 150, the faculty 12.

Saint John's Eve. See JOHN'S, SAINT, EVE OF.

Saint John's River, Quebec, the local name near the town of Saint John, of the Richelieu River (q.v.).

Saint John's University, in Collegeville, Minn., founded in 1857 and chartered the same year. It is a Roman Catholic institution in charge of the Order of Saint Benedict. In 1869 the school was granted power to give degrees; and in 1878 it was further empowered by Leo XIII. to grant the degrees of doctors in theology, philosophy, and canon law. In 1883 it received from the legislature of Minnesota the title of university. In 1902-3 there were connected with the school 39 professors and instructors, and 331 students. The courses lead to the degrees of A.B. and B.S. The preparatory department prepares for the university. There is connected with the school a business department.

Saint John's-wort, a large genus (*Hypericum*) of plants of the family *Hypericaceae*. They

SAINT JOHNSBURY — SAINT JOSEPH

are to be found nearly everywhere in the temperate and torrid zones, and are often shrubs or small trees. The foliage is pellucid punctate or black-dotted, and the leaves and blossoms emit, when bruised, a strong, resinous-aromatic odor, and have a bitter taste, due to an oil possessing astringent and tonic properties, and which held a prominent place in old pharmacopœias. The flowers are perfect and five-merous, borne solitary or in cymose panicles, and are generally yellow. *Hypericum perforatum*, to which formerly the name of Saint John's-wort was limited, has its leaves marked with pellucid dots, somewhat simulating perforations. It is a European plant which has become naturalized in our country, and is a troublesome weed. It is a very smooth, shining herb, sometimes two feet high, with opposite oblong leaves, and bright-yellow flowers in broad terminal cymes. Both petals and leaves are black-dotted. Its yellow, acrid resinous juice will stain the skin purple, and was believed by Dr. Torrey to cause inflammatory trouble in cattle. The dried plant dyed wool yellow.

Tradition states that the Saint John's-wort was so called because blood-like spots appeared on its foliage immediately after the Saint was beheaded, and re-appeared on the anniversary of the date. It was regarded as a universal panacea, and perhaps possessed some curative qualities, especially in external use. It was supposed to preserve persons and property against lightning, but was still more in demand as a preventive of witch-visits, or those of other evil spirits, perhaps because, according to tradition, a baptized person anointing the eyes with the green juice of its inner bark could see witches. Italians gave it the name of "devil-chaser." It was not only worn as an amulet, but was hung over doors and windows; yet it was not safe to tread on it after dark, since the luckless wight that bruised it might be snatched up on a fairy horse and carried about all night; Saint John's-wort, plucked on midsummer night's eve took its place among the love-charms.

Saint Johnsbury, Vt., town, county-seat of Caledonia County; on the Passumpsic River, and on the Boston & M. and the Saint Johnsbury & L. C. R.R.'s; about 34 miles east-northeast of Montpelier. It was settled in 1786 by Jonathan Arnold; and incorporated in 1884. It is in an agricultural region in which there is considerable attention given to dairying; but the principal industry is the manufacturing of the Fairbanks scales. There are about 1,000 men employed in the Fairbanks Scales Works, and an equal number in the combined smaller manufacturing. There are nine churches and one hospital. The educational institutions are the Saint Johnsbury Academy, Notre Dame Academy, public and parish schools, Saint Johnsbury Athenæum and a free library, and the Fairbanks Museum of Natural History. The four banks have a combined capital and deposits of \$2,000,000. The government is vested in a board of trustees. Pop. (1890) 3,857; (1900) 5,666.

CHARLES A. WALTER,
Editor (*Saint Johnsbury Republican*.)

Saint Joseph, Mich., city, county-seat of Berrien County; on Lake Michigan, at the mouth of the Saint Joseph River, and on the

Cleveland, C. C. & St. L., the Père Marquette, and the Saint Joseph, S. B. & S. R.R.'s; about two miles south of Benton Harbor and 23 miles north by west of Niles. It has steamer connection with the Lake Michigan ports. It is in an agricultural region, noted especially for its peaches and other fruit. The chief industrial establishments are flour and grist mills, lumber mills, fruit-basket and box factories, machine shops, lumber mills. In the government census of 1900 there are given 75 manufacturing establishments, with 933 employees. The annual value of the products was \$1,308,277. There is an extensive trade in peaches, apples, and lumber. The two state banks have a combined capital of \$50,000. The educational institutions are a high school, public elementary schools, and a public library. Pop. (1890) 3,733; (1900) 5,155.

Saint Joseph, Mo., city and county-seat of Buchanan County, the third city in size and wealth in Missouri, and located on its western border on the east bank of the Missouri River, 131 miles southeast of Omaha.

History.—In 1826, Joseph Robidoux, born in Saint Louis of French parentage, established a trading post at this point known as the "Black-snake Hills," and thus became the founder of the city, which he later christened with his own name. For hundreds of miles on every side, the whole country was then an unbroken wilderness, inhabited only by the aborigines, who gained a scanty subsistence by trapping and hunting. The furs and pelts of the wild animals they killed soon became a source of extensive traffic between the trader and his Indian neighbors. The famous "Platte Purchase" was accomplished through a treaty with the Indians, dated 17 Sept. 1836. The trading post grew into a town, incorporated in 1845, and then into a city, incorporated in 1851. Its growth at first was not rapid, but steady and gradual. Planted, however, in the midst of one of the finest and wealthiest agricultural sections of the United States, and drawing to itself the larger part of the trade that came from the country to the westward, it later on began to assume a more vigorous and rapid growth. In 1880 it had a population of 32,431; (1890) 52,324; (1900) 102,979; and (1903) 120,000.

Trade.—The development and extension of the business and material resources of the city kept pace with its increase in population. As a distributing point for the entire West, from the Mississippi River to the Pacific Ocean, it has but few rivals, and, outside of Saint Louis and San Francisco, no superiors. In 1903 it had 48 large wholesale establishments engaged in all branches of trade, with over 1,200 traveling men in the field, selling goods to the retail merchants in almost every town and hamlet throughout this vast region of country lying to the westward. The volume of the jobbing business of the city for the year 1902 exceeded \$65,000,000, and the manufacturing output was over \$25,000,000. This is exclusive of the retail trade, which has been correspondingly large.

Schools, Churches and Charities.—The school census, taken pursuant to the requirement of State law, shows that the children of school age, ranging from 6 to 20 years, number 35,865. A large portion of these are in actual attendance upon the public schools, housed in 32 public school buildings and taught by 278

SAINT JOSEPH

teachers. The most imposing of the school houses now in use is the High School building, erected in 1894-5 on a commanding hill overlooking the city, and involving an expenditure of \$113,534. From it and its humble predecessor 1,107 graduates have been sent forth, since the establishment of a high school course in 1868. All the public school buildings, with the grounds on which they are situated, are valued at \$898,412. The attendance upon the private schools is likewise large, and the buildings used for that purpose correspondingly valuable. In the city are 66 church buildings, owned and used by the different denominations as follows: Baptist, 11; Christian, 4; Jewish, 2; Congregational, 2; Episcopal, 4; Lutheran, 3; Evangelical, 2; Methodist Episcopal, 11; Methodist Episcopal South, 7; Presbyterian, 8; Catholic, 8; Reformed, 1; Unitarian, 1; Christian Science, 1; Latter Day Saints, 1. The aggregate value of this church property is in excess of \$1,000,000. The Young Men's Christian Association building was erected in 1886-7 at a cost of \$60,000, and four years later the Young Women's Christian Association took possession of its handsome home on 10th Street. The Memorial Home for the support and care of helpless and needy old people, and the Home for Little Wanderers, for the sheltering and rearing of poor and neglected children, built and endowed by charitably disposed citizens at an outlay of nearly \$100,000, are substantial structures, worthy of their founders and supporters. The most important charitable institution, however, in Buchanan County, is Hospital No. 2, for the care of the insane, located just east of the city limits, erected and sustained by the State. The original building, which was erected in 1873 at a cost of \$200,000, burned down in 1879, but was at once rebuilt, and has since been added to and improved at a total cost of about \$500,000. The institution, which is a very capacious and imposing structure, has a capacity of 1,350 patients, and requires the services of 205 employees. It is modern in all its appointments, and its management has always been a model of excellence.

Public Buildings.—The court-house, built anew in 1873-5 at a cost of \$173,000, injured by fire and rebuilt in 1885, is in the shape of a Maltese cross, and is a very imposing and capacious structure. Here two divisions of the circuit court, a criminal court, a county court, a probate court and several inferior courts are in continuous session most of the year. Here also are located the offices of the county officials. The United States circuit and district courts are held in the Federal building, finished in 1890, involving in its erection an expenditure of \$345,000. In this building are also located the post-office, the United States internal revenue office and the surveyor of customs and his assistants. Even thus early after its completion the building has been found to be wholly inadequate to meet the demands of the public service; and Congress in 1903 appropriated \$225,000 for the purpose of enlarging it to more than double its present size and capacity. There are now in the post-office proper 80 employees, whose yearly salaries aggregate about \$96,000. The receipts of the post-office for the fiscal year ending 30 June 1903 aggregated \$191,249. The receipts at the South Saint Joseph post-office, located in the stock yards

district, amounted to \$19,240 for the same period. A city-hall and market house was erected in 1873 at a cost of \$50,000, which serves the purpose of a market place on the ground floor, and of offices for the numerous city officials in the upper stories. The city is the owner of two public library buildings, one erected in 1902 in the southern part of the city, at a cost of \$25,000—the other erected in 1900 in the central part, at a cost of \$106,534. Though in their infancy, there are 27,500 volumes on the shelves of these libraries, accessible to the free use of the reading public. Saint Joseph has two large opera houses of modern construction and equipment, with a seating capacity of 1,785 and 1,740, respectively, beside a large number of smaller places of amusement. The Commercial Club, assisted by the Board of Trade, looks after the commercial interests of the city. Both organizations occupy the Chamber of Commerce, built in 1884-5 at a cost of \$105,000. Almost \$100,000 have been already subscribed toward the building of a Convention Hall. This subscription is expected to be largely increased in the course of the next few months, when the work of building will be commenced. The city has 50.68 miles of paved streets, 59.33 miles of main and district sewers, a number of hotels and hospitals, one convent, two elevators, several flouring mills, many factories and five parks, all except one being small in size, but all in an excellent state of improvement. There are 21 newspapers published in Saint Joseph, 5 daily, 9 weekly and 7 monthly.

Light and Water Plants.—The city owns an electric light plant, representing in its construction an expenditure of over \$100,000, and which will be enlarged in the near future to twice its present capacity, in order to meet the demands for additional street lighting, resultant from the recent growth of the municipality. In 1902 there was consumed in the city 180,000,000 feet of gas, at a cost to the consumer of \$1.00 per thousand cubic feet. The gas plant, which was built in 1878 and has been in almost continuous extension and improvement since that time, now represents an investment of about \$1,000,000 of money expended in construction. It has in use 56 miles of main pipe and has a capacity of furnishing 2,000,000 cubic feet of gas every 24 hours. Saint Joseph is supplied with water through an extensive system of waterworks, first built in 1879, and improved and extended since that time, until it now represents in cost of construction an expenditure of over \$1,800,000. The water is pumped from the Missouri River, at a point about three miles above the city, into reservoirs and settling basins, located on a hill 317 feet above the level of the river, and is clarified and purified by means of these basins and the Jewell system of filtration. It is then emptied into water mains, which now aggregate 92 miles in length, and is carried by the force of gravitation to the fire hydrants, 794 in number, and to the myriad points of distribution for the consumers throughout the city.

Railroads.—Saint Joseph has 38 miles of electric street railway, with an extensive electric plant connected therewith, to furnish the motive power for its operation. The equipment of cars, both in number and perfection of construction, is such as to satisfy the demands of street railway travel. By a systematic course of super-

SAINT JOSEPH — SAINT JOSEPH'S SEMINARY

vision and improvement the whole system has been kept at all times in splendid condition. In 1902 there was a change of ownership in the street railway plant, the purchasers paying therefor as an investment the sum of \$4,000,000. The city is connected with the outside world by nine railroads, including one in course of construction in 1903. Three lines run to Chicago, three to Kansas City, two to Saint Louis, two to Omaha, one to a connection with the Union Pacific railroad at Grand Island, Neb., and two others traverse that vast territory lying to the west and southwest. Most of them use the Union Station, erected in 1896 at a cost of \$126,000. During the year ending 1 Sept. 1903 there were 438,800 pieces of baggage handled at this station. Two of the railroads centring in the city cross the railroad, wagon and foot bridge, which spans the Missouri River at this point, built by the city in 1872 at a cost of \$716,000. This bridge is about to be enlarged by the two railroad companies using it, so that it will be greatly strengthened and its capacity doubled.

Stock Yards.—A great impetus was given to the growth and prosperity of the city by the improvements and extensions made at the stock yards located at this point, which were begun in the year 1897, and which have been carried on extensively ever since. The stock yards proper consist of 500 acres of land, 80 acres of which are covered by the pens and sheds. There are 20 miles of railroad tracks upon the grounds, and five packing houses engaged in the slaughtering of animals, three of them, Swift & Company, Nelson, Morris & Company, and the Hammond Packing Company have erected large and extensive plants here at a cost of several millions of dollars. A part of the Hammond Packing Company's plant was burned 5 July 1903, but is now being rebuilt on a much more extended plan than before. During the 12 months, ending 1 Sept. 1903, there were slaughtered by these houses 645,694 cattle, 1,681,784 hogs and 637,033 sheep, a large increase, except in the killing of hogs, over the business of the preceding year. During the same period there were 21,407 horses and mules bought and sold, and 51,642 cars of stock handled at the stock yards. There is also a packing house at this point located outside of the stock yards, which does a large business, not included in the foregoing statement.

Financial.—There are nine incorporated banks doing business in Saint Joseph, three national and the other six organized under the banking laws of the State. The Comptroller of the Currency at Washington and the Secretary of State at Jefferson City called for statements from these banks, showing the conditions of their business on 9 Sept. 1903. All responded, making their statements under oath, from which it appears that the entire resources of all the banks in the city, at the close of business on that day, was \$19,478,855.19, and that they had on deposit \$17,371,533.20. The clearings of the five banks belonging to the clearing-house for the 12 months ending 30 Sept. 1903 aggregated \$249,736,100.01. The city has a bonded debt, less the sinking fund in the treasury applicable to its payment, of \$925,562.15. This outstanding indebtedness is in bonds, bearing $3\frac{1}{2}$ and 4 per cent interest in about equal proportions for each rate. There is no floating debt, the city charter

prohibiting the contracting of any debt, without there being money in the treasury with which to pay it. The assessed valuation of property in the city, made upon a basis of about 40 per cent of its actual value, is \$30,240,120.

Government.—Saint Joseph is governed by a mayor, elected for two years, who is the chief executive officer of the city, and by a common council, entrusted with the enactment of all municipal legislation, whose members are elected for four years, one member from each ward of the city, but chosen by the voters of the whole city, the terms of one half expiring every two years. The city has also a board of public works, charged with originating and recommending to the council all ordinances for the improvement of the streets and other public works, and superintending the construction thereof. This board is appointed by the mayor, comptroller and auditor, not more than two members of which can belong to the same political party. There is also a board of park commissioners, to which is committed the custody, improvement and management of the parks, and a board of police commissioners, appointed by the governor, which has charge of the selection and control of the police force and the enforcement of the police regulations. The public schools are controlled by a school board consisting of six members, one half chosen from each of the two leading political parties, so as to free the management of the schools as much as possible from partisan bias. They serve without pay, and their terms of office are so arranged that two of them expire every two years. The fire department, under the control of the mayor and council, consists of a chief, his assistant and 70 firemen, located in 12 firehouses, distributed throughout the city, and equipped with all the engines, hose, ladders and other appliances needed for extinguishing fires.

Bibliography.—Barns, 'The Commonwealth of Missouri' (1877); 'Encyclopedia of the History of Missouri' (1901); 'History of Buchanan County, Missouri' (1881); 'Buchanan County and Saint Joseph' (1898); 'Saint Joseph Directory' (1903).

B. R. VINEYARD,
Saint Joseph, Mo.

Saint Joseph, an island belonging to the province of Ontario in Canada. It is at the mouth of Saint Mary's River, and near the mainland of both Michigan and Ontario. There are many high bluffs and large rocks on the coast, but nearby the whole of the surface is covered with trees, shrubs, and flowers.

Saint Joseph, (1) A river in Michigan whose source is in Hillsdale County. It flows west-northwest, then south into Indiana, west, then northwest, returning to Michigan and entering Lake Michigan at Saint Joseph (q.v.). South Bend, Ind., is on the banks of this river, at the head of navigation. Its total length is about 250 miles. (2) Another river of the same name rises in the southwestern part of Michigan, crosses the northwestern corner of Ohio, enters Indiana, and flows southwest and unites with Saint Mary's River at Fort Wayne, to form the Maumee (q.v.). Its total length is about 100 miles.

Saint Joseph's Seminary, a theological school at Yonkers, N. Y. The local name for the place is Dunwoodie. The seminary belongs

SAINT-JUST — SAINT LAWRENCE RIVER AND GULF

to the archdiocese of New York, but the attendance is not limited to any locality. The history of the school begins as far back as 1833, when Bishop Dubois began at Nyack, N. Y., the erection of a school on the plan of Mount Saint Mary's (q.v.), Emmitsburg, Md. The corner stone was laid 29 May 1833, but the institution was destroyed by fire before it was finished. Later the project of establishing the school in Brooklyn was proposed, but soon abandoned. The next location, selected by Bishop Hughes, was Lafargeville, Jefferson County, N. Y. A school was opened here, 20 Sept. 1838; but it was soon abandoned, as it was too far from New York. The Lafargeville school was intended for both theological and secular studies. The school was removed to Fordham, N. Y., in 1840 and is now known as Saint John's College (q.v.). The theological department was moved, October 1864, to a new home, and Saint Joseph's Seminary, Troy, N. Y., was opened in charge of professors from the University of Louvain, Belgium. The present seminary at Yonkers is on a beautiful tract of land, and built on the eminence known in history as Valentine Hill. The land was purchased in 1890 by Archbishop Corrigan (q.v.), and the new seminary was dedicated 12 Aug. 1896, and placed in charge of the Sulpician Fathers. In May 1898, one of the gifts presented to Archbishop Corrigan in honor of his silver jubilee was the certificate of the entire liquidation of the debt upon the seminary. The seminary chapel was built entirely at the personal expense of Archbishop Corrigan.

The conditions for admission are (1) a well-formed desire to study for the priesthood, (2) entrance examination, (3) must have completed a good classical course, (4) the permission of the bishop of the diocese to which the applicant belongs. The courses of study demand a large amount of work: as, the course in Sacred Scripture is for five and one half years, and the regular class work is supplemented by an academy or seminary composed of interested students who meet once a week to discuss particular questions. In connection with this department there are two courses of Hebrew, and instructions are given in other Semitic languages. All the other courses are equally thorough. In addition the students regularly visit hospitals, penal and charitable institutions, and teach in Sunday schools. In 1904 there were connected with the seminary 17 professors and instructors and 157 students. The library, in the centre of the main building, contains about 30,000 bound volumes.

Saint-Just, sǎn zhüst, **Antoine Louis de**, French patriot: b. Decize (Nièvre) 25 Aug. 1767; d. Paris 28 July 1794. He studied law at Rheims, but devoted himself almost exclusively to literary pursuits until the outbreak of the Revolution, when he became one of its most notable participants. His political career as deputy from Aisne to the convention at Paris in 1792 began with his famous oration setting forth his reasons for voting for the death of Louis XVI. Because of his youth he has been called the instrument of Robespierre, with whom he was closely associated throughout the Revolution. But the extreme measures attributed to him were undoubtedly undertaken

through intensity of personal conviction. In 1793 he was made president of the Convention, and in 1794 was responsible for the execution of Danton, Hébert, and Desmoulins. But the Revolutionary Tribunal, whose acts he had so mercilessly directed, was destined to be dissolved. In July 1794 Robespierre and Saint-Just were executed upon the same scaffold by order of the Committee of Public Safety. The political works of Saint-Just were published in 1833-4. Consult: Fleury, 'Saint-Just et la Terreur' (1851); Hamel, 'Histoire de Saint-Juste' (1859); Aulard, 'Les Orateurs de la Legislatif et de la Convention' (1879-81).

Saint Kil'da, Scotland, an island of the outer Hebrides, belonging to Harris in Inverness-shire and lying 40 miles west of North Uist. It is three miles long by one mile broad with shores rising in perpendicular cliffs from the water's edge. The highest point is Conna-Ghair, a gigantic precipice 1,220 feet high. The richness of the verdure softens an otherwise bleak and forbidding landscape. There are about 40 acres of arable land, and sheep are raised. Sea-birds, petrels, etc., which supply feathers, oil, and meat, form the chief source of income. The fisheries are productive but neglected. The population from 110 to 1851 had dwindled to 71 in 1891. The natives speak Gaelic and inhabit a little village at the head of East Bay.

Saint Kitts, West Indies. See SAINT CHRISTOPHER.

Saint-Lambert, Jean François, zhǎn frān-swǎ sǎn lǎn-bār, MARQUIS DE, French philosopher and poet: b. Nancy, France, 26 Dec. 1716; d. Paris 9 Feb. 1803. He was for many years attached to the court of Stanislaus of Poland when that prince lived in Lorraine, and for a time he served in the French army. He won literary recognition by a volume of descriptive verse, 'Les Saisons' (1796), which received extravagant praise at the time but possessed little merit. His present fame seems to rest upon the fact that he was the successful rival in love of both Voltaire and Rousseau. His 'Fugitive Poems' (1759) and 'Stories' (republished 1883) possess considerable merit, and his 'Universal Catechism,' though somewhat materialistic, was approved as a text-book on ethics by the Institute in 1810.

Saint Lawrence, lá'rěns, an island belonging to Alaska, in Bering Sea, intersected by lon. 170° W. and lat. 63° N. It is about 100 miles long and 34 miles wide, and is about 500 feet, at the highest point, above the sea. It is inhabited by Eskimos who are engaged chiefly in fishing.

Saint Lawrence, Cape, Canada, the north-west projection of Cape Breton Island, Nova Scotia, on the Gulf of Saint Lawrence.

Saint Lawrence River and Gulf. The Saint Lawrence River is in North America; its head-waters are about lon. 93° W., and its mouth near lon. 66° W. The total length from the source of the Saint Louis in Minnesota to its entrance to the Gulf of Saint Lawrence at Anticosti Island is 2,200 miles. The area of the basin is about 530,000 square miles. The area of the water surface of the Saint Lawrence River system, including all the rivers and lakes,

SAINT LAWRENCE RIVER AND GULF

is 95,300 square miles. The area of that portion of the basin which is drained by the Great Lakes is nearly 200,000 square miles. The length of the shore line of the Great Lakes and their rivers is 5,400 miles. This system is the only large one in North America whose main stream flows from west to east, and the only large system, except Columbia, whose main stream does not run in the direction of the greatest extent of the continent.

Formation of Lakes.—Prior to the Glacial period the land area of this region was greater than at present, and broad valleys were excavated by the rivers. With but few exceptions the last formed rocks in this great depressed region belong to the latest formations of the Palæozoic strata. The whole region was under ice-cover during the Glacial period. This vast body of ice moved southward, elevations were worn down, the rocks were carved in fantastic designs, new grooves were formed, and the entire topography was changed. In addition to change of form produced by the movement of the great mass of ice, other and equally great changes were made by the vast amount of debris deposited by the glacial drift. Of this debris one peculiar formation is found in the rocks in Ohio, western New York, and other places, where angular and somewhat rounded stones are imbedded in boulders or striated with rocks. Another is the arrangement of the boulders, showing in many places their removal from their original beds. Sand, clay, and gravel, were washed by the streams into long lines, so that in the Saint Lawrence basin great sand belts extend across the country for miles, and are usually found on the lowlands, at the places that were once edges of ice-coverings. The rocks formed before the Glacial period are in some places covered by glacial deposit for from 100 to 200 feet. On the south side of the Saint Lawrence, at the lower foot-hills of the Adirondacks, may be found rock layers considerably below the surface. Old river channels were dammed, old valleys filled up, and new drainage channels formed. The new sub-basins were changed by the glacial deposit and the removal of former divides. The depressions where the Great Lakes are now were formed in part when the southern margin of the glaciers was obstructed north of the divide which extended through New York, Ohio, Indiana, Illinois, and toward the Northwest by the ice-block. The glacier south of the divide discharged its melted waters through streams flowing generally south. The outlets of the glacial streams from the north ice-covering were at first southerly. One was through New York State, near Ithaca, and through a portion of the Mohawk and Hudson River valleys to the Atlantic Ocean. Another was south of Lake Michigan along channels into the Mississippi Valley and to the Gulf. Another was from Lake Erie by way of Fort Wayne. At first there were only small but numerous depressions along the south margin of the northern glacier. They grew broader as the ice retreated slowly, and gradually merged into each other until the vast lake basins were formed which still preserve proof of their age in the Palæozoic strata that has undergone but little change. Mechanical and chemical agencies and erosion removed rocks and graded the lake beds.

The ancient beaches of the early lakes show that at one time the water occupied a greater space than at present. The Iroquois beach, south of Lake Ontario, is quite distinct, and shows that the old lake was much larger than the present Ontario (see NEW YORK). The ancient lake is supposed to have extended north to the glacier. There are shore-line marks south of Lake Erie some distance from the present shore line, and from 175 to 220 feet above the lake as it is now. East of Lake Huron are beaches showing a shore line from 25 to 260 feet above the present lake. This record of an ancient large lake is called Algonquin beach. The broad beaches of the ancient lake, of which the present Superior is a part, are on the north shore and extend the whole length. They range from 100 to 600 feet above the surface of the present lake. The soils within the area of the lake-beaches now beyond the lake limits differ from the soils farther inland. They possess many of the characteristics of inundated lands. The beach lands are not alike; near Lakes Ontario and Erie are masses of yellow sands, in some parts approaching a gravel, and between are large clay deposits. The Lake Superior beaches of the old lake show broad clay coverings, pinkish in color. The combined area of the lakes north and west of Superior which flow into Superior, is equal to one of the large lakes. (See articles on each one of the GREAT LAKES.)

The Rivers.—The main stream of the system was the last to assume its present form, when the ice covering left the region and the waters began the formation of channels extending to the sea. The streams from the divides gradually made their way to the lowest points of the valley, and entered the main stream. The main outlet channel, or the river Saint Lawrence, may be said to have its source at Lake Ontario and to extend to below Quebec, to the island of Orleans, where it becomes an estuary. From Lake Ontario until it becomes a tidal stream it is a surface river, of which the waters are remarkably clear. The distance from Lake Ontario to the Gulf is 750 miles. The descent from Lake Ontario to tide water is 230 feet. The Saint Lawrence forms the boundary line between the United States and Canada to lon. $74^{\circ} 15' W.$, after which its course is wholly in Canada. In width the Saint Lawrence varies from one to three miles, until it broadens into a very wide stream; at Cape Gaspé it is over 50 miles wide. Just after leaving the United States boundary, the river expands and forms what is called Lake Saint Francis, and a little above the city of Three Rivers is another expansion called Lake Saint Peter. The chief tributaries are the Ottawa, Saint Maurice, Saguenay, from the north, the Chaudière, Richelieu, Saint Regis, Racquette, Grasse, and Oswegatchie, from the south. The Richelieu brings to the Saint Lawrence the waters of Lake Champlain. There are numerous beautiful islands in the Saint Lawrence; at the beginning of the main outlet, near Lake Ontario, there is a group (about 1,500 in all) called the "Thousand Islands." These islands are famous summer resorts.

The Estuary and Gulf.—The estuary beginning below Quebec, is 250 miles long, with an extreme width of 35 miles until it flows beyond Anticosti Island, where it widens, as has been

SAINT LAWRENCE STATE HOSPITAL — SAINT LEGER

mentioned, at Cape Gaspé to over 50 miles. The greater part of the Gulf and the estuary are submerged portions of the river valley. A submerged river channel 800 feet wide has been traced to the eastern edge of the continental plain, about 100 miles from the present coast line. The marine shells found in the sands and clays above Montreal show that at one time the estuary began much farther up the stream than at present. The Gulf of Saint Lawrence has its mouth in the large island, Newfoundland. It enters the Atlantic by three channels; Cabot Strait, between Newfoundland and Cape Breton, about 65 miles wide; Strait of Belle Isle, between Newfoundland and Labrador; and Gut of Canso, between Nova Scotia and Cape Breton Island. The principal islands in the Gulf are Prince Edward Island, Magdalen Islands, and Anticosti.

Navigation.—Ocean steamers of the largest size ascend the Saint Lawrence to Quebec, and large vessels go as far as Montreal. Above are several rapids, and in Niagara and Saint Mary's River are falls. Steamers coming down the river often pass through the channels between the rocks of the rapids, but ascending the stream they have to go through canals which have been built to overcome the obstructions to navigation. The Welland Canal (q.v.), in Canada, furnishes a means of going around the Niagara Falls. Two canals, one on the American and one on the Canadian side, have been built at Saint Mary's Falls. Navigation on the rivers and lakes is closed in winter. The average number of days the Lachine Canal is opened during the year is 220. See CANALS; for history, see CANADA; UNITED STATES.

Saint Lawrence State Hospital, a State institution for the insane situated on the Saint Lawrence River near Ogdensburg, N. Y. It is built on the Cottage System (q.v.), and consists of three principal groups and two detached cottages. The central group includes a central administration building and 12 cottages and utility buildings which are detached except for a one story fire-proof corridor to facilitate communication. The cottages are two stories in height and are substantially and beautifully constructed of Potsdam sandstone and limestone. The cottages for men are on the west and those for women on the east of the administration building. The first is called Reception Cottage East or West and it is here the patients are admitted from home accompanied by a trained nurse sent from the hospital for that purpose. Every effort is made to give this cottage a home-like appearance and to avoid the depressing influence of a large institution. There is a cottage for convalescents, the doors of which are never locked and the patients are permitted to come and go at will. Other cottages are for the disturbed and noisy class, for the quiet and harmless, and for working patients. The Infirmary Group and Group Number Three are one fourth mile from the central group and each accommodates about 400 patients of the chronic classes. The Garden Cottage and Farm Cottage are each one mile from the administration building and are occupied by patients who are employed at gardening and farming. The Saint Lawrence State Hospital is chiefly remarkable as one of the first institutions to abandon the Kirkbride or block

system which dominated asylum construction in this country for 50 years and to establish in its stead a simple and more convenient plan. The first medical superintendent was Dr. Peter M. Wise, to whose genius the hospital owes its plan and organization. The hospital was opened for the reception of patients 9 Dec. 1890, but was not completed until 10 years later. It has accommodation for 1,700 patients and has 336 employees. The total expenditures for the fiscal year ending 1 Oct. 1903 were \$276,750.56; annual expenditure per patient, \$161.89. The value of real estate including buildings, \$2,500,600; value of personal property including furniture, etc., \$143,000.

R. H. HITCHINGS,
Superintendent.

Saint Lawrence University, located at Canton, N. Y. It was chartered in April 1856; the theological school was opened in 1858, the collegiate department in 1859; a preparatory school also was organized, but was discontinued in 1864. The collegiate department is unsectarian, the theological school is Universalist; the two institutions are under the control of one board of trustees, but the seminary has a separate building, faculty, and funds. From 1860 to 1872 a law school was conducted, and in November 1903 a Law Department was again established by the incorporation of the Brooklyn Law School as an integral part of the university under the name of the Brooklyn Law School of Saint Lawrence University. The university, therefore, consists of three departments: (1) the college of letters and science; (2) the theological school; (3) the law school. The college offers two courses, one leading to the degree of bachelor of arts, the other to the degree of bachelor of science; the work of the first two years in each course is prescribed, of the last two years largely elective: the bachelor of arts course is divided into three groups, according to the second language (other than Latin) offered for admission. Thirty scholarships are provided. The main departments of study in the theological school are ethics, history, theology, comparative religions, homiletics, sociology, church administration, psychology, and interpretation and criticism; the full course occupies four years. In the law school the two years' course of study leads to the degree of LL.B., the three years' course to the degree of LL.M. All departments of the university are open to women. The buildings on the Canton campus include the main building, the Herring Library, the Cole Reading Room, the gymnasium, and the seminary building. The library in 1904 contained 20,000 volumes; the productive funds amounted to \$400,000. The students (1903-4) numbered 179 in the college, and 348 in all departments.

Saint Leger, *sânt lěj'ér* or *sil'ín-jér*, **Barry**, British soldier: b. 1737; d. 1789. He served in the siege of Louisburg in 1758, and under Wolfe at Quebec, and checked the flight of the French forces at the Heights of Abraham. He was also the leader of the expedition against Fort Stanwix in the American Revolution. At the close of his career in the British army, in 1784, he was commandant of the royal forces in Canada. His 'Journal of Occurrences in America' was published in London in 1780.

SAINT LOUIS

Saint Louis, *sānt loo'is* or *loo'i*, Mo., city, port of entry; on the west bank of the Mississippi River, about 20 miles below the mouth of the Missouri. It is the metropolis of the State, and by the Federal census of 1900 ranks fourth in population among the cities of the United States.

Topography.—The city stands on a gentle bluff with an average elevation of 100 feet above the river and about 500 feet above the sea. It stretches along the Mississippi a distance of 19 miles, and its greatest width, east and west, is six and one half miles; the area is $61\frac{1}{2}$ square miles. The surface is rolling and drainage by the city sewer system has been easily accomplished. "Mill Creek" Valley, which extends east and west and bisects the city was once the bed of a lake (Chouteau Pond). It is used chiefly for depots, railroad yards, and industrial establishments. Bridges and viaducts carry street traffic across the valley. The Mississippi River borders the city in the form of the arc of a circle, the city on the concave side. In the river are several islands; the largest Cabaret and Kerr belong to Illinois. The river is here a vast torrent of turbid water which picks up and drops again large masses of sand and silt as the river rises and falls. It is very deep abreast the city, and in good water there is a continuous depth of 12 or 14 feet all the way to the Gulf of Mexico. It regularly rises and falls during the year about 25 or 30 feet. High water mark is 412.7 feet above sea-level. The historic water mark of 1844 is still (1903) unsurpassed, though in June 1903 the water was but four or five feet lower. In each case the broad bottom between the channel and the Illinois bluffs was flooded and looked like a vast inland sea. In no case has the river climbed far up the bluff upon which Saint Louis is built. West of the city the land spreads out in a picturesque plateau.

Climate.—The latitude of the city is about $38^{\circ} 38'$, so that it is entitled to a mild winter and a warm summer. Fair summer winds are south and southwest, and the cool winds come from the north and northwest. The record of the United States Signal Office is here given for seven months during the last two years. The figures are the monthly means. (A daily "mean" is half the sum of the maximum and the minimum temperature during 24 hours.)

| | April | May | June | July | Aug. | Sept. | Oct. |
|--------------|-------|-------|-------|-------|-------|-------|-------|
| 1902... | 55.4° | 71.8° | 74.2° | 80.3° | 76.4° | 66.4° | 62.2° |
| 1903... | 57.4° | 69.0° | 70.4° | 80.8° | 77.2° | 69.6° | 59.2° |
| Normal mean. | 56.6° | 66.1° | 75.4° | 79.4° | 77.6° | 70.2° | 58.4° |

The annual rainfall is 37.3 inches. The longitude of the city is about $90^{\circ} 15'$ west from Greenwich; hence "Standard Central" time is about one minute faster than "Mean Solar" time.

Transportation.—In 1874 the Eads Bridge (q.v.) was opened for highway and railroad traffic. Prior to 1874 Saint Louis had no bridge over the Mississippi, and in times of ice gorges and ice-runings direct communication with the East, at this point, was cut off for days. The Merchants' Bridge, three miles up-stream from Eads Bridge, was built in 1890. Twenty-seven lines of railroad meet in Saint Louis Union Station; 10 from the west and 17 from the east, the latter crossing the river by the

Eads Bridge and the Merchants Bridge. Vast quantities of freight cross the river by ferries and are handled by steamboats. Nearly all the coal used in the city crosses the river or comes up the Mississippi in barges. Terminal facilities have lately been greatly increased and the tunnel running from the Eads Bridge to Cupples Station is used for merchandise almost exclusively.

The Union Station with its spacious train shed large enough to house 32 tracks, each one long enough to accommodate 11 passenger coaches, is unique in construction and use. All trains "back in" to the station, stopping at the Midway, an area 130 feet wide and 601 feet long, crossing the station from 18th to 20th streets. Freight, mail matter, and express are handled in subterranean driveways and passages, with the use of 26 elevators. The station covers 13.2 acres of ground. The capacity of the station has recently been increased 200 per cent.

Commerce and Industries.—Saint Louis is the natural commercial metropolis of the territory lying to the west and south, including Texas and Mexico. In manufactures it has always been prominent, and it is now the fourth city in the United States in the value and output of its manufactures. The value of the products of the factories of Saint Louis in 1902 is estimated at \$337,689,000. If the factories of East Saint Louis, Venice, Madison, and Granite City, all lying just across the river and forming parts of this industrial centre, are included, the annual product amounted to \$389,689,000. In 1902 the sales in dry goods and kindred lines amounted to \$120,000,000; the sales of boots and shoes alone amounted to \$50,000,000; nearly one half of the stock being made in the city. The trade in tobacco and cigars, nearly all manufactured here, footed up \$41,000,000; in beer, \$18,000,000; in street cars, \$15,000,000.

The most interesting and the most important commercial feature in Saint Louis is Cupples Station, which deserves an extended description. There is not in the world a similar establishment which approaches it in magnitude and completeness of organization. Cupples Station was planned and inaugurated by Robert S. Brookings, the vice-president and general manager of the Cupples Wooden Ware Company. The object of the station was to save expense, time, and wear and tear in handling merchandise. Expense was to be saved chiefly by the elimination of drays and street wagons drawn by horses. Time was to be saved by reducing the handling to one half, and storing goods in buildings adjoining the station platforms. The saving in wear and tear was to result from less handling and no street hauling. All these ends have been attained. All the 25 lines of railroad converging in Saint Louis haul freight to and from the terminal yards lying between Eighth Street and Grand Avenue. Cupples Station occupies nearly four acres of ground at the east end of the yards on both sides of the main tracks as they leave the tunnel at Eighth Street and Clark Avenue. It owns and controls switches and platforms sufficient for 60 cars, all practically under cover. The 20 big buildings skirting the tracks are occupied by some 30 tenants, including some of the largest concerns in the city dealing in hardware, woodenware, and groceries. The total mer-

chandise handled by Cupples Station is valued at about \$40,000,000 annually, of which \$25,000,000 represents the business of two firms, each the largest of its kind in the world,—the Simmons Hardware Company, and the Samuel Cupples Woodenware Company.

There is a single power-plant for the entire station furnishing heat, light, and power, either electric or hydraulic. The platforms for the handling of goods have a total area of 50,000 square feet, and are on two levels, one by the car doors, and one a story higher. These levels are connected by seven elevators operated by the station employees. The tenants operate 44 elevators to all floors in their respective quarters. The station has over 4,000 four-wheeled trucks, each easily drawn by hand and capable of carrying a load of 5,000 pounds. These trucks carry all the merchandise handled in Cupples Station.

The manner of operating the station is as follows: During the night the various railroads having freight to deliver to Cupples Station place their cars upon the switches adjacent to the lower platforms. At 7 A.M. a force of about 100 station employees open and unload the cars, place the goods upon trucks, and deliver them at the doors of the tenant firms according to their destination. By 9 A.M. the cars are empty, and the goods are for the most part piled away in the respective buildings. Soon the trucks begin to reappear loaded with goods which are to be shipped. These are taken in hand by the station employees in the freight-receiving room on the upper platform; bills of lading are signed; and the trucks are sorted according to a schedule which specifies the order in which cars shall be loaded and immediately removed by the different roads. Each railroad knows just when to send an engine for its cars, and the station forces always see that the cars are ready. The employees of the tenant firms go scarcely beyond their own doors. About 25 per cent of the goods received are delivered at the street doors of the various firms to meet local demands. In this systematic and economical way over 50 cars with 1,000 tons of assorted merchandise are received and shipped in a day, or 300,000 tons in a year. No other single freight station approximates that amount of business. The sight of the station in full activity is most impressive. The constant passing of hundreds of loaded trucks; the simultaneous motion of many elevators; the loading and the despatch of cars,—all this is at first confusing, but a deeper insight detects a perfect, harmonious system which wins the admiration of every attentive visitor.

One further fact remains to be stated, namely, that Samuel Cupples and Robert S. Brookings, the original owners and builders of this great enterprise, and the owners of several neighboring blocks occupied by firms which could not be accommodated in the station, have given the entire property to Washington University, as a permanent endowment for the cause of higher education.

Banks and Trust Companies.—Not to mention the smaller banks, the capital of 20 of the larger banks and 10 trust companies in 1902 amounted to \$42,315,800; their surplus was \$44,951,373, making a total of \$87,267,173. The clearing-house statement shows that the clear-

ings for 1902 of the whole city amounted to \$2,506,804,320.

Municipal Improvements—Parks and Boulevards.—The city has 18 public parks, containing 2,125 acres. The four large parks, Forest, O'Fallon, Tower Grove, and Carondelet, are (1903) about to be connected by a system of boulevards carried across Mill Creek Valley on a magnificent viaduct. Lafayette Park (30 acres) was early improved and seven years ago was the gem of the city. Its wealth of elms, maples, sycamores was almost entirely destroyed by the great cyclone of 27 May 1896. Out of 702 forest trees 575 were broken and ruined. During the season which followed over 1,000 young trees were set out, to begin again the work of rearing a forest of ornamental trees. The cyclone destroyed property in the city to the amount of ten million dollars, and killed some 160 people. Shaw's Garden, the popular name of the Missouri Botanical Garden, was the gift to the people of Saint Louis of the late Henry Shaw. It is beautifully laid out, and full of a vast variety of flowers, trees, and shrubs, collected at great expense from all lands, and most carefully cultivated and housed. The Flower and Plant Garden contains 9.4 acres; the Arboretum, which contains specimens of all trees known which are hardy enough to survive the climate, covers 20.5 acres; the Fruticetum, which contains an extensive collection of hardy fruit trees and plants, extends over eight acres; other grounds near and tributary to the Shaw residence amount to 6.8 acres, making a tract of 45 acres.

Adjoining the Arboretum and vegetable garden is a pasture area of some 80 acres, of which one fourth has recently been graded, drained, supplied with water, and partially planted with North American plants arranged in the familiar sequence of families adopted by Bentham and Hooker; while the remainder will shortly be molded and planted to exemplify the more modern arrangement of Engler and Prantl, on plans already largely prepared. The Botanical Library contains 18,550 books, 22,608 pamphlets, and 66 manuscript volumes. The herbarium contains 400,000 sheets of specimens.

The ownership of the Missouri Botanical Garden is vested in a board of trustees which is charged with the care and maintenance of the garden and the administration of income-bearing property valued at some \$4,000,000, the net income of which shall be spent upon the garden. With this munificent endowment the trustees are able to constantly improve, extend, and enrich the garden. The Henry Shaw School of Botany is conducted as a department of Washington University.

Tower Grove Park contains three fine bronze statues: Shakespeare, Humboldt, and Columbus, designed and executed by Müller of Munich, the gifts of Henry Shaw. Forest Park, two miles long by a mile in width, was a wooded tract of great variety and rare beauty, but one half of it has been loaned to the Louisiana Purchase Exposition Company, and what was for the most part an irregular grove of magnificent forest trees is now covered by a series of exposition buildings, which in extent and splendor stand unrivaled on the face of the earth. The winding Des Peres River is buried

SAINT LOUIS

out of sight; the little lake is filled and covered with magnificent palaces. A mile of lagoons with curving banks of grass and flowers, and many a springing bridge, fill the scene with an amazing wealth of beauty and variety, utterly and entirely new—so great and wonderful is the transformation.

Of all the exposition structures now standing within the limits of Forest Park only the Art Building is to be permanent.

The City Waterworks.—The city waterworks consist: First, of a pumping station and settling basins several miles above the city proper, on the west bank of the Mississippi, a few miles below the mouth of the Missouri. Second, of a conduit leading the water from the settling basins to the pumps at Baden and Bissel's Point. Third, the high-service pumping engines, where the water is pumped into the city mains or into Compton Hill Reservoir, several miles away to the south. Fourth, a system of pipes along every street and to every house, so that the supply is abundant everywhere. All old wells are filled and spring water is no longer used. A water tower near the reservoir furnishes high-pressure water through a separate system of pipes to residences on high ground. The capacity of the works at present is 120,000,000 gallons per day. The average daily consumption is 67,179,600 gallons, or at the rate of over three barrels per day for every man, woman and child in the city. The total length of all underground water pipes of all sizes is over 700 miles.

The Mississippi water coming from northern lakes and from the distant slopes of the Rocky Mountains, though heavily laden with mineral matter and more or less stained with vegetable matter from alluvial fields and forests, was until recently exceptionally wholesome, and when filtered was as clear as crystal. The drainage of river towns and mills was of course objectionable, but before the time when the city of Chicago, with a population exceeding the whole State of Missouri outside the limits of Saint Louis, poured its drainage through the Illinois River into the Mississippi, 40 miles above Saint Louis, the water pumped at Saint Louis was considered excellent. The present condition of the water is unsatisfactory in the extreme. Plans are being made to filter the entire water supply of the city and to eliminate, by legislation or otherwise, the vast evil of Chicago sewage.

The income from the "water rates" can be spent only in the water department. The unappropriated balance on hand in April 1903 was over \$2,000,000, nearly sufficient to build a filtration plant which shall filter all the water used.

Sewers and Streets, Street Cars, etc.—There are 530 miles of sewers and 450 miles of paved streets. The streets are in general macadamized, but about 110 miles are paved with granite blocks, asphalt, or brick, and there are 85 miles of Telford pavement dressed with fine hard gravel. All streets are sprinkled daily throughout the summer months, and the granite and brick pavements are swept and washed. The city is not densely built, as good building ground is abundant; consequently the residence districts extend far into the country. This extension is favored by an admirable supply

of street railways and cars. There are 337 miles of single street tracks at present, under two separate managements. All cars are run by electricity, with overhead trolleys, and the system of transfers is quite general. At present (1903) there are no underground or elevated electric roads in Saint Louis.

In numbering the houses one hundred numbers are assigned to each block, counting westward from the river, and north and south from Market Street. The odd numbers are on the north and west sides. Thus, 2305 Pine Street is on the third house lot west of 23d Street, on the north side of Pine Street.

Education.—The public schools are administered by a Board of Education which is independent of the city government, having its separate charter, and by the Constitution authorized to levy and expend taxes for school purposes. The rate of school tax is by the Constitution of the State limited to six mills on a dollar. The tax actually levied by the Board of Education in 1903 was five mills. The board consists of 12 members elected for six years on general tickets embracing the entire city; four members retire every two years unless re-elected. The expert officers charged with the business of conducting the schools under the authority and supervision of the board are: a superintendent of instruction, a secretary and treasurer, an auditor, a commissioner of buildings, and a supply commissioner.

A normal school is in course of construction which will receive 300 pupils; there are three first-class high schools, with accommodations for 4,000 pupils; a colored high and normal school for 300 pupils; and 91 district schools, of which 12 are for colored children under the care of colored teachers. The present enrollment for day schools is 76,059; for evening schools, 3,353. The number of teachers is 1,790. The cost of maintenance for every pupil in the day schools is about \$20.89.

The estimated revenue for public schools from all sources, including its quota from the income of the State school fund (\$202,251.16) for the year 1903-4 is \$2,788,496.16.

The first year of the school course is devoted to kindergarten instruction and training in 78 kindergarten rooms, specially built and fitted for the purpose. Book work may begin in Grade I. at the age of seven. At the end of the VII. Grade, at the normal age of 14, the child should be fitted for a high school. In the high schools, pupils may choose a classical course, a general literary and scientific course, or a mixed course, including manual training or domestic art and science. In the two highest grades of the district schools the pupils receive one lesson per week in manual training—the boys in mechanical drawing and elementary woodwork, the girls in domestic science (sewing, cooking, and household economics). There is a school for the deaf, enrolling 34 pupils and five teachers.

All day schools are taught 40 weeks a year. There is no law compelling school attendance in Missouri, consequently in spite of a high degree of excellence pervading all grades of the public schools, a few children are allowed to grow up in ignorance. The superior quality of the public schools of Saint Louis is a matter of common observation. This is due to teachers

SAINT LOUIS

thoroughly trained and carefully supervised; and to buildings well equipped. Appointments and reappointments are on merit alone. School houses are now built strictly fire-proof, with every valuable modern convenience.

A vigorous Pedagogical Society containing 400 members, chiefly public school teachers, marks progressive ideas; and a Teachers' Benevolent Annuity Association, with 1,109 members, indicates a desire to co-operate and render mutual aid. The members pay one per cent of their salary as annual dues, and after 25 years of service as teachers (15 in Saint Louis) the women (for men the service is 30 years) may on retiring receive an annuity for life. The number of persons now receiving annuities (1903) is 20. The association has invested a permanent fund amounting to \$48,696.50. This is increased every year by dues, gifts, and an occasional festival held for the purpose.

Washington University is a generously endowed and finely equipped institution for higher and professional education. The charter of the university was signed by the governor of the State on 22 Feb. 1853, hence the name "Washington." It was originally called Eliot Seminary, in honor of its organizer, first president, and third chancellor, Dr. William Greenleaf Eliot. By the terms of its charter the university is strictly non-partisan in politics, and non-sectarian in religion. Hence certain questions are never asked when a professor's chair is to be filled or a tutor is to be appointed. The College was inaugurated in 1857; the Law School was organized in 1867; the Engineering Department in 1870, and Architecture was added in 1900. The School and Museum of Fine Arts became a department in 1879; and the School of Botany in 1885. The Saint Louis Medical School (founded in 1842) was admitted to the university in 1891. The Missouri Dental College was admitted in 1892. In 1899 the Missouri Medical College (founded in 1840) was admitted, forming with the Saint Louis Medical College the Medical Department of the university.

Prior to 1903 the university had no campus; its nine departments were scattered about the city on different blocks and on several streets. The large campus of 113 acres and a group of 11 beautiful granite buildings, erected by the university and occupied during the Fair by the officials and attachés of the Louisiana Purchase Exposition, becomes the permanent home of the Undergraduate Department in 1904. As additional buildings are needed they will be placed on lines indicated, thus forming a succession of quadrangles from east to west.

The secondary schools: Mary Institute, for girls, and Smith Academy and the Manual Training School for boys, are permanently located north of Forest Park, about a mile and a half from the university campus. The Manual Training School was established by ordinance 6 June 1879, and opened as an independent school, with a complete course of study and training for boys of secondary grade in September 1880. For 25 years it occupied the original building at 18th Street and Washington Avenue. It enrolled in 1903-4 over 300 boys. The total enrolment in the university is 2,219 students, and 209 instructors. Its property in educational

buildings, grounds and equipment is \$2,570,000; its endowment \$5,180,000.

The Saint Louis University (Roman Catholic), which dates back to 1829, is a large and flourishing institution on Grand Avenue. Its library of about 38,000 volumes is rich in old books in many languages, huge in size and quaint in binding; the Christian Fathers in Latin, Luther's first editions, the Bible in 21 different languages, are interesting examples. One hundred and nineteen quarto volumes, the gift of the English government in 1831, contain the "Records of the English Government" starting with 'Doomsday Book' and ending with George IV.

The College of Christian Brothers (q.v.) occupies a most imposing structure on the high ground west of Cote Brillante. Forest Park University for young ladies occupies a most attractive building and site immediately south of Forest Park. There are several independent medical schools, a college of pharmacy, a law school, giving instruction exclusively at night, and numerous convents, seminaries, and parish schools.

Libraries.—The Public Library, with 170,000 volumes, is free to all residents. The city contributes annually the income of a tax of $\frac{3}{8}$ of a mill, yielding in 1903, \$166,000. Andrew Carnegie has generously given \$1,000,000 for the erection of a central library building and branches; the branch libraries to be built in different parts of the city. The erection of these buildings will be begun in 1905. A site for a branch library has been presented by Mr. and Mrs. William Barr. There are scattered throughout the city 59 delivery stations for books. The Mercantile Library, containing 127,000 volumes, offers special favors to clerks, and is housed near the commercial centre of the city. It is provided with a fine reading room and a list of 562 periodicals. The present number of annual memberships is 1,603; of life memberships, 516; and of perpetual memberships, 1,310. The walls and niches of the reading room and lobby are decorated by 57 works of art: paintings and statues.

Government and Finance.—The mayor, the council (13) and the house of delegates (28) are elected for four years; the councilmen at large, and the delegates one from each ward. A Board of Public Improvements, consisting of a president, a water commissioner, a street commissioner, a sewer commissioner, a harbor commissioner, and a park commissioner, is organized every four years. All the commissioners are appointed by the mayor and confirmed by the council. The three commissioners first named must be educated engineers. The Board of Police Commissioners (excepting the ex-officio member, the mayor) and the Board of Election Commissioners are appointed by the governor of the State, and are quite independent of municipal control, though all their bills must be paid by the city, the penalty for a negative vote on such bills in the city council being disfranchisement.

The assessed value of the city (about $\frac{3}{4}$ of its actual value) is \$418,046,300. The bonded debt is \$23,000,000, which includes \$5,000,000 given in bonds to the World's Fair. The revenue of the city (not including school taxes),

ST. LOUIS.

SAINT LOUIS

from taxation and licenses, was \$6,800,000 in 1902.

Hotels.—St. Louis is well provided with over 100 hotels, large and small, with accommodations for 21,000 guests. The Planters, The Southern, and The Lindell are first-class in all respects, being new buildings with old names on old sites. During the year 1903 new hotels are going up with capacity for 47,000 guests; many of these, like the Washington, Hamilton, and Jefferson, will be permanent and first-class. A novel feature of the Fair is an "Inside Inn," 400 by 800 feet, capable of receiving 6,000 guests, within the Fair grounds, so that visitors may actually live within the gates.

History.—Saint Louis was founded 14 Feb. 1764, by a party of Frenchmen under Auguste Chouteau, a 14-year-old boy, who had been sent up from New Orleans by his step-father, Pierre Laclède Liguest, to establish a settlement on a site already selected as a post for trading with the Indians. The little village was named in honor of Louis IX. of France. By secret treaty France had already, in 1763, ceded the entire territory west of the Mississippi to Spain, but no knowledge of the treaty was received in Louisiana for some years, and the settlement remained French. In 1765 Saint Louis was made the capital of Upper Louisiana, with Saint Ange de Bellerive as governor. In 1769 the village of Saint Louis contained 17 white men, 16 white women, and 17 negro slaves. In 1770 the Spanish took formal possession, and Don Pedro Pierras was inaugurated governor 29 November. The village remained under Spanish control for 33 years. By another secret treaty Spain ceded the territory back to France, 1 Oct. 1800, and on 30 April 1803 Napoleon sold the entire territory to the United States. (See LOUISIANA PURCHASE.)

The formal transfer of Upper Louisiana from Spain to France took place on 9 March 1804. Capt. Amos Stoddard of the United States army had been commissioned by the French Republic to receive the territory from the Spanish governor, Delassus. On the next day, 10 March 1804, Capt. Stoddard in the presence of a few apathetic French people and a company of United States troops lowered the flag of France and raised the Stars and Stripes and assumed control of Upper Louisiana in the name of the United States. It is said that the only demonstration attending this ceremony was a call for three cheers for the new authority by a prominent citizen, Charles Gratiot. Thus for 40 years Saint Louis had been under France and Spain. General (afterward President) Harrison, who a few months later was in command of the United States post at Cahokia, Ill., organized the new local government. The population at that time was about 1,000 whites and 300 or 400 slaves and free mulattoes.

No sooner was the Louisiana Territory a part of the United States than settlers swarmed across the great river, and in a few years emigrants from Germany in great numbers settled in and near Saint Louis, so that the French became a small minority of the population; but the memory of the early families is well preserved in the names of streets, schools, and parks. The names of Laclède, Chouteau, Gratiot, St. Ange, and Stoddard have already

been mentioned. Carondelet, Gravois, La Salle, Papin, Cote Brillante, Dodier, Soulard, Ceré, Lucas, Dillon, Lafayette, Dozier, Des Peres, Marquette, and others, are reminders of the early history of the city and Territory. King's Highway, an avenue destined to be one of the most beautiful in the city, is a relic of the broad highway originally laid out for the King of Spain, running on the king's land from the rear of Saint Louis village to New Madrid, hundreds of miles south. The pseudonym of "Mound City" arose from the fact that on the east side of Broadway at about Mound Street, there was formerly an immense Indian burial mound; it was removed in 1869.

The War of the Revolution was fought to a finish without causing a ripple in the little French village with its Spanish governor. During the War of 1812, the town was aroused to military activity by rumors of hostile Indians incited by British agents. During the Mexican War the city contributed a regiment which was intended to join General Taylor's army; and sent a company to General Kearney's force of Missouri troops which took possession of New Mexico, and later, under Colonel Doniphan made a long and brilliant march into northern Mexico. (The exploits of this regiment are fully given in the book entitled 'Doniphan's Expedition.') The other regiment returned in a few months, having seen no active service. The first steamboat to land at Saint Louis reached the levee 2 Aug. 1817, which event marked the beginning of its great career as a centre of trade. John Jacob Astor located his western headquarters here for the fur trade in 1819.

Thomas H. Benton, who for 30 years represented Missouri in Congress, began his public career as editor, statesman, and politician, in Saint Louis in 1820. His fatal duel with Charles Lucas, in 1817, was one of the saddest events in the city's history. He is now remembered as the great advocate of a railroad to the Pacific, and on the pedestal of his monument, which faces to the west in Lafayette Park, are these words: "There is the East, there is India."

The Missouri Pacific Railroad, the first built on Missouri soil, was opened in 1854.

During the Civil War Saint Louis, though never a battle ground, was the base of supplies for Union forces from the days of Camp Jackson, when Captain Nathaniel Lyon and Frank P. Blair, with several regiments of volunteers, made prisoners of two regiments of State militia which had been called into camp by Governor Jackson with hostile intent; they thus ensured the safety of the United States arsenal and its large supply of guns and ammunition. Under General Frémont Saint Louis was put into a state of defense, and a cordon of forts surrounded the city on the west.

The first iron-clad gunboats of the United States were built at Carondelet (now South Saint Louis, incorporated into the city in 1870) by Captain James B. Eads, in 1861. These gunboats played an important part in the capture of Confederate strongholds on the Mississippi River, aiding in the capture of Island No. 10, Vicksburg, and Port Hudson.

The Western Sanitary Commission was organized in Saint Louis in September 1861, to

care for sick and wounded soldiers. James E. Yeatman was the president and Carlos S. Greeley treasurer. The work of this commission extended over many fields and was remarkably efficient. In money and sanitary stores the commission received and spent or distributed over \$4,000,000 worth of supplies for soldiers in hospitals and military camps. At a single fair in Saint Louis, lasting six days, \$554,591 was realized for the commission.

In 1865 negro slavery ceased in the city and State by act of a State convention, called to take action upon the subject of emancipation.

The population of the city in 1900 was 575,238, and in 1903, according to the most reasonable estimate, is about 630,000.

CALVIN M. WOODWARD,
Washington University.

Saint Louis, Senegal, West Africa, the capital of the colony known to the natives as Timbuktu or N'dar, is on a small low island near the mouth of the Senegal River. The principal buildings are the cathedral, the great mosque, court-house, barracks and government buildings, bank, chamber of commerce, public library, printing office; and there is an agricultural society. The gardens of the suburbs and the avenues of palms are attractive features of the town. There are large warehouses, and an extensive trade in gums, earthnuts, etc. Water is supplied by an aqueduct $7\frac{1}{2}$ miles in length. Pop. 20,200.

Saint Louis University, The, located at Saint Louis, Mo., and the oldest university in the Louisiana Purchase Territory, was founded by Jesuit missionaries from Maryland; the beginnings were made at Florissant, Mo., in 1823, when a school for the education of the Indians of the Missouri Territory was established at the request of President James Monroe and the Hon. John C. Calhoun, his secretary of war. This school was transferred to Saint Louis in 1829, and classes were opened there for white students in 1829. In 1832 the institution was chartered as a university by Act of the legislature of Mississippi. In 1842 a medical department was added and in 1843 a school of law. The schools of philosophy and divinity were organized in 1857. In 1888, owing to the encroachments of business, the university was moved to its present quarters and the various departments were erected on the new site with the exception of the school of medicine (1903), which is situated one mile distant. The organization of the university now consists of the College, the Academy, the Commercial Department, Military Science, Normal School, School of Philosophy and Science, School of Divinity and School of Medicine. The College offers two courses, the classical, leading to the degree of A.B., and the scientific, leading to the degree of B.S.; the School of Philosophy and Science offers two courses, the philosophical, in which the Latin language and the scholastic method are used, and the scientific, including instruction in mechanics, the sciences, and mathematics, with laboratory work. The course of Divinity extends over a period of four years, leading to the degree of Doctor of Divinity. The Military Department is under the management of an officer of the United States army and military drill is

obligatory on all undergraduate students. Religious instruction in Catholic doctrine forms part of the various courses; non-Catholic students, however, are exempt if they so wish.

The buildings (1903) are: The College, the Academy, the School of Divinity, the School of Philosophy, the School of Medicine, and the Normal School. The Library contains 42,000 volumes, including the library for undergraduates; there are also departmental libraries in theology, philosophy, science, and medicine. The productive funds in 1904 were \$117,000, the students numbered 1,010 and the faculty 133.

J. C. BURKE,
Librarian.

Saint Lucia, one of the Windward Islands, British West Indies, lying south of Martinique; area, 233 square miles. The surface is rugged and mountainous, the mountain sides being mostly covered with dense forests; the valleys and lower heights are fertile and well cultivated. The chief products are sugar, cocoa, and logwood; coffee and tobacco are also raised, and rum is manufactured and exported. The climate is healthful except in certain low, marshy districts. The island was discovered in 1502, colonized by the French in 1563, was claimed by both England and France, and until 1803 its possession was several times exchanged between the two. In 1803 it was definitely ceded to England, and became a part of the government of the Windward Islands. In 1901 there were 44 government schools. Castries, the capital of the island, is one of the most important ports and the second British naval station in the West Indies. Pop. (1901) 50,237.

Saint Lucie Grass. See GRASSES IN THE UNITED STATES.

Saint Luke, Guilds of, were associations of painters organized in mediæval times under the patronage of Saint Luke. The guilds flourished for many years in Holland and admitted as members engravers, printers, and other artists.

Saint Malo, sǎn-mǎ-lō, France, in the department of Ille-et-Vilaine, at the mouth of the Rance, on the English Channel, occupies a rocky island, 43 miles northwest of Rennes. It communicates with the mainland by a causeway called Le Sillon. The harbor affords a total quayage of more than two miles. The principal buildings are the custom-house, chamber of commerce, the parish church of the 15th century, school of hydrography, the Hôtel-de-Ville, with a museum and library; the Casino and statue of Chateaubriand before it, and the ancient castle. The manufactures are hosiery, nets, sailcloth, cordage. It is an important seaport, and ship-building is one of the chief industries. There is trade in corn, fruit, wine, and provisions, chiefly with England. Pop. (1901) 12,597.

Saint Marc, Fr. sǎn mǎrk, Haiti, town on Saint Marc's Bay, on the west coast, 44 miles northwest of Puerto Principe. Near the town is a headland known as Crête a Pierrot, which was strongly fortified by English engineers, and occupied by native soldiers in the war of independence, who here made a strong resistance against the French. It is the shipping port for a fertile valley and exports chiefly coffee and

MAIN ENTRANCE TO THE ART PALACE, ST. LOUIS EXPOSITION.

SAINT-MARC-GIRARDIN — SAINT MARY'S CHURCH

logwood; the town also contains several distilleries. Pop. 20,000.

Saint-Marc-Girardin, sǎn mǎrk zhê-râr-dǎn, **François Auguste**, French statesman and author: b. Paris 12 Feb. 1801; d. 11 April 1873. He was educated at the Collège Napoléon and at the Collège Henri IV., and in 1834 occupied the chair of poetry at the Sorbonne. His political life began also at this time as a member of the Chamber of Deputies. In 1871 he was elected to the National Assembly, and was its vice-president at the time of his death. Among his best known books are: 'Political and Literary Notes on Germany' (1835); 'Essay on Literature and Morals' (1845); 'Course of Dramatic Literature; or, The Use of the Passions in the Drama' (1843-77); 'La Fontaine and the Fabulists' (1867); and 'Jean Jacques Rousseau, His Life and Works' (1875).

Saint Mark's Church (San Marco). See **VENICE**.

Saint-Martin, sǎn mǎr-tǎn, **Louis Claude**, French philosopher: b. Amboise, France, 18 Jan. 1743; d. Aurai, near Chatillon, 14 Oct. 1803. He traveled through Germany, England, Switzerland, and Italy, making converts to his mystical philosophy, which he had derived from a study of the works of Jacob Böhme. His followers styled themselves "Martinists" and held that man on one side of his nature was a type of the universe, a microcosm; on the other the thought and reflection of God. By introspection all knowledge and wisdom could be reached. Of his works the most important are 'Des Erreurs de la Verité' (1775); 'De l'Esprit des Choses' (1800); 'L'Homme de Desir' (1790). Consult: Caro, 'Essai sur la Vie et la Doctrine de Saint-Martin' (1852); Matter, 'Saint-Martin le Philosophe Inconnu' (1864).

Saint Martin, sǎnt mǎr'tin (Fr. sǎn mǎr-tǎn), an island of the Lesser Antilles, lying north of the Leeward Islands, and east of Porto Rico; area, 37 square miles. Its surface is hilly, the elevation being highest in the centre of the island. In the southern part are several salt lagoons from which considerable quantities of salt are obtained. Sugar is the chief agricultural product, rum is manufactured, and sugar, rum, and salt are the chief exports. The island was settled in 1638 by French and Dutch, who were later driven out by the Spaniards. In 1648 they regained possession and divided the island between them, the French taking the northern portion (20 square miles); and the Dutch the southern portion (17 square miles); the French portion is a dependency of Guadeloupe, the Dutch, a dependency of Curaçao. Pop. 6,000.

Saint Martin's Day. See **MARTIN I., SAINT**.

Saint Mary, Ohio, city in Auglaize County; on the Lake Erie & Western, Toledo & Ohio Central, and the Western Ohio Traction line; about 25 miles southwest of Lima. It was settled in 1795, by whom is not positively known; but some county historians give the credit to Charles Murry. It was incorporated in 1820, and became a city under the new code, June 1903. It is in an agricultural region and in the oil belt, but it has large manufacturing interests. The chief manufacturing establishments are chain

works, with 175 employees; spoke works, 250 employees; woolen mills, 75; machine shops, 150; box factory, 60; straw board works, 25; other smaller factories employ about 100. The total number employed in all the manufactories is about 1,000. There are eight churches; and the educational institutions are public and parish schools and a business college. The three banks have a combined capital of \$180,000; the annual amount of business is \$1,200,000. There are two building and loan associations, one daily and two weekly papers. The government is vested in a mayor, council, and marshal. The council is composed of four members and three at large, who hold office two years. Pop. (1890) 3,000; (1900) 5,359.

W. D. MEFFERD,

Editor 'Saint Mary's Graphic.'

Saint Mary Hall, originally this was the parsonage-house of the rectors of Saint Mary's Church, Cambridge University, until it was presented by Edward II. in 1326 to Oriel College. It then became a university hall, and the office of principal was held by Oriel fellows to 1656, from which time the chancellor exercised right of nomination. In 1902 it was reunited with Oriel, in which its site, buildings, and property are now vested.

Saint Mary's, Md., the first settlement made in the State. In 1634 Governor Calvert in his ship, the Ark, sailed up the Potomac to Saint Mary's River, and bought land of the Indians and established a settlement near the mouth of the Saint Mary's. A Jesuit mission was established; many of the settlers, however, were Protestants, and absolute liberty of conscience of worship prevailed. Though Saint Mary's was the capital of Maryland, and for a number of years the only town in the colony, it was never more than a small settlement. In 1694, after Maryland became a royal colony, the capital was moved to Annapolis, and Saint Mary's fell into decay.

Saint Mary's, a river connecting Lake Superior and Lake Huron. It receives the overflow of Superior and discharges its waters into Huron. A fall of 22 feet in the river, at Saulte Ste. Marie was an obstruction to navigation. Two canals have been made; one on the United States side of Saint Mary's Falls, and the other on the Canadian side. The United States canal was opened June 1855. This canal is now one and one half miles long, 100 feet wide at the bottom, and 20 feet deep. Hay Lake Channel, adjoining Saint Mary's River below the Falls, has shortened, by 11 miles, the passage from Huron to Superior. Navigation is closed by ice part of the year. The registered tonnage the first year through the United States canal was 106,296, and for 1900, 20,136,782. The canal on the Canadian side was opened in 1895. The river is spanned by the International Bridge at Saulte Ste. Marie. There are a number of well-wooded islands in the river, all of which are favorite summer resorts.

Saint Mary's Church, Cavalry Engagement at. Gen. Sheridan, after his Trevilian raid, arrived at White House, on the Pamunkey, 21 June 1864. On the 22d the depot at White House was broken up, Grant having established a new base at City Point, and a train of 900 wagons set out, under cover of Sheridan, to

cross the James River on the pontoon-bridge at Bermuda Hundred. It crossed the Chickahominy at Jones' bridge and moved to Charles City Court House *en route* past Malvern Hill, in advance of which were Wade Hampton's and Fitzhugh Lee's cavalry divisions that had kept close to Sheridan after the battle of Trevilian Station (q.v.), and were now hanging on his flank. Keeping Torbert's division with the trains, Sheridan sent Gen. Gregg, with his division and two batteries to Saint Mary's Church, to cover the exposed flank, and Gregg intrenched in a strong position. There was some skirmishing during the 24th, and late in the afternoon Hampton and Lee attacked Gregg on the right flank and in front, and after a stubborn contest forced him to give way, in some confusion, Sheridan says, but losing no material. Gregg, however, says that though the contest was unequal he retired without confusion or disorder; but he left his dead and wounded on the field. Hampton pursued to within 2½ miles of Charles City Court House. The trains were moved back to Douharts' Landing on the James and were ferried over, Sheridan following them across on the 26th. The Union loss as reported was 29 killed, 188 wounded, and 122 missing. The loss in Hampton's division was 6 killed and 59 wounded. Fitzhugh Lee's loss is not reported.

E. A. CARMAN.

Saint Mary's College, located at Saint Mary's, Marion County, Ky. It was founded in 1821 by the pastor of the Catholic settlement as Saint Mary's Seminary; in 1833 the Jesuits took exclusive control, and the name was changed to Saint Mary's College; in 1837 the college was legally incorporated. A college farm was conducted, and all students were required to work one day every week on the farm. In 1846 the Jesuits abandoned the control of the college, and in 1847 it was transferred to the charge of the secular clergy of the diocese of Louisville. Financial difficulties resulted in its being closed from 1869 to 1871, and in the latter year it was reopened under the charge of the Fathers of the Congregation of the Resurrection, a teaching order, and was later recognized as the official Roman Catholic college of the diocese of Louisville. The courses are divided into three departments, the commercial or English high school, the academic or classic high school, the classic or collegiate departments; the courses of the first two departments occupy three years, the course of the collegiate department, four years; the degree of A.B. is conferred on graduates of the collegiate department; A.M. is conferred for one year's graduate work. The library numbered 4,500 volumes in 1904, and is being steadily increased; the annual income in the year 1903-4 was \$16,000; the students numbered 120, and the faculty 10.

Saint Mary's Falls Canals. See SAULT SAINT-MARIE CANALS.

Saint Mary's Seminary, a Roman Catholic theological school in Baltimore, Md.; opened October 1794. From the first the seminary has been in charge of the Society of Saint Sulpice, an organization founded by Father Olier, in 1642, for the purpose of preparing young men for the priesthood. On the site of the present

institution, when the Fathers purchased the place, was the well known "One Mile Tavern." There were only five students in the school during the first three years, and in 1806 only 12 students. The superior-general of the Sulpicians had about decided to withdraw his professors, as they were much needed in other schools; but the entreaties of Bishop Carroll and the advice of Pope Pius VII. prevailed, and the school continued its work. For a time Saint Mary's College, Baltimore, now replaced by Loyola College (1852), and Mount Saint Mary's College, Emmitsburg, were affiliated with the seminary. The latter ceased to be a part of Saint Mary's Seminary, Baltimore, in 1826. Saint Mary's Seminary has the rank of a university, and power to confer degrees in the different departments of the sciences upon such of the students and clergy as satisfy the examination requirements. A student to obtain admission to the seminary must have a well-formed desire to study for the Roman Catholic priesthood, be recommended by his ecclesiastical superior, and for the first year philosophy, must have completed a full classical course, as shall be shown by examination. Students from other schools may be admitted to such courses as their examinations may entitle them. The main library contains about 35,000 volumes; special libraries are in the departments of theology and philosophy. There are well equipped reading and study rooms. Special attention is given to music, especially the Gregorian and Plain Chants. The members of the Association of Saint Camillus, which began in 1894-5 and was organized in 1898, visit hospitals and other institutions. In 1902-3 they had on their visiting list 15 institutions. In 1903 a scholarship was founded by Dr. Charles S. Grindall of Baltimore, for the benefit of "a native of the archdiocese of Baltimore studying for the missions of the same archdiocese." Attendance is not limited to any diocese or country. In 1902-3 there were in the seminary 218 students, 75 in the course of philosophy, and 143 in the course of theology.

Saint Maurice, Canada, a river in the province of Quebec, flowing into the Saint Lawrence at Three Rivers. Its course of 300 miles is marked by fine scenery, and waterfalls, one of which, 22 miles from its mouth, has a height of 160 feet.

Saint Michael (formerly REDOUBT SAINT MICHAEL), Alaska, a settlement on Saint Michael's Island, in the southern part of Norton Sound; lat. 63° 28' N.; lon. 162° 5' W. The settlement, or trading post, was founded in 1833 by Tebenkoff. The island is low and volcanic and is covered with vegetation. Saint Michael is the port where ocean steamers transfer and receive freight which is carried up and down the Yukon. The river vessels pass through the Aphoon Channel, behind a bar, and enter the Yukon by its northern passage. Navigation opens in June and closes in September. Since the discovery of gold, Saint Michael has become most important. During the summer there is a population of between 3,000 and 4,000. Many of the permanent residents are Eskimos. Pop. (1890) 101; (1900) 857.

Saint Michael's, or São Miguel. See AZORES.

SAINT MICHAEL'S MOUNT—SAINT OURS

Saint Michael's Mount, England, in Cornwall, three miles east of Penzance, is an isolated rock of conical form, about 195 feet high. An ancient and picturesque castle stands upon its summit, from whose tower projects the stone lantern called "Michael's Chair." A causeway connects the island with the shore. A fishing village with a projecting harbor nestles at its base. The hill is a geological curiosity, being a vast mass of granite protruding through schistous rocks. In remote times Edward the Confessor founded upon it a Benedictine priory, which at the time of the Conquest was annexed to the abbey of Mont Saint Michel (q.v.) in Normandy. Its possession was disputed during the Lancastrian and Parliamentary wars. After a considerable period it passed from the monks into secular possession, becoming a manorial residence, and in 1660, the property of the St. Aubyns.

Saint-Michel, sǎn mē-shēl, Mont, France. See MONT-SAINT-MICHEL.

Saint Nazaire, sǎn nā-zār, France, a seaport town in the department of Loire-Inférieure, near the mouth of the Loire and 37 miles west of Nantes by rail. Great improvements have been carried out in the port. The town is the terminus of the General Transatlantic Company, and the ship-building yards of this company and that of the Loire employ 2,500 men. Extensive forges employ 1,600 men in the manufacture of steel rails, sheet and bar iron, etc. The town is of recent growth and these industrial works form its chief buildings. Of peculiar interest in the vicinity is an ancient granite dolmen, 10 feet long and 5 wide, resting horizontally on two stones, which extend about seven feet above the surface of the ground. It is believed that Saint Nazaire occupies the site of the ancient maritime town of Corbilo, in whose harbor the Roman fleet was built (56 B.C.) with which Brutus routed the Venetian insurgents. Pop. (1901) 35,813.

Saint Nicolas, sǎn nē-kō-lā, Belgium, in the district of Dendermonde, in East Flanders, 12 miles by rail southwest of Antwerp, occupies a central position in the densely populated region of Waes. The most important buildings are the town-hall and churches. It is an agricultural and manufacturing centre and has a large flax market and manufactures of cotton, wool, lace, needles, bricks and pottery. There is considerable trade in linens, flax, corn, etc. It is celebrated as the place where Philip the Fair in 1497 swore to maintain the privileges of Waesland, of which Saint Nicolas was the capital. Pop. (1897) 29,921.

Saint Olaf College, located at Northfield, Minn. It was founded by the pastor of the Norwegian Lutheran congregation of Goodhue County in 1874; until the year 1886 it had only an Academic (secondary) Department; from 1886 to 1890 it gradually developed into a college, and in 1890 was officially placed under the control of the United Norwegian Lutheran Church. Though this official connection was severed for a time in 1893, the college continued to be closely affiliated with the denomination, and in 1899 the official relation was re-established. In 1900, the college department of the United Church Seminary was united with Saint Olaf College.

The organization of the college includes two departments: the Academic Department and the Collegiate Department. The Collegiate Department offers two courses, classical and scientific, leading to the degrees of A.B. and B.S.; a few electives are offered in the Junior and Senior years. The Academic Department has three courses, the classical and scientific, especially designed to prepare students for the corresponding collegiate courses, and the English course; the latter includes instruction in bookkeeping, commercial law, and domestic economy. Biblical or church history forms a part of the curriculum in both departments; and there is a musical department providing courses in piano and voice culture. The Steensland Library Building was completed in 1902 and contains the museum and a library of 3,800 volumes (1904). The annual income in 1903-4 amounted to \$36,300, the students numbered 341, and the faculty 17.

Saint Omer, sǎn-tō-mār, France, a fortified city in the department Pas-de-Calais, 26 miles southeast of Calais, on the Aa. It is situated on a marshy site, has two harbors, and begins the canalized portion of the Aa. The Gothic cathedral is old and curious. It has fine portals (13th-14th centuries), good paintings, interesting statues and monuments, wood carvings, and fine stained glass, and mosaics. The other notable points of interest are the ruined tower and arches of the Benedictine Abbey of Saint Bertin, an arsenal, a museum, and a library. Saint Sepulchre is remarkable for its beautiful stone spire and stained-glass windows. The town-hall contains valuable records, a picture gallery and a theatre. There is a large public library, and extensive arsenal. Saint Omer manufactures tobacco pipes, cloth, hosiery, tulle, cambric and muslin embroideries. Its trade is in these articles and in paper, flour, sugar, beer and other liquors. The town has often suffered from attack and invasion by French, Flemish, and Spaniards. Pop. (1901) 20,867.

Saint Ouen, sǎn-too-ōñ, France, in the department of the Seine, about one mile southwest of Saint Denis, is an important manufacturing centre, and river-port, with spacious docks. The industrial establishments include foundries, forges, machine and glass works, sugar and saw-mills, and manufactories of rubber-goods, varnish, printer's ink, canned foods, and firearms. Pop. (1901) 35,351.

Saint Ours, Jean Baptiste de, SIEUR D'ESCHAILLONS, French-Canadian soldier: b. Canada 1668; d. Montreal 1747. His father, Pierre de Saint Ours, was the first of the family to come to Canada, and obtained extensive grants of land. The son entered the army at an early age and in 1702 was made lieutenant. He was one of the commanders of the expedition against Fort Orange (Albany) in 1703. He commanded a company in De Ramezay's expedition against the English in 1710, and in 1721 was sent on a special mission to several Indian tribes by the governor, De Vaudreuil. On this expedition Saint Ours endeavored to put a stop to the liquor traffic with the Miamis, and tried to bring about peace between the Sioux and their enemies; also induced the Creeks to form a single village. On his return he subsequently became king's lieutenant of Montreal.

SAINT PATRICK'S COLLEGE — SAINT PAUL

Saint Patrick's College, a theological school in Maynooth, Ireland. It was founded in 1785 and endowed, the only Roman Catholic institution in Ireland which received a government endowment. Several attempts were made to repeal the act granting this aid, and in 1869 the opponents in parliament were successful. The College received, in lieu of its annual income, a capital sum equal to 14 times its annual endowment. The college is now affiliated with the Catholic University of Ireland. It has a large faculty, well equipped library, laboratory, and study rooms. There are from 500 to 600 students in attendance each year. A large number of the students, who have been ordained priests, have been sent to all parts of the world, especially to North and South America; and have filled all ecclesiastical positions from the missionary among savages to that of archbishop.

Saint Paul, the Apostle to the Gentiles. According to Acts xxi. 39 Paul was a native of Tarsus, the most important city of Cilicia. His parents were of pure Jewish descent, for he could boast that he was "of the stock of Israel, of the tribe of Benjamin, a Hebrew of the Hebrews" (Phil. iii. 5). His father, however, was a Roman citizen. How he had acquired this privilege we are not told. It may have been purchased or obtained in some other way. Paul was content to say that *he* was freeborn. Tarsus was a centre of Greek culture and the son of a citizen of that town had ample opportunities to secure the best classical education the times afforded. To what extent Paul shared these advantages is not stated, but his words (Acts xxii. 3) appear to mean that at a comparatively early age he was sent to Jerusalem to receive a *Jewish* rather than a Greek education. The social status of Paul's parents may have been high. There are good reasons for thinking that the family was wealthy (see Ramsay, 'St. Paul the Traveller,' etc., pp. 310 ff). However, this did not interfere with the good Jewish custom of teaching the boy a trade. That he learned to make tents was the more natural since the wool of the long-haired Cilician goats was extensively used for tent-cloth. It is probable that he learned his handicraft before he went to Jerusalem for his education.

Like others with two names mentioned in the New Testament he was more familiarly known in Jewish circles by his Hebrew name *Saul*. Paul was his Roman name, the cognomen given him probably by his father, for what reason we do not know. As his life work developed and he felt himself called to minister to the great Gentile world he preferred his Roman-Greek name to the Hebrew one.

The date of Paul's birth cannot be fixed with exactness. In his letter to Philemon (v. ix.), written probably about 60 A.D., he calls himself an elderly man (*πρεσβύτερος*). This may be taken as signifying, approximately, one who has attained his sixtieth year. Probably he was born within a very few years of the beginning of the Christian era.

His personal appearance was not imposing. His opponents could easily admit that his letters were powerful and at the same time remark that "his bodily presence was weak and his speech contemptible" (2 Cor. x. 10). A very ancient tradition in Asia Minor speaks of him as "bald-

headed, bow-legged, strongly built, a man small in size, with meeting eyebrows, with a rather large nose, full of grace, for at times he looked like a man and at times he had the face of an angel" (see Ramsay, 'The Church and the Roman Empire,' ch. xvi.). Behind such an unattractive exterior lay a physical nature capable of enduring the severest strains (see 2 Cor. xi. 23-28) and a soul endowed with most varied gifts in rich abundance.

To the young Jew of Tarsus the opportunity to study in Jerusalem at the feet of Gamaliel (Acts xxii. 3), one of the most learned rabbis of his day, was a privilege to be used to the utmost, no mere parent-imposed task. Proud of his Pharisaic ancestry and training the young man eagerly pursued his studies "advancing in Judaism beyond many" of his associates, "being more exceedingly zealous for the traditions" (Gal. i. 14). He studied the Old Testament and especially the Law not merely as the authorities for the national religion or for orthodox Pharisaic theology, but as the foundation and source of his personal religion. His religion was his life. He studied to satisfy the hunger of his soul for perfection. His one endeavor was to live the blameless life the law required. So far as externals went he succeeded in doing this (Phil. iii. 6). But the more thoroughly he probed his religious experience to the depths the more hopeless his case seemed to him. The sentence of the law became to his sensitive conscience the sentence of death (Rom. vii. 7-25).

It was while Paul was thus pursuing his studies in the rabbinic schools that Jesus the Messiah lived and died. Whether Paul was in Jerusalem on any of the occasions when Jesus visited the place, or whether he ever saw Jesus in the flesh is doubtful. (2 Cor. v. 16 does not necessarily imply this.) However that may have been, Paul's opposition to Christianity did not begin with the first Christian preaching. Not until the early Church had become well started, when such a teacher as Stephen began to declare the merely temporal character of Jewish ordinances, was Paul's opposition aroused. We meet him first in the record of the martyrdom of Stephen at which the witnesses laid down their garments (Acts vii. 58, see Deut. xvii. 7) "at the feet of a young man named Saul, "who was consenting to his death" (Acts vii. 58, viii. 1). Though too young to have been a member of the Sanhedrin (Acts xxvi. 10 does not mean this) he stood high in the favor of the Jewish authorities and was only too willing to take the lead in a general persecution of all Christians in Palestine and adjacent lands. After having caused the imprisonment of many in and about Jerusalem, numbers of whom were put to death, while others suffered great indignities (see Acts xxvi. 10-11, xxii. 19, ix. 1, Gal. i. 23), he secured authority from the chief priests to proceed to Damascus and take action against any Christians he might find there (Acts ix. 1, xxii. 5, xxvi. 12).

But Paul was not to enter Damascus as a persecutor. As he and his party neared the city a sudden and most profound transformation took place. Paul had a vision, to him brighter than the noonday sun, in which he saw Jesus the Nazarene and heard Him ask "Saul, Saul, why persecutest thou me?" (see the three accounts in Acts, ch. ix., xxii., and xxvi., and

SAINT PAUL

also Gal. i. 15, 1 Cor. ix. 1, xv. 8). It was enough. Henceforth Paul's entire point of view was changed. God had "revealed His Son" in him. He had seen Jesus as *Lord*. It meant parting with all his past, though as yet he saw this only as to some main points. Above all, it revolutionized his idea of Jesus. That one had been to him only the justly crucified leader of a heretical movement. He was now and evermore the glorified Messiah. Helpless, blinded, and weak he was led into the city. Shortly after, he was visited by a Christian disciple in Damascus named Ananias who comforted him with sympathetic words, baptized him and thus recognized him as a Christian brother. Paul soon began to proclaim Jesus as the Messiah to the Jews of Damascus. This only aroused their hostility and they plotted to get him in their possession. He succeeded in escaping by being let down through the wall in a basket (Acts ix. 25, 2 Cor. xi. 32). Avoiding the Arabian guard he made his way into Arabia (Gal. i. 17) where he stayed for upward of three years, not "conversing with flesh and blood," that is, not seeking light or instruction from those who had been Christians before him, but in meditation and communion with God, seeking to sound the depths of that great revelation that had overtaken him on the way to Damascus. What struggles and conflicts he then went through, what changes of view on many details of his Jewish belief, what great revolutions of opinion, what new found hopes and convictions he now experienced—we can see all these reflected in his later speeches and letters. Finally he was able to outline the main points involved in his new faith. That Jesus of Nazareth was and is the Son of God, that in His death forgiveness of sin is made possible, and that through faith in Him forgiveness and salvation are made a personal possession,—these formed the core of his gospel of the cross, a gospel that no man taught him, but which came to him from God (Gal. i. 11).

He was now ready to learn details about Jesus' earthly life and ministry. He therefore returned to Damascus and then visited Jerusalem especially to talk with Peter, the leading apostle (Gal. i. 18-19). According to Acts ix. 27 it was Barnabas who introduced him to the Apostles (only Peter and James, however, according to Gal. i. 18f.). Having gained what he desired from Peter and by his preaching aroused the opposition of his former associates in Judaism he soon left Jerusalem and went into "Syria and Cilicia" (Gal. i. 21; see Acts ix. 30). After some years' labor in these regions, in connection with which we may well suppose that he sought to convert members of his family to the new faith, he was sought out by Barnabas and persuaded to join that good man in the work of building up the new church at Antioch, the metropolis of Syria. This church had almost from the first considered Gentiles as worthy to be approached directly with the Gospel message. In such an atmosphere Paul's own view of the Gospel as suited for man as man independent of his antecedents found room for full expression. After laboring here for a year Paul, with Barnabas, was delegated to carry an offering from the church at Antioch to the mother church at Jerusalem (Acts xi. 27-30, xii. 25). Since

Paul makes no mention of this visit in his survey of his connection with the mother church in Galatians i. and ii. it is probable that it was of no special importance to Paul personally. Returning to Antioch accompanied by John Mark of Jerusalem, Barnabas' cousin, it was soon decided to organize a mission to the adjacent lands. At a meeting of the church Barnabas and Paul were formally set apart through prayer and laying on of hands to this work (Acts xiii. 1-3).

Taking with them John Mark as assistant, the two set out on the First Missionary Journey (Acts xiii. 4-xiv. 28). Cyprus was first visited and traversed from end to end, then crossing the sea to the mainland they disembarked at Perga of Pamphylia. Here they decided to strike inland. For some reason Mark deserted them now and returned to Jerusalem. From Perga they proceeded to Antioch of Pisidia. At this important centre of trade the missionaries stopped. Paul delivered an address in the Jewish synagogue in which he sought to convince them that the Jesus who had been crucified by the rulers in Jerusalem was indeed the Messiah promised in the Scriptures. So great was the interest aroused that a second address was asked for the following Sabbath. At this meeting the majority in the synagogue refused to accept the message and the missionaries then turned their attention to the Gentiles. With such Jews as chose to leave the synagogue they organized a church in which naturally Gentiles and Jews met on equal terms. The work grew rapidly but the opposition of the Jews of the synagogue became so bitter that Paul and Barnabas thought it best to leave. From Antioch they proceeded eastward to Iconium, where they met with much the same experience, except that here the anger of the Jews led to plots against the lives of the missionaries. From Iconium they went on to Lystra and thence to Derbe. At Lystra, the home of the future disciple Timothy, the healing of a cripple led the pagan multitude to think that the gods were again visiting the earth. All these towns were on the great commercial highway leading through southern Asia Minor from Asia to Europe. Though originally belonging to different nations they were then all included in the great province of Galatia and therefore it is most natural to see in the churches founded on this journey the Galatian churches to whom the apostle addressed the Epistle to the Galatians. From Derbe the missionaries retraced their steps and arriving at the coast sailed directly to Antioch without revisiting Cyprus. The journey had been a complete success. It proved how the Gospel was capable of being applied to and understood by the pagan world. The church of Antioch, doubtless, rejoiced greatly at the recital of their experiences, and the way seemed open for larger efforts along the same line.

Just at this time extremely conservative Jewish Christians from Jerusalem disturbed the peace of the Antioch church by teaching, as the orthodox view, that Gentiles, in order to be saved, must not only profess faith in Jesus Christ and be baptized, but also be circumcised and obligate themselves to keep the Jewish law.

What part Paul took in the discussion at Antioch we do not know, but so serious was

the situation seen to be that the church decided to refer the matter to the apostolic body at Jerusalem and delegated Barnabas and Paul to represent them at the council so summoned.

The probable date of the Apostolic Council was 49 A.D. If Paul counts the "fourteen years" of Gal. ii. 1 from his conversion, then that event took place somewhere near 35 A.D. If the fourteen years is to be counted from his visit to Jerusalem to see Peter (Gal. i. 18) then his conversion must have been as early as about 32-33 A.D. Either date is equally probable. The First Missionary Journey probably covered about a year and a half (that is, spring of 47 to fall of 48 A.D.) The doings of the council are reported in Acts xv. which needs to be supplemented by Paul's own statements in Gal. ii. 1-10. The result was a victory for Paul at least to this extent, the mother church put itself on record as recognizing the legitimacy of the Gentile Christian movement and refused to order that Gentile Christians should be circumcised. Paul himself also was given the right hand of fellowship by the "pillar Apostles" and his mission to the Gentiles recognized as divinely appointed.

It was only natural then, that, on their return to Antioch, Paul should propose to Barnabas that they revisit their churches in Galatia. Barnabas was willing but wished to take Mark. Paul would not consent to this. He could not overlook the fact that Mark had deserted them on the first journey. The contention was sharp and the two friends separated. Paul now set out with Silas (Silvanus) as his companion on his second missionary journey (Acts xv. 40-xviii. 22, fall of 49 A.D. to summer of 52). From Antioch they visited Syria and Cilicia and then entered Asia Minor through the Cilician Gates. In due time they arrived at Derbe and Lystra. Here they were joined by Timothy, a choice young convert. After spending some time with the churches organized on the first journey they moved on through Asia Minor, without finding an opening, until they arrived at Troas, where, possibly, Paul met Luke. The "we" sections of Acts begin at this point (Acts xvi. 10). Here the night vision of a Macedonian man calling for help convinced Paul that the Gospel must be carried into Europe. Crossing over to Macedonia, at Philippi, at Thessalonica and at Berea, all Macedonian towns, Paul succeeded in organizing churches. His method was essentially the same in all cases,—to first address the Jewish inhabitants at their synagogue or other meetings, and then, when hostility manifested itself, to withdraw his adherents from the synagogue and organize a church of the free Gentile Christian order. The discontented Jewish element followed him with dangerous persecution and it was to avoid falling into their hands that he left Berea hastily and went on to Athens. Here there was apparently no synagogue and an uninviting field. The city of philosophers and idlers was not thirsting for the Gospel of Paul. But even here Paul's earnestness got the better of him and in spite of misgivings he delivered his famous address on Mars Hill. Perhaps nowhere does Paul's versatility and breadth of view, his profound conception of the universal character of the Gospel message show itself as it does here in this address. But Athens was not prepared for such a message and as soon as his

helpers arrived from Macedonia with the report of the conditions there he sent Timothy back to Thessalonica (1 Thess. iii. 1), while he himself (with Silas, see Acts xvii. 15 and xviii. 5) pushed on to Corinth. Here, at first, he was in a discouraged mood. His first preaching in the synagogue seems to have produced little effect. Making the acquaintance of Aquila and Priscilla, Jews lately banished from Rome, he joined them in working at the tent-maker's trade. But the arrival of Timothy from Macedonia with news of the devotion and constancy of the disciples there stirred him to new efforts. His vigorous preaching in the synagogue now led as usual to a division and the withdrawal of many, including Titus Justus, ruler of the synagogue, to form a Christian church. For a year and a half Paul was busy at Corinth. To organize and build up a Christian community in that large, gay, wicked commercial metropolis was no easy task. It was while here that he wrote his two letters to the church of Thessalonica. The first one was occasioned by Timothy's arrival with good news and is full of words of commendation and hope. The second was written to counteract certain wrong views or inferences, mainly of statements in the first letter. These epistles, perhaps the earliest of the New Testament books, show us the Apostle's mind before the great doctrinal conflicts of the next few years had engaged his attention (see works on New Testament theology, such as those by Weiss, or Beyschlag, or Sabatier's 'The Apostle Paul'). The long stay in Corinth was perhaps shortened by the unsuccessful attempt of the Jews to have him tried by Gallio, the Roman proconsul. Though this came to nothing Paul seems to have left Corinth soon after and crossing over to Ephesus with Aquila and Priscilla he hastened on to Antioch (Acts xviii. 18-22).

It was, possibly, on this occasion that Paul felt called upon to rebuke Peter for his inconsistent conduct in withdrawing from open fellowship with Gentile Christians (Gal. ii. 11 ff.).

His stay in Antioch was not a long one. He soon found himself on his Third Missionary Journey (Acts xviii. 23-xxi. 17, fall of 52 to spring of 56 A.D.) Rapidly going through his old field in Galatia he arrived at Ephesus, then the great commercial emporium of Asia Minor. Here for nearly three years he made his headquarters. For Paul this was a period of most intense activity. Ephesus was a meeting place for all sorts of philosophical and religious speculations. As the patron city of the worship of the great goddess Artemis (Diana) whose temple outside the city walls was one of the wonders of the world, it was a stronghold of paganism and superstition. It was an open door, "but there were many adversaries" (1 Cor. xvi. 9). But it was not alone in Ephesus that "adversaries" were opposing the Apostle. In his old churches in Galatia and in Corinth enemies were sowing seeds of discord. The mischief-makers were members of the extreme Judaistic party, whose opposition to Paul's Gentile Christianity had necessitated the council at Jerusalem in 49 A.D. Only apparently defeated there they determined to carry the conflict into the churches founded by Paul himself. Their arguments were, mainly, that Paul was only a secondary

apostle, not one of the original twelve, that his gospel was therefore only one derived by false reasoning from the normal gospel of Judaistic Christianity, and that Paul's principles practically made the whole Old Testament, especially the Law, of no character or value whatsoever. Only too many in Paul's own churches were ready to listen to such teaching. From Galatia and from Corinth there came news to Ephesus of factious strife, of the adoption of Jewish customs and of growing hostility to himself on the part of those he had taught and trusted. But Paul, though bitterly disappointed and sorely tried, was equal to the emergency. It was in such a furnace of affliction the Epistles to the Galatians and Corinthians were forged. In these he successfully met the points raised by his assailants and, at least in the case of the church of Corinth, succeeded in winning the church back to himself. For the details of these matters readers are referred to special articles on these Epistles. During his sojourn at Ephesus "all Asia" (see Acts xix. 10) had the advantage of Paul's missionary activity. Not long after the tumult caused by Demetrius the silversmith (xix. 23-41) he set out for Corinth, but, uncertain of the reception accorded to his first letter (1 Corinthians) and subsequent messages, he took the indirect route via Troas and Macedonia. In Macedonia Titus came from Corinth with most encouraging news (2 Cor. vii. 5-7) and Paul gladly pushed on to revisit the Corinthian church. He stayed at Corinth during the winter of 55-56 A.D. Before leaving Greece for his long contemplated visit to Jerusalem he penned his most comprehensive and important epistle, to the Christians of Rome, in which he set forth the great fundamentals of the Christian theology and thus prepared them for the visit he had in mind to make them. (See ROMANS.) Paul now hastened to Jerusalem, not stopping at Ephesus, but saying farewell to a delegation from that church that met him at Miletus.

At Jerusalem he presented the mother church with the great collection he had been gathering for some time and was cordially received by James and other leading members, but advised to give evidence to the Jewish Christians that he himself still followed the ancestral mode of life according to the Law (Acts xxi.). Paul was willing to do this, but it brought him into conflict with certain fanatics who accused him of defiling the temple. These were not Jewish Christians, but Jews of Asia who knew of his work in Ephesus and were bitterly opposed to him. A great uproar followed in which Paul was nearly killed, and only rescued by the prompt action of the Roman captain who commanded the garrison of the Castle of Antonia overlooking the temple. Paul's attempt to explain his position to the Jews only enraged them the more and soon after, convinced that plots were being laid against Paul, Lysias the Roman captain sent him under a strong guard to Felix the governor of Palestine at Caesarea. Felix soon discovered that his prisoner was not guilty of any serious offense, but kept him bound in easy confinement, partly from mercenary motives, until his recall about two years later (that is, about 58 A.D.). Felix was succeeded by Porcius Festus before whom Paul was examined and given opportunity

to be tried at Jerusalem. Paul, however, declined and cut the whole matter short by appealing to the emperor. Soon after Festus permitted Paul to state his case before Herod Agrippa II. and other Jewish worthies, hoping thereby to understand it more clearly (Acts xxv.-xxvi.).

Paul was sent to Rome at the first opportunity. With other prisoners under a strong military guard they embarked at Caesarea, changed ships at Myra, experienced shipwreck, were stranded at Malta, and compelled to remain there all winter. In the spring the voyage was resumed and in due time they arrived at Rome. Paul's resolution and courage had commended him to the centurion in charge during the voyage, and he was in consequence treated leniently. Friends met them some miles outside of Rome. In the city, while awaiting the emperor's pleasure concerning his case Paul was permitted to live in his own hired lodging and have free intercourse with any who might desire to see him. One of his first acts in Rome was to call the leading Jews of the city together and set before them the principle of Christianity. The result was, as usual, that some believed him; others did not. Luke says (Acts xxviii. 30-31) that this Roman captivity lasted two years. If it had ended with his execution it would probably have been so stated. The natural inference is that he was released at the end of that period. It was during his Roman imprisonment that he wrote the 'Epistles of the Captivity,' that is Ephesians, Colossians, Philemon, and, probably as the last, Philippians. In these epistles the controversies that raged in Asia and filled his mind when writing to the Galatians and Corinthians are no longer prominent. His mind is full of the thought of the church of Christ, and of the great divine personality who is its head. It is in these beautiful epistles, especially in Philemon and Philippians, that the heart of Paul is seen as nowhere else except perhaps in 2 Corinthians. Some details as to Paul's experience in Rome may be gathered from Philemon and Philippians, not sufficient however to make a complete picture.

After his release (61 A.D.) Paul appears to have undertaken another missionary journey, possibly to Spain (see Rom. xv. 24, also the tradition in Clem. Rom.). He afterward revisited the East and while there (according to what seems the most probable theory) wrote 1 Timothy and Titus. Again arrested he was brought to Rome for a second trial. Before this took place he wrote a letter to Timothy (2 Timothy) beseeching him to come to him as soon as possible. It was probably about 64 or 65 that the great Apostle was executed by command of Nero. (The points in this paragraph have been stated on the theory that the Pastoral Epistles are genuine Pauline letters.)

It is hard to estimate adequately the significance of such a life. More than any other one Paul made Christianity the world-religion. No other man has so profoundly influenced the religious thinking of mankind. He was the greatest man of the Apostolic Age, if not of all ages of the Church. Yet he was ever the disciple and Jesus the Master. Jesus was greater than Paul.

EDWARD E. NCURSE,

Theological Seminary.*

SAINT PAUL

Saint Paul, a remarkable island in the Indian Ocean, half way between Africa and Australia, and about 50 miles south of the island of New Amsterdam. These islands are the exact antithesis of one another, Saint Paul almost barren, and New Amsterdam covered with a dense vegetation. The island is two miles long, 860 feet high and of volcanic origin. Goats, cats, rats and mice flourish, insect life is abundant and sea-fowl in multitudes are characteristic. Fisheries are excellent. Saint Paul was ceded by England to France in 1892.

Saint Paul, the capital of Minnesota, county-seat of Ramsey County, and ranking 23d in population among the cities of the United States; situated on the Mississippi River at what is practically the head of navigation, 2,200 miles from its mouth; by the shortest railroad routes 1,299 miles from New Orleans, 410 miles from Chicago, 1,341 miles from New York, and 1,823 miles from Seattle. It is picturesquely built on a series of benches or terraces of irregular breadth and varying height, the highest land being 266 feet above the level of the river; all the irregularities merging at last in an elevated, rolling plateau. The splendid drainage thus afforded is supplemented, in a portion of the city's area, by a curious provision of nature; the hard upper limestone rock resting at a convenient depth on a sandstone so soft that it is easily worked with pick and shovel, but which hardens on exposure to air. Advantage has been taken of this in tunneling sewers, subways and conduits for water pipes, electric light, telephone and telegraph wires. Add to perfect drainage a cool, dry atmosphere, an ideal water supply—drawn from a series of crystal lakes not far away, fed by ice-cold natural springs and artesian wells, while their entire watershed is protected from nuisances by the ownership and control of the water-board—and we have the main secrets of the winning by Saint Paul, at the Paris Exposition in 1900, of the medal awarded to "the healthiest city in the world." The annual death-rate in 1901 was 9.51; in 1902, 9.45. Due credit should be given for this showing to an excellent administration of its health department, as well as to the natural advantages mentioned. The city occupies an area of 55 square miles, mainly on the left or east bank of the river; connection being made with the portion on the west bank by means of three public bridges and several used by railroads exclusively. Beside these, the irregular character of the site and the general avoidance of grade crossings necessitates the maintenance of 57 other bridges spanning railways, valleys, etc. There are 452 miles of improved streets. With the exception of a few squares where hard brick is used, and some steep inclines, all the business streets are paved with asphalt, as are a large number in the residence districts. The residence streets are beautifully laid out, generally with side lawns and shaded with trees; while the houses are usually set back and apart from one another, so as to allow of wide front lawns and grassy spaces. Summit Avenue, the most fashionable residence street, winding for a portion of its length along the edge of the bluff, and affording fine views of the river gorge and the lower terraces of the city site, is the admiration of all visitors.

Chief Buildings.—Dominating the view, as

the city is approached from the south and east, is seen the new State Capitol of Minnesota, a magnificent structure of white Georgia marble, standing on high ground to the north of the business section; erected at a cost of \$4,500,000, and comparing favorably in elegance and solidity with any public building on the continent. The contour of its lofty dome is especially admired. The new United States building, an expensive structure of pinkish-gray stone, with an imposing tower, shelters the post-office, the customs and internal revenue offices and the United States courts. The old United States building, of limestone, is still attractive in its gothic lines. The City Hall and County Court-house is another fine gothic structure of stone, surmounted by a tower in which is a musical chime of bells, and surrounded by green lawns. It cost, exclusive of the donated site, \$1,000,000. Near the court-house is a handsome modern stone jail. The towering office-buildings of the Pioneer Press Company, the New York Life and the Germania Insurance Companies, the Endicott Arcade, the Manhattan building and the building of the German-American bank afford unsurpassed office accommodations. The old State Capitol building of brick, with four wings surrounding a high square central tower, is an interesting landmark. The City and County Hospital, near the river, is a model institution in architecture, equipment and management. Some of the department store buildings are of immense size. Among the church edifices, the People's Church, with an auditorium capable of seating about 2,500 persons; the Central Presbyterian, the Park Congregational, the First Baptist and the old Cathedral are the most noticeable.

Municipal Service.—The street cleaning and sprinkling services are managed by the municipality; likewise the collection of garbage; the appropriation for street-cleaning in 1903 being \$150,000; for sprinkling, \$40,000; for garbage collection, \$25,000. A hydraulic apparatus is used in flushing the asphalt pavements. The sewage is discharged into the river through 185 miles of mains; 21 miles of which are tunneled through the sand-rock. There is a fine electric street railway service, including 15 lines, with a total length of 123 miles. It is operated in connection with the Minneapolis lines, largely by means of water-power electrically transmitted from dams in the Mississippi. This has recently been supplemented for street railway and other purposes by additional power brought from the Apple River, Wis. Enough more is expected to be derived from the government dams now (1903) in course of erection for the installation of slack-water navigation on the Mississippi between Saint Paul and Minneapolis, to light all the streets and public buildings by electricity. The latter illuminant is already extensively used in the business districts, but the rest of the city is mainly lighted by gas. A large portion of the telephone, telegraph and other wires have already been transferred to underground conduits, and the work is being continued with a view to freeing the streets entirely of poles and overhead wires. The fire department has an equipment valued at about \$600,000, including 16 steam fire engines, four chemical engines, a water-tower and other modern appliances. The police department employs 200 men, and its

SAINT PAUL

work is facilitated by an alarm system with 105 signal boxes, telephones, patrol wagons, etc.

Parks, Boulevards and Public Resorts.—The topography of the city has afforded great opportunities for the laying out of picturesque parks and parkways; and a public-spirited park commission has achieved some notable successes through the expenditure of the means liberally placed at its disposal. The total area of the parks is 1,082.4 acres. Como, Phalen and Indian Mounds parks are the most popular; the first two including beautiful lakes; the last affording what is said to be the most magnificent view on the Mississippi River. Merging with its grounds are those of the State Fish Hatchery. Harriet Island, in the river fronting the business part of the city, has also been made an attractive pleasure ground. Here are located the public baths, with accommodations, for both sexes, on a large scale, not only for bathing but for refreshments; all, with the grounds, being under the control of the health commissioner. The park driveways reach a total of 18 miles; the boulevard drives, $3\frac{1}{2}$ miles. The River Boulevard, only the first picturesque stretches of which are included in the above figures, will, when completed, add many miles to a drive of unsurpassed attractiveness. The Fort Snelling military reservation—a large area at the junction of the Minnesota and Mississippi rivers, adjoining the city on the southwest and connected by a bridge spanning a romantic gorge—is practically a part of Saint Paul's park system. It is one of the most important military posts in the Union.

Fair Grounds.—On the north, surrounded by Saint Paul territory on three sides, but legally not a part of the municipality, are the grounds and beautiful buildings of the Minnesota Agricultural Society, owned by the State. Here is annually held a fair unequalled in the variety of its exhibits and the size of the attending crowds by any "state fair" in the United States; the only local fair surpassing it being that annually held by a private corporation at Saint Louis. The attendance during the six days of the fair in 1903 numbered 240,601 persons.

Schools and Libraries.—The public schools are housed in 47 buildings, most of them of an advanced type. There are four high schools. The enrolment of pupils for 1903 was 26,300; the amount paid for teachers' salaries, \$431,590.78. There are also about 60 private and parochial schools, with an estimated attendance of 15,000; also 11 denominational colleges. The city shares with Minneapolis the advantages of the University of the State of Minnesota; the Agricultural School of that institution being in Saint Paul, and its other buildings near the line dividing the two cities. Operated in connection with the School of Agriculture is the State Experiment Station. This makes the course so thoroughly practical and advantageous that the school has a national reputation, and yearly attracts numbers of students from abroad; being open on equal terms to applicants from any part of the Union. The Public Library, owned and supported by the municipality, is housed in what was formerly the City Hall and Market building. It contains about 60,000 volumes, and the expense of its maintenance and enlargement is about \$37,500 per

year. In the Capitol building are located the Law Library of the State, about 20,000 volumes, and that of the Minnesota Historical Society, 63,000 volumes. There are also seven or eight semi-public libraries, under society management. In the home of President J. J. Hill is the finest gallery of paintings of the Barbizon School on the American continent.

Churches and Charities.—Of the 164 churches and mission stations in the city, 2 are Adventist, 14 Baptist, 24 Catholic, 2 Christian or Disciples, 15 Congregational, 16 Episcopalian, 6 Evangelist, 7 Hebrew, 31 Lutheran, 20 Methodist, 1 People's, 18 Presbyterian, 1 Swedenborgian, 1 Unitarian, 2 Universalist, 2 Salvation Army, 2 Spiritualist, 2 Christian Science. The poor of Saint Paul are exceptionally well cared for, through a public board of control, a well organized relief association, several orphan asylums under denominational control, a Children's Home, where all friendless waifs are cared for until private homes are found for them, a fine public hospital and several other hospitals which care for a limited number of free patients. In addition to all these instrumentalities, by the wills of Mrs. Cornelia Day Appleby and other heirs of the estate of Amherst H. Wilder, about \$2,000,000 have been placed in the hands of trustees, the annual income of which is to be devoted to the assistance of the poor of Saint Paul.

Transportation Facilities.—Saint Paul is the railway centre of the entire Northwest. Eleven trunk lines either begin or terminate here, with a mileage of more than 36,000 miles. With two exceptions, their general offices are located here, mostly in their own buildings; many of them also maintaining extensive car-shops. There are seven lines to Chicago and the East; three to Lake Superior, five to Manitoba and the Northwest, four to the Pacific Coast, three to the Southwest; and five to the South. The "Minnesota Transfer," a sort of clearing-house for the traffic entering the Twin Cities, occupies extensive grounds in the northwest quarter of the city. Steamboats, once the only vehicles of commerce with the South and East, still carry on some freight traffic; and in summer the river is a favorite route for pleasure travel.

Commerce and Manufactures.—Saint Paul is a port of entry and one of the few tea-inspection ports of the United States; a large portion of the teas imported from the Orient being here inspected. The total amount of dutiable goods passing through the custom-house already reaches \$4,000,000 a year; of goods free of duty, \$750,000. The customs collections during the fiscal year ending 30 June 1903, amounted to \$880,000; the internal revenue collections, to \$1,465,570.62. From Saint Paul's peculiar connections with the Canadian railways through the "Soo" line, which affords a competitive route to tide-water both on the Pacific and on the Atlantic, practically outside of American regulation, its merchants are able to compete on even terms with those of Chicago in wholesaling nearly all kinds of goods, imported and domestic. Hence the wholesale traffic of the city has grown to remarkable dimensions, reaching all over the continent. The "wholesale district" is a prominent feature of the business area. The total business done by the wholesale houses during 1902 exceeded \$250,000,000. The peculiar

SAINT PAUL

railway facilities here available have recently attracted much manufacturing enterprise. There are 650 manufacturing plants, employing 25,000 persons, with an output for the last year of over \$125,000,000. By a co-operative movement among the manufacturers of household and office furniture, stoves and fittings, there has been a concentration of business in these lines in the Saint Anthony Park suburb, where a commodious "exposition" or sample warehouse and exchange, has been erected, and where assorted car-loads are made up for any part of the Union. The fur trade has always been a prominent feature of Saint Paul's commerce; the traffic in furs, manufactured and unmanufactured, being now exceeded in America only by that of New York. Other unusual specialties among its manufactures, in addition to those found in all large American cities, are hats, macaroni, and linseed oil, all of which are produced in large quantities. The introduction of electric power, from sources above alluded to, is expected to greatly increase the number of manufacturing industries.

Finances and Banking.—The city is the seat of a great deal of private and corporate wealth; but the assessment of property for taxation is kept low. The total assessed valuation for 1903 was \$93,035,056; the levy, 31 mills. The total expenses of all departments of the city government for the year are stated at \$2,848,505. The bonded municipal debt is \$8,001,000; the per capita cost of schools, \$3.44. There are six national banks, whose combined resources 9 June 1903, were \$30,359,510.18. There are also four commercial and three savings banks organized under State laws, and a number of loan and trust companies and private banks.

Newspapers.—In 1903 there were published in Saint Paul a total of 52 newspapers, of which five were daily and the remainder weekly and monthly. One of the dailies and several others are in German. The Scandinavian languages also have their newspaper representatives.

Government.—The city has a "home rule" charter, adopted in 1900; amendments to which, proposed by a permanent charter commission, may be made by popular vote at any general election. The mayor holds office for two years, has the veto power over acts of the council, and appoints the various administrative boards and heads of departments. These are a board of police commissioners, of park commissioners, water commissioners, school inspectors, fire commissioners, and the library board; the members of all of which serve without pay. He also appoints the engineer and commissioners of public works, a health commissioner, city physician, corporation attorney and market master, with their assistants. The city treasurer, comptroller and clerk are elective officers. The council is composed of two bodies, an assembly of nine members, elected by general ticket, and a board of aldermen, one from each of the 11 wards.

History.—Had the beautiful and significant Indian nomenclature been preserved, when white men first began to label the geographical points of the upper Mississippi region, the place now called Saint Paul would still have been known by the name of "Innijiiska," the White Rock; an appellation derived from the white bluffs at the bend of the river. Although occa-

sionally the site of an Indian camp, it was not until about 1800 that an Indian village was located in the vicinity. This was in the valley or coulee known as "Pig's Eye," below Dayton's Bluff. Long before that date white men had repeatedly visited the spot; the first, it is believed, being two French traders, Groseilliers and Radisson, in 1658. La Salle mentions the locality in a letter written in 1682. The first American to visit and describe the site was Jonathan Carver, of Connecticut; who, in 1766, made an adventurous journey from Boston by way of Mackinac, across Wisconsin and part of Minnesota; and whose heirs afterward vainly claimed the whole site of Saint Paul, and much adjacent territory, by virtue of an alleged grant made to him by the Indians. In 1703, by the treaty with England, that part of the site lying east of the Mississippi became United States territory; the remainder belonging to the Spanish province of Louisiana. President Jefferson sent Lieut. Zebulon Pike, with 20 soldiers, to take possession. By him most of the ground now occupied by the city and by the Fort Snelling military reservation was purchased from the Sioux for the consideration of 60 gallons of whiskey and a few presents. Congress, however, afterward voted the Indians \$2,000 in cash additional. Between 1783 and 1840 about 200 settlers had located their dwellings on and near the site of the future city. Practically all of them were either Frenchmen or the descendants of Frenchmen, and Catholics; maintaining themselves chiefly by hunting and fishing and traffic with the Indians and pioneering parties of whites. They were visited in 1840 by Father Lucian Galtier, under whose guidance they in the following year erected a church of logs, on the crest of the bluff at the foot of what is now Minnesota Street; and dedicated it to Saint Paul. Steamboats had already made a landing place in the vicinity and it began to be called "Saint Paul's Landing," afterward shortened to Saint Paul. The secret of the city's subsequent growth lay in the fact that it was the most northerly point accessible by the steamboat traffic of the Mississippi. Here must be unloaded the supplies for all the fast-multiplying settlements; not only of the territory of the United States in the Northwest, acquired by the Louisiana purchase in 1803, but for large districts in the British possessions. Hence were shipped valuable cargoes of furs, game, and later, of lumber. The steamboat traffic continued, in steadily increasing volume, until the advent of railroads, between 1860 and 1870, when it entered on a steady decline. But meanwhile the country had been filling up, and the city had entered on a new and broader development. On the organization of the Territory of Minnesota, in 1849, Saint Paul was designated as its capital. At that date the white population of Minnesota did not exceed 1,000. In Saint Paul there were only 32 dwellings. The same year witnessed the incorporation of the town and the establishment of the first newspaper—the 'Pioneer,' which survives in the *Pioneer Press* of to-day. Now set in a period of rapid growth. Incorporation as a city took place in 1854. The following year Saint Paul had a population of 4,716—fully 30,000 having been added to the population of Minnesota in a twelvemonth. The city has ever since been

SAINT PAUL DE LOANDA—SAINT PETER

the gateway of a human flood which has poured through it to people the Northwest. In the war for the Union, Saint Paul made a remarkable record. Out of a total population, at the beginning of the struggle, of less than 11,000, and a voting population of a little over 2,000, the city furnished, first and last, 1,498 men for the Union army. The city has during its whole career been practically exempt from the scourings by fire, flood, war, pestilence and disorder which have marked the history of other places. Its story since 1865 has been one of steady and quiet growth in commerce, manufactures and population. With its recently greatly increased facilities for taking care of crowds, it is now a favorite point for the holding of conventions.

Population.—The population in 1860 was 10,401; at the close of the Civil War it had reached 12,976; in 1870 it was 20,030; in 1880, 41,473; in 1890, 133,156; in 1900, 163,065. The directory-publisher's calculation for 1903 shows a present population of 219,870; but this includes the residents of South Saint Paul and other suburbs which, though commercially speaking a part of the city, are not included within the municipal boundaries. The foreign element in the population is very large. The total of foreign-born residents in 1900 was 46,819, while native white persons of foreign parentage numbered 72,077 more. Of the foreign-born population, Germany contributed 12,935; Sweden, 9,852; Ireland, 4,892; Canada, 4,572; Norway, 2,900; England, 2,005; other countries, 9,663.

CONDÉ HAMLIN,

General Manager, The Pioneer Press Co.

Saint Paul de Loanda, lô-ân'da, Guinea, West Africa, near the mouth of the River Benga, is a sea-port and a bishop's see, as well as the principal Portuguese settlement in this part of Africa. It is built on a slope, the better class of people occupying the heights—the black population the sea-board. Once important it is now in decay. Three forts protect the harbor. There are several commodious government buildings and some stone houses. A railroad from Loanda to Ambaca, 140 miles inland, was begun in 1888. Pop. 15,000.

Saint Paul Seminary, The, a Roman Catholic institution founded at Saint Paul, Minn., in 1894. Buildings, grounds, and an endowment of \$500,000 were given by James J. Hill (q.v.); and the institution became the provincial seminary of the ecclesiastical province of Saint Paul. Archbishop Ireland is president of the board of trustees. The Seminary has two courses in theology and in philosophy; and three departments of instruction, theology, philosophy, and arts; the courses in the department of philosophy include physics, chemistry and biology; the courses in the department of arts include Hebrew, Greek, and music, and form a part of both the theological and the philosophical courses; the study of Hebrew is optional. The Seminary has a campus of 40 acres the land sloping gradually toward the Mississippi; the buildings include the administration building, the class building, two residence halls, a dining hall, a gymnasium, and the chapel (erected 1903). In 1903 the library contained over 10,000 volumes, the students numbered 153, and the faculty 12.

Saint Paul's Cathedral. See LONDON.

Saint Paul's School, a noted college preparatory school at Concord, N. H., founded in 1855 by Dr. George Cheyne Shattuck and incorporated on 29 June of the same year. It was opened on 3 April 1856, its first rector being Rev. Henry Augustus Coit who held that position till his death in 1895. By the terms of the founder's deed the trustees of the school must be communicants of the Protestant Episcopal Church. The course of instruction covers six years and the school is divided into six forms and an upper remove. In 1903 it numbered 350 pupils with 39 masters. The buildings, some 60 in all, are situated in a pleasant rural locality rather more than two miles from the city of Concord, the most important of these, architecturally, being the library, the imposing Upper School (built in 1903) and the spacious chapel, the latter containing a superb oaken reredos and a recumbent marble statue of the first rector of the school. The grounds belonging to the institution comprise about 2,000 acres. Rowing and cricket are the favorite sports of this school. The library contains 13,000 volumes and there are two literary societies, the Cadmean and the Concordian. The school journal, 'Horæ Scholasticæ,' was founded in 1860 and is issued monthly. Consult: Adams, 'Some Famous Schools' (1903).

Saint Paul's School, London, England, an endowed grammar school, founded by John Colet in 1512, with no limitations as to country, nation or class. It was built to accommodate 153 students and until 1884 stood in Saint Paul's churchyard. It was instituted for the free education of poor children. The original building was burned down in 1666. In 1824, the second one, built by Wren, was taken down and another erected. In 1884 a new school was opened at West Kensington. The course of study was formerly classical, but is now designed to prepare for army examinations.

Saint Peter, one of the twelve Apostles of Jesus Christ. Peter (from the Greek *πέτρος* a rock, of which the Aramaic equivalent was Cephass) was the son of a certain John or Jonah (cf. John i. 43; Matt. xvi. 17). He was born at Bethsaida of Galilee (John i. 44; xii. 21) but afterward resided at Capernaum where he had a house and was engaged in the fishing business in partnership with his brother Andrew and Zebedee and his sons James and John. (Mark i. 16-20; Luke v. 10-11). His proper name was Simon or Simeon, but the surname Cephass given him by Jesus (John i. 43; cf. Matt. xvi. 18) became, in its Greek form, Peter, the name he was generally known by in the early Church.

Since the firm to which Peter belonged owned boats and nets and hired assistants it is needless to think of Peter as poverty stricken, though it is not probable that he was wealthy.

Of his education we know practically nothing. It is likely that he spoke ordinary business Greek as well as his native Aramaic, for Galilee was largely bi-lingual. He may have been able to read the Old Testament in Hebrew. However, he was not "learned" in the rabbinical sense (Acts iv. 13). He was probably familiar with the Greek Old Testament, but knew but little of the Jewish scholarship of the day.

When John the Baptist appeared in the lower Jordan Valley with his announcement of the

SAINT PETER

coming crisis, Peter and his business partners were among the many Galileans who went to hear the great preacher. Here he became acquainted with Jesus (John i. 40). This first acquaintance did not immediately result in full discipleship, since Jesus had not yet opened His public ministry. It is uncertain to what extent Peter accompanied Jesus before he was formally called when Jesus opened His Galilean ministry (Mark i. 16). Yet it was the earlier acquaintance with Jesus that prepared the way for the summons to a life-work (Mark i. 16; Luke v. 11), when at Jesus' word Simon left his nets and boats and became one of the daily companions of the Great Teacher. As yet, however, he was only one among many whom Jesus attracted to Himself during the early months of His work in Galilee. It was a testing time for Simon. He showed such appreciation of Jesus' person and teaching that he was chosen by Jesus to be one of 12, selected from the larger body of "disciples" who were to be "apostles," that is, intimately associated with Him to learn of Him and (ultimately) be sent out by Him to declare His message and carry on His work (Mark iii. 14). With the brothers James and John he made a group of three with whom Jesus was most intimate and who alone were associated with Him on such occasions as the transfiguration and the prayer in the garden of Gethsemane. To Peter and his companions Jesus' refusal to allow the enthusiastic crowds, after the feeding of the five thousand (Mark vi. 31-44; John vi. 14-15) to proclaim Him as Messiah must have been a great disappointment. But the Twelve remained steadfast and it was Peter who voiced their conviction a little later, in response to Jesus' searching question, that Jesus was indeed the Messiah (Mark viii. 29ff., John vi. 68). This confession drew from Jesus the commendation "thou art Peter (that is, rock) and on this 'rock' I will build my church" (Matt. xvi. 18). The explanation of these words has been a subject of much dispute. Roman Catholics hold that by them Christ conferred a personal supremacy over the Church upon Peter. Protestants deny this, and regard them merely as referring to the truth Peter uttered as the foundation of His Church. When Jesus soon after declared that it was necessary for Him to go to Jerusalem and suffer, Peter protested and was rebuked. The transfiguration scene opened his eyes more fully to the significance of Jesus' person. Thus his education proceeded, new lessons being learned daily. He was, of course, present during the experiences of Passion Week. He and John were sent into the city to prepare the Passover meal which became the Lord's Supper. He witnessed the agony in the garden. When the band arrested Jesus, Peter drew his sword and struck off the ear of one Malchus. Though with the others he fled when Jesus was arrested he followed the party into the city and through the influence of John gained admission into the palace where Jesus' trial was proceeding. Here his fickleness and cowardice again overcame him, and when taunted by a servant maid he denied with an oath that he knew Jesus. Overcome by shame he went outside and wept, but was a witness of Jesus' sufferings on the cross if not of His trial before Pilate. These scenes were so indelibly stamped

on his mind that years after they retained their impression and shaped his thinking (1 Peter ii. 23; v. 1). The despair that settled over his soul when he saw his beloved Master die was not lighted by any definite hope of a resurrection. But when the women who were at the sepulchre early Sunday morning came with the news of an open and empty tomb, Peter and John ran to investigate. They found the tomb empty and returned to their company. Peter was the first of the Twelve to whom Jesus showed Himself after His passion (Mark xvi. 1-8; Luke xxiv. 35; John xx. 1-10; 1 Cor. xv. 5). For Peter this was a new birth, filled with a living hope (1 Peter i. 3). Later Jesus restored Peter to his full apostolic position (John xxi.).

Peter now took a leading part in the direction of the little band of disciples that was the nucleus of the Christian Church. He proposed the election of a successor to Judas Iscariot (Acts i. 15ff.) and on the day of Pentecost made the first statement of Christian doctrine to the world. The sermon as given in Acts ii. 14-36 centres about the necessity of proving to the Jews that the crucified but now risen Jesus was indeed God's Messiah. The argument from the analogy between ancient prophecy and the recent events connected with Jesus was a convincing one to many Jews, and large numbers confessed their faith in Jesus as Messiah. Until the persecution because of Stephen the new movement was confined almost exclusively to Jerusalem, and it was Peter who had the chief share in the guidance of affairs. His associate was John. These two figure prominently in the accounts of the first conflicts with the Jerusalem authorities (Acts iii.-iv.). It was Peter who rebuked Ananias and Sapphira for their covetousness (Acts v. 1-11), who was spokesman for the apostles in their formal trial before the Sanhedrim (Acts v. 17-42), and whose fame was such that later tradition said that even his shadow was able to perform miracles (Acts v. 12-16). After the martyrdom of Stephen the Christian movement took on larger proportions. The work spread throughout Palestine and into neighboring countries. To a certain extent it was supervised by the apostles. The Acts preserve a record of two visitations by Peter in this connection. The first was when he and John were sent by the apostles to oversee the evangelistic labors of Philip in Samaria. Here Peter came in contact with the magician Simon, severely rebuking his cupidity and lack of spiritual perception (Acts viii. 14-25). The second tour was an extensive one in the regions to the northwest of Jerusalem (Acts ix. 32ff.). On it he healed Eneas at Lydda and raised Tabitha at Joppa. From Joppa he was summoned by a vision and by messengers from Cornelius, a centurion stationed at Cæsarea, to preach the gospel to the latter (Acts x.). This was the first recorded preaching of the gospel by Jewish Christians to Gentiles. In this matter Peter came to a result he had not anticipated at first. At the end he found himself doing what he had never done before, fellowshiping freely with Gentiles, recognizing them as Christian brethren and eating with them.

Naturally such conduct provoked sharp criticism on the part of the stricter members of the Jerusalem Church. When Peter returned to Jerusalem he was called upon to give an account

SAINT PETER

of his doings. His defense was that he had been guided by the Holy Spirit and that the Spirit's presence had been manifested while he was preaching to the Gentiles (Acts xi). Sometime after this Peter was arrested by order of Herod Agrippa I., and imprisoned in Jerusalem with a view to executing him on the following day. But he escaped and left Jerusalem immediately (Acts xii. 1-17). Whither he went is not said and for all further knowledge of Peter's movements we must trust to incidental statements in the New Testament or to the very uncertain notices in early Christian literature. Since Herod Agrippa died in 44 A.D. the events narrated in Acts i. 12, in case they are arranged in anything like chronological sequence, must have covered a period of about 15 years. We may say then that for that length of time Peter was the foremost figure of the early Apostolic Church. During this period, three years after his conversion, Paul visited Jerusalem to talk matters over with Peter (Gal. i. 18), staying with him 15 days. This must have been somewhere near 40 A.D. His subsequent career was, doubtless, just as important, but its details have not been preserved. About 49 A.D. Peter was present at the council in Jerusalem and took a leading part (Acts xv. 6ff; Gal. ii. 1-10). By this time he had become recognized as the "Apostle of the Circumcision" (Gal. ii. 7), through whom God was working as effectually as He was through Paul for the "Uncircumcision" (that is, the Gentile world). These expressions of Paul seem to indicate that Peter's activity was—like his own—largely missionary in character, to the Jews of the dispersion, as his was to the Gentiles. For this reason Peter was in Jerusalem only occasionally after his escape from Herod Agrippa in 44 A.D. We learn further, from Gal. ii. 11-14, that at Antioch, either soon after the Council of 49, before Paul set out on his second missionary journey (49-52 A.D.), or at the close of that journey when Paul was at Antioch for a while (Acts xviii. 23), Peter was sharply rebuked by Paul for weakly yielding to emissaries of the strict Judaistic party of Jerusalem and withdrawing from familiar fellowship with the uncircumcised Gentile members of the Church. It is of interest to note that Paul's own words in Galatians imply that Peter, Barnabas, and others had been in the habit of thus freely mingling with Gentile Christians, which is only what we would infer from Acts x.-xi. Full fellowship with the Gentile converts was not discussed at the Council of 49, and Peter's withdrawal did not violate the terms of the agreement reached in the council. It violated the principles there followed, however, and deserved Paul's rebuke.

For the remainder of Peter's career we are in almost total ignorance. He appears to have continued his missionary labors. In these he was frequently accompanied by his wife (1 Cor. ix. 5). Early Christians looked back to him as the first bishop of the Church of Antioch. Whatever truth there may be in this tradition it is certain that he did not organize that great Church. Other ancient traditions speak of his labors in Asia Minor, especially in the regions near the Black Sea. These may be no more than inferences based on the address of the First Epistle. At what point in this

later period are we to place the two epistles attributed to him? The authenticity of the first is more certain than that of the second. It was written from "Babylon" to the "dispersion" of northern Asia Minor. Both terms have been taken in a figurative sense and most scholars hold that it was written from Rome to Gentile Christians in Asia Minor. Neither of these positions rests on any very substantial evidence, though it is just more than possible that the letter was sent from Rome. Mark was with the apostle at the time, also Silvanus, who appears to have penned the epistle (v. 12-13). Since Silvanus was Paul's companion as late as when he wrote 2 Cor. (i. 19) Peter's letter must be dated after 55 A.D. And since Paul's later letters from Rome, Philippians, Colossians, Ephesians, and Philemon (59-61 A.D.) betray no evidence of personal contact with Peter in Rome, the probability is that Peter was in Rome between 56 and 59, and thence sent his message to the churches of Asia Minor; not to the Pauline churches there, but to other communities that were less directly connected with Paul's work. To what place Peter went after leaving Rome, whence he sent the second letter, in case it is his, and whether he returned to Rome,—all these are matters on which we possess no direct information. According to a widespread tradition, which has become generally accepted in Christendom, Peter suffered martyrdom at Rome. It must be admitted, however, that the direct evidence for this tradition cannot be traced much farther back than 180 A.D. At that time it was the firm belief of the Roman Church that both Peter and Paul were martyred at Rome and that the places of their martyrdom (or burial) could be pointed out. The same tradition thought of them as the founders of the Roman Church. All that can be said is that there is no sufficient ground for rejecting the kernel of the tradition, that is, that Peter was at Rome for a longer or shorter period and probably suffered martyrdom at that city. The Roman Catholic Church accounts Peter as the first Bishop of Rome and the first Pope.

EDWD. E. NOURSE, S.T.P.

*Associate Professor of Biblical Theology,
Hartford Theological Seminary.*

Saint Peter, Minn., city, county-seat of Nicollet County; on the Minnesota River, and on the Chicago N. W., and the Chicago, St. P., M. & O. R.R.'s; about 73 miles southwest of Saint Paul. It was settled in 1854 by Captain W. B. Dodd; incorporated in 1865, and chartered as a city in 1873. It is in a farming and lumbering region and in the vicinity are limestone quarries. The chief manufactories are flour and lumber mills, machine-shops and foundries. There are in all about 25 industrial establishments. The State Hospital for the Insane located here, accommodates about 1,200 patients. The educational institutions are the Gustavus Adolphus College (Lutheran), 300 students; public and parish schools, a private business school, and a Carnegie Library. The two banks have a capital of \$100,000. The government is vested in a mayor and a board of aldermen elected annually. A number of the inhabitants are Germans and Scandinavians; but the American-born predominate. Pop. (1890) 3,671; (1900) 4,302.

SAINT PETER PORT—SAINT PETERSBURG

Saint Peter Port, Channel Islands, capital of the Island of Guernsey, on the east coast rises in terraces on the slope of a hill, and presents a very attractive appearance from the sea. The streets are narrow and steep; the environs exceedingly beautiful, studded with handsome residences. The most interesting buildings are St. Peter's cathedral-like church, Elizabeth College (1563), Ladies' College, public hospital, and the handsome market. The Guille-Allès Library, opened in 1882, contains 80,000 volumes. The Royal Court-House is used both as court of justice and as parliament house. The harbor is large and commodious, and is defended by the picturesque mediæval Castle Cornet on a rocky islet at its mouth and by Fort George, a regular fortification on the heights, about one half mile south from the town. Pop. (1901) 18,163.

Saint Peter's College, or **Peterhouse**, England, is the oldest college in the University of Cambridge. It was founded as a hospital and converted into a college in 1286. This and the other sister colleges were modeled after the monasteries, to a certain extent. The present chapel was opened in 1632. The hall and combination rooms have been restored. The poet Gray belonged to this college; also Isaac Barrow, Archbishop Whitgift and Sir William Thomson.

Saint Peter's Lake, Canada, an expansion of the Saint Lawrence River, between the mouths of the Saint Maurice and the Richelieu. It forms the outlet of many rivers, chief of which is the Saint Francis. In its southern portion are found many islands, notable for their fine scenery. The length of the lake is 35 miles; the breadth, 10 miles.

Saint Peter's, Rome. See **ROMÉ**.

Saint Petersburg, *pě'těr-z-běrg*, Russia, the capital of the empire, on the delta of the Neva, at the head of the Gulf of Finland, 400 miles from Moscow, covers an extensive area embracing the banks of the river bordering the mainland as well as numerous islands formed by the many branches of the Neva. Many bridges connect the islands with the mainland and with each other, and these are of various construction, only two of them being permanent; two are built on boats and removed semi-annually, and when the ice descends from Lake Ladoga; the others are built of wood. The city lies very low, on marshy land, which renders it very unhealthy and subjects it to disastrous inundations. About 200 canals have been constructed which obviate this condition somewhat as they receive the surplus water due to heavy gales and the melting of ice and snow in the spring. The banks of the principal canals—chiefly in the Peninsula or Great Side of the city, are protected by solid walls of granite; they are navigable for boats of deep draft. The quays of the Neva are more extensive and substantial than those of any other European city. The great forests extend to the very confines of the town in one direction, while marshy bogs are characteristic everywhere. The most important portion of Saint Petersburg is that south of the Admiralty, from which radiate the principal streets—the Nevski-Prospect—one of the finest streets of the world—the Gorokhovaya Ulitsa, and the Vosnesenski-Prospect. These streets contain the palaces of the court and nobility and of the

better classes. Other streets run parallel to these and to the canals. All are spacious but poorly paved (beyond, on the right bank of the Neva are the homes of the laboring classes). The main buildings are generally erected on wooden piles in large plots. This part of the residential district on the south bank of the Neva occupies the Peninsula or the Bolshaya or Great Side, that on the north bank, including the islands, Petersburg. The latter section contains the commercial and business district and also the important docks and warehouses, the stock exchange, scientific institutions and many schools and colleges. On the Peterburgskiy Island stands the old fortress of Saint Peter and Saint Paul, facing the Winter Palace; it contains the Mint and the ancient cathedral, where all the Russian sovereigns and their families are interred. Here are political prisons, behind which stands the arsenal, and in the wide streets are the houses of the minor government functionaries. Many of the islands contain attractive parks and summer homes of the wealthy. In the midst of a spacious square stands the old Admiralty, whose light and graceful spire is its chief feature; it contains several collections. Near it are grouped the principal buildings of the capital, which include the "Glavny Shtab," containing the Foreign Office and Department of Customs; the War Department; the Cathedral; the Senate and the Synod, and nearby the equestrian statue of Peter the Great. On the right, is the Winter Palace, and the Hermitage Gallery of Art. The former is the largest palace in the world and is a city in itself when occupied by the royal family, accommodating 6,000 persons. Its fine halls are rich in statuary, paintings and gems of art, including the tables of rare malachite. The great court ceremonials take place in this palace, and in its treasury are preserved the costly crown jewels. The Hermitage is a classical structure, built by Catharine II., but reconstructed in 1840–50. It contains the finest art collection in Russia, including sculptures, and masterpieces, representing the Spanish, Dutch, Flemish, French and Italian schools. In Petrovskiy Square stands the cathedral of Saint Isaac, whose gilded domes are conspicuous from all parts of the city. It is of almost cubic form and void of any artistic beauty, its peristyles of colossal red granite monoliths create, however, a striking impression. Its interior decorations are rich, its paintings representative of Russian art for a whole century; on a large square south of the Cathedral stands a monument to Nicholas I., a rather stiff Doric column; other monuments are that to Catharine II.; one commemorating the Russo-Turkish war, etc. The arsenal contains a museum of artillery. The Academy of Sciences has an extensive museum and art collection, and a library of 300,000 volumes, etc. The imperial library is one of the most valuable in the world. It contains about 1,200,000 volumes, 34,000 manuscripts, and 75,000 engravings. This collection was drawn largely from Polish libraries. There are four theatres in which plays and operas are rendered in different languages. In all parts of the city the lofty watch-towers are conspicuous, and are used for signaling danger by fire or water. The general style of architecture is nondescript, and lacks the picturesque element—masses of architecture in endless lines, often gorgeous, but tasteless. Of the 400 churches, besides those

1. The Cathedral of St. Isaac, St. Petersburg.
2. The Column Alexander and the Admiralty.

noted, are the Cathedral of Our Lady of Kasan; the church of Saint Alexander Nevskoi; the church of the Smolnoi convent; and church of the Preobrazhenskaya—rich in military trophies. The chief scientific and educational institutions, of which there is a vast number and variety, besides those already mentioned, include the University, the Ladies' University, the Mining Institute, engineering, naval and military technological and medical institutes and art academies and make Saint Petersburg one of the great intellectual centres of the world. It is also the seat of the Russian publishing trade, and 120 newspapers are printed. The palaces not mentioned are: The Marble, Taurida, Annitchkoff—favorite residence of the Czar—and the new Michaeloff palace, the most elegant building of the capital. The government buildings are remarkable for their size. There are various hospitals and benevolent institutions. The manufactures of Saint Petersburg are extensive and valuable. Most important are the manufactures of Gobelin tapestry, of glass, porcelain, military surgical instruments, articles of malachite and precious stones, and embroideries. There are besides large foundries, the manufacture of textiles, leather, paper, tobacco, jewelry, clocks, etc. The commerce of the city is enormous; 12,000 to 13,000 vessels large and small enter the Port of Cronstadt, 16 miles distant, laden with produce of field and forest; and tons of various goods, including corn, are brought to the city by the railroads. The new and extended railway systems have adduced to a rapid development of trade and industry. Large quantities of grain and other natural products are annually exported, whose value is variously estimated—according to crops—from 73,000,000 to 96,000,000 rubles. The climate, though not very severe, is subject to sudden transitions of temperature; the rate of mortality is greater here than anywhere else in Europe. Two centuries have elapsed since the capital of the Muscovite empire (1702) was founded by Peter the Great, transforming Russia from an Oriental into an Occidental power. He forced Western civilization upon his subjects; compelling them to help build up the capital by residing there, and every vessel by bringing stone in her cargo, to build the walls and pave the streets. The loss of life in constructing the city (owing to the unfortunate site—a Finnish marsh) cannot be calculated. It is now the headquarters of the political, social, military and administrative life of all the Russias, one of the most instructive examples of national development. Pop. (1900) 1,439,375.

Saint Petersburg, Declaration of, an agreement between the European powers made in December 1868 at Saint Petersburg; signed by representatives of Austria, Belgium, Bavaria, Denmark, France, Great Britain, Italy, the Netherlands, Persia, Portugal, Germany, Russia, Sweden, Norway, Switzerland, Turkey and Würtemberg. The powers agreed to use in war no explosive projectile of less weight than 400 grams or 14 ounces avoirdupois. Other provisions were made to reduce the death rate and alleviate the suffering of injured and disabled soldiers by the use of more humane implements of war.

Saint Pierre, Jacques Henri Bernardine de, zhäk ön-rē bār-nār-dēn de sän pē-är, French author: b. Havre 19 Jan. 1737; d. Eragny-sur-Oise 21 Jan. 1814. He received his education at Caen and at Rouen, and entered the government service as a civil engineer. Dismissed for insubordination, he wandered about the continent for several years before he began to write. His first book, 'Voyage à l'Île de France' (1773), an account of his voyage to the island of Mauritius, did not attract attention. Sixteen years later his experiences in this lonely island became the background of his celebrated novel, 'Paul and Virginia,' which was published in Paris in 1788, and almost immediately translated into English, Russian, Polish, Dutch, Spanish and Italian. He was the author of two other novels little known beyond his day, and of two volumes of poetical studies of nature: 'Etudes de la Nature' (1784); and 'Harmonies de la Nature' (1796). His works besides those already mentioned are: 'Essai sur Jean Jacques Rousseau'; 'La Chaumière Indienne' (1790); 'Le Café de Surate' (1790); and his 'Correspondance' (1826). Consult: Barine, 'Les Grands Ecrivains Français' (1891); Maury, 'Etude sur la Vie et les Œuvres de Bernardin de Saint Pierre' (1892).

Saint Pierre, Jacques Legardeur de, zhäk lā-gār-dēr dē, French soldier: b. Normandy 1698; d. near Lake George, N. Y., 1755. He entered the army in early youth and went to Canada where he served against the Iroquois and against the English in the war of 1740. He was one of the first to explore the Rocky Mountains, making the journey up the Saskatchewan River in 1752 and on his return was ordered to Fort de Bœuf, Ohio. While in command there he received George Washington, then adjutant-general of Virginia, who brought a letter from Governor Dinwiddie requesting the withdrawal of French troops from English territory. Washington in his journal comments very favorably on the French commander. Saint Pierre was succeeded by Contrecoeur in 1753 and was appointed to the command of the Indian auxiliaries. He rendered valuable services in Baron Dieskau's expedition and was afterward killed in the action near Lake George where Whiting's regiment was routed. His account of the Rocky Mountain expedition is preserved in the National Library of Paris and was published in the collection of John Gilmary Shea, 'Mémoire ou Journal sommaire de Jacques Legardeur de Saint Pierre' (1862).

Saint Pierre, a town on the island of Réunion, in the Indian Ocean, on the west coast, 34 miles south of Saint Denis, the capital, and the terminus of a railway 83 miles long, connecting with the capital, with Pointe-des-Galets, the chief port, and with Saint Benoit on the east coast. Pop. (1897) 27,900. See RÉUNION.

Saint Pierre, West Indies, a seaport town in the volcanic island of Martinique (q.v.). Prior to the eruption in 1902 of Mont Pelée (q.v.), Saint Pierre was the largest and most flourishing city not only of Martinique but of the Lesser Antilles. It was an important seaport and a bishop's see. The principal buildings were

the cathedral, lyceum, and palace of justice. There was a fine botanical garden containing rare and peculiar specimens, etc.—all destroyed by the sudden catastrophe above noted, together with the entire population. Pop. (1901) 26,011.

Saint Pierre and Miquelon, mēk-lōn, two islands belonging to France, and situated 10 to 40 miles off the south coast of Newfoundland, in lat. 47° N. and lon. 56° 20' W. Miquelon, the larger, is 24 miles long and 6 miles wide, and the two have a combined area of 91 square miles. Miquelon consists of two high, rocky, and barren portions connected by a low neck of sand. Saint Pierre is also a rugged mass of barren granite, and both are surrounded by rocks and reefs. Saint Pierre, however, is the most populous and the residence of the governor. Here is a town of a thoroughly French type, with a wooden cathedral, and administrative offices including the American terminus of the French-Atlantic cable. The islands, the last vestige of France's North American colonies, are important as a station for the French fishing fleets in Newfoundland waters. During the fishing season they are visited by hundreds of vessels and thousands of fishermen, and export annually 30,000 to 40,000 tons of fish. They underwent many political vicissitudes until they were finally ceded to France by England in 1816. Pop. 6,352. Consult Caperon, 'Saint-Pierre et Miquelon' (1900).

Saint Quentin, sǎn kōn-tǎn, France, in the department of Aisne, stands on an acclivity overlooking the Somme, about 95 miles northeast of Paris. Prominent among its buildings is the fine Gothic church of Saint Quentin, erected 1114-77, with a special feature of double transepts. Other buildings are the court-house, library, theatre, hospitals and lyceum. The principal manufactures are cotton and woolen goods, tulle, embroideries, lace and guipure of several kinds; there are important foundries, machine-works for various special industries, brick and tile yards, and in the vicinity, numerous sugar mills. There is an active commerce in cotton and linen yarn, and in grain. Several monuments and statues commemorate the defense of the town and its native literary celebrities. The location of Saint Quentin is of considerable strategic importance, and it has figured conspicuously in various wars, notably in 1557 and in the Franco-German war, 1870. Pop. (1901) 50,150.

Saint Regis, rē'jīs, N. Y. and Canada, village, part in Franklin County, N. Y., and part in Huntington County in the Province of Quebec; on the right bank of the Saint Lawrence River, at the mouth of the Saint Regis River. It is an Indian village, and is owned by members of the Iroquois tribe. It is about five miles from a railroad station in New York State; but it has steamboat connection with Cornwall, Ont., and in summer with all the Saint Lawrence River ports and with Hogansburg in New York, on the Saint Regis River. The village is in a fertile agricultural region; the Reservation extends along the Saint Lawrence, in both the United States and Canada, for a number of miles. Many of the Indians are engaged in farming, but the chief occupation is basket-making in which they excel. There are two churches, a Roman Catholic on the Canadian side, and a Methodist on the New York side, on the

boundary of the Reservation. There are five schools in New York and two in Canada. Eleazar Williams (q.v.) lived for some time in Saint Regis. Pop. 1,400.

Saint Regis Indians, a group of Roman Catholic Iroquois from Caughnawaga, Quebec, who during the French and Indian war were established in a village on which is now its boundary between New York and Quebec. The Jesuits founded among them the mission of Saint Francis Regis, hence their present name. These Indians remained neutral during the Revolution, and their number was considerably augmented by other Iroquois early in the 19th century; but their reservation extending across the international boundary, they were divided in partisanship during the War of 1812. The present population is 2,540, of whom 1,386 are on the Quebec side and 1,154 within the United States.

Saint Remy, sǎn rē-mē, France, in the department of Bouches-du-Rhône, near the forest of Saint Benoit, is a village 14 miles northeast of Arles. It is celebrated for its Roman antiquities, the chief of which are the triumphal arch (100 A.D.) and the monument of the Julii. The latter is attributed to the period of the early empire; and consists of a square base ornamented with military bas-reliefs, surmounted by Corinthian semi-columns connected by arches, which support a second series of 10 Corinthian columns, and a dome. Two statues stand in the upper portion. In 1870, in the vicinity of Saint Remy, the Germans won a victory over the French. Pop. (1901) 236.

Saint Ronan's Well, a novel by Sir Walter Scott, published in 1823. The scene is laid about a mineral spring, a quasi watering place, called Saint Ronan's Well. The book is the only society novel attempted by Scott.

Saint-Saens, sǎn-sōn, **Charles Camille**, French musician: b. Paris, France, 9 Oct. 1835. He received his musical education in the Conservatory of the metropolis and in 1853 was appointed organist of the church of Saint Méry, and in 1858 of the Madeleine, where he continued till 1877. His first comic opera, 'La Princesse Jaune,' was produced in 1872, and 'La Timbre d'Argent' in 1877. 'Samson et Dalila,' a sacred drama, was produced at Weimar also in 1877, and was subsequently successfully revived at Rouen. His grand operas 'Etienne Marcel'; 'Henry VIII' (1883); 'Proserpine' (1887); 'Ascanio' (1890); 'Phryne' (1893), have not maintained their early popularity to the present day. He is also known as a musical critic and has published 'Rimes familières' (1886); 'Problèmes et Mystères' (1894). He was elected member of the Academy in 1881. Although he has not attained the highest rank in opera, many of his instrumental works, which include three symphonies, four symphonic poems, two orchestral suites, several concertos for piano and orchestra, and violin and orchestra, and a quantity of chamber music, show consummate talent, if not genius.

Saint Simon, **Claude Henri**, klōd ǎn-rē sǎn-sē-mōn (Eng. sǎnt sī'mon), COMTE DE, French socialistic reformer: b. Paris 17 Oct. 1760; d. there 22 May 1825. Born of a family which traced its descent to Charlemagne he conceived that his origin destined him to great achieve-

ments. At 13 he offended his father by skeptically refusing to receive his first communion. Before he was 16 he gave his servant orders to call him in the morning with the summons, "Rise, M. le Comte, you have great things to do." At 18 he entered the army and he served in the closing campaigns of the American War of Independence. Returning home with the order of Cincinnatus, he was captured in the naval combat in which the French were defeated by Rodney, and remained a prisoner at Jamaica till the peace of 1783. On his return he was created a Knight of Saint Louis, and appointed colonel of a regiment; but after a brief period of garrison duty at Metz, abandoned the service in order to travel. He went to Holland in 1785, and to Spain in 1787. Here he was successful in introducing diligences in Spain. On the outbreak of the Revolution of 1789 he joined himself to those who petitioned the assembly for the abolition of titles of nobility, but took no further part in the political movements of the time; being wholly absorbed in the pursuit of wealth. Speculation in the national domains created by the confiscation of the effects of the nobility and clergy afforded unlimited scope for his ambition. In this career he was joined by De Redern, whom he had known in Spain. Their speculations were at first unfortunate. Redern fled and Saint Simon was imprisoned as a nobleman for 11 months. On his liberation he realized a considerable fortune by paying for the property he had acquired in assignats, the market value of which had fallen to 6 francs the thousand, while they were still received at full value in payment of the national domains. During his imprisonment he had plenty of time for reflection and the thoughts he entertained may be guessed from a vision which he had. "Charlemagne," he relates, "appeared to me and said, 'My son, your success as a philosopher will equal mine as a warrior and statesman.'" In order to fulfil the mission which he had thus received he became in his 38th year a student of science, resided opposite the Ecole Polytechnique, and subsequently the Ecole de Medecine, in order to enjoy communications with the professors, whom he invited to his table.

He married in 1801 Mlle. de Champgrand, and in the course of a year he ran through his fortune. After this he parted with his wife by divorce. In 1802 and 1803 he traveled in England and Germany, without, as he says, acquiring any new experience of importance. During his stay at Geneva he produced his first work, 'Lettre d'un Habitant de Genève à ses Contemporains.' He proposed that the savants should be maintained at the public expense; that spiritual power should be in their hands, temporal in that of the proprietors; while the "great chief of humanity" should be elected by the masses. Religion, he observed, was merely a human invention. Having exhausted his means he obtained the post of a clerk at the *mont de piété*. At this time he encountered Diard, whom he calls his only friend. This associate not only took on himself the charge of his maintenance, but provided means for the publication of his works.

The death of Diard in 1810 plunged him again into want; and having written two more works, 'Sur la Science de l'Homme.' and 'Sur la Gravitation Universelle,' he found himself with-

out means to publish them. Later Augustin Thierry, who became his intimate disciple, co-operated in editing his work on the 'Réorganisation de la Société Européenne' (1814), in which he endeavored to demonstrate the uselessness of the Congress of Vienna, and to show that a European parliament, with the right to determine differences between different nations, was the only means of preserving general peace; and for the promotion of this he advocated union between England and France. The last proposal, perhaps the most sensible he had yet made, caused him to be regarded as a madman. This was his first work which attracted general notice. Finding the difficulty of procuring the means of subsistence and of publishing his works increasing he made an unsuccessful attempt in 1823 at self-destruction, which resulted in a mutilated visage and the loss of an eye. He next produced his last work, 'Le Nouveau Christianisme' (1825), to which he owes his position as the founder of a sect. Christianity he now averred to be a progressive system, which had been rendered immovable by the bonds of ecclesiastical law. Taking its fundamental principle of love he held the church to be a complete organization of society for ministering to the wants of the whole, and especially of the more numerous and poorer classes. A social hierarchy based on capacities and services, with authority to divide heritages, distribute salaries, regulate vocations, and take all necessary means for making the labor of all contribute to the common good, was deduced from these premises by his disciples, among whom may be mentioned Olinde Rodrigues, Léon Halévy, Bailly (de Blois), and Duvergier. Saint Simon continued to the last to develop and promulgate his views in a periodical publication, 'Le Producteur.'

The disciples of Saint Simon rapidly grew into a sect, and were joined by other eminent men. They attempted to idealize the life of their founder, and make it a consistent whole, dominated from the first by the idea of the mission he was to accomplish. Society was divided by the Saint Simonian doctrine into three classes, priests, savants, and laborers, and was to be governed by the chiefs of the three classes. Capacity was to be the ground of distribution of functions. All property was to become on the death of the proprietor the property of the church or society. All children were to receive a general education till their particular capacities became manifest. Saint Simonism in short, was an attempt to render men benevolent by external regulations; to do the work of Christianity without its authority and without its weapons.

Consult: Booth, 'Saint-Simon and the Saint-Simonians' (1871); Janet, 'Saint-Simon et le Saint-Simonisme' (1878); Weill, 'Un Précurseur du Socialisme' (1894); Warschauer, 'Saint-Simon und der Saint-Simonismus' (1892); Weill, 'L'Ecole Saint-Simonienne' (1896); Charléty, 'Histoire du Saint-Simonisme' (1896).

Saint Simon, Louis de Rouvroy, Duc de, French author: b. Paris 5 Jan. 1675; d. Laferté 2 March 1755. He was employed in several diplomatic missions, and was one of the council of regency under the Duke of Orleans, after whose death he retired to his estates. His memoirs, commenced in 1694, while serving in the army, and on which he labored for 60 years re-

ained a long time in manuscript, and were afterward published in a mutilated form, with many suppressions. The first complete edition appeared in Paris in 1820-31 (in 21 vols.), entitled 'Mémoires complets et authentiques du Duc de Saint Simon sur le Siècle de Louis XIV., et la Régence, publiés pour la Première Foix sur le Manuscrit Original Entièrement Ecrit de la Main de l'Auteur, par M. le Marquis de Saint Simon.'

Saint Simon, *sânt si'mon*, an island of Georgia, at the mouth of the Altamaha River, and separated from Jekyl Island, on the south, by Saint Simon Sound, and from Wolf Island on the north, by Altamaha Sound. In 1733 this island, together with some of the mainland adjacent, was ceded to James Oglethorpe by the Creek Indians. The settlement on the island was attacked in 1742 by a Spanish force from Saint Augustine. The soil is fertile, and the vegetation luxuriant.

Saint Sophia, *sô-fê'â*, Constantinople, a renowned church and mosque, founded in 325-6, by Constantine, at the time when Byzantium became the seat of empire. Saint Sophia was enlarged, rebuilt, destroyed at various epochs, but the present structure is virtually that erected by Justinian. Over 10,000 workmen were employed seven years in its construction, and the rich materials used were taken from nearly every celebrated pagan temple in all parts of the kingdom. The building was approached by a double porch 100 feet in depth. The building formed a square of 241 feet, whose interior represented a Greek cross, surrounded by a woman's choir or gallery, supported by magnificent ancient pillars. A series of domes rise from the centre and rest upon each other, tier upon tier. The height of the dome is 175 feet. The interior was decorated throughout with sculptured marble and fine mosaics. The sedilia of the patriarch and those of the priests were of silver gilt; the dome of the tabernacle of pure gold, surmounted by a massive gold cross studded by precious stones. The sacred vessels and other apparatus were of pure gold; the altar-cloths embroidered with gold and pearls, and the altar itself consisted of molten gold into which had been thrown pearls, sapphires, diamonds and all gems which might enhance its value to the utmost. Its weight amounted to 320,000 pounds, and its total cost was £13,000,000 or \$65,000,000. When the Turks took possession of Constantinople, they transformed Saint Sophia into a mosque, destroying or concealing the Christian fittings or emblems, by coats of plaster. The mosaic pictures were saved in this way, and when Abdul Medjid ordered a complete restoration of the building, the original mosaics of Justinian were discovered. With the sultan's consent, the king of Prussia sent German artists to make accurate copies of these interesting antiquities, which have been published by M. Salzenburg, the artist, at the expense of the Prussian government. The interior is at present restored for Mohammedan worship, and all Christian decorations, especially those representing the human figure, strictly forbidden by the Koran, are hidden from view under a white coating in which mosaics are imitated. Like all mosques, Saint Sophia is closed to all Christian visitors except by special permission, which is easily obtained by the hotel proprietors.

Saint Sulpice, *săh sül-pēs*, the name of a famous seminary in Montreal, Canada, whose building is the oldest in that city, dating back to 1684. It is also the name of a famous seminary for priests in Paris, France.

Saint Swithin, an English prelate of the 9th century. He was ordained to the priesthood in 830, was charged with the education of Prince (afterward king) Alfred, and in 852 was made bishop of Winchester. He died about ten years later. He was canonized a century later. The popular knowledge of this saint's name is due to the belief that if rain falls on 15 July (which is popularly known as Saint Swithin's Day) it will rain for six weeks after. This notion is said to have arisen from the fact that when the bones of Saint Swithin were about to be removed, after his canonization, from their original resting-place in Winchester church-yard to the interior of the cathedral, their removal, which was to have taken place on 15 July, was delayed for 40 days by the excessive rains which fell uninterruptedly for that period.

Saint Thomas, one of the Virgin Islands, Danish West Indies, lying 43 miles east of Porto Rico; area 33 square miles. The surface is hilly, and only a small portion of the land is cultivated; sugar, cotton and vegetables are raised. Earthquakes are frequent but not as destructive as the severe hurricanes, which have several times done a considerable amount of damage in the island. Saint Thomas was once of great commercial importance, its capital Charlotte Amalie was at one time one of the chief emporia of the West Indies. Since the introduction of steam vessels, and especially since 1885, its trade has greatly declined, and Barbados has taken its place as a trade centre. Charlotte Amalie is still of importance as a coaling station, and is a port of call for steamers. The island was first colonized by the Dutch, was held by Great Britain in 1667-71, 1801, and 1807-15, and finally came into the possession of Denmark. In 1870 negotiations were made for its purchase by the United States, but Congress refused to ratify the treaty; it was also included in the treaty of 1902 for the purchase of the Danish West Indies by the United States, which was rejected by the Danish Folkething. Pop. (1901) 11,012. See WEST INDIES, DANISH.

Saint Thomas, Canada, city and county-seat of Elgin County, Ontario; on the Canadian P., Grand T., Michigan Cen., Wabash, and Lake Erie & Detroit River railways; 75 miles southwest of Hamilton, and nine miles north of Port Stanley on Lake Erie. It is one of the most important railway centres in southern Ontario, is the receiving and distributing centre for a rich fruit and farming country, and has an extensive local and export trade. The Michigan Central Railway has large car-building and machine shops here employing many men, and there are important manufactures of foundry products, farm implements, carriages and wagons, mattresses, brooms, churns, blocks and tackle; flax, flour, and planing mills, and breweries. Saint Thomas has gas, electric lights, and water-works; fine county buildings, city hall, and market; handsome residences, schools, and churches; and hotels, banks, and daily and weekly newspapers. Pop. (1901) 11,485.

SAINT THOMAS—SAINT VINCENT

Saint Thomas (Port. *SAN THOMÉ*, sãn to-mã), West Africa, a volcanic island in the Gulf of Guinea, 170 miles west of the mouth of the Gabun River, belonging to Portugal. It contains an area of 360 square miles, and its highest peak, Saint Anna, rises from the centre of the island to a height of about 7,000 feet. The valleys are fertile but unhealthy; the elevated portions, swept by fresh breezes, are on the contrary, salubrious. The chief products are coffee and cocoa, cotton, sugar, indigo, sweet potatoes, dates, etc. There are large numbers of domestic animals. Saint Thomas, on the northeast coast, is the seat of a bishop, and the chief town. The island was discovered by the Portuguese on Saint Thomas Day, 1471, and was colonized in 1493. The Dutch occupied it from 1641 to 1844. With the island of Principe it forms a province administered by a governor. Pop. of Saint Thomas (1900) 37,776; of Principe, 4,327.

Saint Thomas. See *SÃO THOMÉ*.

Saint Valentine's Day, the 14th of February, so called after a Christian martyr of the Roman period. The custom peculiar to the day of exchanging missives of affection and love, is believed to have been handed down from the Roman festival of the Lupercalia, celebrated in the month of February, when the names of young women were put into a box, and drawn out by men as chance directed. For many centuries, if not up to the present time in certain remote districts, Saint Valentine's Eve was celebrated in a manner very similar to the fashion of Roman heathen times, maids and bachelors throwing billets with their names on into a receptacle, and drawing therefrom by chance the name of some one of the opposite sex, who became thereupon for the year following the "valentine," or chosen companion, of the other more or less lucky individual. The sending of valentines by message or mail is one outgrowth of the custom formerly prevalent. To this has been superadded the sending of cheap and often scurrilous caricatures and verses, to persons whom it is sought to annoy. On the other hand, the custom has expanded in a more pleasant direction in the presentation of affectionate valentines by parents to children, and children to parents, and husbands and wives to each other. In genial climates Valentine's Day is about the mating period of birds, and this is supposed to have had something to do with the origin of the customs with which the day is associated.

Saint-Victor, sãn-vêk-tôr, **Jacques Benjamin Maximilien**, COMTE DE, West Indian author: b. Fort Dauphin, Santo Domingo, 14 Jan. 1770; d. Paris, France, 8 Aug. 1858. He was educated at the College of La Fleche, France, and entered journalism. During Napoleon's reign he was on the staff of 'Journal des Débats' and after 1815 he established several Roman Catholic and royalist magazines. He revisited his native land in 1830, spent two years in the United States and then made a tour of the West Indies. He wrote: 'Tableau historique et pittoresque de Paris depuis les Gaulois jusqu'à nos Jours' (1808-12); 'Lettres sur les Etats-Unis écrites en 1832-3' (2 vols., 1835); 'Journal de Voyage' (2 vols., 1836); etc.

Saint-Victor, **Paul Binsse**, French author: b. Paris 11 July 1825; d. there 9 July 1881. He

first made himself known as a dramatic and art critic, but soon rose to eminence as a student of the drama and of art and a permanent contributor to the literature of these subjects. His best known books are: 'Men and Gods' (1867-72); and 'The Two Masques' (1880-3). He has also written: 'The Women of Goethe' (1869), and 'The Theatre of To-day' (1889).

Saint Vincent, vîn'sënt, **John Jervis**, EARL OF, English naval officer: b. Medford, Staffordshire, 9 Jan. 1734; d. 14 March 1823. He entered the navy as able seaman in 1748-9 and in 1755 was promoted to lieutenant. In the Quebec expedition he led the advance squadron in charge of transports and won the rank of commander. In 1787 he was advanced to rear-admiral and in 1790 was returned to Parliament for Wycombe. He commanded in the naval expedition against the French West Indies in 1793, and two years later was made admiral and given command of the Mediterranean fleet. In the engagement with the Spanish fleet off Cape Saint Vincent, 14 Feb. 1797, he captured four of the enemy's ships and averted the impending invasion of England. For this he was granted a pension and made Earl Saint Vincent. He was 1st lord of the Admiralty 1801-4, and introduced many reformatory measures. He held once more command of the Channel fleet but retired in 1807. At his death the nation raised a statue to him in Saint Paul's cathedral.

Saint Vincent, one of the Windward Islands, British West Indies, lying between Saint Lucia and Grenada; area, 132 square miles. A chain of volcanic mountains traverse the island from north to south, culminating in the volcano of Soufrière in the north (3,000 feet). Many of the valleys are fertile and about one sixth of the total area is under cultivation. Sugar was once the most important product, but the sugar industry has declined, especially since the hurricane of 1808 which destroyed a large number of plantations. The production of arrowroot has correspondingly increased in importance; cocoa, cotton, fruits and vegetables are also raised, and good timber is obtained from the forests. There is a considerable trade, particularly with the United States. The island was discovered by Columbus in 1498, and was then inhabited by Caribs; the Caribs were finally subdued by Great Britain in 1795-6, and transported to Ruatan, in the Bay of Honduras; a few returned to Saint Vincent where a reservation was assigned them. The island is governed by a governor and a legislative council of four official and four nominated unofficial members; before 1877 there was a representative government. In 1812 an eruption of Soufrière devastated a part of the island; and in May 1902 occurred another eruption, contemporaneous with that of Mont Pelée (q.v.). Premonitory signs of eruption were given as early as February 1901, and these warnings increased as soon as Mont Pelée began to be active; the eruption commenced on 6 May, with a burst of smoke, followed by flames; it ceased for a time the next morning, but reached its full force in the afternoon of that day (7 May). Sounds resembling heavy cannonading were heard at sea for 400 miles; and ashes fell in Barbados, 100 miles distant. Several large plantations were destroyed, and about 1,600 persons killed. Pop. (1900) 44,600.

Saint Vincent de Paul. See VINCENT DE PAUL, SAINT.

Saint Vincent de Paul, Society of. See SOCIETY OF SAINT VINCENT DE PAUL.

Saint Vitus' Dance. See CHOREA.

Sainte Anne de Beaupré, *sănt ăn dē bō-pră*, Canada, a village of Montmorency County, Quebec, at the mouth of the Sainte Anne River, on the north shore of the Saint Lawrence River, 25 miles by rail northeast of Quebec. The fine modern basilica and the ancient parish church, containing relics of Sainte Anne, are visited annually on the saint's feast day, 26 July, by thousands of pilgrims. Sainte Anne is also a favorite summer resort. Pop. (1901) 360.

Sainte-Beuve, *sănt bēv*, **Charles Augustin**, French literary critic: b. Boulogne-sur-Mer 23 Dec. 1804; d. Paris 13 Oct. 1869. He was educated at a school in his native town, and from 1818 at the Collège Charlemagne and the Collège Bourbon in Paris. He studied the physical and natural sciences under Lamarck and Magendie, and in 1823 entered the school of medicine. In 1824 he became a contributor to the 'Globe,' a liberal and philosophical journal. A review of Victor Hugo's 'Odes' contributed in 1827 gained him the friendship of the poet, and thenceforward he identified himself with the romantic movement. In 1829 appeared his novel, 'Vie, Poesies, et Pensées de Joseph Delorme'; and in 1830 he dedicated a volume of poems, 'Consolations,' to Victor Hugo. About this period he was associated with the Saint Simonians, and afterward with Lamennais, but soon broke with them and also with Hugo and the romanticists. His novel 'Volupté' (1834) essentially autobiographical, may be regarded as marking this turning-point in his career, but 'Pensées d'Août' (1837), a volume of poems, is still colored by his religiosity. His next and greatest work, 'Port Royal,' is a history of Jansenism. He was admitted a member of the French Academy in 1844, and four years later accepted a professorial chair at Liège. His lectures there formed the basis of his next work, 'Châteaubriand et son Groupe Littéraire sous l'Empire' (1860). He eagerly welcomed the *coup d'état* and finding it impossible under the Second Empire to secure a hearing at the Collège de France, where he was professor, published his undelivered lectures in a volume entitled 'Etude sur Virgile' (1857). In 1865 he was appointed a senator, and regained popularity by his defense of freedom of thought and speech. In 1849 he began the series of Monday critical articles on literary subjects which has gained him a European reputation. These articles were published in two series, 'Causeries du Lundi' (1851-62); and 'Nouveaux Lundis' (1863-72). Among his other works are: 'Portraits de Femmes' (1844); 'Portraits Littéraires' (Portraits Contemporains) (1846); 'De la Liberté de l'Enseignement' (1868); 'P. J. Proudhon, sa Vie et sa Correspondance' (1872); 'Lettres à la Princesse' (1873, being letters to Mathilde, sister of Napoleon III.); 'Chroniques Parisiennes' (1876); 'Correspondance' (1877-8); 'Nouvelle Correspondance' (1880); 'Le Clou d'Or' (1880); 'La Pendule' (1880); and 'Lettres au Professeur Gaulhier' (1895). Consult: D'Haussonville, 'Sainte-Beuve, sa Vie et ses Œuvres' (1875); Pons, 'Sainte-Beuve et

ses Inconnues' (1879); Troubat, 'Souvenirs du dernier Secrétaire de Sainte-Beuve' (1890); Vattier, 'Sainte-Beuve' (1892); Fisher, 'A Group of French Critics' (1897); Brunetière, 'Evolution des Genres,' Vol. I. (1899).

Sainte Chapelle, Paris, one of the most interesting of the old architectural monuments of the French capital. It stands entire inside the Palais de Justice, in the large court to the left of the main entrance from the Boulevard du Palais. It was built in 1245-8, during the reign of Saint Louis, as the chapel of the royal palace, a few other remnants of which now form parts of the Palais de Justice. The main body (115 feet long and 36 feet wide) is a Gothic nave almost perfect in style. The upper chapel, used by the royal family, has an exquisite interior, and almost the entire wall-space is occupied by 15 large windows of stained glass set in beautiful tracery. Services are held in the chapel once a year at the opening of the courts.

Saint-Claire-Deville, Henri Etienne, *šn-rē ā-tē-ăn sânt klār dē-vēl*, French chemist: b. St. Thomas, W. I., 11 March 1818; d. Paris 1 July 1881. In 1844 he organized the Faculty of Sciences at Besançon, becoming himself professor of chemistry and dean, and in 1851 professor of chemistry in the Normal School at Paris. Shortly afterward he assumed a similar chair at the Sorbonne. He first produced aluminum (1855) and platinum in commercial quantities. He discovered anhydrous nitric acid in 1849; devised methods for fusing platinum, iridium, cobalt, etc.; determined the density of metallic vapors at exceedingly high temperatures. Many of his papers appeared in 'Comptes rendus de l'Académie des Sciences de Paris,' and in the 'Annales de Chimie et de Physique.' He published 'De l'Aluminium, ses Propriétés, sa Fabrication' (1859), and 'Metallurgie du Platine et des Métoux qui l'accompagnent' (1863).

Sainte Croix, *kroi*, an island of the Danish West Indies. See SANTA CRUZ.

Sainte Cunégonde, *kū'nē-gond*, Canada, a city of Hochelaga County, Quebec, two miles distant from Montreal, of which it is a suburb. It has many handsome residences, churches, and schools, and some manufactures. Pop. (1901) 10,912.

Sainte Genevieve, *sănt jēn'ē-vēv*, Mo., city, county-seat of Sainte Genevieve County; on the Mississippi River; 46 miles south of Saint Louis. It was first settled by the French in 1735, being the oldest settlement in the State. The site of this original settlement was about three miles south of the present site, but a severe flood in 1785 caused the colonists to move to higher ground. In 1810 it had a number of large stores and was the place from which Saint Louis obtained supplies. It is situated in an agricultural and stock-raising region; there are limestone quarries and copper mines in the vicinity, and the city contains several lime kilns and flour mills; fruit-growing and wine-making are also important industries. It is the seat of a Roman Catholic convent and academy. Pop. (1890) 1,586; (1900) 1,707.

Saintes, *sănt*, France, in the department of Charente-Inférieure, 28 miles southeast of Rochefort, occupies a picturesque slope overlooking

the Charente, which is crossed at this point by a bridge formerly supporting the ancient triumphal arch of Germanicus. Among other interesting Roman antiquities are the ruins of an amphitheatre, which is only surpassed by the Colosseum of Rome. In the Antiquarian Museums are preserved 7,000 medals and many pieces of sculpture. Saintes was once a bishop's see; the ancient cathedral, still standing, was nearly destroyed (1568) by the Huguenots. There are other ancient churches, of which Notre Dame is a fine example of architecture of the 11th and 12th centuries. The other public buildings are a communal college, courthouse, library and theatre. There are manufactures of iron, copper, woolen and cotton goods, pottery, casks and leather. Trade is in wheat, corn, brandy, timber, etc. Saintes was the ancient capital of the Santones, and later, of the province of Saintonge. Pop. (1901) 18,219.

Saintin, sǎn-tǎn, **Jules Emile**, French painter: b. Lemé, Aisne, France, 14 April 1829; d. Paris 14 July 1894. He studied under Drölling, Picot and Lebourcier and won several medals in the Salon and a third-class medal at the Paris Exposition of 1889. Several years of his life were spent in the United States where he painted some fine portraits and several genres such as 'The Pony Express' (1863) and 'Abandoned' (1880). Among his American portraits is that of Stephen A. Douglas (1860). His work as a portrait painter is correct and academic, and most of his genre pictures derive their main interest from the subjects they represent, not from any inherent distinction of style or handling.

Saintine, sǎn-tēn, pseudonym of **JOSEPH XAVIER BONIFACE**, French novelist, poet, and dramatist: b. Paris, France, 10 July 1798; d. there 21 Jan. 1865. He wrote about 200 plays, a volume of poetry, and several philosophical stories. His best known work is 'Picciola' (q.v.) (1837), which received the Montyon prize, ran through 40 editions and was translated into several languages. He published a series of stories entitled: 'Jonathan, the Visionary' (1827); 'History of the Wars in Italy'; etc.

Saints' Days are days set apart by the Roman Catholic Church for religious services in honor of particular saints, after whom the days are named in the calendar. The celebrations differ in different countries, and according to the relation of the name of a particular saint to a particular locality. In the United States and Great Britain such celebrations take the form of religious services held in churches. In continental Europe and in South America saints' days often take the form of great municipal or even national celebrations. In Sweden, which is Lutheran as to state religion, it is customary to celebrate what is known as the name-day, or day of the saint after whom a person is named, in a similar manner to a birthday.

Saints' Everlasting Rest, **The**, a devotional work published by Richard Baxter (q.v.) in 1650. By its deep piety, and its style of dignified eloquence, hardly a word of which has grown obsolete, it has taken a place with the 'Pilgrim's Progress' in the literary treasures of English Nonconformity. Consult French, 'Baxter and the Saints' Rest' (1877).

Saintsbury, sǎnts'bŭ-rĭ, **George Edward Bateman**, English literary critic: b. Southampton 23 Oct. 1845. He was educated at Oxford, was senior classical master in Elizabeth College, Guernsey, 1868, when he became headmaster of Elgin Educational Institute 1874-6. From 1875 to 1895 he was engaged in journalistic and literary work in London, and in the last named year became professor of English literature in Edinburgh University. He holds a leading place among contemporary English critics and among his many published works are: 'Primer of French Literature' (1880); 'Dryden' (1881); 'Short History of French Literature' (1882); 'Manchester' (1887); 'History of Elizabethan Literature' (1887); 'Essays in English Literature 1780-1860' (1890); 'Essays on French Novelists' (1891); 'Miscellaneous Essays' (1892); 'The Earl of Derby'; 'Corrected Impressions' (1895); '19th Century Literature' (1896); 'The Flourishing of Romance and the Rise of Allegory' (1897); 'Sir Walter Scott' (1897); 'A Short History of English Literature' (1898); 'Matthew Arnold' (1899); 'A History of Criticism' (Vol. I, 1900); and 'The Earlier Renaissance' (1901).

Sais, sā'is, Egypt, in hieroglyphics SA, a ruined city on the Rosetta branch of the Nile, 67 miles northwest of Cairo. It was an ancient religious capital, whose famous temple of the goddess of Neith contained the mysterious veiled statue, the subject of Schiller's ballad and of Novalis' romance. In Sais the fête of burning lamps was celebrated, attracting many foreigners; and here was a tomb of Osiris. Sais was also a renowned educational centre frequented by the Greek sages. It gave its name to two Egyptian dynasties, founded by natives of the city. The Saiti kings ruled Egypt for 150 years, until the country was invaded by the Persians under Cambyzes.

Saivas, sī'vaz, one of the three great divisions of the Hindu religion, and meaning the worshippers of Siva. These are separated into sects which have varied in number at different periods in the religious history of Hindustan.

Sajou', same as SAPAJOU (q.v.).

Sajous', **Charles Euchariste de' Medici**, American physician: b. at sea off coast of France, 13 Dec. 1852. He was graduated from Jefferson Medical College, Philadelphia, in 1878, and was clinical lecturer there 1884-90. He has edited 'Sajous' Annual of Universal Medical Sciences' (45 vols., 1888-96); and written 'The Internal Secretions and Principles of Medicine' (1903); 'Diseases of the Nose and Throat' (1885); 'Curative Treatment of Hay Fever' (1884).

Sakai, sā'kī, Japan, on the southwest of the island of Hondo, seven miles south of Osaka. Before the rise of the latter town it was the chief commercial port of Japan. Osaka now monopolizes the trade. Pop. (1899) 50,203.

Sakhalin, sā-gā-lēn', or **Saghalien** (properly **Karafu**), Siberia, a long mountainous island in the North Pacific, opposite the mouth of the Amur. Its area contains 24,560 square miles. The Strait of La Pérouse separates it on the south from Yezo, Japan, and the Sea of Okhotsk bounds its eastern and northern shores.

The narrow and shallow Strait of Tartary separates it from the mainland. Mounts Bernijet and Ktöns-pal (2,000 to 5,000 feet) are the highest points of mountain ranges extending from north to south, and interspersed with valleys of varying width. The principal rivers are the Tym and the Poronai, navigable for a short distance and teeming with fish, especially salmon. Petroleum and naphtha exist, and coal is mined by Russian convicts. Agriculture does not succeed owing to the extremely rigorous climate. The island is covered with dense forests. Bears, tigers, sables, and wild reindeer abound. Vegetation is Siberian in character. Sakhalin's history begins with the Stone Age, relics of which and of the Bronze Age are still extant, as seen in houses, bones, and implements discovered. The island formerly belonged to the Chinese empire, but early in the 19th century it was annexed by the Japanese who ceded it to Russia in 1875. Russia has attempted to colonize the island by convicts; some 4,000 to 5,000 of them now work the coal mines. Other inhabitants are Ainos, the aborigines, a primitive and peculiar race;—Gilyaks, Oroks, and Japanese, who live by hunting and fishing. Otarcas, seals and dolphins are a source of profit. Alexandrovsk is the chief seaport. Pop. (1897) 28,166.

Sakhara, sāk-kā'rā, Egypt, the necropolis of Memphis, about two miles distant from the ruins of the ancient city on the confines of the Libyan Desert. The chief interest lies in its antiquities, tombs and catacombs. Many pyramids rise among its ruins, one of which is remarkable for its doorway of inlaid tiles, and as bearing a royal name. Mariette discovered numberless sarcophagi, catacombs of the sacred Ibis, tombs of the god Apis, numerous grottoes, etc.

Sak'i, a South American monkey of the genera *Brachyurus*, *Pithecia* and related groups. The term is rather indefinite. See MONKEY.

Saki, sāk'kē, or **Sake**, the native beer and common stimulating drink of the Japanese. It is made from rice, and is drunk warm, producing a very speedy but transient intoxication.

Sakieh, sāk'ī-ē, **Sakia**, or **Sakeeyeh**, a machine used in Egypt for raising water from the Nile for the purpose of irrigation. It consists of a series of cogged wheels, turned by a buffalo or camel, each revolution of the wheel working up a series of earthen pitchers which empty themselves into a trough or pool.

Sakta, sāk'ta, the designation in the Hindu religion of a worshipper of the Sakti, the power or energy of the divine nature personified in a female form. If the tendencies of the worshipper are toward the adoration of Vishnu, then the personified Sakti is termed Lakshmi or Mahalakshmi; if it be toward that of Siva, the Sakti is denominated Parvati Bhavani, or Durga. At least three fourths of the Hindus of Bengal are of this sect, and of the remaining fourth, three are Vaishnavas to one Saiva. Wilson divides the Saktas into Dakshinis, Vamis, Kanchelias, and Kararis. Another classification is into the Dakschinacharis and the Vamacharis, followers of the Right Hand and of the Left Hand Ritual.

Sakuntala, the most famous drama of the Sanskrit poet Kalidasa (q.v.). The fable of the play is as follows: King Dushyanta while on a hunting expedition falls in love with the

hermit maiden Sakuntala. He is espoused to her, and departs from the hermitage to the royal city, leaving with Sakuntala a ring which she is to present in claiming him as her lawful husband. But through the curse of an aged hermit whom the maiden has offended, Dushyanta loses all recollection of Sakuntala, and is to remain unmindful of her until he catch sight of the magic ring. Her hermit father meanwhile is anxious that the royal child who is to be born of her shall first see light in the palace of her husband and hurries with her to the royal city where she finds that she has lost the ring and is repudiated and repulsed by the King, and carried off by a whirlwind to a remote mountain. There she gives birth to a son. The ring had dropped into a sacred pool, and comes to light through the agency of a fish; whereupon Dushyanta remembers his marriage and seeks to recover his wife. Some years afterward Indra transports him to the far off mountain retreat of Sakuntala where the union of the separated pair is beautifully described. The drama is full of natural feeling, and vivid description and the action is strong and interesting. (See SANSKRIT LANGUAGE AND LITERATURE.) Consult the translations (with introduction) of Sakuntala by Monier Williams, Edgren, Jones, and Jackson.

Sal-ammoniac. See AMMONIA.

Sal-tree, a valuable timber-tree of India (*Shorea robusta*) second in importance only to the teak. It is found in large forests along the base of the Himalayas and again in another belt in eastern India. It belongs to the order *Dipterocarpaceæ*, and yields a hard, heavy dark-brown, close-grained wood which is very durable, and highly valued, particularly for gun-carriages and railway ties. A whitish aromatic resin (sal-dammar) used to calk ships and also for incense (see DAMMAR) is obtained by tapping the trunk. The tusser silkworm feeds on the leaves. The sal forests are protected by the government of India.

Sala, sāl'a, **George Augustus Henry**, English journalist and author: b. London 24 Nov. 1828; d. Brighton, Sussex, 8 Dec. 1895. He received some instruction in drawing, but at 15 was obliged to provide for himself. He was a theatrical scene painter for a time, then turned to etching and engraving and had some success as an illustrator. In 1848 he turned to literature and from 1851 to 1856 contributed regularly to 'Household Words,' edited by Charles Dickens. His first experience as "special correspondent" was in the letters he wrote for this journal from Russia after the Crimean war. In 1863-4 he was in the United States reporting the Civil War for the *Daily Telegraph*, and later published 'My Diary in America in the Midst of the War.' He followed Napoleon III. to Algiers and published as a result, 'A Trip to Barbary by a Roundabout Route' (1866). He established 'Temple Bar,' a periodical which he edited from 1860 to 1866 and derived a large income from journalism, but much of his work is cheap and inflated, and no doubt was an important factor in the development of modern reprehensible newspaper methods. He wrote a critical biography of William Hogarth (1860); and, in addition to works of travel already mentioned, 'America Revisited' (1882); 'A Journey due South' (1885); 'Right Round the World' (1888),

works embodying his observations as a tourist and lecturer across the American continent to Australia and India.

Salaam, sa-lām', or **Peace Be With You**, the common salutation among Mohammedans. The answer is, "On you be peace and the mercy of God and his blessings." It is improper to address this answer to any but a believer.

Salad Plants, various herbs whose tender, succulent foliage is eaten raw, with or without a dressing. In general, salads should be grown quickly and served as soon as possible after being gathered. They all delight in moist, rich soil with abundance of humus and nitrogenous plant food. Most of them may be sown as soon as the soil can be worked in spring, and some may be sown in autumn and allowed to remain until spring. Few do well in hot weather. Clean cultivation is essential with all of them, and since they are usually quick growing plants, they are favorites for growing between the rows of later maturing plants, such as cabbage, peas, beets, etc., which are themselves used by market-gardeners in the same way, a later crop being put upon the land as soon as they are gathered. That is, a crop of salads, one of cabbage and one of perhaps celery may be obtained from the same area in one season.

In America the most important salad is lettuce, which is extensively grown by truckers and market gardeners, especially in the east from Florida to Massachusetts, the season starting in January in the south and advancing northward until June, the hot weather checking its production. In the autumn there is a less marked southerly migration. In the north large quantities are also grown under glass to supply local demands. Probably the endive ranks second as a market salad. Its consumption is, however, far less than that of lettuce, and it is less cultivated in the south than in the north, where the cooler climate is more suitable. As a home-salad mustard and cress are probably of next importance in America; in Europe they are grown in enormous quantities for the general market, but in America they are seldom offered for sale. Watercress is more important as a market salad and probably ranks next to endive. It is grown in streams or in damp ground, immense quantities being shipped to the eastern markets from Virginia. Chicory and dandelion are both popular in the east, but probably more as pot-herbs than as salads. They usually require longer to attain edible size than lettuce and like endive are generally blanched. Chicory is occasionally used in the United States to make *barbe de capucin* and *witloof*, two salads very popular in Europe. The roots are dug in autumn, trimmed and for the former laid horizontally in pyramidal heaps with alternate layers of sand or soil in dark cellars and kept moist by occasional watering; for the second they are buried vertically and covered with some fermenting material for a few weeks. The former is the succulent leaf produced; the latter is a small head something like Brussels sprouts. Either may be used as salad or as pot-herb.

Saladin, sāl'a-dīn, or properly **Salah-ed-Din Yussuf Ibn-Ayud**, sultan of Egypt and Syria: b. Tekrit 1137; d. Damascus 3 March 1193. He entered the service of Nureddin, emir

of Syria; became vizier in Egypt about 1169; suppressed the Fatimites in 1171; was proclaimed sultan in 1174; and conquered Damascus and Syria. The great object of his policy was to expel the Christians from Palestine, and recover the city of Jerusalem (see **CRUSADES**). An atrocious massacre of Mohammedan pilgrims by Chatillon added to his ardor; and his vow of revenge against the perpetrator he was enabled to make good by his famous victory on the Plain of Tiberias in 1187, where he captured Guy de Lusignan, king of Jerusalem, Chatillon (whom he cut down after the battle with his own scimitar), and many more. The fruits of this victory was the towns of Acre, Said, and Beyrout; after which he laid siege to Jerusalem, which yielded (1187) in a capitulation, to the articles of which Saladin faithfully adhered. He then proceeded against Tyre, but failed in consequence of the destruction of his fleet by the Franks. The intelligence of the loss of Jerusalem reaching Europe produced the crusade under the Emperor Frederick Barbarossa (q.v.), whose death inspired Saladin with hopes soon damped by the arrival of the forces of Richard Cœur-de-Lion of England, and of Philip Augustus of France. The recovery of Acre by the two kings took place in 1191, upon which event Philip returned to France, and Richard, after twice defeating the sultan, took Caesarea and Jaffa, and spread alarm as far as Jerusalem. At length a truce was concluded between Richard and Saladin (1192), by the terms of which the coast from Jaffa to Tyre was ceded to the Christians, while the rest of Palestine remained to the sultan. The departure of Richard freed Saladin from his most formidable foe. Though chargeable with unjustifiable means of acquiring power, Saladin employed it, when obtained, usefully for his subjects, whose burdens he lightened, while he benefited them by many useful works and establishments. Magnificent in his public undertakings, he was frugal in his personal expenses. He has been celebrated in Western literature for courage, moderation, and justice. Scott introduces him into 'The Talisman,' disguised as the physician Adonbec and as Ilderim. Consult: Reinaud, 'Notice sur la Vie de Saladin' (1874); Baha-ed-din, 'The Life of Saladin' (1897); Lane-Pool, 'Saladin, and the Fall of the Kingdom of Jerusalem' (1898).

Salado, sā-lā'fhō, a river of Argentina, rising in the eastern slopes of the Cordilleras, and emptying into the Paraná after a course of 750 miles. It is salty, hence the name.

Sal'al, an evergreen shrub (*Gaultheria shal-lon*), of the northwestern United States, from 2 to 10 feet high, with dark-green leaves and reddish twigs, bearing racemes of flowers, succeeded in August by dark-purple fruit, "salal-berries," of the size of buck-shot, rough on the outside, very juicy and of a sub-acid flavor.

Sal'aman, **Malcolm Charles**, English author: b. London, 6 Sept. 1855. He was educated at Owens College, Manchester and at first studied mechanical engineering. He then turned to journalism and especially to dramatic and art criticism. He was dramatic critic of the London 'Sunday Times' 1883-94, and was on the staff of the London *Daily Graphic* 1890-1900. He has published several volumes of verse and sev-

eral popular farces and comediettas such as 'Boycoated'; 'Both Sides of the Question'; 'A Modern Eve' (1894).

Salamanca, Mexico, a town in the State of Guanajuato, situated in the southwestern corner of the state, on the railroad to Guadalajara. It lies in a wide, fertile, but somewhat marshy plain. Among its seven churches one is a gothic structure built on an ambitious plan. The chief industry of the town is the manufacture of porcelain. Pop. (1895) 13,121.

Salamanca, sāl-a-măn'kă, N. Y., village in Cattaraugus County, on the Allegheny River, and on the Lake Erie & Western, the Buffalo, Rochester & Western, and the Western New York & Pennsylvania R.R.'s; 54 miles south of Buffalo. It was incorporated as a village in 1878. The lumber business is the chief industry, and there are several saw and planing mills; the village also has a tannery, wire-mattress factory, cigar factories, an embroidery factory, and railroad machine shops. It contains two national banks with a combined capital of \$100,000. It has both natural gas and electric light plants, and a gravity system of waterworks. The town has a public high school, established in 1881, with a school library of over 3,000 volumes (1904); and a Roman Catholic parish school. Pop. (1890) 3,692; (1900) 4,251.

Salamanca, sāl-lă-măn'kă, Spain, (1) capital of a province of the same name, in Old Castile, 120 miles northwest of Madrid, occupying three hills on the right bank of the River Tormes. Its numerous and magnificent ecclesiastical and educational institutions have secured for Salamanca the title of "Little Rome." On the great plaza are the town-house, post-office and stores. The Plaza Mayor is one of the finest squares in Europe, and is surrounded by an arcade supported by 90 Corinthian columns. The cathedral, begun in 1513, is a fine example of the florid gothic, with an elaborate portal, lofty dome, and graceful interior columns. There are also an old and massive cathedral of Norman-French style (1102), numerous other churches, and as many convents; the College of St. Bartholomew or Old College (1410), a classic building with an Ionic portico; College of Jesuits; that of the military order of Calatrava, College of the Archbishop (1522, by Fonseca), a colossal and sumptuous edifice with a fine façade and a chapel containing sculptures by Michelangelo; and Saint Domingo, the largest convent. The University of Salamanca is one of the most venerable and celebrated in Europe (13th century), whose students once numbered 14,000, coming from all parts of the globe. The cloisters of the two buildings comprised in the university are remarkably elegant, with graceful arches and elaborate moldings. There are numerous other schools, a theatre, bull arena, asylums, hospitals, handsome residences and palaces, etc. The most distinguished of the latter are the palaces of the Marquis of Valdecarzana, and of the counts Garcigrande, Maldenadas, Espinosa and Monterey. There is an electric-light plant and manufactures of leather, blankets, hats and pottery. Salamantica (its ancient name) was an important city of the Vettones. In 222 B.C. it was taken by Hannibal, and later under the Goths was a favored city. It was ravaged by the Moors and retaken in 1095. Columbus was

lodged (1484-6) in the Dominican convent. In 1543 Philip II. was married to Mary of Portugal. In 1812, the Duke of Wellington gained a victory over the French under Marmont. Pop. (1897) 24,156.

(2) The province of Salamanca contains 4,940 square miles, the greater part of which is covered by forests of oak and chestnut. The principal rivers are the Tormes, Douro, Yeltes, Agueda and the Alagon. There are good harvests of cereals, hemp, oil, and wine. Gold is found in the streams, and iron, lead, copper, zinc, and coal in the hills, but the mines are only partially developed, partly due to the difficulties of transportation. The manufactures are unimportant and mainly for home consumption. The cloth of Bejar is especially good. Tanning of hides is a considerable industry. The province is traversed by a railway to Portugal. Besides the capital, the only other cities are Bejar and Ciudad Rodrigo. Pop. (1900) 320,765.

Sal'amander, the name applied generally to the species of tailed Amphibians (*Urodela*), but originally to the common European genus *Salamandra*. The smaller strictly aquatic species are known as newts (q.v.) or tritons; some of the larger species have received special names, as Kongo-snake, hellbender, Siren and water-dog (qq.v.). The remaining salamanders are terrestrial or semi-aquatic and only rarely remain permanently in the water. One Californian species (*Autodax lugubris*) is partly arboreal. They are of small size and lizard-like form; but the popular notion that they are lizards is altogether erroneous, as they are strictly batrachian in structure and life-history. The skin is smooth, glandular and scaleless, the skull possesses a well-developed parasphenoid bone and two occipital condyles, and all, except a few terrestrial species, pass through an aquatic gill-breathing stage. Some of the larger aquatic species advance but little beyond this condition; but in the great majority it is larval only and is succeeded by an abranchiata and sexually mature state. The axolotl (q.v.) of the genus *Amblystoma*, is a remarkable instance of a sexually mature larva. Many adult salamanders breathe by means of lungs, but a recent noteworthy discovery is the total absence of lungs in a large proportion of species, in which respiration takes place partly in the skin, but especially by means of a special vascular area of the pharynx. Most of the species deposit their large eggs in water, sometimes in a mass of jelly, as *Amblystoma* (q.v.), sometimes separately or in strings, as *Speleperus*; but others, like *Desmognathus fusca* and *Plethodon*, seek drier places beneath stones and guard the eggs, and the terrestrial salamanders of Europe (*Salamandra*) are ovoviviparous. All are carnivorous and subsist upon insects, worms, etc. They are chiefly active at night, and during the day conceal themselves beneath stones and logs. During cold weather they pass into a more or less profound state of hibernation. Owing to the numerous cutaneous glands the skin is always moist and cold, from which arose the remarkable superstition that these animals, which, as a matter of fact, require abundant moisture to sustain life, have the power not only of resisting, but of quenching, fire. From this the name is applied to many articles, and

SALAMANDER—SALE

by the ancients to a mythical creature, having fire-resisting qualities. The cutaneous secretion is poisonous to many of the lower animals. For a classification of salamanders see *URODELA*; for development see *EMBRYOLOGY*. Consult, Cope, 'Batrachia of North America' (Washington, 1889); Gadow, 'Amphibia and Reptiles' (New York, 1901).

Salamander, a kind of gopher (q.v.).

Salam'ba, the native Filipino name for a kind of fishing apparatus, used near Manila, fitted on a raft composed of several tiers of bamboos. It consists of a rectangular net, two corners of which are attached to the upper extremities of two long bamboos, tied crosswise, their lower extremities being fastened to a bar on the raft, which acts as a hinge; a movable pole, arranged with a counterpoise as a sort of crane, supports the bamboos at the point of junction, and thus enables the fishermen to raise or depress the net at pleasure. The lower extremities of the net are guided by a cord, which, being drawn toward the raft at the same time that the long bamboos are elevated by the crane and counterpoise, only a small portion of the net remains in the water, and is easily cleared of its contents by means of a landing net.

Salamis, sāl'a-mīs, or **Koluri**, an island off the coast of Greece, in the Saronic Gulf, about 10 miles east of Athens. It covers an area of about 30 square miles; is of irregular shape and rocky surface, and separated from the mainland by narrow, winding channels, giving access to the beautiful Bay of Eleusis, which has the appearance of a lake. Its soil is well adapted to the olive, and vineyards thrive. The other chief product is honey. The old city of Salamis stood on the south coast, and the famous naval battle of 480 B.C., between the Greeks and Persians, soon after the great battle of Thermopylae, was fought in the narrow eastern strait. The principal town is Koluri.

Salamambo, sā-lām-bō', a historical romance by Gustave Flaubert, published in 1864. It resulted from the author's visit to the ruins of old Carthage, and is a kind of revivification of the ancient capital and its people. The scenes testify to the great erudition of the author, but critics complain that the picture has too little perspective. All is painted with equal brilliance—matter essential and unessential.

Sal'angane, a swift (*Collocalia fuciphaga*) of the Mayalan Archipelago, famous as the producer of the edible birds' nests. See *BIRDS' NESTS*, *EDIBLE*.

Salary Grab, in American history, the popular name for the general increase in Federal salaries in 1873. The Constitution provides for the compensation of the President, senators, representatives, justices and Federal officers from the Federal treasury. The Act of 3 March 1873 provided that the President's salary be increased from \$25,000 to \$50,000, that of the chief justice from \$8,500 to \$10,500, those of the Vice-President, cabinet officers, associate justices and speaker of the house from \$8,000 to \$10,000, and of senators and representatives from \$5,000 to \$7,500. Another act, 4 March 1873, was retroactive as regarded the salaries of members of Congress during the previous two years. This, the

essence of the "salary grab," excited so much indignation that the laws were repealed, except those affecting the salaries of the President and justices.

Salawatti, sā-lā-wā'tē, a Melanesian island off the western coast of New Guinea, covering an area of about 750 square miles. A chain of chalk cliffs, rising to a height of 2,500 feet, skirts the northern coast; the remaining portion is a deep valley covered with virgin forests. Salawatti was discovered by Watson in 1764. It is regarded as belonging to Dutch New Guinea. Pop. (est.) 5,000 to 6,000.

Salayer, or **Saley**, **Islands**, East Indies, a small group of islands off the southern coast of Celebes, from which they are separated by the strait of Salayer, 13 miles wide. These islands form a part of the Dutch province of Macassar, the greatest native mart of the archipelago, in the trade passing east as far as and including New Guinea—tortoise shell, pearl shell, spices, birds-of-paradise skins, and beche-de-mer. The principal island of the group is Salayer, or Great Salayer, about 30 miles long by 8 miles broad. Pop. of group, 60,000.

Saldanha (sāl-dā'nā) **Bay**, South Africa, on the west coast of Cape Colony, 80 miles north of Cape Town, is a minor commercial port on the Atlantic, for the western provinces of South Africa. It is chiefly of service in the coast trade, and of all the harbors of this seaboard is the only one affording shelter and anchorage at all seasons. It was formerly the chief Dutch naval station in South Africa.

Sale, **George**, English Oriental scholar: b. about 1680; d. London 13 Nov. 1736. Little is known of his life except that he was a solicitor in London, and at an early period turned his attention to the study of Arabic and other Oriental languages. In 1726 he began the publication of an Arabic translation of the New Testament for the Society for the Promotion of Christian Knowledge, and was for years engaged in the work of that association. He is best known by his admirable translation of the Koran in 1734, still highly esteemed. Consult Davenport, 'Sketch of the Life of George Sale.'

Sale, **SIR Robert Henry**, English military officer: b. Buckden, Huntingdonshire, 19 Sept. 1782; d. Mudki, India, 21 Dec. 1845. He entered the army with an ensign's commission in 1795, was promoted lieutenant in 1797, and in 1798 was ordered to India. He was engaged at Seringapatam, and in 1810 took part in the expedition against Mauritius. In 1813 he was promoted major, and in 1815 he returned to England with his regiment. He served in the expedition against Burma in 1824; in 1838 became brevet-colonel and was placed in command of a brigade in the army of the Indus. In the war with Afghanistan which followed Sale played an important part. He became major-general in 1840; was in command of the army which stormed Khurd Kabul Pass in 1841 and defended Jelalabad in the siege of 1841-2. He was knighted for his conduct at Kabul, received the thanks of Parliament for his services in the war, and was promoted colonel of his regiment. In the Sikh war he was wounded at the battle of Mudki, 18 Dec. 1845, and died three days later.

Sale, in law, is an agreement by which one of the contracting parties, called the seller, gives a thing, and passes the title to it, in exchange for a certain price in current money. It differs from a barter and exchange in that, in the latter the consideration instead of being paid in money consists of goods or merchandise susceptible of a valuation. Sale is often applied to a transfer for a consideration of either real or personal property, but in its technical sense, it applies to personal property, as the transfer of real property is effected under a conveyance. Good faith is essential to the validity of a sale, and fraud in relation thereto will vitiate the contract. A sale is not valid if the subject thereof is illegal and prohibited by law, or if the transaction involves an illegal act. To constitute a valid sale there must be proper parties; a thing which is the subject of the transaction; an agreed price; the consent of the parties and some performance by them, such as the payment or delivery which is required to complete the contract. The thing or object which is sold must actually exist at the time of the sale, otherwise the sale is invalid, and if only a part of the subject of the sale exists or is destroyed before the sale is completed, it is optional with the buyer to rescind or enforce his contract. A conditional sale is one where some particular act agreed upon by the parties remains to be done in order to complete the sale. In most of the jurisdictions of the United States statutes have been enacted which require that contracts for the sale of certain goods must be in writing, in order to bind the parties thereto. One who by his acts approves of what has been done, such as knowingly using goods which have been left at his house by another who intended to sell them, is held to have confirmed the sale. Both parties to a sale must agree as to the terms, in order to make the contract binding.

Salem, sā'lēm, Ill., city, county-seat of Marion County; on the Baltimore & O. S. W. and Chicago & E. I. R.R.'s; 97 miles southeast of Springfield. It is in an agricultural and coal-mining region; its chief industry is the culture, evaporation, and shipment of fruit. It has also several flour mills. It contains a public high school, founded in 1870. Pop. (1890) 1,975; (1900) 1,995.

Salem, India, (1) chief town of a district of the same name, on the river Tirumanimutur, 207 miles southwest of Madras. It is well-built, but unhealthy, being located in a narrow valley, and subject to sudden and frequent changes of temperature. There is a large weaving industry, some cutlery. There is a municipal college, three printing presses, four reading-rooms, and an English mission. Pop. (1901) 70,627. (2) The district embraces 7,529 square miles and is very hilly, intersected by broad plains. The principal rivers are the Cauvery with its numerous tributaries. The forests are valuable, magnetic iron ore abundant, corundum and chromate of iron deposits. The chief crops are millet, grain, rice, ragi, oil seeds, and some cotton, indigo, coffee and tobacco. Much of the area is irrigated. Pop. (1901) 2,205,898.

Salem, Mass., city, one of the county-seats of Essex County; on a peninsula formed by

two inlets of the Atlantic, known as North River and South River, and on the Boston & Maine railroad; 14 miles northeast of Boston. It was founded in 1626 by Roger Conant, and chartered by John Endicott in 1628. The Church was organized 6 Aug. 1629 with Samuel Skelton and Francis Higginson as pastor and teacher. In 1633 Roger Williams was pastor of the church here, but was driven out in 1636. In 1692 the witchcraft delusion broke out, and 19 persons were hanged as witches on Gallows Hill, while Giles Cory was pressed to death for refusing to plead, the only instance on record in America under the English statute. (See WITCHCRAFT.) In 1774 the first provincial assembly was held here and declared for the independence of the Massachusetts colony; and in 1775 the British under Capt. Leslie were prevented from crossing the North Bridge in their search for arms and ammunition. Salem furnished over 150 armed privateers during the Revolution. It was incorporated as a city in 1836, and furnished a large quota of troops during the Civil War. It was the birthplace, and for a time the residence of Nathaniel Hawthorne. Before the War of 1812 Salem had practically a monopoly of the East Indian and China trade; since then the foreign commerce has gradually been transferred to Boston and other ports, but there is an important coasting trade in coal, large quantities of which are landed here for transportation to inland towns. The manufacturing industries are also of importance; they include a large cotton mill, tanneries, a lead factory, chemical works, cordage works, and shoe factories. There are six national banks with a combined capital of \$2,000,000, and two savings banks. It is connected with Beverly, Peabody, Marblehead, Lynn, and other towns by electric road, and is a centre of local trade. The town is irregularly laid out, but has a number of beautiful modern residences and three public parks. There are also several of the earliest colonial houses standing, and a large number of mansions built in the days of the town's commercial supremacy; among the former are the Corwen, or "witch house," and the birthplace of Timothy Pickering. Among the numerous points of interest in Salem are the old cemetery, formerly known as "The Burying Point," the old court-house, where the witchcraft trials were held, the new court-house, the new city-hall, the public library, the Salem Athenæum, the Essex Institute with a valuable library of nearly 400,000 volumes, and the Peabody Academy of Sciences. The Essex Institute contains a valuable historical collection of relics of colonial days and the witchcraft craze, a fine collection of old furniture and works of art, and a large number of valuable manuscripts; the Peabody Academy of Sciences contains an almost complete Essex County natural history collection, an ethnological collection from the Orient, Mexico, and South America, largely gathered by the Salem sea captains, Japan and China being largely represented; also an interesting collection of the models and pictures of ships built in Salem. The charitable institutions include a hospital, an Old Ladies' Home, an Old Men's Home, and a city Orphan Asylum. The city has a public classical and high school established 1856, and three Roman Catholic parochial

SALEM — SALERNO

schools; it is also the seat of two private secondary schools, a commercial school, and a State normal school. The city government is vested in a mayor, a board of aldermen of seven members, and a city council of 24; the waterworks are owned by the municipality.

Consult: Felt, 'Annals of Salem' (2 vols.); Osgood and Batchelder, 'Historical Sketch of Salem'; Powell, 'Historic Towns of New England'; Putnam, 'Old Salem'; Silsbee, 'Half Century in Salem'; and 'Visitor's Guide to Salem' (published by the Essex Institute).

Revised by GEORGE FRANCIS DOW,

Secretary, the Essex Institute.

Salem, N. J., city, county-seat of Salem County; on the Salem Creek near its junction with the Delaware, and on the West Jersey & Seashore railroad, 31 miles southwest of Philadelphia, Pa. It was first settled in 1641, and this first colony was succeeded by a Swedish fort; it passed into the hands of the Dutch, then to the English in 1664, and was in that portion of New Jersey which was bought by the Quakers in 1674. The Quakers established a new and prosperous colony and in 1682 Salem was made a port of entry; in 1778 it was plundered by the British. It is the trade centre of a fertile agricultural region; and in addition to its railroad facilities has regular steamboat communication with Philadelphia. It has also a variety of manufacturing interests, including fruit canning establishments, iron foundries, glass manufactories, flour mills, an oil-cloth factory, and a hosiery mill. It has two national banks with a combined capital of \$250,000. It contains a public library, founded in 1804, and a Friends' preparatory school. Pop. (1890) 5,516; (1900) 5,196.

Salem, Ohio, city in Columbiana County; on the Pennsylvania Company railroad; 61 miles southeast of Cleveland. It is the largest town in the county, and the centre of a rich agricultural and stock-raising region. Its manufacturing interests are numerous and varied; they include machine shops, manufactories of engines, wire nails, pumps, and stoves, galvanized iron works, furniture, church furniture, church organ factories, brick-works, and tile-works. There are two national banks with a combined capital of \$300,000. The city has a public high school, established in 1865. Pop. (1890) 5,780; (1900) 7,582.

Salem, Ore., city, capital of the State, and county-seat of Marion County; on the Willamette river, and on the Southern Pacific railroad; 44 miles south of Portland. It was first settled in 1840 by Methodist missionaries, was incorporated as a city in 1853, and became the State capital in 1860. It has regular steamer connection with Portland, and is the trade centre of a fertile agricultural region. Its manufacturing interests are numerous and important; they include flour mills, woolen mills, fruit evaporating and canning establishments, tanneries, brick-kilns, tobacco factories, carriage and wagon factories, and agricultural implement works. The city is well built with wide regular streets and two public parks. The State Capitol, built in 1875-6, is a handsome structure; among the State institutions in the city are the Institute for Deaf Mutes, the Institute for the

Blind, the insane asylum, the reform school, and the penitentiary. The city contains the State and a Masonic library, and a public high school established in 1892; and is the seat of the Academy of the Sacred Heart (Roman Catholic), of the Capital Business College, and of Willamette University (Methodist Episcopal). At Chemawa, a few miles distant, is an Indian industrial training school. Pop. (1890) 4,515; (1900) 4,258.

Salem, Va., town, county-seat of Roanoke County, on the Roanoke River and on the Norfolk & Western railroad; 51 miles west of Lynchburg. It is the centre of an agricultural and tobacco-growing region, and has a variety of manufacturing interests, including tobacco factories, tanneries, chair and carriage factories. It has a national and a state bank. The charitable institutions include two orphan asylums. There are medicinal springs in the vicinity, and it is a popular resort with Southerners. The town has a public high school and is the seat of Roanoke College, established 1853 under the control of the Lutheran Church. Pop. (1890) 3,279; (1900) 3,412.

Salem Witchcraft. See WITCHCRAFT.

Salema, a Pacific coast food-fish (*Kyphosus analogus*), about 18 inches long and steel-blue in color. It is one of the rudder-fishes, allied to the croakers, and several closely related species are known as chopas, especially *K. sectatrix*, a large West Indian and Florida form, which is called "chub" at Key West, and affords good sport for the angler.

Sal'ep, a demulcent and slightly nutritive drug, consisting of the oval tubers of certain orchids (*Orchis mascula* and *O. morio*), but not of the hand-shaped tubers of *O. latifolia* and other species. These tubers are prepared in central and southern Europe and in the Levant, and are dug up as soon as the flower-stalks decay, being then in best condition; the skin is rubbed off, and they are dried, appearing as brownish-yellow, translucent, and horny bodies, inodorous and insipid in taste. The powdered salep, containing a large amount of mucilage and starch, makes a nutritious jelly with water, and is a suitable food for convalescents. The *Tacca pinnatifida*, growing in the islands of the Pacific, furnishes a starch called Otaheite or Tahiti salep.

Salera'tus, aerated salt; originally potassium bicarbonate, an imperfectly carbonated salt, formerly much used in cooking. The name is now commonly applied to the commercial article sodium bicarbonate, which is used in cookery to neutralize acidity and for raising dough through the evolution of carbonic acid, and is also a common constituent of baking-powders.

Saleruo, sa-lér'nō (Ital. sà-lèr'nō), Italy, (1) capital and seaport of the province of the same name, on the Gulf of Salerno, 32 miles southeast of Naples. It stands upon an acclivity whose summit is crowned by the ruins of an ancient citadel, and is surrounded by a massive stone wall. The Marina is a broad promenade winding for 1½ miles along the shore. The lava-paved streets are bordered with few good buildings, the chief of which is the cathedral (1084), of Gothic architecture, adorned with a portico of porphyry and Corinthian pillars from Pæstum—the ruins of

which are in the vicinity. Here are the tombs of Margaret of Anjou, of Gregory VII., and a sepulchre containing the bones of St. Matthew. Other edifices are the governor's palace, theatre, hospitals, churches, and convents. It also has courts of justice, a seminary and a lyceum. The chief industries are cotton and silk spinning and printing. The manufactures are glass, ceramics, macaroni, iron, and leather goods, thread, linen, etc. There is excellent wine in the neighborhood. Founded by the Greeks, Salerno became an important city under the Romans, passing into possession of the Goths and later to the Lombards, who in turn were expelled by the Normans. Of the ancient city, Salernum, are still to be seen several temples, an amphitheatre, and a theatre. In the mediæval period it was celebrated for its school of medicine, founded by Robert Guiscard (11th century). It was annexed to the kingdom of Naples at a later period. Pop. (1901) 42,727. (2) The province has an area of 1,916 square miles. It occupies the extremity of Campania on the Tyrrhenian Sea. It is covered with spurs of the Apennines, the chief of which are Monte Cervati, Polveraccio, Alburno, and Sacro. The principal streams are the Tusciano, Mingardo, and Alerto; the products are wheat, corn, flax, hemp, olives, figs, wine, and fruit. Pop. (1901) 564,328. (3) The Gulf of Salerno, or Gulf of Pæstum, is a semicircular indentation of the Mediterranean Sea, separated from the Bay of Naples by Point Campanellas. On its shores stand the picturesque and interesting towns of Amalfi and Salerno, and the ruins of ancient Pæstum (q.v.).

Sales, sāl-z or sāl, **Saint Francis de**. See FRANCIS DE SALES, SAINT.

Salesian Fathers. See ORDERS, RELIGIOUS.

Salford, sāl'fōrd, England, a corporate town of Lancashire, adjoining Manchester, of which industrially and economically it is practically an integral portion. Pop. (1901) 220,956. See MANCHESTER.

Salic Law, an ancient code or system of jurisprudence of the Salians. It appears to have been committed to writing about the 5th century, but according to Hallam it did not originate before the time of Clovis. The particular law, commonly called the Salic law, by which females were excluded from the throne of France, has been the subject of much dispute, and its modern application was probably fortuitous. The laws of the Salians do not appear to have usually excluded women from inheritance, and the particular law on which the exclusion rests did not originally refer to the crown, but to certain lands called Salic; and does not appear to have excluded women from the line of inheritance, but only from inheriting immediately. Its object may have been to secure the performance of military service. It remained in force from this time till the close of the French monarchy.

Salicin, $C_{13}H_{17}O_7$, a glucoside existing in the bark and leaves of most varieties of the willow and poplar. Colorless, silky, crystalline needles, bitter taste, soluble in water or alcohol. Boiling with dilute acid gives glucose and saligenin or salicyl alcohol. Oxidation gives salicylic acid. Used to some extent as an anti-

periodic in malarial disorders, but not as efficient as quinine. Believed by some to be valuable as a substitute for salicylic acid in the treatment of rheumatism. Dose 10 to 30 grains.

Salicornia, a genus of the *Chenopodiaceæ*, with about 10 species, growing in saline soils. The three American species are curious naked, jointed plants, sometimes two feet high, with many opposite terete branches and leaves reduced to mere scales at the nodes, and appearing to ensheath the upper joints. The flowers are also reduced to pistils and stamens, and are pocketed in groups in hollows at the axils of, and behind, the upper scales. They are succulent herbs, so brittle as to be called glass-worts, and grow over such large areas of marsh lands that when their usual green hue turns to red in the autumn they form great patches of vivid color. Hence the common name marsh samphire.

Salicylic (sal-ī-sīl'ik) Acid and some of its important Compounds. Salicylic acid, ortho-oxy-benzoic acid. $C_6H_4.OH.CO_2H$, occurs in the free condition in the buds of the *Spiraea ulmaria* (meadow-sweet) and as a methyl ester in the oil of *Gaultheria procumbens* (wintergreen). It may be prepared by oxidation of saligenin, a compound obtained from salicin; also by action of carbon dioxide on dry sodium phenolate at the proper temperature. A very pure form is obtained by the action of alkalis on oil of wintergreen. Fine white needle-like crystals of a sweetish acid taste, slightly soluble in cold water, easily so in hot. Its aqueous solution is colored a violet upon the addition of a small amount of ferric chloride. It is a valuable antiseptic, the presence of even very small amounts being sufficient to prevent the decomposition of most animal and vegetable tissues or products. Used extensively in the preservation of milk, beer, cider, meats, canned goods, and other food products. The question of its action on the consumer is still open, but the weight of evidence seems to be that its continued use is injurious to the digestive organs and to the general health. It forms a number of crystalline salts of the metals, the most important being

Sodium Salicylate, a white or pinkish white finely crystalline body, of a sweetish taste, soluble in water or alcohol. Often used as a preservative in place of the free acid, but the most important use is as a remedy for rheumatism, gout, etc. Dose from 10 to 30 grains.

Methyl Salicylate, $C_6H_4.OH.CO.OCH_3$, synthetic oil of wintergreen, forms the larger part of the oils of wintergreen and of birch, may be made by action of methyl alcohol (wood spirit), sulphuric acid, and salicylic acid. The compounds derived from salicylic acid that are used in medicine are very numerous, some of the important ones being Salicylanilid, Salol, Salophen, Betol, Salifebrin, Salipyrin, etc. They are used as antiseptics or as antirheumatics.

Salicylol, Salicylic Aldehyde, or Ortho-oxy-benzoic Aldehyde, is a volatile oil occurring in the blossom of the meadow-sweet. May be obtained by careful oxidation of saligenin or salicin. An aromatic oil, colorless when pure, but turning red on exposure to light and air, slightly soluble in water, easily so in alcohol.

Used to some extent in the perfume industry, and as a flavoring substance. Said to be added to vermouth and other liqueurs.

Salida, sā-lī'da or sa-lē'da, Colo., city in Chaffee County; on the Denver & Rio Grande railroad; 64 miles southwest of Colorado Springs. It is the centre of a mining region where iron, copper, and silver are the principal ores; marble, onyx and limestone are also quarried in the vicinity; and agricultural and stock-raising interests are of some importance. The city contains large railroad shops, and a bank with a capital of \$50,000. The Rio Grande General Hospital is located here, and there is a public high school. Pop. (1890) 2,586; (1900) 3,772.

Salii, sā'lī-ī, priests of Mars in ancient Rome, so called from the Latin word *salire*, to leap and dance. Numa fixed their number at 12; Tullus Hostilius added another 12, who were called Salii Collini. Their origin is thus accounted for by the Romans: In the time of Numa Rome was desolated by a pestilence, which ceased when the gods let fall from heaven the "ancile" (a shield of a peculiar form). The soothsayers declared that this shield was the sign of the perpetuity of the Roman power, and advised that 11 others should be made similar to it, so that the true ancile could not be so easily purloined. This advice was followed. On the 1st of March every year when the Salii offered sacrifices to Mars they carried the shields about the city, clashing them together, executing warlike dances, and singing the Salian hymns—ancient songs in praise of Mars and the other gods, and of distinguished men, particularly of Mamurius, who made the 11 shields. The dress of the Salii was a purple tunic embroidered with gold, and bound with a brazen belt, and a toga with a purple border. On their head they wore a high cap in the form of a cone, with a sword by their side, a spear or rod in their right hand, and an ancile in their left. None but patrician youths whose parents were alive could be admitted among the Salii.

Salina, sā-lē'na, Kan., city, county-seat of Saline County; on the Smoky Hill River, and on the Union Pacific, the Missouri Pacific, the Atchison, T. & S. Fé, and the Chicago, R. I. & Pacific Railways; 110 miles west of Topeka. Salina was founded in 1857 by Col. William A. Phillips; became a borough in 1873; and a city in 1880. It is governed by a mayor and eight councilmen elected for two years. It is the commercial centre for a fertile agricultural and stock-raising region, and valuable salt springs and gypsum quarries are in the vicinity. It has several grain elevators, and exports large quantities of grain; extensive flour and paper mills, and other manufactories. There are three banks with a combined capital of \$150,000; 11 denominational churches; high school, public library, and federal court buildings. It is the seat of St. John's Military School (Protestant Episcopal), Kansas Wesleyan University, Skelton's Business College, and the Kansas Wesleyan Business College. Pop. (1900) 6,074.

T. A. CORDRY,
Editor *Salina Journal*.

Salina Formation, or **Salina Stage**, in North American geology an important group of beds, belonging to the upper part of the Siluric

series (q.v.), named from a township in Onondaga County, New York, where salt springs, issuing from this formation, were discovered in the 17th century by the Jesuit missionaries. The formation, which consists mainly of shales, with frequently extensive salt and gypsum beds, comes to the surface in an east and west belt extending from Herkimer County, New York, westward across the Niagara River into Canada. Its erosion has caused a belt of low, often swampy country, averaging normally from 8 to 15 miles in width, which is followed by the Erie Canal and the New York Central and other railroads. The formation extends across Canada, where its outcrop is chiefly drift-covered, into Michigan, where it comes to an end. Southward it is known in northern Ohio (500 feet thick) at a depth of 2,000 feet below the surface, but disappears in southern Ohio. Southeastward the formation is known in Pennsylvania and Maryland. The salt of the formation is distributed in irregular lenticular beds, which, with their outer stratified shale seams, often aggregate several hundred feet in thickness. The salt is largely obtained from wells by the leaching process and the solar evaporation of the brine. The chief localities where this is carried on in New York State are Syracuse and Warsaw. The beds of this formation are for the most part non-fossiliferous, and were deposited in an enclosed basin or dead sea which characterized eastern North America in late Siluric time. See PALÆOZOIC; SALT.

Salinan (sā-lē'nān) **Indians**, named from Salinas River. A linguistic family of North American Indians formerly inhabiting parts of San Luis Obispo, Monterey, and San Benito counties, California, their habitat extending from the Coast Range to the Pacific and from the headwaters of the Salinas River to near the present Solidad. They subsisted by hunting and fishing, eking out their livelihood by means of acorns, seeds and roots. They manufactured coiled basketry, but of their general habits and customs almost nothing is known. The missions of San Antonio (1771) and San Miguel (1797) were established among them by the Spanish fathers, the baptisms during the mission period numbering 4,400 and 2,400 respectively. The population gradually decreased, however, and now the stock is represented by only a score of individuals.

Salinas, sā-lē'nās, a river in California, in Monterey County, which flows north by west into Monterey Bay. It is about 150 miles long.

Salisbury, sālzb'ūrī, **Edward Eldridge**, American philologist: b. Boston, Mass., 6 April 1814; d. New Haven, Conn., 5 Feb. 1901. He was graduated from Yale in 1832, and from Yale Divinity School in 1835. After some years spent abroad in the study of Oriental languages, he was made professor of Arabic and Sanskrit at Yale in 1841. He was president of the American Oriental Society in 1863, and for several years conducted its official organ. He was the author of a 'Discourse on Arabic and Sanskrit Literature' (1843); 'Principles of Domestic Taste' (1877).

Salisbury, **Robert Arthur Talbot Gascoyne Cecil**, MARQUIS OF, English statesman: b. Hatfield, Hertfordshire, 3 Feb. 1830; d. there 22 Aug.

1903. He was educated at Eton and at Christ Church, Oxford, became a fellow of All Souls' in 1853, was elected (as Lord Robert Cecil) to the Commons as a Conservative for Stamford in 1854, and continued to represent that borough until 1868. In Parliament he quickly made his mark as a brilliant and caustic Tory debater; and he was active in the discussion of public measures, especially as an opponent of the abolition of church rates in 1858 and a supporter of Disraeli's reform-bill in 1859. Made secretary for India in the Derby ministry in 1866, he was again placed at the head of the India office in 1874 by Disraeli. He accompanied the latter in 1878 to the Congress of Berlin, and contributed largely toward the result of its deliberations. The Gladstone campaign having carried everything before it at the general elections of 1880, he was in the opposition until 1885 and its leader in the upper house from Disraeli's death in 1881. From this time until his retirement in July 1902, he retained supremacy over his party, never questioned in the Lords and rarely in the lower chamber. Gladstone was defeated on a budget resolution, and in June 1885, Salisbury organized his first ministry, himself taking the portfolio of foreign secretary. But after a ministry of 227 days, Gladstone returned to power in February 1886. Salisbury kept up a vigorous struggle against the Home Rule bill, and following on Liberal reverses (1886), became a second time prime-minister, and, after a cabinet reconstruction, also foreign secretary. During this second administration, which continued until 1892, several measures of importance were passed into law; but Home Rule, once more placed at the head of the Liberal programme, aroused through Gladstone's influence so wide an interest that the general elections of June 1892 once more swept the Conservatives from office. When the Home Rule bill came up for its second reading before the Lords in September, Lord Salisbury asked for the throwing out of the bill, which was promptly effected with but 41 dissenting votes. Gladstone relinquished the premiership to Rosebery, who went out of office in 1895. Salisbury then held his third, last, and longest ministry from 2 July 1895 to 11 July 1902, in all 7 years and 9 days. He had to deal with the Armenian and Cretan questions, with the safeguarding of British special interests in China, the Venezuelan boundary question and the United States attitude thereto, the Egyptian campaigns, the Fashoda affair, and the South African war (1899-1902). Though he found it in later years a matter of necessary policy to maintain good terms with the Washington government, his attitude was in reality the traditional Tory one of dislike for the United States and its diplomacy. After the elections of 1900, the cabinet was reconstructed, Lord Salisbury becoming lord privy seal, and Joseph Chamberlain taking the foreign secretaryship. It was said that the premier failed to direct the war policy, and that Chamberlain was the leading figure of the cabinet. Salisbury withdrew from public office in 1902, to be succeeded as premier by A. J. Balfour. He observed throughout his career a consistent procedure as a Tory, and carried his high office with distinction, though his statesmanship has been called in question. In both domestic and foreign matters he had much of contempt for the governed classes. His knowledge of

diplomatic minutiae was extensive, and he was looked upon as the dean of European chancelleries. Outside of his public life he held numerous offices of honor, including that of Lord-Chancellor of Oxford from 1869; and he was much interested in the physical sciences. (See ENGLAND, *History*.) Consult: Puling, 'Marquis of Salisbury' (1885); Traill, 'Marquis of Salisbury' (1891); Aitkin, 'The Marquis of Salisbury' (1901); How, 'The Marquis of Salisbury' (1902).

Salisbury, Rollin D., American geologist: b. Spring Prairie, Wis., 17 Aug. 1859. He was graduated from Beloit College, Wisconsin, and taught in the academy of that institution in 1881-3. He accepted the chair of geology there in 1884, occupying it until 1891 with the exception of 1887-8, which he spent at the University of Heidelberg. He was appointed professor of geology at the University of Wisconsin in 1891, and since 1892 has occupied the chair of geology at the University of Chicago. He has been connected with the United States geological survey since 1883, with the New Jersey State geological survey since 1891, and has published: 'Physical Geography of New Jersey' (1896); 'Geography of Chicago and its Environs' with W. A. Allen (1899); 'Geography of the Region about Devil's Lake and the Dalles of Wisconsin' with W. W. Atwood (1900); etc.

Salisbury, formerly **Fort Salisbury**, Africa, capital of Southern Rhodesia, in Mashonaland, 372 miles by rail from Beira on the eastern coast, and 298 miles by rail north of Bulawayo. Its two parts are known as the Causeway and Kopje, separated by an intervening space of about three quarters of a mile. Municipal and government offices have been established; and there are several hospitals, a cathedral, stock exchange and other buildings. Causeway is the residential district and government headquarters; the Kopje, the business district. Gold and coal mines abound in the environs, and the plateau is suitable for agriculture. The increasing native and European population includes over 500 whites.

Salisbury, Conn., town, Litchfield County, on the Housatonic River, and on the Philadelphia, Reading & New England railroad; 63 miles northwest of Hartford. The town contains the villages of Salisbury, Lakeville, Lime Rock, Chapinville, and Ore Hill. It was first settled about 1720 by Dutch from New York; New England settlers came to the town about 1740 and it was incorporated in 1741. The mining of the iron ore found in the vicinity soon became an important industry, and during the Revolutionary War much of the cannon, shot, etc., for the colonies was made at Salisbury. The iron mines continue to yield ore of excellent quality, and the town has several blast furnaces, also a cutlery factory, a railroad machine shop, and a foundry. The region is hilly, and the township contains Bear Mountain, the highest elevation in the State. The Connecticut School for Imbeciles is located here; there is a public academy (high school), a public library, established by the Library Association in 1771; also Saint Austin's School, a Protestant Episcopal secondary school. Pop. (1890) 3,420; (1900) 3,489.

SALISBURY — SALISHAN INDIANS

Salisbury, or **New Sarum**, *nū sā'rūm*, England, a cathedral city, the capital of Wiltshire, 80 miles southwest of London, stands on the Avon at its confluence with several smaller branches. It is built in modern style, and the streams by which it is divided are crossed by bridges which connect the various sections of the town. Most conspicuous among the public buildings is the splendid cathedral, dating from 1220, one of the grandest and most interesting specimens of Gothic architecture in England. It is in the form of a double cross, with a graceful and exquisite interior and has a spire 404 feet high. The light and airy pillars and pilasters are of Purbeck shell marble. There is some stained glass, and many interesting old monuments. Within the spacious precincts of the cathedral are the episcopal palace, the deanery, and other buildings. There are three parish churches in the town, besides a Roman Catholic chapel, an artistic structure. The market-place is a central wide open space, at the southeast corner of which stands the council-house, with a handsome Doric portico. Saint Nicholas Hospital and the Poultry Cross are ancient edifices of some architectural merit. Educational and charitable institutions are numerous. Salisbury was formerly renowned for its manufactures of woollens and cutlery, but is at present chiefly important as a distributing centre. Pop. (1901) 19,421.

Salisbury, Md., village, county-seat of Wicomico County; on the Wicomico River, and on the Baltimore, C. & A. and the New York, P. & N. R.R.'s; 84 miles southeast of Baltimore. It is in an agricultural and lumbering region, and has a large trade, exporting chiefly grain, fruit, vegetables, and lumber. The most important manufacturing establishment is a yellow pine box factory, the largest in the United States; there are also saw and planing mills, flour mills, and a wool carding mill. There is a national bank with a capital of \$50,000, and a state bank. The village has a public high school established in 1872. Pop. (1890) 2,905; (1900) 4,277.

Salisbury, N. C., city, county-seat of Rowan County; on the Southern railroad; 130 miles west of Raleigh. It was originally settled by English churchmen from Salisbury, England, and was named for that city; it was selected as the county-seat as early as 1753, but was not chartered until 1770. It is the centre of an agricultural and mining region; and contains tobacco-factories, iron foundries, machine shops, railroad workshops, tanneries, and cotton and woolen mills. There is a national bank and a state bank. The city has a public high school, established in 1899, which had in 1903 a library of over 1,200 volumes; and it is also the seat of Livingstone College, established in 1882, by the African Methodist Episcopal Church, for the education of the colored race, and the State Colored Normal School. Pop. (1890) 4,418; (1900) 6,277.

Salisbury Plain, England, in the county of Wilts, is a high, rolling plain of considerable extent and of chalky formation, from which diverge the majority of the hill chains of central and southern England. The name applies actually to the district lying between Salisbury

and Devizes, although the plain may be said to extend both north and south of Salisbury. It is about 20 miles long, by 14 broad, the greater length being from north to south. Eight miles north of Salisbury, upon this plain, stands the historical and desolate Stonehenge (q.v.).

Salishan (*sā'lish-ən*) **Indians** (*Okanagan, sālšt*, "people"), referring specifically to the Flathead Indians, hence *Salish*, or *Selish*, of which the stock name is an adaptation. A linguistic stock of North American Indians comprising a large number of tribes or bands, most of them insignificant in numbers, the original habitat of which included an isolated area on the Oregon coast, occupied by the Tillamook and Nestucca, who were separated from their congeners to the north by Chinookan and Athapascan tribes; then beginning on the northern coast of Shoalwater Bay *Salishan* tribes occupied the entire northwestern part of Washington, including the Puget Sound region, excepting small tracts about Cape Flattery and southward, and near Port Townsend, which were held by Chimakuan tribes. Eastern Vancouver Island was also inhabited by *Salishan* tribes, while the greater part of their territory lay on the mainland opposite, including much of the upper Columbia. On the south they were hemmed in mainly by *Shahaptian* tribes; on the east they dwelt to a little beyond the Arrow lakes and their feeder, one of the extreme northern forks of the Columbia, where they were met by Lewis and Clark in 1804. On the northeast *Salishan* territory extended to about lat. 53°. In the northwest the main area did not reach Chilcat River, but the *Bella-coola* occupied an isolated area on Dean inlet, Burke channel, and *Bella-coola* River, British Columbia. The *Salishan* tribes were successively visited by Juan de Fuca (1592), by the Spanish navigators who later explored the coast, by George Vancouver (1792-4), and by Lewis and Clark (1804-6), who gave the first definite information regarding them. The fur-traders penetrated their country early in the 19th century and while Astoria, at the mouth of the Columbia, was not founded within their immediate territory, its establishment formed the beginning of the change in the primitive condition of the *Salishan* and the surrounding tribes which perhaps reached its climax soon after the establishment of the trading post at Victoria, B. C., in 1843. In their habits and customs the *Salishan* Indians may be divided into the coast and the interior groups. Among the former, at least, the gentile system is recognized, descent being in the male line; their houses are long communal structures, built of puncheons and designed to accommodate several families, each with its own fire; sea products formed their chief sustenance; the canoe played an important part in their daily life; slavery was practised, and the *potlatch*, a curious institution which consisted of elaborate feasting and the distribution of personal property, held sway to such an extent as frequently to impoverish the most progressive members of the tribe. The interior *Salishan* tribes hunted and fished for salmon in the many streams that drain their former territory; their

SALIVA—SALIVARY GLANDS

houses, unlike those of the coast, were conical, constructed of poles covered with grass, pine-needles, bark, and earth. The custom of head-flattening was practised particularly among the coast Salish, but, strange as it may seem, this habit did not prevail among those members of the stock now designated by the name "Flat-heads." There are many tribes or sub-tribes of the Salishan stock in Washington, Montana, and British Columbia, numbering in all about 18,500 individuals, of whom about 8,000 are within the limits of the United States. The principal Salishan tribes within Canadian territory are the Lillovet, Okanagan, Thompson Indians, and Lhuswap. Of the population of the Canadian divisions of the stock little reliable information is obtainable, as many tribes or tribal divisions are assembled on each of several reservations, only the combined population of which is known. These are distributed as follows: Fraser River agency, about 5,000; Kamloop's agency, about 2,600; Cowichan agency, about 1,850; Okanagan agency, 950; Williams Lake agency, 1,900; Kootenay agency, 50. The principal Salishan tribes or bands on reservations in the United States are:

Colville Agency, Washington.—Cœur d'Alène (Skitsuish), 474; Colville, 296; Kalispel or Pend d'Oreilles, 150; Lake or Senijextee, 307; Spokane, 653; Okanagan, 575; Sanpoil and Nespelim, 400.

Puyallup Agency, Washington.—Chehalis, 156; Georgetown, Humptulip, Quaitso, and Quinaiel, 324; Nisguali, 107; Puyallup, 536; Skallam or Clallam, 317; Skokomish, 165; Squaxon, 118.

Tulalip Agency, Washington.—Lummi, 340; Muckleshoot (collective), 148; Port Madison, 150; Swinomish, 313; Tulalip, 488.

At Large in Washington.—Nooksak, 200; Piskwans or Wenatchi, 166.

Flathead Agency, Montana.—Charlot's band of Flatheads, 157; Confederated Flatheads, Pend d'Oreilles, and Kootenai, 1,310; Lower Kalispel or Pend d'Oreilles, 53; Spokane, 77.

F. W. HODGE,

Smithsonian Institution, Washington, D. C.

Saliva. See SALIVARY GLANDS.

Saliva'tion, or Ptyalism, a superabundant secretion of saliva, sometimes occurring in disease, but usually, in medicine, either determined locally by the use of masticating irritants, or by drugs which act upon the whole system, especially by mercurial preparations. In the last case it is accompanied by a coppery taste, and by the swelling of the gums, which become of a pale rose color, except close to the teeth, where they are of a deeper red. The breath is "mercurial" and very fetid, and the teeth seem elongated and loosened. If the use of mercury is continued the swelling of the gums increases; it affects the tongue and all the salivary organs; finally, the mucous membrane is studded with small superficial ulcers covered with a white skin. Salivation is ordinarily anticipated, during mercurial treatment, by maintaining cutaneous perspiration by means of warm baths, friction, and exercise. If salivation is persistent notwithstanding the use of these means, emollient gargles containing more or less of opium are used, and on the abatement

of the salivation they are replaced by astringent tonics. Salivation was formerly frequent, but has become rare through modifications in mercurial treatment.

Salivary Glands, the glands which secrete saliva, the fluid of the mouth, or spittle; that secretion whereby food in the mouth is reduced to a pulpy condition, and through the chemical action of which certain changes are effected in the constituents of the food. In man the salivary glands comprise three pairs, as in the mammalian class generally. Of these the largest is the parotid gland, lying in front of the ear, before the mastoid process of the temporal bone, and behind the ramus of the lower jaw. Its duct is the parotid duct, or duct of Steno. It opens into the mouth opposite the second upper premolar tooth. This gland measures from $2\frac{1}{2}$ to 3 inches in length, and is nourished by branches from the main trunk of the external carotid artery, from the temporal, facial, and other blood-vessels. The submaxillary gland, next in size, is in the lower portion of the lower jaw, above the digastric muscle. Its duct (Wharton's duct) is about 2 inches long, and its arteries and veins are derived from the facial and lingual vessels. The third distinct salivary gland, the sublingual, is still smaller, and is situated on the floor of the mouth, beneath the front part of the tongue. It is from $1\frac{1}{2}$ to 2 inches through its long axis. Its numerous ducts open on the floor of the mouth by many minute apertures. The excretory ducts of subsidiary glands in the mouth open simply on the mucous membrane of the mouth. The minute or microscopic structures of the salivary glands are composed of lobes in turn composed of lobules, each of which contains a small branch of the main duct of the gland, the subdivisions of which ultimately terminate in minute vesicles or sacs, known as acini. The salivary fluid as found in the mouth is usually mixed with the mucus secreted by the mucous or lining membrane of the mouth, and is thus rendered of viscid consistence.

Salivary glands are absent in some mammals, as whales; in some reptiles, as crocodiles; and in most fishes. In mammals alone salivary glands are present of the definite structure seen in man; but in many reptiles, as in serpents, definite (buccal) glands exist, within the inside margin of the jaws. In birds the submaxillary glands may be of large size; and in some forms, as woodpeckers, the saliva may be normally of a viscid consistence, adapted for smearing the tongue, and for thus aiding in the capture of insect-prey. Swifts, as is well known, secrete in their salivary glands a glutinous substance of which in great part, often almost wholly they build their nests. (See BIRDS' NESTS, EDIBLE.)

When first secreted, saliva gives an alkaline reaction. During digestion this alkaline condition persists. During fasting saliva gives a neutral reaction, as also when slowly secreted, its alkalinity then being neutralized by the acid of the mucus of the mouth. Microscopically examined, saliva shows minute solid particles, probably derived from the secreting structures; and when mixed with the fluids of the mouth it contains also epithelial scales from the mouth

and tongue, and mucus corpuscles, mostly from the tonsils. Freed from these, the saliva is a fluid either colorless or bluish-gray.

During mastication the flow of saliva is greatly accelerated, the presence of food in the mouth acting as the stimulus to its secretion; and different foods affect the secretion in different degrees; while mental impressions, without the presence of food, will cause saliva to flow, or will "make the mouth water." The functions or uses of saliva are both mechanical and chemical. It acts mechanically to incorporate and mix the food in the mouth, to render swallowing easier, and to keep the tongue and mouth moist, so aiding articulation. (See DIGESTION.)

The secretion of the pancreas markedly resembles that of the salivary glands in chemical composition, and exerts an action on the food similar in many respects, and in those forms in which salivary glands may be wanting or undeveloped the pancreatic secretion may supply the place of the salivary fluid. Among invertebrates salivary glands are usually well represented. Insects and other *Annulosa*, and the generality of mollusks thus possess definite structures devoted to the secretion of the salivary fluid.

Calculus concretions (salivary calculi) may form in the salivary glands, and may cause obstruction of their ducts, and necessitate the performance of an operation for their removal. Saliva would appear to become abnormal and to constitute a source of infection in hydrophobia or rabies; and syphilis is said to have been transmitted through this medium. Occasionally the elements of urine have been present in saliva—forming the so-called urinary saliva of pathologists—in consequence of diseased conditions, on the removal of which the secretion became restored to its normal composition. Milky saliva, so named from the presence of milk constituents, has also been described as a condition occurring in some parturient women.

Salix, one of the two genera of the family *Salicinea* (the other being *Populus*). The species are dioecious trees and shrubs, inhabiting principally the northern hemisphere and the temperate and arctic zones, and very abundant therein, especially along the banks of streams and ponds. The leaves are alternate and narrow, and the small flowers, reduced to a disk bearing either stamens or pistil, according to sex, are gathered into unisexual catkins, each flower subtended by a bract. These catkins usually appear before the leaves, and are fertilized by insects, having nectaries for their attraction, the male flowers, moreover, showing large bright-colored anthers, and a honey-like odor. The two-valved capsules contain numerous seeds, crowned by dense plumes of soft hairs, which enable them to float off on the wind, and be disseminated by it.

Many fossil forms of *Salix* have been found. Salicin is a crystalline glucoside obtained from the bark of various species of *Salix*, and is one of the sources of salicylic acid, for which it is sometimes substituted in medical practice. See also WILLOW.

Sallee, sã-lë', **Sali**, or **Sla**, Morocco, a seaport on the western coast of the Atlantic, 106

miles west of Fez, at the mouth of the Buregreb, formerly the great centre of Moorish piracy, immense depredations being committed from it upon European commerce. The river, which formerly admitted large vessels, is now choked up with sand. On the opposite side of the river stands Rabat (q.v.), called often New Sallee. Pop. of Sallee about 12,000.

Sallust, sãl'üst (GAIUS SALLUSTIUS CRISPUS), Roman historian: b. Amiternum, in the Sabine district, 1 Oct. 86 B.C. (668 A.U.C.); d. Rome 13 May 35 B.C. (719 A.U.C.) or 34 B.C. (720 A.U.C.). He held the offices of *quæstor* and *tribunus plebis*, attained senatorial rank, was of the Cæsarian faction in the civil war, went to the war in Africa as prætor in 47 B.C., and after the close of the struggle at Thapsus was made commander in Africa with title of proconsul. Having returned to Rome in 45 B.C., he formed the extensive gardens celebrated as the *horti Sallustiani*. The chief remains of his historical works are two monographs, one on the conspiracy of Catiline ('*De Conjuratione Catilinæ*'), the other on the war against Jugurtha ('*De Bello Jugurthino*'). The 'Catiline' was prepared more largely from literary sources than from the original documents which appear to have been accessible; hence it is vague and inaccurate as to chronology and fact. It aims rather at the explanation of motive and general development, and this it expresses with frequently epigrammatic neatness, but at times so sentimentally as to be obscure and involved. The 'Jugurtha' exhibits much the same features, but is based on a more thorough research, and is more finished and even in style. Of Sallust's largest work, the five books of 'Historiæ,' there are extant only four speeches, two letters, and a few fragments. There are editions of the 'Catiline' by Schmalz (1886), Thomas (1884), Cook (1884), and Turner (1887); of the 'Jugurtha' by Thomas (1877), Schmalz (1886), and Brooke (1885); of both, with fragments of the 'Histories,' by Frazer (1890), Merivale (1858), and Capes (1884). There is an English version by Pollard (1882).

Sally-Lunn, the name given a popular tea-cake; so called from Sally Lunn, a pastry cook of Bath, England, who used to cry them about in a basket at the close of the 18th century.

Salm-Salm, zãlm-zãlm, **Felix**, German soldier: b. Anhalt, Prussia, 25 Dec. 1828; d. Gravelotte, Alsace, 18 Aug. 1870. He was the youngest son of the reigning prince Salm-Salm, and became an officer in the Prussian army, but later joined the Austrian army. In 1861 he came to the United States, and served during the Civil War as colonel of the 68th New York regiment. He next offered his services to Maximilian, of Mexico, whose fortunes he followed as aide-de-camp and chief of the imperial household, until the death of that emperor, when he again entered the service of Prussia. He was killed in the battle of Gravelotte during the Franco-Prussian war. His wife, AGNES LECLERCQ, an American actress, whom he married in 1862, accompanied him upon all his subsequent campaigns, and became known for her deeds of bravery and ministrations to the sick and wounded. Her experiences in Mexico and

other fortunes of war are told by her husband in his book: 'My Diary in Mexico in 1867.'

Salmagun'di, a dish of minced meat, seasoned with pickled cabbage, eggs, anchovies, olive oil, vinegar, pepper, and similar ingredients. In an applied sense the word means pot-pourri, a medley, a miscellany.

Salmagundi Club, a famous club of artists in New York, established in 1875. In 1904 it had upward of 400 members. The club house in West 12th Street, New York, was formerly the residence of Rogers, the sculptor.

Salmasius, sāl-mā'shī-ūs, **Claudius** (Latinized name of **CLAUDE DE SAUMAISE**), French scholar: b. Sémur-en-Auxois 15 April 1588; d. 3 Sept. 1653. His father, a learned man, instructed him in the ancient languages, and then sent him to Paris to study philosophy. His edition of 'Florus,' published in 1609, is a remarkable proof of his early erudition. In 1606 he went to Heidelberg to study law under the celebrated Gothofredus (Godefroi). On his return to France in 1610 he began to practise law, but soon withdrew to devote his whole time to critical labors and learned controversies. His mother, a Calvinist, had educated him in Protestant principles; and in 1623 he married a Protestant. Several years later he passed some time at the country seat of his father-in-law, near Paris, where he completed his great labor on Pliny and Solinus. In 1629 his father was desirous of transferring to him his own place as magistrate, but as he openly professed Calvinism, the keeper of the seals, Marillac, refused to sanction the nomination. In 1651 he accepted the professorship which had been held by Scaliger at the University of Leyden. His friends made several attempts to recall him to France, and Cardinal Richelieu offered him a pension on condition of his writing a history of his ministry; but Salmasius declined all these offers. In 1649 Charles II. of England induced him to write a defense of his father ('Defensio regia pro Carolo I.'), which was answered by Milton's 'Defensio pro Populo Anglicano.' (See MILTON.) The 'Defensio Regia' offended his republican patrons in Holland, and he accepted the invitation of Queen Christina to visit Sweden (1650). But the climate was so unfavorable to his health that he returned to Holland the following year. The most important of his works are: 'Plinianæ Exercitationes in Solinum'; 'Scriptores Historiæ Augustæ'; 'De Mutuo'; 'De Modo Usurarium'; 'De Fœnore Trapezitico'; 'De Re Militari Romanorum'; 'De Re Hellenistica'; 'Observationes in Jus Atticum et Romanum.' Besides the classical and many modern languages, he was acquainted with Hebrew, Chaldaic, Arabic, Persian, and Coptic.

Salmon, sām'ôn, **George**, Irish mathematician: b. Dublin, Ireland, 25 Sept. 1819. He was educated at Trinity College, Dublin, took orders in the Anglican Church and was professor of divinity at Dublin University in 1866-88. He was president of the mathematics and physics section of the British Association in 1878, and since 1888 has been provost of Trinity College, Dublin. He has published: 'Conic Sections'; 'Geometry of Three Dimensions'; 'The Reign of Law' (1873); 'Infallibility of the Church'

(1888); 'Cathedral and University Sermons' (1900); etc.

Salmon, a fish of the family *Salmonidæ*, regarded as the highest type of the true or teleostean fishes. The eminent American ichthyologist, Dr. D. S. Jordan, who has made a special study of this group, speaks of it as follows: "As now restricted, this is no longer one of the large families of fishes, but in beauty, activity, gaminess, and quality as food, and even in size of individuals, different members of the group stand easily with the first among fishes. The *Salmonidæ* are confined to the northern regions, and north of about 40° N., are everywhere abundant where suitable waters occur. Some of the species, especially the larger ones, are marine and anadromous, living and growing in the sea, and entering fresh waters to spawn. Still others live in running brooks, entering lakes or the sea as occasion serves, but not habitually doing so. Others again are lake fishes, approaching the shore, or entering brooks in the spawning season, at other times retiring to waters of considerable depth. Some of them are active, voracious and gamy, while others are comparatively defenseless and will not take the hook. The large size of the eggs and their lack of adhesiveness, with the ease by which the eggs may be impregnated, render the salmon and trout especially adapted for artificial culture. The *Salmonidæ* are of comparatively recent evolution, none of them occurring as fossils, unless it be in recent deposits. The instability of the specific forms and the lack of sharply defined specific characters may be in part attributed to their recent origin, as Dr. Gunther has suggested."

The family includes the American genera *Coregonus* (whitefish), *Argyrosomus* (ciscoes), *Stenodus* (inconnus), *Cristivomer* (lake-trout), *Salvelinus* (chars or "trout"), *Oncorhynchus* (Pacific salmon), and *Salmo* (Atlantic salmon, and salmon-trout).

ATLANTIC SALMON.—The body of the Atlantic salmon (*Salmo salar*), native to the rivers of both sides of the North Atlantic, is moderately elongate and but little compressed; the greatest depth is about one fourth the total length without the caudal fin. The length of the head is about equal to the depth of the body. The mouth is of moderate size. The scales are comparatively large, and number about 120 in the lateral line. The dorsal fin has 11 rays and the anal 9 rays. The color, like the form, varies with sex, age, food and condition. The adult is brownish above and silvery on the sides, with numerous small black spots often X or XX shaped, on the head, body and fins, and with red patches along the sides of the male. Young salmon (parrs) have about 11 dusky cross-bars, besides black and red spots. Weight 15 to 40 pounds.

Its original natural range in America stretched from Greenland to Long Island Sound.

The vast abundance of salmon was one of New England's chief recommendations to immigration in colonial days. The Merrimac is reported to have been so filled with them during the spring migration that they sometimes crowded those near the banks out on dry land. Even as late as 1783 Peters reported in his 'History of Connecticut' that the "shad, bass and salmon more than half support the province."

SALMON

There is no good reason to suppose that they did not originally run in the Hudson, although direct evidence that they did so in abundance is lacking. DeKay mentions that one was taken in August, 1840, near Troy, N. Y., weighing 40 pounds. Long before that year, however, the New York market had ceased to be supplied from the Connecticut, and had begun to bring salmon from the Kennebec, packed in ice. In the Saint Lawrence, however, few if any salmon entering the river from the sea ever ascended as far as Lake Ontario, and the salmon inhabiting that lake and its tributaries have always, as a rule, made the lake their sea, and the limit of their downward migrations. The reason for the decline was everywhere the same—over-fishing in the rivers with seines, and the damming of the upper streams for milling or other purposes. Although Peters had recorded that in 1783 salmon "fill the Connecticut River for many days, and no finite being can number them," the Rev. D. D. Field stated in 1819 that they had scarcely been seen there for "15 or 20 years."

In respect to the habits and feeding of the salmon Dr. G. Brown Goode has written at great length. He remarks that most of the tribe are peculiarly fresh-water fishes, though several share the sea-dwelling habit, and others, like the brook-trout, descend into salt water when not prevented by barriers of temperature. "I am inclined to the view that the natural habitat of the salmon is in the fresh waters, the more so since there are so many instances . . . where it has been confined for years in lakes without apparent detriment. . . . The salmon while it remains in the sea, or in the brackish estuaries, takes particular delight in feeding on crustaceans and their eggs, small shrimps and young crabs. When in the rivers they eat but little, though they are at times eager enough for food, as testify their voracious rushes at the angler's fly-hook. The absenteeism of the salmon is due principally to the dearth of desirable food in the rivers. The young fish stay in fresh water for one and frequently two years. When they pass down to the sea they weigh but a few ounces. They find congenial food and begin to grow rapidly. The broad world of ocean affords them new opportunities for adventure and self-advancement, and it is only when summoned by the duties of family life that they return within the narrow limits of the old home. When salmon live in the lakes they prey upon minnows and other small fishes, but those of the sea delight also in small crustaceans and their eggs, to which they owe the vivid color of their flesh. The habits of successive generations become hereditary traits."

It is as an adult, four years or a little more old, that the salmon enter the rivers and work their way toward their head. They have been for two or two and a half years in the sea, where and how living is little known; but the probability is that they do not go very far from the mouth of the river in which they were born. They enter as soon in the spring as the water has reached a moderate degree of warmth, and therefore appear in southern rivers much earlier than in northern ones. They are in magnificent condition, and make their way up-stream with extraordinary persistence and force, overcom-

ing swift rapids, climbing cataracts and leaping unbroken falls as much as 12 feet high; but only the strongest can accomplish so great a feat, and sometimes only after repeated efforts. It is during this early advance that the angler seeks the streams where they are running and throws his line for the grandest sport afforded by fly-fishing in fresh waters. Having reached, as near as time or circumstances permit, to the sources of the stream the eggs are poured out in vast quantities by the females, and simultaneously the males void their milt, so that impregnation takes place at once. This takes place in our rivers late in October or in November. The development of the embryo proceeds for a time, but soon is checked by the winter cold, so that it does not burst the shell of the egg until the next April or May.

At this time the embryo salmon has a slender half-transparent trunk, less than an inch in length, carrying, suspended beneath, an immense ovoid sac—the "yolk-sac." For about six weeks after hatching it hides in crevices among stones, keeping up an incessant fanning with its pectoral fins. During this period it takes no food, but is supported and nourished by the yolk-sac, the substance of which is gradually absorbed into the rest of the body, and not until the sac has nearly disappeared does the salmon really look like a fish and begin to seize and swallow food. It now puts on a mottled coat, with several heavy dark bars across its sides, and bright red spots, larger and fewer than those of a trout, and looks therefore very unlike the adult salmon but much like a young trout. In this stage it is termed, in Scotland and England, a "parr," and it was formerly thought to be a wholly different species from salmon.

The parr stage lasts a year or two in British rivers, and the few observations made in America indicate that it is more likely two years than one in our rivers. The parr, at first but little over an inch in length, is provided with good teeth and a good appetite, and beginning to feed at a season of the year when the water is almost crowded with small insects and other more minute creatures, it grows rapidly, probably increasing its weight 30 or 40 times the first summer. In two years it reaches the length of 6 or 8 inches, and its bright red spots and dark bars have given place to a silvery coat like the adult salmon. It is now termed a "smolt" and is ready to go to sea, which it does with little delay, and passes out beyond the range of man's observation, but to a region where it finds a rich feeding-ground and rapidly increases in size. In northern rivers, those of New Brunswick and beyond, as in those of northern Europe, the salmon returns from the sea when it has attained a weight of 2 to 6 pounds, and is then termed a "grilse." In the rivers of Canada, in general, grilse occur in great numbers, coming in from the sea at a later date than the adults, but ascending like them to the upper waters, mingling freely with them, rising to the same fly, and caught in the same weirs. In our rivers grilse are seldom seen; yet it by no means follows from this that our salmon do not pass through the same phases of growth, or that the growth is more rapid, but merely that when in the grilse stage they generally lack the instinct that impels their more northern relatives to seek fresh water.

SALMON

Of the characteristics of grilse, as ascertained in the rivers they frequent, it will be sufficient to say that they exhibit to a great degree the characteristics of the adult; that the main external differences are a shorter head, slenderer form, and a difference in the color and markings; that they are remarkably active and agile, leaping to great heights; that the male is sexually well developed and mates with the adult, but that the female is immature, and that, like the adult, they abstain from food and consequently lose flesh during their stay in fresh water.

PACIFIC SALMON.—There are five species of salmon on the Pacific coast which belong to the genus *Oncorhynchus*, namely, the chinook or quinnat salmon (*O. tshawytscha*), the red or blueback salmon (*O. nerka*), the humpback salmon (*O. gorbuscha*), the silver salmon (*O. kisutch*), and the dog salmon (*O. keta*). The features which separate the Pacific salmons from the Atlantic salmon are not marked, and consist chiefly in a larger number of rays in the anal fin, and more branchiostegals, gillrakers, and pyloric cæca.

The characters noted in the following key will usually be sufficient to distinguish the different species of Pacific salmon:

Quinnat Salmon.—Scales in longitudinal series from 135 to 155, averaging about 145; pyloric cæca 140 to 185; gillrakers comparatively short and usually 23 in number, 9 being above the angle; rays in anal fin 16; branchiostegals 15 to 19. Body robust; head conic; eye small; caudal fin deeply forked. Color above dusky, sometimes with bluish or greenish tinge; sides and belly silvery; head dark, with metallic lustre; back and the dorsal and caudal fins with numerous round black spots.

Blueback Salmon.—Scales in longitudinal series about 130; pyloric cæca, 75 to 95; gillrakers comparatively long and 32 to 40 in number; rays in anal fin 14 to 16; branchiostegals 13 to 15. Body rather slender; caudal fin much forked; anal and dorsal fins low. Color, above bright blue, sides silvery, no spots.

Humpback Salmon.—Scales very small, 210 to 240 in longitudinal series; pyloric cæca very slender, about 180 in number; gillrakers short, about 28, 13 being above angle; anal rays 15; branchiostegals 11 or 12. Color bluish above, silvery on sides; hind part of back, adipose fin, and tail with numerous black spots, largest and of oblong form on tail.

Silver Salmon.—Scales large, 125 to 135 in longitudinal series; pyloric cæca comparatively few and large, 45 to 80 in number; gillrakers long and slender, 23 in number, 13 below angle; anal rays 13 or 14; branchiostegals 13 or 14. Body long; head short, conic; snout blunt; eye small; fins small, caudal deeply forked. Color bluish green, sides silvery, finely punctulated; spots few and obscure on head, back, dorsal, adipose dorsal, and upper rays of caudal.

Dog Salmon.—Scales of medium size, 138 to 155 in lateral line; pyloric cæca 140 to 185; gillrakers short and few, 9 above and 15 below angle; 13 or 14 rays in anal fin; branchiostegals 13 or 14. Form of quinnat, but head longer and more depressed. Dusky above and on head, paler on sides; very fine spots on back and sides, often wanting; tail plain dusky or finely spotted, with black edge; other fins blackish.

These salmons are the most important group

of fishes entering the rivers of North America. The steelhead (*Salmo gairdneri*), technically a trout, but popularly regarded as a salmon, also inhabits the waters of the Pacific coast and adds to the importance of the salmon tribe.

In recent years the annual catch of salmon in the Pacific States and Alaska has been over 100,000,000 pounds. In 1899 the quantity of salmon canned was 2,450,000 cases of 48 one-pound cans. The weight of the fresh fish represented by this pack, together with the large quantities sold, fresh, salted, and smoked, was about 175,000,000 pounds, with a value, as placed on the market, of nearly \$9,000,000.

The quinnat is known in various parts of its range as Chinook, king, Columbia, Sacramento or tyee salmon, and is the most important of these salmons. It is not only superior in food qualities, but attains a vastly larger size, has a wider geographical range and a greater commercial value. When fresh from the ocean it is a very handsome, well-formed fish, greatly resembling the Atlantic salmon, although less symmetrical and graceful. It is of a uniform rich red color, becoming paler or streaked upon the approach of the spawning season. Its value for canning purposes is largely enhanced by the persistence of the red color of the meat after cooking. In size no other salmon in the world compares with it. In the Yukon River, Alaska, it reaches a weight of over 100 pounds. Farther south, it runs smaller, although in the Sacramento individuals weighing 50 or 60 pounds are not rare; 22 pounds is a fair average weight in the Columbia River and 16 pounds in the Sacramento. Its known range is practically from Monterey Bay (latitude 36½) to the Yukon River, but it probably ranges farther north. While in the sea, quinnat salmon probably do not wander very far from the mouths of the rivers they have left, and for this reason usually return to spawn in the rivers in which they were hatched. They prefer the larger rivers, like the Sacramento, the Columbia, the Nushagak, and Yukon. They are very persistent in ascending the rivers to spawn, and have been seen crowding up the rivulets which form the headwaters of the Sacramento until nearly half their bodies were exposed to the air. No matter how far the headwaters of a river are from the ocean, some of the salmon will press forward until stopped by impassable obstructions or water too shallow for them to swim in. On reaching the headwaters they remain for a week or two before proceeding to the spawning grounds. Their rate of progress varies with the season, and probably depends to a great extent on the rainfall and the state of the river, rain, roily water, and high water always hastening their progress.

When they first come from the ocean the sexes are almost identical in appearance, but as the time for spawning approaches a difference is noticed between the males and the females, which during the spawning season becomes more marked. The fully developed ova of the female give her a round, plump appearance, while the male grows very thin. His head flattens, the upper jaw curves like a hook over the lower, the eyes become sunken; large, powerful, white, dog-like teeth appear on both jaws, and the fish acquires a gaunt and savage appearance. As soon as they reach fresh water their appetites

SALMON

grow less, their throats begin to narrow, and their stomachs to shrink. This does not at first entirely prevent them from feeding, but it changes them enough to enable them to overcome the temptation to return to their well-stocked feeding-grounds in the ocean, and the longer they remain in fresh water the greater are the changes, and the desire to turn back for food is correspondingly lessened. This change comes about gradually, increasing day by day from the time they leave tidewater until at the near approach of the spawning season their throats and stomachs become entirely incapacitated for receiving food, and the desire and ability to feed leave them entirely. The great reserve of flesh and blood which they bring with them from the ocean enables them to keep the vital organs active until their mission up the fresh-water streams is accomplished.

Quinnat salmon, like all the Pacific salmon, do not return to the sea, but die on or near their spawning grounds. After spawning they rapidly deteriorate, the flesh shades off to a light, dirty pink and they become foul, diseased, and much emaciated. Their scales are wholly absorbed in the skin, which is of a dark olive or black hue, and blotches of fungus appear on their heads and bodies, and in various places are long white patches where the skin is partly worn off. Their fins and tails become badly mutilated, and in a short time they die exhausted.

The spawning season of the quinnat varies in different rivers and, considering the entire coast, lasts at least six months. In July the summer run is spawning at the headwaters of the McCloud and Sacramento rivers in California; in August and September, farther down these rivers. In October the fall run has begun in the McCloud and below, and this run continues spawning through November into December. In the Columbia the spawning begins at the headwaters in June; at Clackamas, 125 miles from the mouth of the river, it begins about the middle of September and continues until November. A few days before they are ready to spawn the salmon hollow out elongated cavities with their heads and tails in the gravel beds of the river where there is some current, and here in due time the eggs and milt are deposited. The eggs drift into the crevices in the pile of stones thrown up below the hollow, sink to the bottom, and remain in that protected position during incubation; here, also, the young remain until the umbilical sac is absorbed. The eggs and young are liable to destruction by freshets, but are comparatively safe from other injurious influences. The quinnat is not so prolific as the Atlantic salmon, 300 or 400 eggs to each pound weight of the parent fish being a fair average.

As the salmon ascend the rivers they are caught by gill nets, fyke nets, pounds, weirs, seines, wheels, and other devices, but in the Sacramento and Columbia the greater numbers are caught with gill nets drifting with the current or tide as they head upstream. In the rivers they are comparatively safe from enemies except otters, ospreys, and fishers, but immense numbers are destroyed at the mouths of the streams by seals and sea lions. The quinnat has been introduced into Japan, Australia, New Zealand, and Europe, but efforts to acclimatize

it on the Atlantic coast of the United States have so far been unsuccessful.

Considering the entire west coast the blueback salmon (*O. nerka*) is probably more numerous than all the other salmons combined. It is known in different regions as blueback, redfish, red salmon, Fraser River salmon, and sock-eye or saw-qui. It ranks next to the chinook in commercial value, being especially important in the Columbia and Fraser rivers and in Alaska. For canning purposes it is but little inferior to the chinook, the color of the flesh being a rich red, which persists after canning. Large quantities are canned in British Columbia and in Alaska, particularly on Kadiak Island, and its commercial importance to that Territory is indicated by the fact that nearly half of the entire salmon pack of the world comes from Alaska and the majority of the fish there canned are of this species. Comparatively few red salmon are sold fresh in the United States. It is next to the smallest of the salmons, the maximum weight being about 15 pounds, but it rarely weighs over 8 pounds and the average is scarcely 5 pounds. In various lakes this fish weighs only half a pound when mature, and is called the little redfish. It ranges from Humboldt Bay, California, to the far north, but in general it ascends only those rivers which rise in cold, snow-fed lakes. Except in the breeding season the color of this fish is a clear bright blue above, with silvery sides and belly. At the spawning period the back and sides become red, and the male develops an extravagantly hooked upper jaw.

The humpback salmon is the smallest of the Pacific salmons; its average weight is only 5 pounds, and it rarely reaches 10 pounds. Its range is from San Francisco probably as far north as the Mackenzie River, and it is also common on the Asiatic coast. In food qualities the fresh-run humpback is scarcely inferior to any other salmon. While the flesh has a very fine flavor, it is paler than that of other red salmon, and the species has consequently been neglected by canners; but it is probable that it will eventually be utilized for canning purposes, and its excellent qualities when fresh are undoubtedly destined to give it a great commercial value. Its chief consumption now is by Alaskan natives. The humpback salmon generally seeks the smaller streams for the purpose of spawning and deposits its eggs a short distance from the sea, sometimes within only a few rods of the ocean. At Kadiak Island, Alaska, where it is often very abundant, it arrives in the latter part of July, the run continuing only a few weeks. Spawning takes place in August.

The silver salmon is also known as silver-sides, skowitz, kisutch, hoopid salmon, and coho salmon. It is a beautiful fish, having a graceful form and a bright silvery skin. Its flesh, which is fairly good, usually has a bright red color, but as this fades on cooking it is not highly regarded for canning purposes, though large quantities are thus utilized. Its average weight in the Columbia and Puget Sound is 8 pounds, but in Alaska it averages nearly 15 pounds. Its range is from San Francisco to northern Alaska, and as far south on the Asiatic coast as Japan. It runs up the rivers to spawn in fall or early winter, when the waters are high, but usually does not ascend great distances from the ocean.

The dog salmon is the least valuable of the Pacific salmons, although it is dried in large quantities by the Alaskan natives. Its average weight is 12 pounds and the maximum is about 20 pounds. It is found from San Francisco to Kamchatka, being especially abundant in Alaska. The enlargement and distortion of the jaws give the species a very repulsive look, and the large teeth give to it its common name. When just from the ocean, the flesh has a beautiful red color and is not unpalatable, but it deteriorates rapidly in fresh water. It spawns in shallow rivers and creeks. Larger quantities are utilized in Puget Sound than elsewhere in the Pacific States, and it is also used considerably by the natives of Alaska.

The Steelhead.—Another anadromous salmonoid fish found on the Pacific coast, popularly regarded as a salmon, is the steelhead (*Salmo gairdneri*), known also as hardhead, winter salmon, square-tailed trout, and salmon trout. It resembles in form, size, and general appearance the salmon of the Atlantic coast, and is distinguished from other Pacific coast salmon by its square tail, its small head, round snout, comparatively slender form, light colored flesh, and its habit of spawning in spring. It is more slender than the quinnat and consequently not so heavy for its length. Its average weight in the Columbia is about 10 pounds, although it sometimes reaches 30 pounds. Its range is very extended, reaching from the southern coast of California to the Alaska Peninsula, and is found in almost all the streams of the Pacific States which empty into the ocean. It begins to enter the Columbia in the fall, and is then in prime condition. Like the chinook, the steelhead ascends rivers for long distances, and it has been found almost as far up the tributaries of the Columbia as the ascent of fish is possible. As the greatest quantities of steelheads are caught in the spring, when they are spawning and are in a deteriorated condition, they are not generally esteemed as food; but when they come fresh from the sea and are in good condition, their flesh is excellent. As the demand for salmon has increased, steelheads have been utilized for canning, and they have formed a noteworthy part of the canned salmon from the Columbia River for a number of years past, as well as from the short coast rivers of Washington and Oregon. Their consumption fresh has been increasing yearly and considerable quantities have been sent to the Eastern States in refrigerator cars.

Artificial Propagation.—The first steps in an effort to restock with salmon the rivers of the eastern coast were undertaken by Massachusetts and New Hampshire about 1865. At first eggs were obtained from Canada, but this source was cut off, and the authorities were compelled to attempt to get eggs by capturing salmon in the spring at the mouth of the Penobscot River, in Maine, and keeping them alive and well until they spawned in November. After some experimenting a few live salmon were safely caught and carried in floating cars to Craig Brook, near the mouth of the Penobscot, where ponds and hatcheries fed by a clear stream had been prepared for them. The fish thrived; year by year quantities of eggs were obtained and despatched to other places to be hatched. In 1880, however, the Craig Brook station was acquired by the

U. S. Fish Commission and enlarged into a regular establishment for the rearing of fry, on an extensive scale, to the age of six or seven months. Later other establishments were opened for the rearing and distribution of the landlocked salmon. Still more extensive operations in salmon culture have been undertaken on the Pacific coast to replenish the rivers of California and the Columbia basin, from 40 to 50 millions of fry (principally quinnat) are annually being artificially hatched, reared and placed in the headwaters of the various rivers. For treatment of the eggs and fry, see FISH-CULTURE. See also FISHERIES.

Washington, 1884); Day, 'Fish of Great Britain' (London, 1880-4); Jordan and Evermann, 'Fishes of North and Middle America' (Washington, 1898); 'Reports' and 'Bulletins' of the U. S. Fish Commission, especially the 'Manual of Fish-Culture,' and Moser's Report of the operations of the Albatross during 1898.

Salmon, a river in Idaho, which rises in Custer County, flows north and west into Snake River. Its course is irregular; its total length is about 400 miles.

Salmon Dance, among the American Indians, a dance of the Yurok, Karok and other tribes, held in the early spring on the Pacific coast when the salmon begin to run up the rivers. No one is permitted to catch a salmon before the dance, nor for 10 days afterward.

Salmon-trout, a name applied to several distinct species of *Salmonidae*: in the eastern United States to the great lake trout (*Cristivomer* or *Salvelinus namaycush*) which resembles the true charrs or trouts except for the crested and toothed vomer bone and prominent teeth on the base of the tongue. The color varies greatly, but is usually dark gray with numerous well separated rounded spots of lighter gray. This species reaches a length of upward of three feet, and has been known to attain a weight of 125 pounds. It is especially characteristic of the Great Lakes, but is found in fresh waters from Maine to Vancouver and northward to Alaska. Except when spawning in the autumn they live in the deeper waters of the Lakes and are extremely voracious. Next to the whitefish the lake-trout is the most important food-fish of the Great Lakes, and is caught chiefly by means of extensive gill nets operated by tugs. In order to maintain the fisheries many millions of eggs are now hatched artificially, both by the United States and by the Michigan Fish Commissions. In the West the steelhead salmon (*Salmo gairdneri*) and related species are sometimes known as salmon-trouts. The steelhead resembles the rainbow trout (q.v.), but is very much larger, has small scales and a larger mouth. It is abundant in nearly all of the rivers of the Pacific coast, from California to Alaska, and is caught in considerable quantities for canning, and, when captured in the fall immediately after leaving the sea, is esteemed as a fresh fish. The common Atlantic salmon (*Salmo salar*) also sometimes receives the name of salmon-trout, as in the Gulf of Saint Lawrence. The salmon-trout of Europe (*Salmo trutta*), also known as bull-trout and sea-trout, occurs in the Baltic Sea

about the British Isles and along the coast of France, and enters the rivers emptying into these seas. Its life history resembles that of the common salmon, with which it readily hybridizes. See SALMON; TROUT.

Salmond, sām'ond, **Stewart Dingwall Fordyce**, Scottish theologian: b. Aberdeen 22 June 1838; d. there, 20 April 1905. He was educated at Aberdeen and at Erlangen University, was a Free Church clergyman and occupied the chair of theology at the Free Church College at Aberdeen from 1876 till his death. He was appointed principal there in 1898. His publications include: 'The Life of Christ'; 'The Christian Doctrine of Immortality' (1895-1902); etc.

Salmon'idæ, a family of highly organized fresh-water and anadromous fishes of the northern parts of the world, which includes the salmon, salmon-trout, whitefish, grayling and their relatives. See SALMON.

Sal'ol, phenyl-salicylate, $C_6H_4.OH.COOC_6H_5$, a drug obtained by the interaction of salicylic acid and phenol. A white crystalline powder odorless or with a faint aromatic smell, nearly tasteless, almost insoluble in cold water, easily so in alcohol, ether, or chloroform. A powerful antipyretic but chiefly used as an intestinal antiseptic. In the small intestine it is decomposed by the pancreatic juice into phenol (or carbolic acid) and salicylic acid, both of which are well known antiseptics. Used therefore in cases of typhoid fever, fermentative dyspepsia, and in other diseases of the intestinal canal. As it contains salicylic acid it is valuable in cases of rheumatism, gout, etc. Dose from 15 to 30 grains.

Salome, sa-lō'mē, a Hebrew female name, common in Palestine in the days of Jesus Christ. The most notable bearer of it was the granddaughter of Herod the Great, born 10 A.D., who married her uncle, Philip the tetrarch. She appears in the gospel as a young girl, who is instigated by her mother Herodias to ask of Herod Antipas the execution of Saint John Baptist. The name was also borne by the mother of James the Elder and John the Evangelist, one of those women of Galilee who attended Jesus in his journeys and ministered to him. (Matt. xxvii. 56.) She asked of Christ for her sons a special place of honor in his kingdom (Matt. xx. 21) and was a witness of the crucifixion (Mark xv. 20). Some infer, from comparing Matt. and John xix. 25, that she was a sister of Mary the mother of Jesus.

Salomon, **Haym**, American patriot and financier: b. Lissa, Poland, 1740; d. Philadelphia, Pa., 6 Jan. 1785. But meagre details are preserved of his early career, but his record as an American patriot and his services in aid of the government in Revolutionary days are well known. He was called "the good Samaritan" by S. H. Gay in his life of James Madison, and is referred to by Madison as rejecting all recompense for the pecuniary help bestowed. He was a prisoner in New York in 1775, and in 1778 escaped to Philadelphia. There acquiring wealth as a banker, he freely loaned to Robert Morris over \$350,000. He negotiated all the war subsidies from France and Holland,

and when Continental money was withdrawn, causing suffering among the poor of Philadelphia, he distributed \$2,000 in specie to relieve distress. The large indebtedness of the government to Haym Salomon was never repaid to him nor to his heirs and has been the subject of some discussion. It was favorably reported to the United States Senate in 1850. Although the amount of public securities and Revolutionary papers filed in the register's office, Philadelphia 15 Feb. 1785 reached \$353,744, the inroads of the British army in 1814 destroyed every record in relation to the vouchers. On 24 Feb. 1893 a bill was presented to the House that a gold medal be struck off in recognition of Haym Salomon's services, his heirs to waive all claims for indemnity; but the measure, although reported favorably, was too late for consideration. Consult: 'A Sketch of Haym Salomon, from an unpublished MS. in the papers of Jared Sparks'; H. B. Adams, in 'Publications of American Jewish Historical Society, No. 2' (1894).

Salomons, **SIR David Lionel Goldsmith-Stern**, English electrical engineer: b. 28 June 1851. He was mayor of Tunbridge Wells in 1895, has been vice-president of the Institution of Electrical Engineers, and has published: 'Electric Light Installations'; 'Photographic Formulae'; and various monographs on electrical topics.

Salon, sā-lôn', **The Paris**, (1) the large gallery in the Louvre, in Paris, in which art exhibitions were formerly held; (2) a name given the annual art exhibition in Paris; (3) the leading galleries where modern artists exhibit their works. See PARIS.

Saloniki, sā-lō-nē'kē, or **Salonica** (ancient, THESSALONICA), Turkey in Europe; (1) a seaport and the capital of a vilayet, on the gulf of the same name, in the Ægean Sea, 315 miles southwest of Constantinople. It occupies a fortified slope, and, surrounded by stately cypresses and lofty white walls, ascends from the shore in triangular form. Its architecture is characteristically Oriental, the early Christian churches having been converted into mosques. Chief of these is Saint Sophia, similar to the celebrated mosque of that name in Constantinople, on a smaller scale, but beautiful; the church or mosque of Saint George (with walls 20 feet thick), which contains early Christian mosaics dating from 400 A.D.; Saint Demetrius, with a fine interior; and various others, besides Greek churches and Jewish synagogues. The numerous antiquities include the Citadel, or ancient Acropolis, with its seven towers, called by the Turks *Fedi-Kulch*, containing a triumphal arch which dates from the time of Marcus Aurelius; the Propylæum of the Hippodrome, a splendid Corinthian colonnade of five pillars; the triumphal arch of Augustus, commemorating the battle of Philippi; the arch of Constantine, etc. There are large bazaars, and aqueducts bring water from the distant hills to the city. Saloniki, however, is also characterized by much squalor and miserable quarters. Since the construction of various railway systems, and harbor improvements, the trade, already considerable, has increased. The exports consist of corn, cotton, wool, tobacco, silk cocoons, opium,

wine, brandy, skins, antimony, and timber; the imports, of sugar, flour, coffee, coal, iron, and hardware, petroleum, salt, rice, glass, etc. Great Britain has the largest volume of trade; next in importance are Italy, France, Austria-Hungary, and Turkey. Salonica (formerly Therna) is mentioned in historical annals, in connection with Xerxes' march through Greece. It was rebuilt by Cassander in 315 B.C. St. Paul preached here, and addressed two of his epistles to the converts of this place. During the Roman-Macedonian wars it figured as the chief station of the Macedonian fleet. After the civil wars it became the first city in Greece. It was a seat of the Christian Church at a very early period. During the barbarian invasions, it was the most important stronghold and place of defense of the Eastern empire. In mediæval times it was taken (904) by the Saracens; (1185) by the Sicilian Normans; (1430) by the Turks. Many of the inhabitants are Jews and Greeks. Pop. (1900, estimated) 150,000. (2) The Gulf of Salonica (ancient Sinus Thernaicus) is the extreme northwestern arm of the Ægean Sea, between the peninsula of Chalcidice and the coast of Thessaly. It has a length of about 85 miles, a breadth of 35 miles, and consists of two distinct parts—one wide, extending from south-east to northwest; the other narrow, from south-west to northeast.

Sal'pa, a genus of free-swimming ascidians of the order *Thaliacea*, and the family *Salpidae*. They are met with as single or solitary organisms and as compound collections, the so-called "salpa chains." The solitary salpa produces by budding from a process termed the stolon, a long chain of aggregated embryos, which become the salpa chain. The individuals of this compound chain have the power of producing, by means of eggs, new solitary salpæ. The entire life-history, however, is not so much one of an alternation of generations as of a process of budding (asexual), alternating with reproduction by means of eggs (sexual). Each salpa is of oval or quadrate form, with an aperture at either extremity. Locomotion is effected by the expulsion of water from the posterior aperture, and the salpa-chains thus swim over the surface of the ocean. The principal organs of the body are compacted to form the so-called "nucleus." The salpæ are beautifully transparent and colorless and often phosphorescent. They abound in the waters of the Gulf Stream and in the Mediterranean.

Sal'sify, a biennial composite (*Tragopogon parvifolius*), sometimes attaining four feet in height. It grows wild in the south of Europe, but is cultivated as a vegetable. It has narrow grass-like leaves and solitary showy purple heads of ligulate florets, the involucre consisting of lanceolate leaflets much longer than the florets. The flowers close before noon. The fruits are plumed, and float through the air like those of a dandelion. Salsify is hardy, and has a very long tapering tap-root, white and fleshy, and with a flavor resembling oysters, whence it is sometimes called vegetable oyster or oyster plant. Black salsify (*Scorzonella hispanica*) comes from Spain, and is closely allied to the true salsify. It has a root like that of *Tragopogon*, except that it has a blackish skin. The leaves are undulate, and the flowers yellow. The plant was once used for snake-bites.

Salsil'la, the common name of several species of the amaryllidaceous genus *Bomarea*, which produce edible tubers. Some are cultivated in greenhouses for their large gorgeously spotted flowers, borne in cymes on twining stems, and *B. edulis* is cultivated in the West Indies as a vegetable, its fleshy roots being also a diuretic and sudorific.

Sal'sola, a genus of the *Chenopodiaceæ*, with about 50 widely distributed species growing in saline soils, or on seashores. The small, axillary flowers are apetalous, but have a five-parted calyx, which in fruit encloses the utricle, and has a broad, horizontal, membranous wing. A maritime species (*S. kali*), the prickly saltwort, is a familiar spiny annual, its decumbent branches, spreading from the central tap-root so as to form large rosettes on the sand. The closely-set rigid leaves radiate in all directions; they are small, awl-shaped, and succulent, the mid-vein ending in a strong prickle. It is a widely diffused species, and like some other plants of the same family, was formerly collected and burned for the impure carbonate of soda found in its tissues. Lumps of the fused ash were an important article of commerce, called barilla (q.v.), and yielded about 50 per cent of soda, being the original source of that chemical. Salsola was also a component of the "sope," mentioned by Jeremiah. To this genus also belongs the Russian thistle (q.v.).

Salt, sàlt, **Henry Stephens**, English biographer: b. Nynce Tal, India, 1851. He was educated at Cambridge and subsequently engaged in literary work and social reform. He has been honorary secretary of the Humanitarian League from its founding in 1891, and editor of 'The Humanitarian' and 'The Humane Review.' He has published: 'Life of James Thomson'; 'Life of Thoreau'; 'Richard Jefferies: a Study'; 'Shelley: Poet and Pioneer'; 'Animals' Rights'; 'The Logic of Vegetarianism'; etc.

Salt, SIR **Titus**, English manufacturer: b. Morley, Yorkshire, 20 Sept. 1803; d. 29 Dec. 1876. He was the first to introduce the manufacture of cloth from the wool of the alpaca into England. The model village of Saltaire (q.v.), three miles from Bradford, on the river Aire, was built in 1853 for the workmen engaged in his factories. He was a member of parliament in 1859, and in 1869 was made a baronet. Consult: Baggins, 'Life of Sir Thomas Salt' (1877); Holroyd, 'Saltaire and its Founder.'

Salt, the common name for sodium chloride, NaCl. It occurs native in large quantities, and it may also be prepared by neutralizing hydrochloric acid with sodium carbonate or with sodium hydrate, and evaporating the solution. It is soluble in water, its solubility at the boiling point being only a little greater than the solubility at the freezing point. It is insoluble in absolute alcohol, and in aqueous alcohol it dissolves to a greater or lesser extent, according to the proportion of water present. Salt crystallizes in the isometric system, usually in cubical or pyramidal forms, though octahedra also occur. Its solution is neutral to test papers, and a saturated solution, when cooled to some degrees below the freezing point of pure water, deposits a hydrate having the composition

$\text{NaCl} + 2\text{H}_2\text{O}$. When cooled to 9°F . below zero, a saturated solution throws down the hydrate $\text{NaCl} + 10\text{H}_2\text{O}$. Pure salt is ordinarily white in color, but it is transparent and colorless, with an ice-like lustre when crystalline. It is slightly hygroscopic, and when heated it decrepitates markedly. It melts at about 1500°F ., and it may be vaporized by raising it to a strong white heat in a current of nitrogen gas. Its specific gravity is 2.16, and its specific heat is about 0.214. Salt is far more transparent to radiant heat than glass is, and physicists therefore employ prisms and lenses of clear rock salt in experiments upon the infra-red rays of the spectrum. (Consult, on this point, Tyndall, 'Contributions to Molecular Physics in the Domain of Radiant Heat.') Salt, from its abundance, is greatly used in the arts as a source of chlorine and of sodium. (See CHLORINE and SODIUM.)

In chemistry, a general name for any compound which may be regarded as consisting of an acid with its hydrogen partially or wholly replaced by one or more metallic bases, or by basic radicals; or for a compound consisting of a basic substance whose hydrogen has been more or less completely replaced by acid radicals. Ordinary sodium chloride, NaCl , for example (which is the substance commonly known as "salt" about the household), may be regarded as hydrochloric acid, HCl , in which the hydrogen has been replaced by sodium. Acetamide, $(\text{C}_2\text{H}_5\text{O})\text{H}_2\text{N}$, is a "salt" in accordance with the second portion of the definition, since it may be regarded as consisting of ammonia, NH_3 , in which one atom of hydrogen has been replaced by the monovalent radical "acetyl," $\text{C}_2\text{H}_5\text{O}$, of acetic acid. Simple chemical salts are classified, for convenience, as "acid," "normal," and "basic." An "acid" salt is one whose acid radical still contains one or more atoms of replaceable hydrogen; while a "normal" salt is one which contains no replaceable hydrogen. When sulphuric acid (H_2SO_4), for example, reacts with salts of potash, the potassium may replace half of the hydrogen of the acid, or all of it. In the former case we have the compound KHSO_4 , which is known as "acid sulphate of potassium"; and in the latter case we have the compound K_2SO_4 , which no longer contains hydrogen, and which is therefore called the "normal" sulphate. The acid salt may be regarded as an intermediate stage between the original acid and the "normal" salt. A "basic" salt is one which contains one or more molecules of hydroxyl, or of a metallic oxid, which can be replaced by an acid radical with the formation of a normal salt. A basic salt may therefore be regarded as intermediate between the base and the normal salt. Comparatively weak bases, such as lead and bismuth, form basic salts, but powerful bases like lime and soda do not. Lead, for example, forms a basic nitrate having the composition $\text{Pb}(\text{OH})\text{NO}_3$; and when this is treated with nitric acid (HNO_3), the hydroxyl is replaced by an " NO_3 " radical, as indicated by the equation

A salt which contains two different basic or acid radicals is called a "double salt." Ordinary sodium-potassium tartrate, or "Rochelle salt," $\text{KNaH}_4\text{C}_4\text{O}_6 + 4\text{H}_2\text{O}$, is an example, and so

also is strontium aceto-nitrate, $\text{SrNO}_3(\text{C}_2\text{H}_3\text{O}_2)$. The phenomena which occur when two normal simple salts combine to produce a double salt are doubtless quite complicated in some instances. The double salt $\text{MgSO}_4 \cdot \text{K}_2\text{SO}_4$, which is formed by the combination of the normal sulphates of magnesium and potassium, appears, when in solution, to be a simple mixture of the two constituent normal sulphates; but, on the contrary, the double salt $\text{PtCl}_2 \cdot 2\text{NaCl}$, which is formed by the union of platinum chloride (see PLATINUM) and sodium chloride, acts as though it were the normal sodium salt of an acid having the composition H_2PtCl_6 .

Physiological Uses of Salt.—Salt as a universal commodity has been used in all ages and civilizations. In biblical times the Jews offered salt to Jehovah with the first fruits of the harvest and the fruits of the earth; Homer calls it divine and chronicles its use in the re-pasts of his heroes; Tacitus tells of furious wars between the Germanic tribes for the possession of salt springs near their territories. Mungo Park saw the inhabitants of the coast of Sierra Leone give all that they possessed, even their wives and children, to obtain a salt supply. Salt is, in fact, an object of so general consumption, so necessary to man, that it affords an assured medium of exchange. The need for salt is not confined to man. Many animals seek this substance with avidity. Nothing pleases the appetite of sheep more than salt. Cattle may suffer cruelly from a lack of salt, and that, on the other hand, they thrive when it is added to their ration. Reindeer and red and roe deer love to lick the surface of brackish puddles and saline efflorescences. In all climates, in all latitudes, wild ruminants and other hoofed animals resort to salt licks, a circumstance of which hunters take advantage, choosing their shooting covers either where salt naturally effloresces or where they themselves have scattered it.

Salt was first used as an aliment at the time of transition from the pastoral and nomadic stage to sedentary and agricultural life. The Indo-European languages have no common word to designate salt, nor have they any for the greater number of the objects that relate to agriculture. But, on the other hand, they have common roots for all words relating to pastoral occupations. This is an indication that the primitive peoples from which modern races sprang were separated before they abandoned a pastoral life. They did not learn the art of agriculture until later, and with it they learned the use of salt. There are populations, ethnic groups, and castes that have never adopted it. The Egyptian priests did not salt their food. Plutarch was astonished at this strange disdain. And in the same way there are animals of the farm that are very fond of it, the dog and cat that do not care for it at all.

There is a well-established relation between a vegetable diet and the need for salt, and reciprocally between an animal diet and the exclusion of this article from food. The two kinds of diet, however, are not distinguished from each other by the quantity of salt which they contribute to the organism. In fact, both kinds are very poor in salt. Although both contain equally small quantities of chloride of sodium, they are distinguished from each other by another min-

eral product which they possess in an unequal though considerable degree. This is potash. In marked contrast with common salt, this substance, always abundant, varies greatly in its relative quantity in different kinds of food. There are foods that contain a great deal of it, and these are precisely those that are taken from the vegetable kingdom. Plants are generally distinguished by their richness in potassic salts. They accumulate enormous quantities of them, drawing them from the poorest soils. Inversely there are other aliments derived from animals that are generally relatively poor in these compounds. In fine, the capital difference that distinguishes in the eyes of the chemist the two modes of diet, is the abundance of potash in the vegetarian ration and its deficiency in the meat ration. The information given by chemical analysis may be succinctly stated as follows: The vegetable kingdom furnishes the economy with much potash and very little soda—about 25 to 150 times more potash than soda. On the other hand, the animal kingdom reduces the supply of potash without reducing in the same degree the supply of soda. It introduces into the economy no more than 2 to 5 times as much potash as soda. All this is perfectly true and interesting in itself, but what hidden relation is there between the proportion of potash that distinguishes the two diets and the inequality in the need for salt which they produce. M. Bunge believes that he has discovered this relation. His hypothesis is that potash is responsible for the like or dislike of salt in cookery. This he justifies by a series of closely connected inductions. The need for salt is the consequence of the loss of salt from the organism, as thirst is the consequence of the loss of water due to hemorrhage, transpiration, or other causes. The need for salt implies a previous loss of salt. Secondly, the loss of salt should be a phenomenon of a chemical nature resulting from reactions of disintegration. Thirdly, this chemical phenomenon having, as is proved by experiment, a relation to the different kinds of diet, should be caused by their chemical characteristics—that is to say, by the difference in their proportions of potash. Contrary to M. Bunge, it is claimed by other chemists that an exclusive vegetable diet causes a need, a particular appetite, which can be satisfied by substances having the taste of cooking salt and containing either chloride of sodium or chloride of potassium. In brief, from a chemical point of view, it is a need for chlorides; from a physiological point, a need for salty savor; that is to say, for a particular kind of gustative sensation.

Condiments and seasonings are found to have a justification that is to some degree of a physiological character. They insure the proper action of the stomach. Salt does more. At the same time that it puts in motion the secretion of the stomach it furnishes it with materials, at least with some of them. Hydrochloric acid, which is characteristic of the gastric juice and insures its digestive efficacy, is derived from salt, from the chloride of sodium of the blood. The same origin should be ascribed to the chlorine compounds found in the juices of the stomach, fixed chlorides and organic chlorine. In other terms the material for the chlorine compounds of the gastric juice

comes primitively from the salt of our food. Ordinary salt, the chloride of sodium, is one of the constituent elements of animal organisms, existing everywhere in them. The blood has a saline taste more or less marked; all the secretions are salty; the tears themselves are more salty than bitter, whatever good people may say about them. Salt water, in fact, bathes all living particles and leaches continually from the organic structure, escaping from all its tissues, carrying with it the waste matters which should be rejected from the body. Common salt is more suitable than any other for this purpose. In a dose of 9 grams per 1,000 it forms a solution innocuous to the anatomical elements, that can circulate around the most delicate of them without causing the least damage. This close association with salt has become habitual to them from immemorial usage; they have adapted themselves to it, and it would lead to some inconvenience if another mineral constituent should be too abruptly substituted for it. In certain animals that have been bled to exhaustion, life may be kept up for some time if the blood is replaced by a saline solution, named, because of its properties, the physiological solution. A turtle or a frog in whose veins this fluid circulates continues to live for a considerable time.

According to statistical data the daily consumption of salt in Europe is on the average 17 grams per capita. Of these about 2 grams are necessary to cover the loss by disassimilation. These two grams represent *nutritive* salts. The remaining 15 grams would then represent on the one hand 8 to 10 grams carried away by excretions and necessary for restoring the constitution of the circulating liquids, and a surplus; but, considering the influence of salt upon the secretions, it would not be prudent to say that this surplus is a sacrifice made to the pleasures of appetite.

Besides taking an active part in certain of the vital phenomena, common salt fulfils better than any other substance the conditions of a medium that is indifferent and yet suitable for the physiological necessities of living matter. In animals as well as in plants, in the mobile corpuscles of the blood as well as in the fixed elements of the tissues, living protoplasm is always rich in potassic salts. The interior medium which bathes it abounds, however, in sodic salts, particularly the chloride of sodium, resembling in this respect sea water, which might, if properly diluted, circulate in the veins and replace for a time the plasma of the blood, as we have seen may be done with the physiological solution. Some naturalists, recalling the circumstances under which life appeared on the globe, and the manner in which it was for a long time maintained in the saline waters of the Palaeozoic seas, have thought they perceived in this fact the survival of an ancestral condition. From this point of view chloride of sodium would be an element handed down from remote times, belonging to a medium suitable to animal life, to the blood and to the organic humors; and salted food, by introducing it about the anatomical elements of the body, would recall the marine origin of animal life, would connect, as one may say, the physiology of the present with that of the past.

SALT DEPOSITS—SALT INDUSTRY

Salt Deposits, Formation and Geology.
See SILURIAN SYSTEM.

Salt-glazing. See GLAZING.

Salt Industry, The. The history of the manufacture of salt in this country is somewhat obscure in its early dates, but covers the entire period subsequent to the settlement of the colonies by the English. The early processes of making salt, which was first produced in this country in Virginia prior to 1620, consisted of exposing sea-water to the rays of the sun or by boiling it in pans or kettles till the salt had settled to the bottom. Later these same processes were used in extracting salt from the natural salt springs, but at the present time sea-water is little used for this purpose. Instead wells are sunk into the salt body, fresh water pumped into them, and when thoroughly saturated is pumped out again, the salt extracted from the brine thus produced. There are several methods of extracting salt from this brine, kettles, open pans, vacuum pans or grainers in which the brine is placed, being heated either directly or by steam. Where kettles or open pans are used, the brine is usually boiled by direct heat, whereas in the grainers and vacuum pans steam heat is used. In the grainer process the brine is evaporated from rectangular vats about 12 inches deep by means of coils of pipes suspended in them and carrying either live or exhaust steam; when the brine is evaporated, the salt is removed from the bottom of the pan by mechanical scrapers. Solar salt is made in vats or ponds, covered and uncovered, and rock salt is mined and is now produced in greater quantities than solar salt.

There are several grades of salt prepared for the market in the United States; Rock, solar, common fine, common coarse, all of which are not dried by artificial means after manufacture; and so-called "dairy" salt, used more especially in the manufacture of butter and cheese. (See SALT; SILURIAN SYSTEM.) The statistics of the industry as given in the Twelfth Census are as follows:

| | 1900 | 1890 |
|-------------------------------|--------------|--------------|
| Number of establishments..... | 150 | 200 |
| Capital..... | \$27,123,364 | \$13,437,749 |
| Clerks, officials, etc..... | 406 | 203 |
| Salaries..... | \$199,748 | \$184,249 |
| Wage-earners..... | 4,774 | 4,255 |
| Wages..... | \$1,011,140 | \$1,593,442 |
| Miscellaneous expenses..... | 750,539 | 674,183 |
| Cost of materials used..... | 3,335,922 | 1,826,773 |
| Value of product..... | 7,990,897 | 5,484,618 |

The table at the top of the next column shows the quantity of salt produced by states for the years 1890 and 1900:

For purposes of comparison the salt industry will be described according to states.

California.—The Spaniards, Mexicans and Indians first gathered salt in this state from the "tide lands" along the shores of Alameda Bay, the natural sinks or ponds there retaining the water which was evaporated by the sun, thus leaving the salt. No attempt was made to improve the quality of the salt till 1864, at which time the Crystal Salt Works

| | 1900 | 1890 |
|------------------------|--|--|
| STATES AND TERRITORIES | Number of barrels of salt manufactured | Number of barrels of salt manufactured |
| Michigan..... | 5,206,510 | 3,729,110 |
| New York..... | 4,894,852 | 3,220,250 |
| Kansas..... | 1,645,350 | 1,140,799 |
| Ohio..... | 1,460,516 | 499,514 |
| California..... | 640,420 | 255,328 |
| Texas..... | 312,430 | |
| Utah..... | 235,671 | 626,420 |
| West Virginia..... | 221,554 | 285,461 |
| Louisiana..... | 208,850 | |
| Virginia..... | 151,301 | |
| Pennsylvania..... | 140,000 | 172,400 |
| Illinois..... | 56,782 | |
| Nevada..... | 56,782 | |
| Oklahoma..... | 7,971 | 25,250 |
| Massachusetts..... | 4,856 | |
| All other States..... | 930 | 536,319 |
| The United States..... | 15,187,819 | 10,406,860 |

were built. These works consisted of ponds for receiving and settling the sea-water so as to precipitate the gypsum and other impurities less soluble than the salt. After the salt itself was precipitated, the mother liquor, or bittern, was drained off leaving a salt of high quality, which was gathered up and conveyed to the warehouses. Thousands of tons of salt are taken to refining works in San Francisco, where it is subjected to artificial heat for the purpose of more thoroughly drying it, and ground into various forms used in chlorination works, packing-houses and silver mills, and for table and dairy uses. The principal salt works in California are located on San Francisco Bay, under the management of the Federal Salt Company, but there are other works located at Salton, in Riverside County; National City, in San Diego County; near Danby, in San Bernardino County; and from the saline springs near Sites, in Colusa County, and at Black Lake, in San Luis, Obispo County, a small quantity of salt is annually produced. In 1900 the total production in California amounted to 640,420 barrels.

Illinois.—There is only one establishment in Illinois, located at Saint John, Perry County, which in 1900 produced 56,782 barrels of salt.

Kansas.—The first salt produced in Kansas came from the marshes scattered over the central part of the state, along the banks of which crude factories were engaged in the business till 1868, but these were in time superseded by others of a more modern character. In 1867 wells were sunk at Solomon City and a plant erected for the purpose of drying the brine which had been struck at about 75 feet. In 1874 William Dewar established a plant in the same city, using the solar system of drying. The manufacture of salt was not very extensive prior to 1880, when 2,000 barrels were made; by 1890 this amount had increased to 1,140,799 barrels, and in 1900 to 1,645,350 barrels. The greater portion of the salt made in 1900 was evaporated by the grainer and open pan methods, though a small amount was made by solar evaporation. In the development of the coal and petroleum industries in 1887, rock salt was struck near Hutchinson. In the same

SALT INDUSTRY

year a body of salt was also struck at Lyons, in Rice County, by a party of prospectors in search of oil or natural gas. In 1890 a company was formed and a shaft sunk, the drill penetrating the body of salt at 800 feet and passing through the bed to a further depth of 265 feet, making the total depth of the mine 1,065 feet. On sinking this shaft through the bed of salt, 15 workable veins, ranging from 4 to 18 feet in thickness, and alternating with layers of shale from three-quarters of an inch to five feet in thickness, were penetrated. In mining this salt, mining or channeling machines operated by compressed air are first used to undercut the salt; holes are made by air drills, dynamite inserted and exploded by electricity, thus bringing the salt to the bottom of the mine. It is then removed from the mine to the mill above ground, crushed and separated into nine different grades by passing over screens. It is then stored in bins ready for shipment or to be loaded on railway cars. The quantity of rock salt produced in 1900 in Kansas amounted to 468,029 barrels.

Louisiana.—Until 1898 nearly all the salt produced in Louisiana came from Avery Island, where the first attempt to make salt in the state was made in 1791 by John Hays. The first shaft sunk on Avery Island was eight by eight feet and 83 feet deep. This was afterward leased to the American Salt Company, which continued it to a depth of 190 feet. In 1897 a new shaft, 500 feet deep, was sunk near the old one, and the new works were equipped with the most modern appliances. In 1898 a shaft was sunk on Belle Isle by the Gulf Company, of Morgan City, but water by dropping through the roof forced the abandonment of this, and a new one was sunk near it, an evaporating plant erected, and a considerable quantity of salt produced by the grainer process. Mining of rock salt was begun in May 1862, 10 pits being dug, but the works were in operation only 11 months. The entire production of salt in Louisiana in 1900 was 208,850 barrels, the largest annual output from a single mine being from the Petite Anse, whose production averages 25,000 to 50,000 tons.

Michigan.—An appropriation of \$3,000 was made on 4 Mar. 1838 by the state for experimentation by the state geologist, and other work was done in 1840, 1841 and 1842, but no well was sunk till 1859 when a private corporation established a plant at Saginaw. During the year 1860, 472 barrels were produced and was gradually augmented, but irregularities in manufacture soon compelled the establishment of a state salt inspection bureau, and the salt manufactured was regularly inspected by the state official. In 1900 the production amounted to 5,206,510 barrels.

Nevada.—In 1900 there were only three establishments in the state, the product being made from brine springs by solar evaporation. In that year the production was 7,671 barrels.

New York.—The manufacture in New York by white men was begun in 1788 in the Onondaga district. In 1707 the state assumed control of this reservation, maintaining it

until 1898 when the title was sold because of the great expense of keeping up the works. During the first 44 years only boiled salt was made in the district, but in 1841 solar salt was also made. In 1883 the Warsaw district was opened up and about the same time the Genesee district began producing. In 1885 rock salt mining was begun near York, Livingston County; in 1892 shafts were sunk at Livonia and Greigsville in the same county; but at the present time the industry is carried on by one company. In 1900 the production of salt amounted to 4,894,832 barrels, and of rock salt about 150,000 long tons are annually mined.

Ohio.—Saltmaking was first attempted in 1798 at the Old Scioto Salt Works on the Salt Creek, in Jackson County. These continued till 1808 when the management was taken over by the state under the direction of the state superintendent, but as they became unprofitable as a state institution, they were later sold. It was not till 1825 that the other properties in Ohio were developed. The principal grades of salt made are table, dairy and common fine, made in 83 grainers, 38 open pans, 31 kettles and 5 vacuum pans. Four covers or ponds also produced solar salt. The total production in 1900 was 1,460,516 barrels.

Oklahoma.—The first works were established in 1896, near Okeene, on a branch of the Cimarron River, and this was soon followed by three others, the total amount of the output of the four in 1900 being 4,856 barrels, valued at \$4,329.

Pennsylvania.—The salt industry was established in the Conemaugh River Valley early in the 19th century. About 1810 William Johnson commenced boring on this river near the mouth of the Loyalhanna, and was soon followed by many others. In 1812 salt was discovered near the present site of Saltsburg, in Indiana County, and by 1820 there were 32 pans and 190 kettles in operation in this county; Armstrong County had 38 pans in operation; Erie County 18 kettles of 32 gallons each and Westmoreland County six establishments producing 70,000 bushels. In 1900 there was only one establishment in the entire state, the total output being 140,000 barrels.

Texas.—The first well was sunk at Colorado in 1884, followed by another in 1889, and by a third in 1899. The total product in 1900 was 312,436 barrels, valued at \$256,900, the greater portion of the production being made in grainers or open pans.

Utah.—The first salt was harvested in 1848 from the shores of the Great Salt Lake. In 1900 the production amounted to 235,671 barrels, nearly all of which was made by the solar evaporation process. About 1860 the chlorination process for the reduction of silver from its ores was discovered, and salt for this purpose, produced at the Great Salt Lake, was first used at the Alice Mine in Butte, Montana.

Virginia.—The only factory in this state is located in Saltville, in the valley of the Shenandoah River. The production in 1900 was 151,391 barrels, the larger portion of which

SALT LAKE CITY

was used in the production of soda-ash, bicarbonate of soda, etc., by an electrolytic process.

West Virginia.—The principal points at which salt has been manufactured in this state are: Charleston, on the Kanawha River; Hartford, Mason City, Clifton and other places in Mason County, along the Ohio River; and near Birch on the Elk River; but the seat of the industry at the present time is in Mason County, only one of the four establishments in operation being outside. The first salt furnace in Kanawha County was erected in 1797, by a Mr. Brooks. On 1 Nov. 1807, David and Joseph Ruffner began boring for salt on the land which is now the present site of Charleston, on 15 Jan. 1808 struck a large stream, and on 8 February secured their first output. By 1817 there were 30 furnaces and 15 or 20 wells in operation, which number had increased in 1835 to 40 furnaces. In 1849 Williams & Stevens erected the first salt furnace on the Ohio River at West Columbia; in 1854 another was erected by Hartford, Conn., parties; a third was erected at Mason City; and within a few years 10 more were erected, but the development of the industry in other states injured the trade in this state so much so that in 1900 there were only four in operation. The total output in that year was 221,534 barrels, made in 23 grainers and 36 kettles.

Salt Lake City, Utah, capital of the State; the central seat of Mormon power; the metropolis of the State and centre of trade for a vast region, is finely located on a gentle slope at the western base of the great Wasatch range of mountains. The magnificent mountains behind the city, the lovely valley in front, the stately Oquirrh Range beyond the valley and Great Salt Lake, 20 miles to the northwest, add immensely to the attractions of the city. The population numbers approximately 70,000. The first settlement on the site was made by the immigrants who came in the first immigration, under the leadership of Brigham Young, and reached the valley on 24 July 1847. The elevation of the site above sea-level is 4,300 feet. The main portion of the city is laid out in blocks of ten acres each, the streets run at right angles and are 132 feet wide. Being in the arid belt, all vegetation depends upon irrigation, but nevertheless, it is a city of gardens, shade-trees and flowers. The city is a central station for the Rio Grande Western Railroad, the southern terminus of the Oregon Short Line Railroad, the eastern terminus for the San Pedro, Los Angeles, and Salt Lake Railroad, and roads from San Francisco Bay running east and from Denver running west, now under construction, will meet in Salt Lake about 1907.

The Mormons.—Since 1847, Salt Lake has been the headquarters of the Church of Jesus Christ of Latter Day Saints (see MORMONS), the home of the President and many of the high officers of the Church; the place where the semi-annual general conferences of the Church meet in April and October. The Temple, the Tabernacle and Assembly Hall (for winter services and for priestly meetings and consultation), with the Temple Annex, occupy a square. The Tabernacle is a unique structure, 150 feet by 250 feet in size, roofed like a bee-hive, the roof arches being without support over the structure, with comfortable seating capacity for 8,000 people,

though not unfrequently 12,000 people gather there. It has the finest pipe organ in America. It is the chief place of worship for the Mormon people, though each of the wards of the city has a meeting-house where services and Sunday schools are held every Sabbath morning, and evening meetings during the week. The Temple is one of the most splendid structures in America. Its walls are of gray Wasatch granite, in solid blocks 9 feet thick at the bottom, 6 feet thick at the top, with a foundation 16 feet thick and 16 feet deep. The interior is finer than was Solomon's Temple. The building is 186½ feet long by 99 feet wide, and is 107½ feet high from foundation to cap stone, while towers and pinnacles extend 50 feet higher. The ground was consecrated and work begun in 1853, it was finished and dedicated in 1893. It is used for marriages, baptisms, and all the secret rites and ceremonials of the Mormon Church. Since its dedication only the faithful are permitted to enter it. It cost, with furnishings, about \$4,000,000.

Public Buildings.—The city has many other fine structures. The joint City and County Building, which is also the present State Capitol, is a most attractive building and cost with furnishings \$800,000. The Mormon Church authorities are clearing ground for the erection of their Administration Building. It will be 330 feet square and 12 stories high. Though to be called the "Administration Building," it will really be a Memorial building to Joseph Smith, the Prophet, and the very highest in architecture and art will be invoked to make it a glorified monument. It is expected that six years will be required in which to complete it. The fine building of the United States Government is nearing completion. The city has many imposing business blocks, some of the homes are palatial; the public school-houses are among the noblest in the country. Both the Episcopal and Catholic denominations have great hospitals; the Latter Day Saints have a commodious hospital; there are three private hospitals while a Home for poor and needy miners, built by the charity of Mrs. Mary Judge, and the Saint Ann's Orphanage, built on the charity of Senator Thomas Kearns, are noble structures. The first known surgical operation for the removal of gall stones was performed in Holy Cross Hospital, Salt Lake City. The Latter Day Saints' College occupies several imposing structures, one of which is a Memorial Hall built in honor of Brigham Young. The Utah State University has a commanding site on the Bench east of the city. The Military Post of Fort Douglas is three miles east of the centre of the city at an altitude 600 feet above Main Street.

Government.—The government consists of a mayor, a council of 15 members, a treasurer, recorder, auditor and two judges elected every two years. The chief of police, fire chief, board of public works, water master, board of health, city physician and building inspector are appointed by the mayor and confirmed by the council.

The city has warm springs within its limits, and the hot springs four miles out, are equal in medicinal virtues to those of Eureka, Ark. In the bathing season trains run every few hours to Great Salt Lake, 25 minutes' ride. The city owns its own water system. A private monopoly owns the light, the electric power plant

SALT LICK

and street car franchises of the city. The car company operates 135 miles of electric road.

Trade and Commerce.—The trade of the city is very great, extending over Utah, western Wyoming, southern Idaho and eastern Nevada. The great mining districts of Park City, Big Cottonwood, Tintic, Bingham, Mercur, and Ophir, are none of them more than three or four hours' ride from the city; the great smelters are in the valley only eight miles away, and Salt Lake is the general depot and clearing-house for their business. The miners from all over Utah and far into Nevada and Idaho send their ores to Salt Lake smelters for reduction, and purchase their supplies in the city. The bullion purchased in the city aggregates \$15,000,000 annually. There are ten banks in the clearing-house, five savings banks and several loan associations. The total clearings for the ten banks in 1903 amounted to \$156,623,532. The Salt Lake Mining and Stock Exchange in 1903 sold 10,169,741 shares that aggregated \$6,165,323.15. The Lehi Sugar Factory, the chief ownership and business of which is in Salt Lake, in 1903 made from 70,000 tons of beets, 23,000,000 pounds of sugar. The Salt Works on the lake shore and owned in the city, manufacture annually 60,000,000 pounds of salt valued at \$300,000. The Zion Co-operative Mercantile Institution sold goods last year to the amount of \$4,096,278. The product of its shoe factory amounted to \$200,000.

Education.—The public schools of Salt Lake are an interesting feature of the city. The law requires the attendance of all minors (6 to 18 years) for a fixed number of months annually. Books to pupils are free. The schools are governed by a board of education of 10 members. The board and superintendent are elected by the people biennially. There are 23 school buildings. In 1903, 15,987 pupils were enrolled, 13,000 attended the primary and grammar schools, 900 the high schools. The curriculum covers all branches taught in the best schools of the country, including music, dancing, sewing and manual training. In the high schools military training is insisted upon during the first and second years; and students are fitted for any of the universities of the country. In the graded schools 310 teachers are employed; in the high schools 35. Teachers' wages are from \$40 per month to \$125. The rule is to increase the salaries of the younger teachers from \$20 to \$40 per annum until the maximum wage is reached. In the schools one or more teachers came from practically every State in the Union. One public school building is just being completed at a cost of \$120,000. The annual expense for schools is over \$200,000. The value of the school property is \$1,216,664.80 or about 4 per cent of the total valuation of property in the city. Cost of maintaining schools per annum \$206,437.50, cost of books \$26,120, cost, based on enrolment \$24.90 per capita, cost per capita for books \$1.95.

Religion.—The great majority of the people are Latter Day Saints. They have over 30 places for public worship. But 35 years ago, the Roman Catholics established a mission in Salt Lake, a little later built a church and hospital. They now have charge of the great Holy Cross Hospital, the Saint Ann Orphanage, the Miners' Home, Saint Mary's Academy,—All Hallows College for boys and young men, and their new cathedral, one of the finest and largest

in the west, is drawing near completion. A Protestant Episcopal Church was founded in Salt Lake in 1867, and two years later a hospital. It now conducts the hospital, has a church and a cathedral and carries on Rowland Hall, a modern high-class seminary for girls and young women. The Methodists came in 1869. They have five churches in the city, and a number of lesser structures where only the Scandinavian language is spoken. A Presbyterian Church and school was founded in 1875. Westminster College had been added to its schools, and a new and very fine church is nearing completion. The Congregationalists have a great school and beautiful church. The Unitarians, the Central Christian Church, the Baptists and Christian Scientists each have places of worship. The Jews have a fine synagogue. The Josephites,—those who believe that Joseph Smith was a prophet but not a polygamist, have a representation in the city.

Theatres.—There are two theatres in Salt Lake, one built by the people several years ago, prior to the coming of the railroad. A Home Dramatic Company was formed, instructors were sent for; there was plenty of native talent, the theatre was a success, the Home Dramatic Company still flourishes. One result has been that Salt Lake has more first-class musical talent than any other city of its size in America. The Tabernacle Choir of 500 voices has a national reputation. The organist in the Tabernacle, the leader of the orchestra in the theatre, are both native Utahans. At the great jubilee celebration in 1897 there were 18 native martial bands in the procession.

Climate.—No better climate can be found than in Salt Lake. In winter the thermometer seldom descends lower than 12 degrees above zero; it seldom reaches 100 degrees above in summer,—it has more clear days than any other city and with the lake, the mountains, the springs and the delicious air, it is a natural sanitarium.

History.—The history of Salt Lake has no counterpart. The first band of immigrants were desperately poor. The soil they located on would produce nothing except through irrigation; they were 1,000 miles from any settlement east or west; they came as refugees; they were met by desolation; still at their coming they knelt upon the parched soil and held a praise service. Their first crop was almost a failure, their second was nearly all destroyed by locusts; that they lived through their trials must have been because they had grown superior to distress. But they did live and multiplied. They had disciplined themselves to be content with life's barest necessities; they had few comforts, luxuries they did not even dream of. They had been tossed naked upon the frontier, "a flaming sword that turned every way" was behind them. Since then there has been much clashing, once the government sent an army against them, but the city has grown and has become a great trade centre; it is the spot from which the Church of Jesus Christ of Latter Day Saints in every land receives direction; it is a beautiful city in itself; its surroundings are altogether august.

Population.—(1880) 20,768; (1890) 44,843; (1900) 53,531; (1904) 70,000.

C. C. GOODWIN,
Formerly Editor 'Salt Lake Tribune.'

Salt Lick, a place where salt is found on the surface of the earth, to which wild animals resort to lick it up; sometimes near salt springs.

SALT RANGE—SALTONSTALL

Salt Range, or **Kalabagh**, India, a mountain system in the Punjab, beginning on the south side of the Jhelum, and extending west to the Indus, reaching an elevation of from 3,200 to 5,000 feet. It consists of two chains running from east to west, which join in a high plateau; the general relief is bleak and dreary, while wildly picturesque. The mountains derive their name from the precipitous hills of solid rock-salt which occur on the border of the plateau. The salt stands out in huge cliffs at Mári, and the town of Kálábágh is built in an almost perpendicular hill of solid salt, in successive tiers,—the roof of each tier forming the street for the tier above. About 60,000 tons of salt are quarried annually, four fifths from the Mayo mines, near Pind Dadan Khan. Coal and other minerals also are found.

Salt River, (1) in Kentucky, has its rise in Boyle County, in the central part of the State; from whence it flows north, then west, then north by west to the northern boundary of the State, where it enters the Ohio at Westpoint, about 20 miles southwest of Louisville. It is about 100 miles long; and the chief tributaries are Rolling Fork and Beech rivers. (2) A river in Missouri, which has its source in Schuyler County, in the northeastern part of the State, flows south by southeast to Monroe County, turns east, then northeast and southeast, and enters the Mississippi near the town of Louisiana, in Pike County. It is about 200 miles long.

Salta, sál'tá, or **San Miguel de Salta**, Argentina. (1) capital of a province of the same name, in the elevated and well-watered Valley of Lerina (1,202 metres), about 800 miles northwest of Buenos Ayres. It is a bishop's see, and has a cathedral. Other important features are: the main square or Plaza on which stand the Cabildo, or capitol; the *Colegio Nacional*; a branch of the National Bank; an orphan asylum, hospital and the above-mentioned cathedral. There is a brisk trade, especially transit trade with Bolivia. It is connected by rail with Buenos Ayres and Jujuy. The town is neat but unhealthful. Pop. (1901) 17,500.

(2) The Province of Salta is situated in the northern part of Argentina, and covers an area of 45,000 square miles. Its frontier borders on Bolivian territory. At the west it is mountainous. The highest summits reach an elevation of 6,000 metres, the plateaus 1,300 to 4,000 metres, and some of the passes 3,600 metres. The Sierra Lumbre and the Sierra de Sanita Maria border on the Andes. The mountains contain rich mineral deposits of gold, silver, copper, nickel, iron and lead. The waterways are numerous: The Vermejo and its tributaries, Rio San Francisco and Rio Balle, and Rio Passage (del Juramento), which joins the Paraná as Rio Salado. The climate depends upon the altitude, and different crops are planted accordingly. The products are sugar, corn, wine, and European fruits; barley, potatoes, and fodder-crops. The lower slopes and valley contains the pampas; the high summits and plateaus are treeless. The inhabitants are for the most part a mixed race of Spaniards and Calchaqui Indians. Pop. (1900) 131,938.

Salter, sál'tér, **William Mackintire**, American author: b. Burlington, Iowa, 30 Jan. 1853. He was graduated from Knox College in 1871; studied for the ministry at Harvard and at Yale, and later pursued courses in political and social science at Göttingen, and at Columbia University. Since 1883 he has been a lecturer for the Societies for Ethical Culture in Chicago and in Philadelphia. He is the author of: 'Die Religion der Moral' (Leipsic 1885); 'Ethical Religion' (1889); 'First Steps in Philosophy' (1892); 'Anarchy or Government? An Enquiry in Fundamental Politics' (1895).

Saltillo, sál-tél'yō, Mexico, capital of the State of Coahuila; situated on the Tigre river, 65 miles southwest of Monterey, near the border line between that State and its neighbor on the north, the state of Nuevo Leon, elevation 5249 feet above sea level. It was given the rank of city in 1827 and named Leon-a Vicario, or Saltillo, by which latter name it is universally known. It was noted for many years for the superiority of the serapes made by the Indians of the vicinity,—a distinction, however, which has hardly been maintained in recent years. The battle field of Buena Vista, the scene of the defeat of the forces of Santa Ana, by General Taylor, in 1847, is but five miles distant, and near this are the baths of San Lorenzo. In the immediate vicinity are successfully grown all the fruits of the temperate zone and many which pertain to the tropics. The principal buildings are the Civil Hospital, the Penitentiary and the Acuña Theatre, and the chief manufacturing establishments are cotton mills, flouring mills and soap and cotton seed oil manufactories. The city enjoys a favorable reputation as a health resort. The three principal educational institutions,—the Juan Antonio de la Fuente School, the College of San Juan Nepomenceno, and the Normal School maintain creditable museums and there are four public libraries,—the State Library and those connected with the three Schools above named, which altogether contain over 6,000 volumes. The Bank of Coahuila, with a capital of \$1,600,000, and agencies of the National Bank, the Bank of London and Mexico and the Bank of Nuevo Leon provide the financial resources of the community. Pop. (1906) over 25,000.

Salto, Uruguay, the capital of the department of the same name on the northwest frontier opposite Concordia, Argentina, and at the head of navigation for large vessels on the Uruguay River. It is the shipping port of the surrounding region, a rich stock-raising district, and is 250 miles northwest of Montevideo, the capital of the republic, with which it is connected by rail. Pop. of town 10,000; of department (1900) 40,589.

Saltonstall, sál'ton-stál, **Gurdon**, American colonial governor: b. Haverhill, Mass., 27 March 1666; d. New London, Conn., 20 Sept. 1724. He was graduated at Harvard in 1684, and became minister of the church of New London, Conn., in 1691. He succeeded Governor Winthrop as chief executive of Connecticut in 1708, and continued in office until his death. Through his efforts the first print-

ing press was established in the colony. He was also active in the founding of Yale and in its establishment at New Haven.

Saltpetre. See NITRATE OF SODA.

Saltpetre, Chile. See NITRATE OF SODA.

Salts, a very important class of substances in chemistry. The word salt was first used to designate the solid residue obtained by evaporation of sea water, and as sodium chloride is its chief constituent the term *salt* got to mean popularly that substance alone.

Many other substances besides common salt are known by the general name *salts* because of their similarity to common salt in general physical properties, such as solubility in water, taste, having crystalline form, etc. Some of the most common are saltpetre, smelling salts, etc. See below.

The chemical meaning of the term salt is quite another thing. While the substances mentioned above are indeed salts in the chemical sense, many other substances, as oil of wintergreen, for example, that have none of the physical characteristics of common salt must also be included under this term. To the chemist, a salt is a chemical compound that may be considered as derived from an acid by the replacement of part or the whole of the hydrogen of the acid by a metal or a "radical" playing the part of a metal. For example, the salt sodium nitrate, NaNO_3 , is derived from the acid HNO_3 , by the replacement of the hydrogen by the metallic element sodium, Na; also ammonium chloride NH_4Cl is derived from the hydrochloric acid HCl by similar replacement of hydrogen by the radical NH_4 . The most general chemical conception of the composition of salts is that which formulates them as M_xN_y , where M is the basic or positive portion and N the acid or negative part of the salt. Either M or N may be either elementary atoms or groups of different atoms acting as single atoms (radicals). Examples AgCl , $\text{Ag}(\text{NO}_3)$, NH_4Cl , $(\text{NH}_4)_2(\text{SO}_4)$.

Salts are formed in many ways; one of the most important being by the action of an acid on a base by which water and a salt are formed, the salt differing in properties from both the acid and base used. Thus hydrochloric acid and potassium hydroxide mutually react, the products being potassium chloride and water. $\text{HCl} + \text{KOH} = \text{KCl} + \text{H}_2\text{O}$. Salts are frequently formed by the action of an acid on a metal. Zinc and sulphuric acid forming the salt zinc sulphate and hydrogen $\text{Zn} + \text{H}_2\text{SO}_4 = \text{ZnSO}_4 + \text{H}_2$. A very common method for the formation of salts is by the process called double decomposition, whereby two new salts are formed when solutions of two salts are brought together. When a solution of barium chloride is added to a solution of sodium sulphate a white solid separates which is a new salt barium sulphate, while in the solution is another new salt, sodium chloride. $\text{BaCl}_2 + \text{Na}_2\text{SO}_4 = \text{BaSO}_4 + 2\text{NaCl}$.

Salts are often classified as normal, acid, basic, and double. An acid having more than one hydrogen atom replaceable by basic atoms or groups may form both acid and normal salts according to whether a part or whole of that hydrogen is replaced. Sulphuric acid H_2SO_4

can form acid salt KHSO_4 and the normal salt K_2SO_4 . An acid having three replaceable hydrogen atoms can form three varieties of salts. Phosphoric acid H_3PO_4 , for example, can give two acid salts KH_2PO_4 , K_2HPO_4 , and a normal salt K_3PO_4 . A basic salt is one derived from a base having more than one hydroxyl (OH) group and in which all of the hydroxyl groups have not been replaced by acid groups. Basic bismuth nitrate $\text{Bi}(\text{OH})_3\text{NO}_3$ is derived from bismuth hydroxide $\text{Bi}(\text{OH})_3$ by replacement of only one (OH) by the acid group NO_3 . An acid salt still contains acid hydrogen and will unite with more base to form a normal salt. A basic salt still contains basic hydroxyl (OH) and will unite with more acid to form a normal salt. A normal salt contains neither acid hydrogen nor basic hydroxyl. The term double salt has been applied to two different classes of compounds, the dividing line between which is, however, often very faint. Acids having more than one replaceable hydrogen atom may form normal salts in which two or more different basic atoms or groups are combined with the acid group, as magnesium ammonium phosphate, $\text{Mg}(\text{NH}_4)\text{PO}_4$ or potassium sodium tartrate $\text{KNa}(\text{C}_4\text{H}_4\text{O}_6)$. Another class of double salts is formed by the union of two or more molecules of certain normal salts $\text{K}_2\text{SO}_4:\text{Al}_2(\text{SO}_4)_3$, $\text{PbI}_2:2\text{KI}$, etc.

Method of Naming Salts.—Part of the name is derived from the basic element or group present; thus those containing sodium are called sodium nitrate, nitrate of sodium, or often nitrate of soda, chloride of soda, etc. The other portion is derived from the acid element or group present. Thus salts derived from nitric acid are called nitrates; from hydrochloric acid, chlorides; from sulphurous acid, sulphites; from perchloric acid, perchlorates. It will be noticed that all but the last syllable is the same as the name of the acid and also that this last syllable differs according to the last syllable of the name of the acid. An acid whose name ends in *ic* forms a salt whose name ends in *ate* (see exceptions below). One ending in *ous* forms an *ite* salt. A salt in which the acid part is a single element has the termination *ide*, even though the acid name ends in *ic*. Thus sulphuric acid forms sodium sulphate; sulphurous acid, sodium sulphite; hypophosphorous acid, sodium hypophosphite; hydrochloric acid, sodium chloride. Sometimes a metal forms two salts with the same acid in which the number of acid groups united with one atom of the metal varies. Thus iron (ferrous) unites with nitric acid forming two salts, $\text{Fe}(\text{NO}_3)_2$ and $\text{Fe}(\text{NO}_3)_3$. The first one containing the smaller number of acid groups is called ferrous nitrate while the other is ferric nitrate.

The naming of acid salts has called into use a few other terms. The acid sodium salt of sulphuric acid HNaSO_4 is called acid sodium sulphate or hydrogen-sodium-sulphate. With an acid like phosphoric, H_3PO_4 , having three acid hydrogens we have H_2NaPO_4 , di-hydrogen-sodium-phosphate or primary sodium phosphate, HNa_2PO_4 , hydrogen-di-sodium-phosphate or secondary sodium phosphate. The normal salt Na_3PO_4 is also called tertiary sodium phosphate.

SALTUS — SALUTATION

As has been said the term salt, salts, sal, are often applied to various substances of household or medicinal use. A few of the most common are given below with list of their correct chemical names. Sal soda, sodium carbonate; Epsom salts, magnesium sulphate; Rochelle salts, sodium potassium tartrate; saltpetre, potassium nitrate; sal ammoniac, ammonium chloride; salts of tartar, potassium carbonate; Glauber salts, sodium sulphate.

Saltus, sâl'tûs, **Edgar Everston**, American novelist: b. New York 8 June 1858. He was educated at the Sorbonne in Paris, Heidelberg and Munich, and was graduated from Columbia Law School in 1880. His first book was 'Balzac: a Study' (1884), which he followed by 'The Philosophy of Disenchantment' (1885), and 'The Anatomy of Negation' (1886), two works attempting a popular exposition of the theories of Schopenhauer and von Hartmann. Among his novels are: 'Mr. Inoué's Misadventure' (1887); 'The Truth About Tristrem Varick' (1888); 'Eden' (1888); 'A Transaction in Hearts' (1889); 'The Pace that Kills' (1889); 'Enthralled' (1894); 'When Dreams Come True' (1895); 'The Yellow Fay' (1905).

Saltville, Engagement at. The extensive salt works at this place, in southwestern Virginia, furnished that State, the adjacent States of the South, and the Confederate armies their supply of salt. Not until the third year of the war did the Union forces make any serious efforts to destroy these works. On 2 May 1864 Gen. Crook started from Charlestown, on the Kanawha, to join Gen. Sigel in the Shenandoah Valley, and one column of 2,600 cavalry, under Gen. Averell, was directed upon Saltville to destroy the works, and was afterward to rejoin the main column under Crook. After a very difficult march through the mountains Averell reached Tazewell Court House where he learned that Saltville was well defended by earthworks and artillery, and was held in strength by Gen. W. E. Jones, whereupon he abandoned the idea of an attack, and, after a severe engagement at Wytheville on the 10th, joined Crook at Union on the 15th.

Late in September 1864 Gen. S. G. Burbridge with a mounted force of about 5,000 men, advanced through eastern Kentucky to Prestonsburg and up the Louisa Fork of the Big Sandy on Saltville. He was met 23 miles from Saltville by a small brigade of Confederate cavalry, which delayed him two days, thus enabling Gen. Breckinridge to gather about 3,500 men at Saltville, so that when Burbridge appeared before the place, 2 October, he found the salt-works well defended, with Breckinridge in command. He made an immediate attack and was stubbornly resisted, but after a hard struggle he gained the right and centre of the Confederate works. The Confederate left resisted all his efforts, and at 5 P.M. Burbridge withdrew from the contest, and abandoning his dead and wounded, marched all night toward Prestonsburg, thence continuing his retreat. The Union loss was 54 killed, 190 wounded, and 104 captured. The Confederate loss was much less.

On 12 Dec. 1864 Gen. Stoneman with 5,700 men, started from Bean's Station, Tenn., on a raid into southwestern Virginia. He attacked Saltville and carried it on the 20th, burned the

town, and destroyed the salt-works. (See STONEMAN'S RAID.) Consult: 'Official Records,' Vols. XXXVII., XXXIX., XLV.; Pond, 'The Shenandoah Valley'; Van Horne, 'History of the Army of the Cumberland', Vol. II.; The Century Company's, 'Battles and Leaders of the Civil War,' Vol. IV.

E. A. CARMAN.

Saltzmann, zälts'män, **Karl**, German painter: b. Berlin 23 Sept. 1847. He was a pupil of Goldschmidt and of the marine painter Hermann Eschke. He made a trip round the world in the train of Prince Henry of Prussia and later became professor in the Academy at Berlin. His principal works are: 'Dawn by the Sea' (1874); 'Entrance into Harbor of Colberg'; 'Harbor of Valparaiso' (1882); and 'Saved' (1884).

Salus, sâl'ûs, in Roman mythology, the goddess of health, prosperity and public welfare.

Saluta'tion, any mode of greeting or of kindly or respectful or reverential address, by word or gesture when persons meet, whether equals with equals or inferiors with superiors. The lowest class of salutations, which merely aim at giving agreeable bodily sensations, are compared by Tylor ('Early History of Mankind,' ch. iii.), to the tokens of kindness exchanged among the lower animals: such are patting, stroking, kissing, pressing noses, blowing, sniffing, etc. Among American Indians one mode of greeting consists in rubbing each other's arms, breast or abdomen and their own: to the same class belong the patings and slappings of the Fuegians. The Andaman Islanders salute by blowing into another's hand with a cooing murmur; Charlevoix tells of an Indian tribe on the Mexican Gulf who blew into one another's ears, and a similar usage was found existing in Equatorial Africa by Du Chaillu. The kiss is by no means, what it has been by some authors reputed to be, a universal and instinctive act of salutation: it is unknown over half the world, and there the prevailing usage is that of smelling or sniffing, called "rubbing noses"; Darwin finds this custom existing among the New Zealanders and Linnæus among the inhabitants of the Lapland Alps; but it is the custom of Polynesians, Malays, the populations of Indo-China and the Eskimo. In ancient Greece it was customary to kiss the hand, breast or knee of a superior; in ancient Rome the kiss was a token of civility and was a customary mode of salutation among kinsmen and close friends. In the early Christian Church the kiss was a sign of fellowship, and Saint Paul in four places of his epistles and Saint Peter in one make such mention of the "holy kiss" as proves it to have been customary in the assemblies of the faithful. In the Roman Catholic Church the "kiss of peace" is to this day exchanged among the clergy after the consecration of the elements in the solemn high mass; but it is not practised by the laity in the nave of the church. The kissing of the feet was from very early times a customary mode of doing homage; it still continues in a modified form in the papal court, where the person who comes into the presence of the Pontiff kisses the golden cross upon his sandal. The custom of kissing among men

appears to have persisted in England till the middle of the 17th century; it still exists in the countries of continental Europe. In those countries the servant kisses the hand of master or mistress; and there remains a trace of this custom in the Spanish language, in the formula used at the close of a letter, equivalent to "your obedient servant," *beso a Vmd. las manos*, "I kiss your worship's hands." The embrace is almost universal: it is used by the rude Andaman Islanders, the Blackmen of Australia, the Fuegians, as it was used by the Patriarch Jacob, or by Philoctetes and Eumæus when, on recognizing Ulysses (*Odyssey*, Dryden, xxi.),

Around his neck their longing arms they cast,
His head, his shoulders, and his knees embraced;

or as it is still used among highly cultured people. The attitude of cowering or crouching in presence of a superior is seen represented in all the sculptures of ancient Egypt and Assyria; and in barbarous countries it still persists, as in Dahomey or in Siam; little different is the self-abasement of a Siberian peasant in presence of a noble. Bowing in sign of reverence may range all the way from Jacob's bowing himself to the ground seven times to do honor to Esau, and the gesture little more than a nod practised in modern society. Claspings hands was among the ancient Romans, as among us, customary among acquaintances; it is a custom not very widely diffused, but in late years it has been introduced among rude peoples, such as Australians, Hottentots and Fuegians through their contact with European traders and missionaries. The familiar words of greeting differ but little among modern civilized peoples. Our "Good morning" and "How do you do?" have their equivalents in the other European languages. But in German countries wherever the population is chiefly Catholic a current form of salutation, especially among peasants, is *Gelobt sei Jesus Christus*, and the response, *in Ewigkeit. Amen* (Praised be Jesus Christ for evermore. Amen). In Ireland it is, or used to be, a custom among simple folk for one on entering a house to pronounce the benison "God save all here," and the response would be "God save you kindly, sir (or ma'am)." The biblical "Peace to thee and to thine house" is still in use among the Moslem: *Salam 'alaikum. Wa- 'alaikum as-salam* (Peace be on you. And on you be the peace). The salutation of the ancient Greeks both at meeting and parting was *χαίρε* (be joyful); the Romans used two words, both signifying "be in health" or "be well"; on meeting their word was *Salve*, at parting *Vale*. The English phrase Good-by is the remnant of the ancient pious formula, God be wi'ye, and answers to the French Adieu, Spanish A'Dios, Italian Addio, etc.

Salutes, Military, an essential form of discipline regulated and enforced by military law. All officers salute on meeting and on making or receiving official reports. Military courtesy requires the junior to salute first or when the salute is introductory to a report made at a military ceremony or formation to the representative of a common superior, as for example to the adjutant or officer of the day, the officer making the report, whatever his rank may be, is required to salute first; the officer to whom the report is made will acknowledge by saluting

that he has received and understood it. When under arms the salute is made with the sword or saber if drawn, otherwise with the hand, and a mounted officer always dismounts before addressing a superior who is not mounted. On official occasions officers, when indoors and under arms, do not uncover, but salute with the sword, if drawn, and otherwise with the hand. If not under arms they uncover and stand at attention, but do not salute except when making or receiving a report.

When an enlisted man without arms passes an officer he salutes with the hand farthest from the officer, but if mounted he salutes with the right hand, and officers are to be saluted whether in uniform or not. When armed with the saber and out of ranks an enlisted man salutes with the saber, if drawn, but otherwise with the hand. If on foot and armed with a rifle or carbine he salutes with his weapon. A mounted soldier dismounts before addressing an officer not mounted. An enlisted man, if seated, rises on the approach of an officer, faces him and salutes; if standing he faces the officer for the same purpose. If both remain in the same place or on the same ground such compliments need not be repeated, and soldiers, if at work, do not cease work to salute an officer unless addressed by him. Before addressing an officer an enlisted man salutes as prescribed, and he also makes the same salute after receiving a reply. Indoors and unarmed an enlisted man uncovers and stands at attention on the approach of an officer. He does not salute unless he addresses or is addressed by the officer. If armed he salutes as though outdoors.

When an officer enters a room where there are soldiers the word "attention" is given by someone who perceives him, when all rise and remain standing in the position of soldier till the officer leaves the room; but soldiers at meals do not rise. Officers are required to at all times acknowledge the courtesies of enlisted men by returning salutes given, and when several officers in company are saluted, all who are entitled to the salute return it.

Salutes with Cannon. The salute to the Union—one gun for each State—is fired at noon of the Fourth of July at every military post and on board commissioned naval vessels belonging to the United States. The National Salute of 21 guns is the salute for the National flag, the President of the United States, presidents of foreign republics or sovereigns of foreign states visiting the United States. The Vice-President of the United States, and American and foreign ambassadors are saluted with 19 guns; the president of the Senate, speaker of the House of Representatives, members of the cabinet, the chief justice, a congressional committee, governors within their respective States or Territories, viceroy or governor-general of provinces belonging to foreign States, general of the army, admiral of the navy, and same ranks in foreign armies and navies, 17 guns; American or foreign envoys, or ministers plenipotentiary, assistant secretaries of the navy or war, lieutenant-general, or a major-general commanding the army, and corresponding ranks in the navy and foreign armies and navies, 15 guns; ministers-resident accredited to the United States, major-general, rear-admiral, and corresponding ranks of foreign armies and navies,

SALVADOR

13 guns, and *chargés d'affaires*, brigadier-general, commodore, and corresponding ranks in foreign armies and navies, 11 guns. Consuls-general accredited to the United States receive a salute of 9 guns.

Salutes are only fired between sunrise and sunset, and not on Sundays, except in international courtesies. The national colors are always displayed at the time of saluting. The salute to the flag is the only salute which is returned, and this must be done within 24 hours. United States vessels do not return the salute to the flag in United States waters if there is any fort or battery there to do it. Nor do United States vessels salute United States forts or posts.

If there are several batteries or forts within sight or 6 miles of each other, one of them is designated as the saluting fort, and returns all salutes of foreign men-of-war. In New York, Castle William, on Governor's Island, is the saluting fort.

Salvador, *säl-vä-dör'*, the smallest and most densely populated of the Central American republics, bounded on the north and northeast by Honduras, on the southeast by the Gulf of Fonseca, on the south by the Pacific Ocean, and on the west by Guatemala. Its area is usually given as 7,225 to 7,255 square miles; but an official publication, dated 1902, containing results of the census taken by the government on 1 March 1901, represents that the total area (the sum of the areas of the 14 departments) is 34,126 square kilometres, with an average population of 29.5 persons to the square kilometre. (See below: *Population*.)

Political Divisions.—The departments are: Santa Ana, Ahuachapán, Sonsonate, La Libertad, San Salvador, Chalatenango, Cuscatlán, La Paz, San Vicente, Cabañas, Usulután, San Miguel, Morazán, and La Unión. The largest cities are: the capital, San Salvador, population 59,544; Santa Ana, 48,120; San Miguel, 24,768; Nueva San Salvador, 18,768; San Vicente, 17,892; Sonsonate, 17,016; Zacatecoluca, 15,130; Ahuachapán, 14,136; and Sansuntepeque, 12,456. The capital is situated in the valley of Las Hamacas, on the Acelhuate River, 2,115 feet above sea-level. Frequent disasters have taught the inhabitants the art of building earthquake-proof structures. The streets are well lighted, and nearly all are paved. In addition to the offices of the government departments and of the courts, the city has an academy of science and belles-lettres, national library, astronomical observatory, museum, botanical garden, chamber of commerce, several parks and public squares, a good water-supply, four banks of issue, etc.

Physical Geography.—On the northern frontier rises the great mountain chain, the Sierra Madre or Cordillera, with peaks 7,000 to 8,000 feet high, in which primitive rocks predominate. About 15 miles from the coast, and running parallel with it, is a range composed of plutonic material. Both systems include transverse ridges; the latter, the Coast Range, is intersected by the valleys of the Lempa and Grande rivers, and in or near it are situated the volcanoes San Vicente (7,683 feet), San Salvador, Santa Ana, San Miguel, Usulután, Apaneca, Izalco, Sociedad, and Chinameca (4,200 feet), most of which are extinct. Earthquakes are of

frequent occurrence: the capital has been wrecked by them 11 times since 1539, and is, in fact, "so subject to rockings and tremblings of the earth as to have acquired the name of the swinging hammock." The best natural harbor is that of La Unión, but it is not yet connected with the inland towns by rail. Acajutla and La Libertad are open roadsteads.

Mineral Resources, Soil and Climate.—In a recent report devoted to mining operations, the consul-general of the United States writes from San Salvador: "For this republic a report can only be made on the production of gold and silver. While a number of promising copper fields are known, almost nothing has been done as yet in their development. . . .

Owing to a general reticence on the part of local mine owners, it is impossible to state what each mine is producing. . . . The exportation of precious metals during 1900 was only \$77,945, while in 1901 the amount produced and exported reached the total of \$192,735.23. Of this very little is silver, as the ores of the mines now being worked carry only a small percentage of this metal." The soils on the slopes of mountains, table-lands, and in the valleys, formed by the detritus of the rocks and decomposed vegetable matter, are remarkably fertile. The year is divided into two seasons—the rainy months being those from May to October, the dry from November to April. Low coast lands are hot and unhealthy; a comparatively cool and agreeable climate is found in the highlands of the interior.

Agriculture and Commerce.—Nearly all parts of the republic are well adapted to agriculture, which is, therefore, the principal occupation of the inhabitants. Products are: coffee, indigo, rubber, cacao, balsam, tobacco, and a variety of grains, seeds, and fruits. In regard to coffee, the following statistics were prepared by the government: Area planted in coffee trees, 50,000 hectares (hectare = 2.471 acres); virgin lands suitable for growing this crop, about 20,000 hectares; average bearing life of a coffee tree in Salvador, 30 years, and average production 350 grams. The shipments of coffee from the republic to foreign countries in 1900 were: To Australia, 1,343,251 pounds; Belgium, 210,834 pounds; Chile, 1,830 pounds; Colombia, 2,290 pounds; England, 5,329,398 pounds; France, 23,815,148 pounds; Germany, 7,420,280 pounds; Italy, 4,462,905 pounds; Spain, 38,344 pounds; United States, 7,477,476 pounds; total 50,101,756 pounds. The value of the coffee exported in that year was given as 7,568,339 silver dollars; other exported articles, with their values in silver dollars, being: Indigo, 638,700; balsam, 295,439; tobacco, 111,127; sugar, 96,981. In 1901 exports were valued at 10,956,045 silver dollars, and imports (subject to duty) 6,537,876 silver dollars. See also EXPORTS AND IMPORTS OF LATIN-AMERICA.

Shipping, Railways, etc.—In 1901 vessels to the number of 515, carrying 204,157 packages of merchandise and 2,626 passengers, entered the ports of Acajutla, La Libertad, and La Unión. From the same ports cleared 514 vessels, carrying 424,304 packages of merchandise and 2,567 passengers. In order to stimulate maritime commerce, subventions were given (1902) to the Pacific Mail S.S. Co., the Pacific Steam Navigation Co., and the South American S.S. Co.

(Compare message of the President, 12 Feb. 1903.) There were in operation in the republic 132 telegraph and 62 public telephone offices. The post-offices handled 1,623,561 pieces of domestic mail matter, and the international service consisted of 494,900 pieces, in 1901.

Weights, Measures, and Money.—Fanega (dry) = 1.5745 bushels; *centaro* (liquid) = 4.2631 gallons; *libra* = 1.043 pounds; *cara* = 33.874 inches. The decimal system, though made obligatory by law, 1 Jan. 1886, has not been universally adopted. The monetary unit is the silver *peso*. On 1 Jan. 1904 it was stated that the "dollar" (silver *peso*) of Salvador was worth \$0.424 in U. S. currency. A bill on monetary reform, passed 30 Sept. 1892, provided: "Gold shall be the standard," but the government has been only partially successful in its endeavors to carry out this radical change.

Government.—By the constitution, "legislative power is vested in a body called the National Assembly of Deputies," which meets in February, each year. Deputies, three from each department, are elected by the people. "Executive power is vested in a citizen who shall have the title of President of the Republic"; his term is four years; he cannot be re-elected until after the expiration of a second period of equal duration. The vice-president is also chosen for four years. Secretaries of state or ministers are appointed by the president, the portfolios being: Foreign Affairs, Justice, and Religion; Treasury, Public Credit, War, and Marine; Interior and Government; Public Works, Instruction, and Charities. "Judicial power is vested in a Supreme Court of Justice, in Chambers of third and second instance," etc. Each of the 14 departments has its governor, whom the Executive appoints. Municipalities are governed by officers chosen by the people.

Finances.—The president's message of 12 Feb. 1903 shows the financial situation of the country in 1899-1902, inclusive,—amounts being stated in silver dollars:

| REVENUE FROM CUSTOMS, LIQUOR TAXES, ETC. | | | |
|--|----------------|----------------|----------------|
| 1899 | 1900 | 1901 | 1902 |
| \$5,276,383.29 | \$6,654,143.69 | \$7,690,679.73 | \$8,589,747.11 |
| EXPENDITURES — LEGISLATIVE, EXECUTIVE, JUDICIAL, PUBLIC CREDIT, ETC. | | | |
| 1899 | 1900 | 1901 | 1902 |
| \$5,176,212.10 | \$6,794,873.60 | \$7,640,891.17 | \$8,570,847.58 |
| FOREIGN DEBT. | | | |
| 1899 | | | 1902 |
| \$9,062,500.00 | | | \$9,062,500.00 |
| INTERNAL DEBT. | | | |
| 1899 | | | 1902 |
| \$12,002,718.41 | | | \$9,676,628.52 |

Duties are levied on both imports and exports. In 1901, for the coffee exported the duties paid amounted to \$529,917.64 silver.

Army and Navy.—The constitution, Articles 134 and 135, provides: "In case of war, all able-bodied Salvadorians from 18 to 50 years of age are soldiers. The strength of the standing army in time of peace shall be fixed every year by the legislature, and shall be limited to what is strictly necessary to protect the ports," etc. In practice, about 4,000 regulars are maintained, and the militia numbers about 25,000. The navy has one vessel, which is employed to enforce revenue laws.

Population, Education and Religion.—The census of 1 March 1901 showed, as the total number of inhabitants, 1,006,848, of whom 772,200 were mestizos, ladinos, and whites, and 234,648 Indians of pure blood. Under the constitution (Art. 33), "teaching is free. Primary instruction is compulsory. The instruction given in the establishments supported by the state shall be laical and gratuitous." About 31,000 students and pupils are enrolled at the institutions of learning of various grades: the university, the normal and high schools, and the 585 primary schools. Article 12 of the constitution provides: "The free exercise of all religions . . . is guaranteed. No religious act shall serve to establish the civil status of a person."

History.—In the summer of 1524 Pedro de Alvarado invaded the territory now called Salvador, coming from Mexico by way of Guatemala. The Indian capital, Cuscatlan, was captured the following year. On 4 April 1528 the city of San Salvador was founded, but it became necessary to abandon the site originally chosen in favor of the present one, and the transfer was made in 1539. As a subordinate part of the viceroyalty of Guatemala, Salvador continued to be a Spanish possession until 1821 (see EMANCIPATION IN LATIN-AMERICA for declaration of independence, etc.) Between 15 Sept. 1821, when Guatemala severed her connection with Spain, and 1824, when the Central American confederation was formed (see CENTRAL AMERICA), Salvador was compelled to assent to the annexation of her territory by Mexico. After the federation had dissolved (1839), Morazán tried to reunite the five small states of which it had been composed: in September 1842 he was made prisoner and shot at San José, Costa Rica. In 1885 the president of Guatemala, Gen. Justo Rufino Barrios, made an effort to restore the old relations between the states in the northwestern part of Central America. He also failed. On 13 Aug. 1886 Salvador promulgated the constitution which is now in force. The most important single fact in the history of the little republic, as in that of Guatemala (q.v.), is the survival of the Indian element in undiminished force. Educated Salvadorians of the present day, when writing of the sufferings of the natives during the period of Spanish supremacy, unconsciously refer to the wrongs *sustained*, not *inflicted*, by their own ancestors. (It is desirable to add, in view of the diversity of usage, that the forms "Salvadorian" and "Ecuadorian" seem to be preferable to "Salvadoran" and "Ecuadoran".)

Consult the Handbook of Salvador, issued by the Bureau of American Republics; also Bulletins of that Bureau for 1902-1904; Bancroft, 'History of Central America'; Reyes, 'Notiones de Historia del Salvador'; Squier, 'The States of Central America.'

MARRION WILCOX,
Authority on Latin-America.

Salvage, the act of saving a ship or goods from extraordinary danger, as from fire, the sea, an enemy, pirates, or the like. In commercial and maritime law: (1) A payment or compensation to which those persons are entitled who have by their voluntary efforts saved ships or goods from extraordinary danger, as from fire, the sea, an enemy, pirates, or the like.

SALVATIERRA — SALVATION ARMY

The amount of salvage to be paid is generally agreed on between the salvors and the owners of the property salvaged; but if they cannot agree, the sum to be paid, and the proportions in which it shall be paid, are determined by the Admiralty Court. The crew of a ship are not entitled to any salvage for any extraordinary efforts they may make in saving their own vessel. (2) The property saved from extraordinary danger by the voluntary efforts of the salvors. See ADMIRALTY LAW.

Salvatierra, sāl-vā-tē-ēr'rā, Mexico, city in the State of Guanajuato, on the Rio Lerma, and the Celayo-Acambaro R.R.'s, 50 miles southwest of Queretaro. The chief industry is cotton-spinning. Pop. 14,322.

Salvation, the deliverance wrought out by Christ for mankind, according to the general belief of Christians. The word is also applied to the conversion of unbelievers to the Christian faith and doctrines, and to the change of heart which takes place when a person, previously irreligious, is sincerely impressed with the determination to adopt Christian rules of life. Such a person is said to have "found salvation." Another and common meaning of salvation is the entrance into heavenly bliss, "when this mortal form shall put on immortality."

Salvation Army, The. The story of the Salvation Army is the story of an aggressive religious organization that has won its way around the world entirely on its own merits, and has built itself up from what had hitherto been regarded as most unpromising material. The Army is organized on military principles, with a view to reaching the non-churchgoing masses of the world. It was first started in July 1865, in the East End of London as the Christian Mission. Thirteen years later, at Christmas 1878, it received the name of The Salvation Army. Since then its growth throughout the world has been phenomenal. General William Booth, who is its well-known father and founder, was born in Nottingham, England, on 10 April 1829. In 1852 he entered the ministry of the Methodist Church and became a powerful evangelist, attracting immense crowds and witnessing thousands of conversions. Finding, however, that the churchless masses could not be reached by ordinary methods, he resigned his pastorate and established the Christian Mission which afterward developed into The Army. In this he was ably assisted by his wife, Catherine Booth, who was familiarly known as the Mother of the Salvation Army. She was born in 1829 and died on 4 Oct. 1890. She was regarded by many as the most eloquent and powerful woman speaker of the century, and did more than any other to open up the way for women to preach the Gospel. The absolute equality of women as leaders, officeholders and preachers became one of the cardinal planks in The Army platform. As a temperance movement the value of the work of The Army cannot be over-estimated. It has been said that The Salvation Army has been the means of converting hundreds of thousands of confirmed drunkards. As total abstinence is a condition of membership, this can be readily understood.

The international headquarters of The Army are at 101 Queen Victoria Street, London. Its world-wide operations are carried on in 49 coun-

tries and colonies, embracing 7,585 posts, under the charge of 16,020 officers and employees, with 45,000 local officers, 16,000 brass bandmen and about 50,000 musicians. Fifty-eight periodicals are published in 24 languages, with a weekly circulation of about 1,050,000. There are 668 social relief institutions in the world, under the charge of nearly 3,000 officers and employees. About 7,000 fallen women annually pass through the 113 rescue homes, and from 80 to 90 per cent of these are permanently restored to lives of virtue. About 1,500 ex-convicts pass annually through the prison gate homes. There are 132 slum settlements in the poorest districts of great cities, the worst dives, saloons and tenements being regularly visited. The number of annual conversions in connection with the spiritual work have averaged from 200,000 to 250,000 during the past ten years, making a total of over 2,000,000, of whom not less than 200,000 were converted from lives of drunkenness.

The headquarters of The Salvation Army in America are at 120 West Fourteenth Street, New York. Commander Booth Tucker is in charge of the work. The first party of officers, under Commissioner George Raitlon, landed in New York in February 1881. The work has made rapid progress, especially during the last few years, for which the figures stand as follows:

| Institutions, etc. | 1896 | 1903 | Increase |
|--|----------|-----------|-----------|
| Officers and employees.... | 2,000 | 3,171 | 1,171 |
| Corps and institutions.... | 620 | 900 | 280 |
| Institution for the poor.... | 30 | 209 | 179 |
| Accommodation in same.... | 600 | 9,560 | 8,960 |
| Expended annually in poor relief..... | \$20,000 | \$800,000 | \$780,000 |
| Persons provided with Thanksgiving and Christmas free dinners..... | | 300,000 | 300,000 |

The American social relief institutions for the poor are greater in number than in any other country, and now include 81 workingmen's hotels, 6 hotels for women, 15 food depots, 32 industrial homes for the unemployed, 22 second-hand stores, 5 labor bureaus, 3 farm colonies, with nearly 3,000 acres of land and about 400 men, women and children as colonists, 21 rescue homes for fallen women, taking care of 2,000 girls annually. More than 650 children are daily cared for in our various institutions. Work is annually found for about 50,000 of the unemployed with outside employers. Nine hundred and eighty-nine officers and employees are entirely devoted to caring for the poor. During the coal famine (1903) more than 200,000 buckets of coal were distributed at cheap rates among the poor in New York, while in Chicago, Boston and other cities similar distributions took place. In summer, penny ice, summer camps and summer outings have been arranged in most of the large cities. At Christmas and Thanksgiving 300,000 free dinners are given to the poor. The real estate held by the Army in the United States now amounts to about \$1,500,000, its personal property to over \$400,000 and its annual trade turn-over to more than \$200,000. The Salvation Army is incorporated in the State of New York. For the development of its trade a special corporation has been formed

named the Reliance Trading Company; while the Salvation Army Industrial Homes Company has been incorporated for the extension of its rapidly advancing industrial homes for the unemployed. Training colleges for cadets have been established for the training of officers in New York and Chicago, with a small branch in San Francisco.

The principal literature of the Salvation Army includes the following books: 'Darkest England,' 'Religion for Everyday,' and 'Training of Children,' by General William Booth; 'Servants of All,' and 'Bible Battle Axes,' by Bramwell Booth, and the 'Life of Catherine Booth,' the 'Life of Consul Emma Booth Tucker,' by F. Booth Tucker. Its weekly papers are the 'War Cry,' with a circulation of 75,000, the 'Stridsvoget' (Swedish War Cry) 7,500, the 'Kriegsruf' (German War Cry) 1,500 fortnightly, and the 'Young Soldier,' 26,000, issued for children.

COMMANDER BOOTH TUCKER,
Salvation Army.

Salvator, one of the names of the monitor lizard; and also applied to a South American lizard, the teju (q.v.).

Salve Regina, sāl'vē re-jī'na, the first words of a prayer addressed to the Mother of Christ, in Roman Catholic religious services. The words are also applied to the music used in connection with the prayer.

Salvia, a large genus of the *Labiata*, occurring in temperate or warm regions, several living in the southwestern United States. They range in size from herbs to shrubs, in foliage from entire to pinnatifid leaves, and in inflorescence, from axillary to paniced. The flowers are sometimes two inches long, and of nearly every hue except yellow; and the floral leaves are often changed into colored bracts, adding to their brilliance. The genus is remarkable for the arrangements made for cross-fertilization. The blossoms have a two-lipped corolla, two rudiments of stamens and two polliniferous stamens. The latter stand at the entrance to the throat of the flower, have short immovable filaments, and a very long connective between the two anther cells of which the lower is abortive. This connective is crescent-shaped, the horns pointing outward, and rocks upon the filament in such a manner that a bee entering the blossom pushes back the lower arm, and brings down the other on its back, so that the pollen-filled anther cell deposits part of its contents there.

Salvia officinalis, the common sage (q.v.) and many others are cultivated either for savory herbs or for their flowers; or, as in the Clarys (*S. selarea*), for colored bracts; or, as in *S. argentea*, for its woolly white foliage.

Salvini, sāl-vē'nē, **Tommaso**, Italian tragedian; b. Milan 1 Jan. 1829. He began his studies at Florence but showing a talent for acting, his father, who was an actor, put him under the instruction of Gustavo Modena and at 16 he entered upon his stage career. In 1849 he left the stage to take part in the war of Italian independence, was made a corporal and served throughout the siege of Rome. He returned to the stage the following year and acted in the company with Adelaide Ristori. He soon began the study of those parts that he later played with such success, Orosmane in 'Zaire,'

'Oreste,' the 'Saul' of Alfieri, and Shakespeare's 'Hamlet' and 'Othello.' His success in Italy was such as to warrant him in looking abroad for honors and he next appeared at Paris where the critics were equally enthusiastic in his praise. In 1865 he took part at Florence in the celebration of the 600th anniversary of the birth of Dante, reciting passages from the 'Divine Comedy.' He played in various cities of Spain and in 1871 went to South America to play at Montevideo, Buenos Ayres and Rio de Janeiro. In 1873 he appeared for the first time in the United States, enacting Othello at the Academy of Music, New York, 16 September. In 1875 he appeared in London. He afterward played in many parts of Europe and again in America in 1880, his supporting company being American actors, speaking English while he spoke Italian. He has made five visits in all to the United States; in one of these (1886) playing Othello to Edwin Booth's Iago, and the Ghost to the other's Hamlet. He retired from the stage in 1891. Besides parts already mentioned he has appeared with distinction in the Egisto of Alfieri's 'Merope'; Paolo in 'Francesca da Rimini'; Oedipus in a play of that name written for him by Nicolini; Conrad in 'La Morte Civile'; in 'Samson, The Gladiator,' 'Macbeth,' 'King Lear,' 'Coriolanus,' and finally in 1891 at Florence as Iago. Consult Winter, 'Shadows of the Stage' (1892); 'Leaves from the Autobiography of Tommaso Salvini' (1893).

Salvinia, a genus of an aquatic family (*Salvinaceæ*) of cryptogams. They are floating plants, widely distributed in warm regions and not far removed from the ferns. *S. natans*, common in southern Europe, has a sparingly branched stem lying on the water, and develops three leaves at each node; two of these float as oval, green and papillose foliage, hairy underneath, while the submerged third is divided into numerous hairy filaments, hanging like tassels in the water, and metamorphosed into absorptive organs, that appear to be true roots, but are not. The spherical sporocarps, or sori, are borne near the junction of these filaments with the stem, and are generally in groups of three, each enclosed in a cup-like growth from the filament, like the indusium of a fern, and enclosing unisexual sporangia. The sporangia are composed of either microspores or macrospores. The microspores form antheridia, and liberate spermatozoids which fertilize the archegonia developed by the macrospores. Several species of the *Salvinaceæ* are useful in aquaria.

Salwin, sāl'wēn, **Salween**, or **Saluēn**, Burma, the most important river of the country. It has its source in the Tanla Mountains, south of the Kuen Lun, drawing also from the Kara Nor, some of its water. At its source, it is known as Nagtschu, and consists of the united volume of water coming from the glaciers of the mountain streams rising on the Tibetan plateaus. Its name among the Chinese is Lu-Tse-Kiang. The Burmese call it Thanlwin. About 160 kilometres from its mouth appear many dangerous rapids, a great menace to navigation. The current is variable. It is a wild and picturesque stream, whose aspect varies greatly in the dry and wet seasons. After the

rains the water washes high up the slopes against the trees of the forests; the average difference between high and low water amounting to from 50 to 90 feet. In the lower part of its course, islands also obstruct navigation (not visible at high-water). The worst part is the gorge between the Yōnzalin and Kyankhnyat rivers. Many ferries are used to cross the river, and at these points villages are built on the heights above. There are a few bridges in Chinese territory. The Salwin's chief tributaries are the Nam Yu, Nam Oi, Hsipa Haw, Nam Nim, Nam Ting, Nam Kyek, Nam Nang, Nam Kao, Nam Hka, and Nam Pang—its largest tributary,—the Nam Hsim, Mē Sili, and Mē Sala; the Nam Hang, Nam Pan, Nam Teng, Nam Pawn, the Thaung-yin and the Yōnzalin. The Salwin cuts the British Shan states almost in two. Kyodam, the great timber depot, lies 30 miles below the junction of the Thaung-yin and the Salwin. A cable stretched across the river at this point catches all the timber (teak), which is made into rafts and floated down to Kado, near Maulmein (where the revenue is collected). From Kyodan southward, and as far as Shwegōn, 63 miles from Maulmein, boats and steamers of light draft can safely navigate. The area of the Salwin basin is 62,700 square miles. Its length 800 miles, breadth from one to four miles.

Salzburg, zālts'boorg, Austria, (1) capital of the duchy or province of that name, occupies a position of singular beauty on the Salzbach, 87 miles southeast of Munich. It lies in a valley from which tower the wooded slopes of the Salzburg Alps. The steep sides of the Mönchsberg rise from the midst of the town, rocky and rugged. In the ancient cemetery of Saint Peter, the vaults are hewn in rocky clefts. Many of the private and public buildings are handsome marble structures, and are suggestive of the Italian. Shady promenades skirt the winding river. The cathedral is a fine specimen of Renaissance, built in 1614-28 in imitation of Saint Peter's. A monument to Mozart, who was born here, stands in Mozart-Platz. The present palace of the archbishops is an imposing edifice, opposite to which are the government offices and law courts. Across the river is the Mirabell palace, once the summer residence of the prince-archbishops. There are 24 churches, a theological seminary and schools, hospitals, fine libraries, a museum, riding schools, etc. Salzburg is a very popular summer resort, which contributes much to its development and progress. A park, theatre, art gallery and baths are among the most recent improvements. There are numerous benevolent and charitable institutions. Salzburg engages in a variety of small manufactures, such as musical instruments, marble ornaments, iron-ware, cement, artificial wool, etc. Its trade is improving. Its origin and development were equally ecclesiastical, its archbishops German princes. The monastery and bishopric founded here (500-700) by Saint Rupert of Worms, was the nucleus of the present town. It has been the scene of several religious conflicts, and is distinctively Catholic. Pop. (1900) 32,924. (2) The duchy covers an area of 2,762 square miles. It is characteristically mountainous with longitudinal valleys intersecting the hills. Of the 200 lakes, Lake Zell is celebrated for its wondrous mountain

panorama. It has many mineral and thermal springs, and valuable mines and forests. Pop. (1900) 193,247.

Salzbrunn, zālts'broon, Germany, a group of three villages in Prussian Silesia, 30 miles southwest of Breslau. It is famous as a watering place and has eight mineral springs. The water is alkalo-saline. Many thousand bottles are exported annually and several thousand persons visit the springs in the season. The water is especially adapted to pulmonary complaints. There are various industrial works, including glass and porcelain factories, wool looms, coal mines, and brick-yards. Pop. 6,459.

Sámal, sǎ'māl, an island of the Philippines in the northern part of Davao Bay forming the east shore of Pasiputan Strait, length 17 miles, width 13 miles, area 140 square miles. Its general elevation is 820 feet, some parts of the shores are low and wooded, and other portions are high and rocky. The soil is fertile, and chocolate is the chief product; excellent timber is also obtained. The island is well populated, having seven small towns on its western coast.

Samales, sǎ-mǎ'lēz, (1) a small tribe of the Philippine Islands, living on the island of Samal in the Gulf of Davao, on the east coast of the island of Mindanao. They are of the Malay race. (2) The name sometimes given to the Moros inhabiting the islands between Basilan and Sulu, Philippines; they are also called Sámals-Laút.

Samana (sǎ-mǎ-nǎ') Bay, an indentation of the eastern coast of Santo Domingo, Haiti, 30 miles long and 10 miles wide. It affords an excellent harbor, being well sheltered and deep, capable of accommodating the largest vessels. The ports of Sanchez and Santa Barbara de Samana are on the north coast. The bay has an important position near the route from the United States to the Isthmus of Panama; in 1870 a treaty was negotiated providing for its purchase by the United States, which the United States Senate refused to ratify.

Samar, sǎ'mār, an island of the Philippines, the third in size of the archipelago. It lies southeast of Luzon, in the extreme north-eastern part of the Visayan group, and east of Leyte from which it is separated by the narrow strait of San Juanico; length northwest and southeast 156 miles; width 75 miles; area 5,198 square miles, with dependent islands 5,488 square miles.

Topography.—A central mountain chain traverses the island from northwest to southeast, being divided near the centre by the valley of the Ulut River; there is also a group of mountains in the extreme northwest. Their height rarely exceeds 1,700 to 1,800 feet. The island has a number of rivers, of which the largest and most important are the Oras and Ulut on the east, the Bató on the north and the Gándara on the west, and there are four lakes. Among the natural curiosities is an arch over the Basey River formed by two limestone rocks from 34 to 40 feet high. In the rocks on the left a cave opens 37 feet above the water, which is 94 feet deep; it has been partially destroyed by the caving of the rocks overhead. The place is known as the *Cuevas de Sojotón*.

Industrial Resources.—The soil is fertile and adapted to the production of all the staples of

the Philippines; the most important products are hemp, sugar, rice and cocoanuts; the hemp product for export was over 21,000,000 pounds in 1899. Coffee, chocolate, tobacco, and wheat are also cultivated in abundance. A number of medicinal plants grow on the island, the most famous being the one producing the seed called "isigud," or the "fruit of San Ignacio," also known as "Catbalogan seed," because large quantities of it are grown near the town of Catbalogan. This is highly prized by the Chinese as an efficacious remedy for cholera. Valuable timber is found; bamboo and rattan are abundant; and wax and honey are obtained in large quantities. Coal, gold, and copper are found in the mountains, but have not been mined. The raising of horses, cattle, hogs, and goats is an important industry. Sugar and coconut-oil are manufactured, and there are other manufactures for domestic use. Though there are few roads in the island, there is good communication with the interior by means of the rivers which are navigable for native boats. There is also an extensive coastwise trade, and trade with Manila.

People and Government.—The people of Samar are of Visayan blood, representing most fully the characteristics of the Malay race. They are, as a rule, industrious. Some native refugees, about 10,000, live in the mountains, practically independent and savage in their manner and customs. During the last insurrection there was an insurgent stronghold at Sojoton which was captured by United States troops in November 1901. The island of Samar with its adjacent islands was constituted a province and placed under civil government in 1902, in accordance with the provincial government act of the Philippine Commission. Pop. (estimated 1901) 195,386.

Samara, sä-mä'rä, Russia, (1) capital of a province of the same name, at the junction of the Samara River with the Volga, 550 miles southeast of Moscow. It is the seat of a governor and of a bishop, and one of the main ports of the Volga. Its principal buildings are its churches—mostly Russian—convents, schools and seminaries; theatre, banks, industrial establishments, philanthropical institutions, public libraries, and museums. Its manufactures include machinery, leather, soap, etc. There is an enormous trade in corn, hides and meat, fish and caviare and salt, and a large transit trade between Samara, Khiva, Bokhara and Tashkend. Three markets are held annually. The Koumiss health resorts are celebrated. Pop. (1897) 91,672. (2) The Province of Samara, in the southeast, has an area of 58,302 square miles. At the north it consists of flat low tablelands, interspersed by deep river valleys. The chief streams are the Volga, Tcheremshan, Sok and Samara. The Zhiguleff mountains rise opposite the town of Samara, from the banks of the Volga. The remainder of the province is covered by low, flat steppes, excepting two spurs of the Obshchiy at the southeast. Agriculture and gardening are the chief occupations of the inhabitants, also stock-raising and bee culture. There is considerable domestic and foreign commerce. The principal fairs are held at Novouzensk and Bugulma. More than an average number of schools are provided. The Serghievsk

mineral springs are much frequented. There is a large German colony. The chief towns are Samara, Bugulwa, Buguruslan, Buzuluk, Nicolayevsk, Novo-Uzen, and Stavropol. In 1889 Samara suffered from famine and a great plague and the Russian Red Cross Society cared for 100,000 people. Pop. (1897) 2,763,478.

Samarang, Java, a seaport town on the north coast, 255 miles east of Batavia, the principal port for the trade of Middle Java, since 1873 connected at Surakarta with the Java railway. The European quarters have all the appearance of a typical Dutch town. The more important buildings are a military hospital, the city hall (1854-64), Christian churches and schools. A fort and a coast battery provide defense for the town. The river is silted up at its mouth, but a canal, constructed in 1879, serves as a harbor. The roadstead is exposed during the west monsoon. Pop. (1900) 89,286, including 12,372 Chinese and 4,800 Europeans.

Samaria, sa-mä'ri-ä, Palestine, (1) the ancient capital of Samaria, 36 miles northwest of Jerusalem, occupied the acclivity of an isolated and abrupt height—Mount Sameron, which is separated from the surrounding mountains by a rich and well-watered plain. The town rose in terraces from this plain to a height of 400 or 500 feet. Samaria was the capital of Northern Israel from the date of its foundation by Omri, about 925 B.C., to the time of its capitulation to the Assyrians 721 B.C. The site was selected by Omri for a stronghold and capital, as commanding two of the most important high-roads. The situation surpasses greatly that of Jerusalem, though not so picturesque. It commands, however, a charming view toward the Mediterranean, the mountains of Shechem and Mount Hermon. The most important ruins are those of the time of Herod. It was in Samaria that the 10 tribes of Israel founded their independent state after the revolt, perpetuating their mutual animosity by incessant warfare. Thus the name Samaritan became a term of bitter reproach. This antipathy was religious as well as political, but was later mitigated by the return of the Samaritans to the ancient form of worship, and by the erection of a temple, modeled after that of Solomon in Jerusalem, soon after Alexander the Great had passed through Syria. Samaria having been presented by Augustus to Herod, he rebuilt the city which had been the residence of all the kings of Israel till its overthrow by the Assyrians,—calling the new temple Sebaste, in honor of the donor. An old church or mosque, once dedicated to John the Baptist, in the adjacent village of Sebastieh, marks the scene of that saint's burial or martyrdom. (2) Samaria, the name also given to the kingdom of Israel and the subsequent Roman province forming the central portion of Palestine stretching southward from the Plain of Esdraelon, declining south of Hebron, into the desert plateau of Et Tih.

Samaritan Language and Literature, the tongue and literary productions belonging to the inhabitants of Samaria, a region in Central Palestine of indefinite boundaries, possessing a capital of the same name.

Samaritan Language.—The Samaritan language was formed of varied elements gradually collected and assimilated from the Hebrew,

Chaldee, and Syriac. Greek, Latin, Persian and Arabic also contributed words to this dialect which grew up among a people isolated and even secluded in some respects, but through whose territory passed the immemorial trade route which connected Egypt and Africa with Assyria and the far East. Thus roots and heterogeneous scraps of language were jumbled together in the vernacular of an illiterate people, whose grammar was irregular, whose orthography was uncertain; there appears a complete confusion between the gutturals and cognate letters severally; quiescents or silent vowels prevail, and while vowel sounds are uncertain that of *a* is the most prominent. When the Arabians conquered Palestine in the 7th century this language gave place to that of the conquerors excepting among the priests, where it survived as the language of religion and ritual; thus it shared the fate of Hebrew among the Jews, Latin in Italy and the Roman provinces and Sanskrit in Hindustan. Like all Semitic languages it is read from right to left and the alphabet consists only of consonants, namely, *alaf, bith, gaman, dalat, i, ba, sen, it, tit, jud, kaph, labad, mim, nun, simcat, in, phi, sadi, goph, rish, shan, tav*. The two vowels with which certain words begin have a slight consonantal value. There are no accents or other diacritical symbols, and no vowel points as in other Semitic languages, but some consonants are used as vowels. The numbers are written as in Hebrew. The characters appear in two forms one of which is found in manuscripts, the other being confined to engraved inscriptions.

Samaritan Literature.—The literature of the Samaritan people consists of many departments, including Grammar and Lexicography. Three grammatical treatises on the Samaritan language were published from a manuscript at Amsterdam in 1862. They expound the theories of certain Arabian grammarians, from whose philological works whole passages are copied word for word. The Samaritan pronunciation may be judged of by the transliteration of Hebrew words into Arabic. No Samaritan lexicon has yet come to light. The lexicography therefore, of the language is in an inchoate condition. The nearest approach to a glossary is to be found in the fragments of 'Tardeschemans' (interpreters) Hebrew-Arabic dictionaries now preserved in the Imperial Library at Saint Petersburg. There are also at Paris in the Bibliothèque Nationale des Anciens Fonds a concordance of forms occurring in the Scriptures with the Arabic and Samaritan words in parallel columns. The Imperial Library at Saint Petersburg also possesses some Samaritan calendars, or astronomical tables. In legendary lore are several extant manuscripts. The British Museum possesses a 'Commentary on the Legends ascribed to Moses,' which is largely a compilation from Jewish sources. Of a similar character is the 'Jewelled Necklace in Praise of the Lord of the Human Race,' that is, Moses, who is credited with a divine nature, while great emphasis is laid upon the circumstances of his birth and the miracles he wrought. These two are typical of a somewhat extensive Samaritan legendary literature. The Samaritan commentaries on the Pentateuch are many in number, and interesting as showing the doctrines of these

people. It abounds in quotations from the Pentateuch, the prophets and the Mishna, and avoids all references to the Deity which imply an anthropomorphic conception. A number of fragments from such commentaries are also preserved at Saint Petersburg. The Samaritan 'Chronicle or Book of Joshua,' sent to Scaliger by the Samaritans of Cairo in 1584 seems to have revised and redacted into its present form about 1300 A.D. from 4 special manuscripts, 3 Arabic and 1 Hebrew, that is Samaritan. Among other things it relates that "King Joshua" waged war with 300,000 mounted men against two kings of Persia, and was succeeded on his throne by five "royal" rulers—the last being Sampson. The 'Chronicle of Abulfath' covers a period from Adam to Mohammed and is full of the wildest fables. Consult: Ravis, 'A Discourse of the Oriental Tongues, viz., Ebrew and Samaritan, with a Grammar of the said Tongues' (1649); Crinesius, 'Lingua Samaritica ex Scriptura Sacra Fideliter Eruta'; Young, 'Samaritan Root Book'; Nutt, 'A Sketch of Samaritan History.'

Samaritan Pentateuch, an ancient version of the books of Moses, which has been preserved by the Samaritans, and along with the book of Joshua, constitutes their sacred scriptures. The Samaritan Pentateuch is most probably a recension of the same original as that from which the Jewish came, and possesses an independent value in determining the text. It is written in a non-Hebrew character, probably older than that of the Hebrew Septuagint. A manuscript copy of the Samaritan Pentateuch is in existence which is said by the Samaritans to have been written by Abishua, the great-grandson of Aaron. There are various other manuscript copies of this version, besides a translation of it in the Samaritan vernacular and one in Arabic, which after the 7th century superseded Samaritan as the language of the people. The work was known only through Origen, Jerome, and other early writers, until Pietro della Valle discovered a copy of it at Damascus in the 17th century. There are now several printed editions. See SAMARITAN LANGUAGE AND LITERATURE.

Samaritans, so called from the city of Samaria, the capital of the kingdom of Israel, and from Samaritis, the region adjoining that city. The policy of the Israelitish kings was, as a rule, to keep their subjects apart from too close association with the kingdom of Judah, and the breach between the two peoples was made wider, when, after the captivity of Israel, Assyrian colonists inter-married with the remnant left behind by the conquerors, and the Samaritans ceased to be of purely Hebrew descent. The New Testament shows the aversion with which they were regarded by the Jews in the time of Christ, and even to this day when the Samaritans are represented by a few families still worshipping at Mount Gerizim, the dislike with which the Jews look upon them is as strong as ever. The Samaritans claim to be purely Mosaic in their creed, and that the Jews have departed from the ancient teachings of Israel. They worship one God, practise circumcision and the purifications, and keep the feasts, except the Purim and the feast of the Dedication. They look for a Messiah, and believe in a resurrection from the dead, and retribution in a future

life for wrongs done in the present one. They marry among themselves only, and practise polygamy in a limited degree. See also ISRAELITES; JEWISH SECTS.

Samarkand, *sām-ar-kānd'* (ancient, MARCANDA), Asiatic Russia, chief town of the Zerafshan district, and formerly capital of Sogdiana, in a fertile valley, 130 miles east of the city of Bokhara. The citadel stands at the west and beyond is the newly-built town. The Righistan, or main square, is of unrivaled beauty in its architectural features. The principal buildings are a palace, the bazaars, the Ulug-beg *madrassa*, or college; the tombs of Timur and his wives; two other colleges of the 17th century — splendid buildings, highly decorated with arabesques, enameled tiles of various colors, rich marble, and inscriptions of gold, etc., and 250 mosques. There is a brisk trade, and the chief items of commerce are cotton, silk, wheat, rice, horses, asses, fruit, and cutlery. Gardening is the principal occupation, and there is some manufacturing. Wheat, rice, and silk are exported, chiefly to Bokhara, silkwares, fine fruits, and rock-salt are imported. Samarkand has been for more than two centuries a great Asiatic mart. As Marcanda, it was taken by Alexander the Great: Timur made it his capital and in his time it contained a population of 150,000. In the 15th century it was celebrated as a school of astronomy and mathematics. It had a checkered history; taken in 712 by the Arabs, who introduced the creed and customs of Islam, it finally fell into possession of the Russians in 1868. Pop. (1901) 55,000.

Sam'arskite, a rare and exceedingly complex, velvet black, nearly opaque mineral. It is distinguished by its dark reddish-brown streak, splendid, vitreous to resinous lustre and conchoidal fracture. Its hardness is 5 to 6, specific gravity 5.6 to 5.8. Its usually rough crystals are rectangular prisms of orthorhombic symmetry. It is a niobate (and tantalate) of iron uranium, and the cerium and yttrium metals. It is chiefly remarkable for the large number of rare metals which it contains, including samarium, terbium, gadolinium, and the doubtful mosandrum, decipium, and phillipium. Its only European locality is Miask, Russia, but it is found sparingly in Canada, also in the United States in Connecticut, Maryland, and Colorado. The only localities of commercial importance are in North Carolina.

Sambourne, *sām'boorn*, **Edward Linley**, English cartoonist: b. London 4 Jan. 1845. He was educated at the City of London School and Chester College, and at 16 became an engineering draughtsman. In 1867 Mark Lemon, editor of ('Punch'), accepted a small drawing from his hand, and he soon formed the connection that has lasted through life. In 1871 he was given a seat at the Table and in 1901 he succeeded Sir John Tenniel as chief cartoonist. He has had practically no artistic education, but developed for himself an original style after first showing some inclination to the methods of Leech and Keene. He displays ingenuity and firmness of touch, and a classic feeling for line. He is perhaps the least humorous of the ('Punch') artists, being weighted with a strain of seriousness and dignity. He has illustrated

Burnand's 'New History of Sandford and Merton' (1872); Kingsley's 'Water Babies' (1885); 'Hans Andersen's Fairy Tales' (1887); etc. Consult: Spielmann, 'History of Punch' (1895).

Sambre, *sānbār*, river of France and Belgium, a tributary of the Meuse. It rises in the northern part of the French department of Aisne, flows between steep and rocky heights, receives several smaller streams, and finally, after a very tortuous course, empties at Namur into the Meuse. The Sambre is 110 miles long. It is navigable from Landrecies for 148 kilometres, and from that point for 67 kilometres is canalized, having 10 locks. The Sambre Canal passes southward as far as Oise, connecting the Seine and Maas.

Sambuke, an ancient musical instrument: though applied sometimes to several musical instruments of different kinds, such as a lyre, a dulcimer, a triangular harp or trigon, and a large Asiatic harp.

Sam'bur, a large deer (*Cervus unicolor*), widely distributed throughout southeastern Asia, and the species of most importance to the sportsman. Large bucks approach five feet in height at the withers, and may exceed 500 pounds in weight. The antlers are large and rough, have the brow-tine sprouting at an acute angle with the beam instead of at or near a right angle, and dividing into two subequal tines at the extremity: the beam sometimes exceeds 40 inches in length in fine specimens from the Bay of Bengal. The color is properly a uniform deep brown, but paler and less handsome hues are often seen; the hair is long and wiry, and forms an erectile mane on the necks of full-grown stags. This deer is an inhabitant of the woodlands, coming out to graze on the hill-slopes, at times, for like the wapiti it subsists mainly upon grass and herbage, but never far from a refuge in the jungle; yet at certain seasons browses the new twigs, or seeks for fruits. There is great variety in their circumstances and habits throughout the wide area of the distribution of this species, and consequently a puzzling amount of variation in their form and appearance, so that several separate species have been without good reason, as further study has shown. Consult Blanford, 'Mammals of India' (1888); Lydekker, 'Deer of All Lands' (1898).

Samian Ware, the name of a kind of ancient Greek pottery made of Samian earth, or to a variety of Roman pottery made in imitation of this. The vases are of a bright red or black color, covered with a lustrous silicious glaze, with separately molded ornaments attached to them.

Sam'nites, an ancient people sprung from the Sabines, and inhabiting the province of Samnium, in Lower Italy. The Samnites are described in Roman history as a people fond of war and of liberty, who were brought completely under the Roman yoke after long and bloody wars, which continued with few interruptions 53 years. After the most fatal defeats, and the entire devastation of their country, the Samnites, together with the other nations which had assisted them, found them

SAMOA DISASTER—SAMOAN ISLANDS

selves obliged to submit to the supremacy of Rome, 290 B.C. When the Italian allies of Rome revolted against her in the year 90 B.C. the Samnites once more rose against their oppressors, and fought with desperation. But Sulla entirely subdued them, and commanded that every Samnite should be put to death. Three days after the battle he ordered 4,000 of them who had been taken prisoners to be put to death on the Campus Martius. The few that remained lived from that time scattered in villages. The Samnites cultivated various arts and manufactures, for the proximity of the refined Greeks in Lower Italy had a very beneficial influence upon them. Even their laws and constitution were borrowed in a great degree from the Greeks. Their form of government was democratic. At the commencement of a war they were accustomed to choose a common general.

Samoa's Disaster, The. See SAMOAN ISLANDS.

Samoa Islands, The, or Samoa, formerly known as the Navigator Islands, an important group of islands in the South Pacific Ocean, belonging partly to Germany and partly to the United States. They are located about 2,000 miles south of the Hawaiian Islands, in an almost direct line between San Francisco and Australia and slightly south of the direct steamship line connecting the Philippines with the proposed Panama interocean canal. The islands extend from about latitude 13° to 15° S., and from longitude 168° to 173° W. They lie 2,410 miles north of Auckland, N. Z., and about 4,200 miles southwest of San Francisco. The group comprises 14 islands, of which only Savaii (700 square miles), Upolu (500 square miles), Tutuila (200 square miles), and the Manua group (26 square miles) are important. The total area is about 1,700 square miles. The climate is tropical, with abundant rainfall and a mean temperature of 80° in December and 70° in July.

Topography.—All the islands are peaks of a submarine chain of volcanic mountains. Barrier reefs encircle the larger islands more or less, and especially Upolu. Brown and bare in many places at low water, the reefs are submerged at high tide, when the surf booms and bursts upon them in miles and miles of snowy whiteness. Between the outer reef and the shore stretches a lagoon of multi-tinted waters, varying in width from 200 yards to two and three miles. This generally smooth belt of water is, in effect, a canal encircling the islands and is the highway along which all intercourse is had between different points of the islands. In the interior lofty mountains rise, leaving broad stretches of comparatively level land bordering the shore and reaching up to low-lying foot hills. Water courses extend down the mountain side through which the tremendous rains, turning into furious torrents in a few minutes, have cut and cañoned great ravines into the bottom of which no man has ever yet penetrated. In many places the sides of the mountains are not far from perpendicular. Yet such is the climate that they are held in place by the network of growth that covers them. Over such a surface, filling every gap and opening, finding a footing between boulders, no matter how closely packed, shrouding the valley, climbing and capping the peak, is spread a tropic forest of often giant trees, with enormous spreading roots,

gnarled, twisted, of eccentric, fantastic shape. Enormous vines are pendant from the tops, hang from one to another, writhe and twist up the sides and upon the ground, weaving all into an almost solid body, through which a man must cut his way at every step.

Savaii.—Savaii, the most westerly member of the Samoan group, is much the largest and most rugged. It is ridged with lofty, cloud-encircled mountains that are covered with a mantle of dense tropical foliage, giving to them an evenness of outline that delight the eye of the newcomer. The interior of the island, which has never been explored and concerning which little is known, is wholly occupied by mountains. Only a small strip of alluvial land bordering the shore is productive and the island is capable of sustaining a small population.

Upolu.—Ten miles east of Savaii is Upolu, in many respects the most attractive island of the group. Its centre is occupied by a range of hills, the sides of which are covered with vegetation and slope gently down to the sea with many intervening valleys and broad plains. The soil of these slopes is for the most part stony. A comparatively small part of it can be cultivated, but on the lower foot-hills it is largely alluvial and consequently very fertile. Here all the productions of the tropics grow in abundance and the gentle, half civilized natives have made their villages and plantations, where they spend an indolent life, with a minimum of care and labor. Upolu has no perfectly sheltered harbors except those of Apia and Saluafata, upon the north coast, which are anchorages of considerable area. They afford convenient shelter from the easterly trade winds and for the most part are perfectly safe, except during the hurricane season, which includes the months of December, January, February and March. At that time, these anchorages being opened to the north, are exposed to the full fury of the cyclonic storms that annually traverse this region, and blow most heavily from that direction. Upon such occasions great losses occur. Ships are driven ashore, where they break up on the coral reef; sometimes they go down at their anchors.

Tutuila.—About 40 miles off the eastern coast of Upolu lies Tutuila, on the south side of which is Pango-Pango harbor. This is the only land-locked anchorage in the group and affords protection in all kinds of weather to the largest men-of-war or ocean vessels. The land around the harbor is level and well adapted for wharves, warehouses or other structures. It is more suited to steamers than to sailing vessels, since the heavy trade winds sometimes blow directly into the entrance, making it difficult for vessels under sail to leave it. But as a harbor for steamships it probably has no equal among the thousand islands of the Pacific. It lies, moreover, directly in the great circle track between Australia and America, and is, therefore, a convenient calling place for vessels traversing the Pacific.

The Smaller Isles.—Within the sea reef of Upolu lies the Island of Manono, that is little more than a barren rock, but has played a great part in the domestic history of the group. It has always been the cradle of a feudal aristocracy and the focus of native politics. Its chiefs have held a commanding influence in all

SAMOAN ISLANDS

Samoan affairs. The Manua Islands, three in number and of small area, are 60 miles east of Tutuila. Although they are properly classed with the Samoan group they have little in common with the three larger islands already mentioned save in their language and origin.

Flora and Fauna.—The flora is similar to that of other Polynesian groups, and the fauna is extremely limited. The only indigenous mammal is a species of rat. There are several reptiles, including four species of snake. Among the birds the most remarkable is a species of ground pigeon.

Racial Characteristics.—The Samoans belong to the so-called brown people or Malayo-Polynesians. Although they have always been considered as having affinities with the Malays of the Indian Archipelago, nothing is positively known about their origin. That they are a branch of the Malay race or family is not much

in their faces, giving that melancholy air and meekness which Humboldt first pointed out as a characteristic of the islanders of the Pacific. Their skin is dark olive, resembling polished copper, presenting no difference in the sexes, though the prominent chiefs and better families are much lighter, with smoother skin. They are also taller and more symmetrical in person than the common people. The infant is much lighter in complexion than the adult. The male Samoan is tall, erect and proud in bearing, with smooth, straight, and well-rounded limbs, the contour seldom presenting muscular protuberance or development. Females are generally slight, especially the young girls; erect and symmetrical, easy and graceful in their movements, the charm of light-heartedness seeming to follow every action. Beauty of feature is not the rule; though many of the village maids are exceedingly attractive. Generally the profile is

Map of Samoan Islands.

questioned and they are also remotely allied to the Malagasy of Madagascar. The parent race has disappeared; but that branch from which the Samoans are descended was one of its earliest offshoots, and having remained almost free from admixture of blood, nearly represents the original. They trace back directly to the great Aryan family and their ancestors centuries before the present era emigrated from India and established themselves in the Indian Archipelago, whence they afterward pushed further on into the Pacific. Never having been subject to the inroads of other alien races, and the consequent admixture of blood, the Samoans have preserved uncorrupted and unchanged many of their original racial characteristics. Especially the men—they are of splendid physique, handsome, bright, strikingly erect, sound, healthy, vigorous, and of tremendous strength. Many of the distinctive marks of the European appear

decided and the facial angle distinct, the occiput broad, but seldom elevated. Unlike the Malay, the nose is not artificially flattened, deformity of person never having been practised among them. The nose is usually straight, but not so delicate in structure as that of Caucasians; the mouth large, and the lips thicker than those of the Europeans. The profile of the young girls is often very pronounced; the hair is black, soft, and sometimes fine and wavy, never crisp and curly in either sex. Among the men beards are not so general as among the whites; yet many have luxuriant beards. The eye is black, soft and pleasing.

Industrial Pursuits.—Native industries are few and of the simplest character. Blessed with a soil and climate quite equal to the gratification of their simple desires with little or no exertion on their part, the people are wholly lacking in incentive to labor. They build primitive houses,

SAMOAN ISLANDS

stone fences and canoes, and in war time dig ditches, throw up earthworks and construct forts and palisades; they cultivate the yam and taro and to some extent, since the advent of the whites, collect cocoanuts and make copra; they manufacture cloth and mats and engage in fishing and in collecting the food that nature offers to them freely for the gathering; that is about the extent of their work. For the rest, it is dancing, singing, fishing, church going and feasting. Undoubtedly the work in which the people have displayed their greatest ingenuity is in the construction of their houses. These are handsome edifices, particularly the fale-tele or council houses that are features of all the villages, and in many instances are of imposing dimensions. The houses are built of the wood of the bread-fruit tree. They are slightly oval, some 25 or 30 feet high. In building them three centre posts are raised, which support a ridge pole, while cross beams are lashed in at different heights, thus binding the structure firmly together. A thatching of sugarcane or pandanus leaves covers the roof. Large houses generally have permanent sides; the smaller ones are open all around, but are curtained by mats.

Education and Religion.—The first Christian missionary visited Samoa in 1830. In 1903 nearly every native had embraced the Christian religion. The observance of Sunday is marked by a rigidity and seriousness that are not surpassed, perhaps even not equalled, in any civilized land. With them Sunday is a day of rest and religious devotion. Food is collected on Friday and prepared on Saturday. On the Sabbath scarcely a boat is to be seen; the hunter is never in the woods during its sacred hours. Attendance upon church meetings affords almost the only sign of life; even the sports of the children are sacrificed, in a large degree, to the strict observance of the day. To a stranger the villages seem deserted. Three denominations have been established in Samoa and there has been strong rivalry between them. All the churches have good schools, those of the London Missions and of the Catholic Church, being especially well conducted and prosperous. At Malua, on the coast of Upolu, 12 miles to the west of Apia, the London Missionary Society maintains a settlement or college that was founded by the Rev. Dr. Turner. The establishment consists of a house for the principal, or resident missionary, a large building which is used as church and schoolroom, and a number of cottages standing in regular order round an open place or square. At Leulumoenga is a college that was established about 1890 for the purpose of educating the sons of the chiefs and of teaching them English. Roman Catholics took the initiative in teaching English. The Protestant missionaries, at first, declined to admit natives who desired to learn English into schools attended by whites and half-castes, nor would they teach English in the native schools. Later they erected near Apia a fine high school or college for Samoan girls of the upper class.

In education, the Samoans have displayed quite as marked proficiency as in their assimilation of Christianity. Probably fully one half of all persons over 20 years of age can read and write. Under that age, all of both sexes, with but few exceptions, are educated to that extent. Beyond this, and the addition of elementary

arithmetic, education does not extend, save to those in the mission schools, who are preparing themselves for the ministry. Samoans are keenly alive to all the advantages of education. Every village, without exception, has its resident pastor, or faife'au. This person is at once minister and teacher, regularly teaching the village school besides attending to his ministerial duties. In like manner each village is provided with a building that serves for the purpose of schoolhouse as well as church.

Trade and Commerce.—Cotton, sugar, coffee and cocoanuts are the leading articles of trade in the islands. The copra of commerce is obtained by drying the kernel of the coconut, the copra, which is exported to Europe and the United States, being used in the manufacture of coconut oil. The exportation of copra from the islands in 1901 amounted to 12,565,909 pounds, valued at \$231,372. A considerable portion of this was exported to the United States, a larger proportion, however, to Germany, whose citizens control its commerce through a trading company which has long been established there. The coconut and copra productions, however, vary greatly from year to year. The imports and exports of the two German islands of the Samoa group in 1901 were \$373,898 and \$241,808. The trade of the American island of Tutuila amounted in the same year to over \$100,000, the exports representing \$25,000. In 1901 over 100 vessels with a tonnage of 200,000 entered the harbor of Pango-Pango.

The Harbor of Apia.—Like all others in the South Sea, the harbor of Apia is a natural one. A coral reef runs almost the entire distance across the mouth of the large bay, leaving only a narrow entrance. The natural obstruction constitutes a perfect breakwater. The harbor is further divided into two parts by a long reef extending directly out from the shore. Upon one side of this reef the water is very shallow and is available only for small trading vessels. The other section of the harbor accommodates the men-of-war and large ocean-going craft. From the harbor Apia presents a long, crescent-shaped line of white houses, glittering in the sun and half hidden in groves of coconut trees. Here and there float the flags of the various consulates and of the business establishments. Half way up the hillside a waterfall tumbles over the rock and is accented so strongly against the dark background of foliage that it can be seen a distance of 10 miles from the shore. Through a small valley near the middle of the bay the water of this river meets the ocean. A nearer view of the place dissipates some of the enhancement that distance has lent to it, but still one finds that it is not without a certain mild attractiveness. The houses are all of wood and in a considerable state of dilapidation. There is practically only one street in the town and that has only one side. The cottages of the foreigners are generally built of California redwood and are picturesquely located along the main thoroughfare that extends parallel with the beach from Matautu to Mulinuu; they are surrounded with flowers and tropical plants. On the extreme left, as seen from the harbor, is the American consulate building, with a large, well-built structure with red shingle roof, near it. Further along the beach is the English missionary church, with the

SAMOAN ISLANDS

British consulate next to it. Toward the right hand corner of the bay are grouped the buildings used by the German consulate. Native huts and a few small stores make up the rest of the town. There are no wharves and no public buildings of importance. One of the old landmarks by which ships steer their course into the harbor, is the Roman Catholic Mission Church. This is situated near the centre of the town and is of fair proportions, being built entirely of coral block cut from the reefs near by and enclosed within a wall of the same material. Half a mile distant, on a hill in the rear of the church, stands a college and a chapel of the Roman Catholic denomination in which native men are educated to be missionaries.

History.—The islands were first visited by whites in 1721. The French explorer De Bougainville named the group in 1768. In 1787 John F. G. de la Perouse spent several weeks in and around the islands; his experiences with the natives were not altogether agreeable, for on the island of Tutuila Captain de Langle, the second in command of the expedition, with several sailors, was massacred by the natives. In 1839, the famous expedition of Commodore Charles Wilkes, of the United States Navy, made the first thorough survey and exploration of the principal islands of the group. Commodore Wilkes also negotiated an agreement with the principal chiefs by which the interests of the natives and the whalers and traders, visiting the islands from time to time, were provided for. He appointed a consul to represent the United States and took measures to insure amicable relations in the future between the islands and the United States. It is worth pointing out in this connection that this agreement that Commodore Wilkes negotiated was really the beginning of treaty connections between the Samoans and the outside world. A third of a century elapsed after Commodore Wilkes' visit before anything more formal or important developed in the relations of the islanders to the United States or to any European nation. Notwithstanding the steady development of commercial interests in the islands, no serious attempts were made by any nation to obtain a footing in Samoa. During this entire period, however, the islanders had a friendly disposition toward the United States, and later a coaling station at Pango-Pango was secured by the American government.

The native government of the islands had been from time immemorial under the two royal houses of Malietoa and Tupea, except on the island of Tutuila, which was governed by native chiefs. In 1873, at the suggestion of former residents, a house of nobles and a house of representatives were established, with Malietoa, Laupepa, and the chief of the royal house of Tupea as joint kings. Subsequently Malietoa became sole king. In 1887 he was deposed by the German government on the claim of unjust treatment of German subjects, who formed the bulk of the foreign population of the island, and was deported first to German New Guinea and then to Kamerun, in Africa, and finally in 1888 to Hamburg; Tamasese, a native chief, being meantime proclaimed by the Germans as king, though against the protest of the British and American consuls at Samoa. Mataafa, a near

relative of Malietoa, made war on Tamasese and succeeded to the throne.

Meanwhile a commercial treaty was negotiated between a representative of the Samoan government and the United States Secretary of State, William M. Evarts, by which the claim of the United States to the harbor of Pango-Pango as a coaling and naval station was affirmed. Germany followed in the footsteps of the United States in negotiating a treaty, securing to that country practical control of the harbor of Saluafata; the same treaty also gave the Germans unusual commercial privileges and exceptional power in the adjustment of affairs between German residents at Apia and the Samoans. Great Britain also concluded a treaty, securing a naval station and coaling depot and other privileges.

In March, 1889, a terrific hurricane swept over the islands, and a great naval disaster was recorded. Rear Admiral Kimberley, of the United States navy, with his flag hoisted on the Trenton, had arrived early in March and besides the flagship his squadron included the Vandalia and the Nipsic. The German men-of-war at Apia were the Adler, the Eber and the Olga, while Great Britain was represented by the Calliope. On the afternoon of 15 March came the first indication of the hurricane. Late in the day the storm broke with terrific fury. Increasing in violence, by midnight it was a raging gale and by morning a howling tempest. The next morning several of the smaller ships broke loose from their fastenings and either collided with each other or were dashed to pieces on the jagged reefs. The first of the men-of-war to succumb to the storm was the little German gunboat Eber. Colliding sharply with the Nipsic, with a force that almost sent both of them to the bottom, she smashed head on to the reef and almost instantly sank with a loss of 71 lives. The Adler followed with a loss of 20 lives. The Vandalia was wrecked and her commander, four officers and 39 men were drowned. The Olga and the Nipsic were beached and the Trenton wrecked.

In 1889, a conference between the representatives of the American, British, and German governments, was held at Berlin, at which a treaty was signed by the three powers guaranteeing the neutrality of the islands in which the citizens of the three signatory powers would have equal rights of residence, trade, and personal protection. They agreed to recognize the independence of the Samoan government and the free rights of the natives to elect their chief or king and choose a form of government according to their own laws and customs. A supreme court was established, consisting of one judge styled the Chief Justice of Samoa. To this court were referred: First, all civil suits concerning real property situated in Samoa; second, all civil suits between natives and foreigners or between foreigners of different nationalities; third, all crimes committed by natives against foreigners or committed by such foreigners as are not subject to any consular jurisdiction. The capital was located at Apia. A commission was appointed to investigate titles to land alleged to have been purchased from the natives, and this in 1894 completed its labors, confirming about 75,000 acres of land to Germany, 36,000 to British, and 21,000 to Americans.

Malietoa, who had been deported, was restored as king in November 1889, and continued as such till his death, which occurred 22 Aug. 1898, when the consuls of the three powers, with the chief justice as president, took charge of the administration pending the election of a successor. Out of the election and recognition of this successor to King Malietoa, deceased, serious disagreements between the local representatives of the three governments maintaining the joint protectorate over the islands occurred. These were followed in 1899 by a new government between the three nations.

The Treaty of 1899.—The treaty bears date at Washington 2 Dec. 1899, and after reciting its purpose to be to adjust amicably questions between the three powers in respect to the Samoan group, and to avoid further misunderstandings, proceeds textually as follows:

Article I.—The general act concluded and signed by the aforesaid powers at Berlin on the 14th day of June, A.D. 1889, and all previous treaties, conventions and agreements relating to Samoa are annulled.

Article II.—Germany renounces in favor of the United States of America all her rights and claims over and in respect to the Island of Tutuila, and all other islands of the Samoan group east of longitude 171° west of Greenwich. Great Britain in like manner renounces in favor of the United States of America all her rights and claims over and in respect to the Island of Tutuila, and all other islands of the Samoan group east of longitude 171° west of Greenwich. Reciprocally the United States of America renounces in favor of Germany all their rights and claims over and in respect to the Islands of Upolu and Savaii and all other islands of the Samoan group west of longitude 171° west of Greenwich.

Article III.—It is understood and agreed that each of the three signatory powers shall continue to enjoy in respect to their commerce and commercial vessels in all the islands of the Samoan group privileges equal to those enjoyed by the sovereign power in all ports which may be open to the commerce of either of them.

Article IV.—The present convention shall be ratified as soon as possible, and shall come into force immediately after the exchange of ratifications.

In faith whereof, etc.

JOHN HAY.
HOLLEBEN.
PAUNCEFOTE.

A separate treaty was negotiated to cover the provision for the settlement of claims in Samoa. It sets forth that the three governments are "desirous of effecting a prompt and satisfactory settlement of the claims of the citizens and subjects of their respective countries resident in the Samoan Islands on account of recent military operations conducted there, and have concluded a convention for the accomplishment of this end by arbitration."

The king of Sweden and Norway was made arbitrator, and he was not only to determine the amount of claims, but was "to decide to what extent either of the three governments is bound, alone or jointly with the others, to make good these losses."

The nature of the claims to be adjusted is set forth in Article I. of this treaty, as follows:

All claims put forward by American citizens or German or British subjects, respectively, whether individuals or companies, for compensation on account of losses which they allege they have suffered in consequence of unwarranted military action, if this be shown to have occurred, on the part of the American, German or British officers, between the 1st of January last and the arrival of the joint commission in Samoa, shall be decided by arbitration in conformity with the principles of international law or considerations of equity.

There is also a provision to the effect that "either of the three governments named, with the consent of the others previously obtained in every case, may submit to the king for arbitration similar claims of persons not being natives,

who are under the protection of that government, and who are not included in the above-mentioned categories."

The chief advantage obtained by the United States in this agreement is that the island of Tutuila contains the harbor of Pango-Pango, one of the finest in the South Pacific, and which cuts the island nearly in two. Tutuila is 17 miles long by 5 broad. The United States gave no *quid pro quo* for the Island of Tutuila either to Germany or Great Britain; but Germany surrendered a large amount of territory and other important rights to Great Britain in return for the latter's surrender of rights in Samoa. Germany gave up the portion of the Solomon group which she owned, and consented to a division of the neutral zone in West Africa, giving to Great Britain the territory about the mouth of the Volta River, which British diplomats long tried in vain to obtain. On 12 Jan. 1900, Malietoa addressed a protest to the governments of the United States, Great Britain and Germany, against the Samoan treaties. He characterized the partition of Samoa as a gross violation of the treaties and as a crime against the law of nations, only equal to the dismemberment of Poland, Denmark, and France. During the Boer war in South Africa, Great Britain surrendered her remaining rights in Samoa to Germany, which country with the United States possessed the islands in 1903.

Government.—Germany governs Savaii and Upolu and the adjacent islets, and the United States, Tutuila and the Manua group. German Samoa is administered by an imperial governor, and a native chief, assisted by a native council. The American possessions are in charge of a naval governor.

Population.—The aggregate population of the islands in 1903 was about 38,000, of which something over 200 were British subjects, 300 Germans, 100 Americans, 25 French, and 25 of other nationalities, while the remainder were natives of the Polynesian race. The bulk of the population was located in the three principal islands, the number in Upolu being 16,600, in Savaii, 14,000, and in Tutuila, 4,500.

Samos, sā'mōs, now **Samo**, or **Sousam-Adassi**, an island in the Ægean Sea belonging to the Grecian Archipelago. It is 45 miles southwest of Smyrna, and is separated from the coast of Asia Minor by a narrow channel, Little Bosphorus, and from Nikaria and the Furni Islands by the Great Bosphorus. It covers an area of 213 square miles and has several good harbors on the coast; it is traversed by two rocky and barren mountain ranges, relieved by some forests of pines, with vineyards and olive groves on the lower slopes. The valleys are well-watered and fertile, and contain beautiful scenery. Samos is tributary to Turkey to the extent of paying an annual stipend to the sultan, but is otherwise governed by a Greek prince nominated by the Porte. The capital and chief city is Vathy, on the north side. The old capital, Khora, is a poor place on the south side. This was the site of the famous temple of Hera. The island is extensively cultivated, produces excellent Muscadine wine, corn, fruit, and vegetables.

The minerals include silver, lead, antimony, calamine, manganese, and copper. Samos is renowned as the birthplace of Pythagoras and other distinguished men. It was formerly inhabited by Ionian Greeks. The chief exports are wine, brandy, raisins, hides, leather, oil, tobacco, and carob-beans. Pop. (1900) 54,830.

Samosatenes, or **Samosatians**, a heretical sect, followers of Paul of Samosata, bishop of Antioch, from 260 to 274 A.D. He denied the divinity of Jesus Christ, saying Jesus was simply man, though favored with the indwelling of the Logos from the instant of his conception: by the unvarying conformity of his will to the Divine will, he became like unto God, and through love he became one with him. His doctrine was condemned as impious by three councils of bishops, the third of which by decree deposed him, 269 A.D.; but Paul would not comply with the decree, till at last, after the overthrow of his great patron, Zenobia, queen of Palmyra, it was enforced by order of the Emperor Aurelian, 274 A.D., who declared that the controversy had been determined by the judgments of the bishops of Italy and in particular the bishop of Rome. The Samosatenes are also called Paulinians.

Samothrace, *sām'ō-thrās*, or *sā-mō-thrā'sē*, or **Samothraki** (Turkish, *Samadrek*), an island of the Ægean Sea, about 40 miles northwest of the entrance to the Dardanelles, and nearly opposite the mouth of the Hebrus, 36 miles from the coast of Thrace. It is rugged and mountainous and of almost oval form; its highest summit, *Saoce*, reaches an elevation of 5,248 feet. On the northern coast are sulphur springs of considerable renown. The principal products are grain, wood, oil, honey, and wax, and on the coast there is a considerable sponge fishery carried on by traders from Smyrna. In the northern part of the island the ruins of ancient Samothrace were found (1873-5) consisting of Cyclopean walls; a Doric temple of marble, and another of circular form. Samothrace was of importance from early times, and is frequently mentioned in the works of Pliny, Homer, and others. Here Poseidon witnessed the contests between Greeks and Trojans on the plains of Troy. But its chief renown was due to its having been the seat of worship of the Cabiri, and to its religious mysteries, supposedly derived from the Pelasgians. The island is once mentioned in history in connection with the expedition of Xerxes, one of its ships having taken a conspicuous part in the famous battle of Salamis. The island was first colonized by Phœnicians, afterward joined by Greeks. It always enjoyed autonomy, partly owing to its sacred character, partly to its lack of political importance—due to the fact of its having no good harbor. Saint Paul visited the island in the course of his second missionary expedition (Acts xvi. 11). The inhabitants are mostly Christians. Pop. 4,600.

Sam'ovar, a Russian tea kettle, the water in which is boiled by means of hot coals contained in an iron tube; and then poured over the tea.

Samoyedes, *sām'oi-dēz*, or **Samoiedes**, a Mongolian people inhabiting the shores of the Arctic Ocean, from the Kanin Peninsula, on

the eastern shores of the White Sea, in European Russia, to the Gulf of Khatanga, in the northeast of the government of Yeniseisk, Siberia. They consist of three principal tribes, speaking different dialects. Their origin is unknown, but they are supposed to have come from more southern regions, and have been erroneously confounded by the Russians with the Laplanders, whose country, called in the Lapland tongue *Sameanda*, has probably given them their name. They are nomadic, and live chiefly by fishing, hunting, and keeping reindeer. Their principal wealth consists in herds of reindeer, which supply them with food, clothing, tents, utensils, etc. They are of small stature, usually between four and five feet; have a flat, round, and broad face, thick lips, wide nose, little beard, black hair, in small quantity. They are extremely superstitious, and generally peaceable. They are unacquainted with the art of writing, their traditions being imperfectly preserved only in their songs. When Russian expansionists first became acquainted with them they had already been driven from their native seats by the Tartars, and separated from their kindred tribes.

Sam, originally an Indian article of food consisting of maize, broken or bruised, which is cooked by boiling, and eaten with milk.

Sam'pan, a boat of various build used on the Chinese rivers, in Straits Settlements and elsewhere, for the conveyance of merchandise, and also frequently for habitation. They are swift sailers both with oar and sail.

Sam'phire, an umbelliferous plant (*Crithmum maritimum*), pale-green with bi-triternate leaves and fleshy very succulent leaflets, and umbels of small yellowish flowers followed by fennel-like fruits. It grows wild along the rocky shores of northwestern Europe, near the water, and when abundant, is used as a pickle, salad, or potherb. It can also be cultivated in gardens, if not too far from the coast, and if supplied with plenty of salt and soda solutions. The name is a corruption of the old French "herbe de Sainte Pierre," and it is also called in England Saint Peter's-wort.

Sample, **Robert Fleming**, American Presbyterian clergyman: b. Corning N. Y., 19 Oct. 1829; d. N. Y. City, 12 Aug. 1905. He was graduated from Jefferson College in 1849. From 1853 he was engaged in various pastorates in Pennsylvania and Missouri until 1868 when he assumed charge of the Westminster Presbyterian Church, New York, where he remained and was pastor emeritus from 1902 till his death. He was professor of Christian ethics in Lincoln University, was editor of 'North and West' in 1895-1902, travelled widely in Europe and Palestine, and was connected with numerous religious educational and religious organizations. He published: 'Early Dawn' (1861); 'Beacon Lights of Reformation' (1889); 'Elements of Pulpit Power' (1901); etc.

Samp'son, **Archibald J.**, American diplomat: b. near Cadiz, Ohio, June 1839. He was graduated from Mount Union College, Ohio, in 1861, served through the Civil War in the Union army, attaining rank as captain, was admitted to the bar in 1865, and settled in Seda-

SAMPSON — SAMSON

lia, Mo., where he engaged in law practice. He removed to Colorado in 1873, became attorney-general in 1876 and in 1889-93 was United States consul at El Paso del Norte, Mexico. He established his home at Phoenix, Arizona, in 1893, and since 1897 has been United States minister to Mexico.

Sampson, Deborah, American heroine: b. Plymouth, Mass., 17 Dec. 1760; d. Sharon, Mass., 29 April 1827. She served in the Continental army for three years during the Revolutionary War, disguised as a man and bearing the name of Robert Shurtleff. She gained a reputation for coolness and courage in action and was engaged in many daring enterprises. She was wounded by a sabre cut on the temple in a skirmish near Tarrytown and later was shot through the shoulder. During the Yorktown campaign she was seized with brain fever and her sex was discovered. She was discharged by Washington, receiving from him a note and a purse of money, and later was invited to the capital, where Congress voted her a pension and a grant of lands. She published her experiences under the title 'The Female Review' (1797).

Sampson, William Thomas, American naval officer: b. Palmyra, N. Y., 9 Feb. 1840; d. Washington, D. C., 6 May 1902. In 1860 he was graduated from the United States Naval Academy, where he had been the highest officer of the cadet battalion. His first assignment was on board the frigate *Potomac*. He was promoted lieutenant 16 July 1862, and two years later became executive officer on the ironclad *Patapsco* of the South Atlantic blockading squadron. He held the watch, 15 Jan. 1865, on the turret roof of the *Patapsco* when that vessel was blown up and sunk by a torpedo in Charleston harbor. Only his own coolness saved his life in that catastrophe. He became lieutenant-commander in 1866, and commander in 1874. In the autumn of the last-named year he was detailed for the third time as instructor at the Naval Academy, and remained there four years in charge of the department of physics. Later he became assistant-superintendent of the Naval Observatory, and in 1884 was a member of the International Prime-Meridian and Time Conference at Washington. He was superintendent of the torpedo station at Newport, 1885-6; representative to the International Marine Conference at Washington in 1886; and superintendent of the Naval Academy, 1886-90, where he introduced great improvement in the state of training. In 1889 he was promoted captain, and later put in command of the *San Francisco*, the first steel cruiser of the new navy. During his term as chief of the Bureau of Naval Ordnance, 1893-7, the use of smokeless powder was perfected by experiments conducted under his supervision. Upon quitting this post he was put in charge of the battleship *Iowa*, which had been placed in commission in June 1897, and with this ship he took his place as senior captain in the North Atlantic Squadron. On 17 Feb. 1898, two days after the battleship *Maine* was blown up in Havana harbor, he was appointed president of a board of inquiry directed to investigate the causes of that disaster. On 22 March the investigation was concluded

and Capt. Sampson, promoted to the rank of acting rear-admiral, succeeded Admiral Sicard in command of the North Atlantic Squadron. Upon the declaration of war with Spain, 21 April, he was ordered with his fleet to blockade the northern coast of Cuba. A few days later the Navy Department was informed of a Spanish fleet under Admiral Cervera having sailed from the Cape Verde Islands toward Cuba. Admiral Sampson was forthwith ordered to intercept this fleet in its supposed progress to the relief of Havana. On 1 June he arrived off Santiago, where the Spanish fleet had meantime been located, and at once effected a strict blockade. On 3 June, under his orders, an unsuccessful attempt was made by Naval Constructor R. P. Hobson and others to prevent egress of the Spanish fleet by sinking the *Merrimac* in the channel-entrance to the harbor. On the morning of 3 July Sampson had withdrawn on the flagship *New York*, and was proceeding to Siboney for a conference with Gen. Shafter, the commander of the land forces, when it was discovered that the Spanish ships were leaving the harbor of Santiago. The *New York* was put about and, under full steam, overtook the blockading fleet already giving battle under the direction of Commodore Schley, commander of the flying squadron, and second in command of the blockading fleet. The entire Spanish fleet was destroyed, and Admiral Cervera was captured. After the close of the war a long and bitter newspaper discussion ensued over the question whether the chief honors of this victory belonged to Sampson or Schley. A court of inquiry which met three years later, at the request of Schley, decided against his claims, but the controversy prevented Congress from awarding any official recognition to Sampson for his success. For two years from October 1899 Admiral Sampson held command of the Boston Navy-Yard. In October 1901 he was placed on waiting orders; his health was much impaired; he was retired from active service 9 Feb. 1902, and resided in Washington until his death.

Samshui, China, a treaty port in the province of Kuang-tung, situated on the river West, about 100 miles west of Canton. The town is small, but favorably situated for foreign trade.

Sam'son, one of the judges over Israel. He was of the tribe of Dan, and the circumstances attending his birth, heralded as it was by an angel, his consecration as a Nazarite, and those visitations of the Spirit of the Lord through which he was enabled to perform feats of heroic might, marked him out as a man raised up to meet a national emergency. The first recorded instance of the exercise of his great strength is in connection with his marriage to a daughter of the Philistines. At the wedding-feast Samson proposed a riddle to the guests, wagering 30 shirts and as many suits of clothes that they could not guess it in seven days. The secret of his riddle being betrayed to them by his wife, Samson went to Askalon, killed 30 Philistines, and gave their clothes to his guests. His wife having, during his absence in his own country, married again, he caught 300 foxes, and tying them together tail to tail, with a fire-brand between them, let

them loose in the fields of the Philistines. His own countrymen bound and delivered him into the hands of his enemies, but he snapped the cords asunder, and killed 1,000 Philistines with the jaw-bone of an ass. From this period Samson was judge of Israel for 20 years. While on a visit to Gaza the gates of the city were closed upon him by the Philistines, whose intention it was to kill him, but he rose and carried off the gates to a distance of 20 or 30 miles. Not long after he fell in love with Delilah, to whom he revealed the secret of his strength, and she by cutting off his hair, deprived him of his powers, and betrayed him to his enemies, who put out his eyes, and set him to work in a mill with slaves. At a great festival in honor of Dagon Samson was brought out to furnish sport to the Philistines. But his hair had grown again, and his vigor having returned with it, he took vengeance on his enemies by pulling down over their heads the building in which they were assembled. Milton has made his death the subject of a drama — 'Samson Agonistes' (1671), Handel that of an oratorio, 'Samson' (1743) — and his exploits have been illustrated in the woodcuts of Dürer, and the paintings of Guido Reni, Rembrandt, and Rubens.

Samson Agonistes, äg-ō-nīs'tēz ('Samson the Combatant'), a sacred drama published by John Milton (q.v.) in 1671. It shows Samson, as according to the Scripture narrative, blinded and bound, but at the last triumphant over the Philistines.

Sam'uel, Hebrew judge and prophet about 1140 B.C., whose rule preceded the establishment of the kingly office. His name, in Hebrew "Shemuel," meaning "asked from," or "heard of God," is explained by his story as a child. He was the son of Elkanah, of Ramathaim-zophim, belonging to the tribe of Levi, by Hannah. Hannah had been barren previous to the birth of Samuel, but she prayed earnestly to the Lord for a man-child, and vowed that if her petition were granted she would consecrate the child to the Lord all his days. Her prayer being heard she took her son to Shiloh to surrender him to the high-priest to be trained to the service of the Lord. The boy grew up devoted to the temple service; but after the death of Eli nothing more is heard of Samuel for a space of about 20 years, while the Ark, restored by the Philistines, was in the house of Aminadab. He then exhorted the Israelites, when they were hard pressed by the Philistines, to abandon their idolatry, and to fear God and worship Him, as their only means of deliverance. His prayers and sacrifices gained for them the victory at Mizpeh, and it is probable that from this time, and in consequence of the leading part Samuel then took, he obtained the name and authority of judge. It is recorded that he judged Israel all his life, going a yearly circuit from Ramah, where was his home, to Bethel, Gilgal, and Mizpeh. At Ramah he built an altar to the Lord. His administration was distinguished by the restoration of the neglected worship of Jehovah. He also established schools of the prophets. In his old age the corruption of his sons, to whom he had transmitted the active duties of the office of judge, excited dis-

content among the Hebrews, who demanded a king. Samuel reluctantly yielded to this revolution, but at the same time anointed the king of the general choice. After the establishment of the monarchy Samuel still continued to be judge in matters affecting morals and religion, in addition to the exercise of his prophetic functions. In his bearing toward Saul Samuel conducted himself with wonderful dignity and kindness. He earnestly desired that Saul, as king, should rule well in the fear of the Lord, and that his dynasty should be permanent. When Saul attacked the priestly office and privileges Samuel anointed a new king, David. He did not live to see the contest between David and Saul decided; but even after his death his spirit, evoked by the witch of Endor, threatened Saul with the divine vengeance. See SAMUEL, BOOKS OF.

Samuel, Books of, two books of the Old Testament, which are one book in Hebrew manuscript, the division into two books being first introduced by Bomberg, at Venice, in 1518. That the prophet and judge Samuel did not write the books as a whole is made evident by the fact that his death is recorded in Book I, chapter xxv. There is a common opinion, however, that Samuel wrote the previous chapters, and the statement in I Chronicles, xxiv. 29: "Now the acts of David, the king, first and last, behold they are written in the book of Samuel the seer, and in the book of Nathan the prophet, and in the book of Gad the seer," leaves no doubt that Samuel did write a book, and his eminent position among the leaders and prophets of Israel would make it most probable that the book had been preserved. As to the portions of which Samuel was certainly not the writer, it is manifest that they were written very near to the events which they describe, and that they do not belong to the more recent period of Jewish national history. It is regarded by high authorities as probable that the books were written soon after the death of David and before the secession of the 10 tribes under Jeroboam. The books are of great historic value; they are clear and simple in style, and they bear proof of accuracy in narration, and of assurance on the part of the writer that he was stating facts within the general knowledge of his contemporaries. See DAVID; JEWS AND JUDAISM; JUDGES, BOOK OF; SAMUEL; SAUL.

Consult: Driver's work on the text, and the commentaries on Samuel by Delitsch, Keil, Otto Thénien, and Hensler Königsfeldt.

Sam'uels, Samuel, American seaman: b. Philadelphia 14 March 1823. At the age of 11 he went to sea as cabin boy, and became a captain at 21. He was for some years captain of the Dreadnaught, the fastest of sailing packets. During the Civil War he commanded the United States steamer John Rice (1863-4) and the McClellan, at the capture of Fort Fisher (1865). He was captain of the Fulton, the last of the American packet steamships between New York and Havre (1866), and gained international fame by winning the first ocean yacht race with the Henrietta (December 1866). He organized in 1872 the Samana Bay Company of Santo Domingo, but his concession was revoked in 1874.

SAMURAI—SAN ANTONIO

Since that date he has been identified with large business interests in New York and Brooklyn.

Samurai, the feudal warriors of Japan, who, prior to the revolution of 1867-8, comprised about one sixteenth of the population, and are now represented by the *shizoku*, or knights. They were distinguished by indomitable courage, their marvelous feats of arms, fervent patriotism, intense loyalty, and a strong antipathy to foreigners, which was in marked contrast to the hospitable and courteous demeanor of the mass of the population. They were the military retainers of some 276 daimios or feudal chieftains, the more powerful among whom were those of the southern clans Satsuma, Choshu, Tosa, and Hizen. After the re-opening of foreign relations due to United States initiative in 1854, the enlightened Japanese discovered at once that to place themselves commercially and politically on a level with the progressive nations of the world they had to adopt Occidental methods, and the prominent chiefs and their samurai were the first to advocate the suppression of the Tokugawa shogun, the supremacy of the mikado, the surrender of feudal powers, and a reorganized administration for the building up of a constitutional monarchy, most of which was effected by the revolution of 1868.

The samurai expected that the military and naval services would be exclusively reserved for them and their descendants. The radical measures adopted in 1871, however, led to the total abolition of feudalism, and the absorption of the samurai into the mass of the people, in many cases with a praiseworthy self-abnegation, but in others not without serious opposition. That of the famous Saigo of Satsuma, hitherto one of the most prominent reformers, culminated in the civil war of 1877, and the total defeat of the samurai and their pretensions. See JAPAN.

C. LEONARD-STUART,

Editorial Staff, 'Encyclopedia Americana.'

Sam'vat, a method of reckoning time in India, generally used except in Bengal. Christian dates are reduced to Samvat by adding 57 to the Christian year. See CALENDAR.

San Andres, sän än'dräs, or **Pico de Orizaba**, Mexico, an extinct volcano, called by the Aztecs Citlalepetl, or Mountain of the Stars, $6\frac{1}{2}$ miles southeast of the city of Orizaba. It is 5,550 metres high, and the loftiest mountain of Central America. Its highest pass, Cuchilla, has an elevation of 4,418 metres, snow-line of 4,292 metres; the deepest glacier, El Corte, 4,015 metres. It was first ascended in 1848, by two American officers, Reynolds and Maynard. Its last eruption extended from 1545-66.

San Angelo, an'jël ô, Texas, town, county-seat of Tom Greene County; on the Concho River, and on the Gulf, Colorado & Santa Fé railroad; 180 miles northwest of Austin. It is the centre of a prosperous stock-raising and wool-growing region; agriculture is also carried on successfully in the vicinity; fruit and celery being important products. The town contains flour mills and an ice factory. There are three national banks with a combined capital of \$300,000. It has an elevation above sea-level

of 2,000 feet, and is a health resort, especially for consumptives. There is a public high school established in 1889. Pop. (1890) 2,615; (1900) 2,700.

San Antonio, Texas, city, county-seat of Bexar County, and the largest city in the State, is on the San Antonio River 150 miles from the Gulf coast and about the same distance from the Rio Grande border at Laredo. This quaint and picturesque old Spanish city is beautifully laid out on a plateau 661 feet above the sea-level, along both banks of the San Antonio, a few miles from where it bursts forth—at once a river of volume and great natural beauty—from hundreds of crystal springs, in a noble woodland park. Through the western part of the city runs a smaller stream flowing out of another group of sparkling waters, situated in a live-oak grove, known as San Pedro Springs.

Railroads.—The Southern Pacific, International and Great Northern, Missouri, Kansas and Texas, San Antonio and Aransas Pass and San Antonio and Gulf railroads pass through the city, and the extension to it of the Frisco main line is assured, making it a great railroad centre, from which four distinct lines penetrate into Mexico.

Water Works and Sewer System.—The San Antonio Water Works Company, a private corporation, has established a thoroughly modern system, with an investment of over \$2,000,000, and 120 miles of mains. The water is obtained from 13 large artesian wells, furnishing a daily supply of 38,000,000 gallons of wholesome water. The company also owns riparian rights around the head springs of the San Antonio River and has a large reservoir adjacent on a hill, kept fully supplied for any emergency. The sewer system cost the city some \$550,000. It has 80 miles of sewers, constructed after the most approved engineering science, and meeting the latest sanitary requirements.

Street Railway and Lighting.—The traction company has 60 miles of well built electric lines with modern equipment and excellent service. There is also maintained a complete plant for gas and electric lighting and power, with all the necessary mains and supply lines.

Parks and Plazas.—There are 22 cultivated parks and plazas in the city, under the management of a park commissioner; and it is renowned for the exquisite beauty of its natural parks and the attractive features of its old Spanish plazas. Brackenridge Park, situated adjacent to the head springs of the San Antonio River, is a noble forest of 200 acres, left in its natural state of oak, pecan, and shrub growth, and containing miles of well kept walks and drives. In this park there is maintained a rare collection of buffalo, deer, antelope, elk, and other wild animals. San Pedro Springs is another favorite resort, with lakes, shady groves and an excellent "zoo." Seventeen iron bridges span the serpentine windings of the river in its 13 miles' course through the city, giving picturesque views at many points.

Many of the quaint characteristics of the old Spanish *régime* are still to be found in the public plazas, fragrant with their tropical trees and plants and famous for their Mexican chile and tamale stands, and in the narrow streets in the old parts of the city, still called by their liquid

SAN ANTONIO

Spanish names. The San Antonio Club, country fishing and hunting associations, golf links and tennis grounds afford recreation for the society world; the military reviews and artillery drills of the large garrison at Fort Sam Houston draw crowds of visitors; and the annual spring carnival and battle of flowers on San Jacinto day have made San Antonio as noted as the Mardi-Gras spectacles have New Orleans.

Public Buildings.—Among the public buildings are the court-house, costing \$700,000; the Federal building, \$300,000; the market house and convention hall, with a seating capacity of 4,000 \$60,000; and the city-hall, \$210,000. Mention may also be made of the Grand Opera House, the San Fernando Cathedral, part of which was built in 1749, the Saint Mark's Cathedral, the new hospital, the Menger Hotel, whose open courts are filled with tropical plants, palms and flowers; and numerous stately and ornamental business blocks.

Commerce, Banking, and Manufactures.—The unique situation of San Antonio, 200 miles from any rival business centre, has given it a commanding position as to the trade of a large section of Texas and Mexico. Large wholesale houses, 12 in number, push their business through a territory larger than the State of Illinois. The city possesses about 150 manufacturing establishments, including two very large breweries, several machine shops and foundries, flouring mills, binderies, cotton presses, cement works, broom factories, oil mills, etc., and their products are distributed through a vast section. There are six national banks in San Antonio with a combined capital of \$1,600,000, and deposits of over \$7,000,000; there are also six private banks, two of which are of large capital, and which altogether contain deposits of some \$3,000,000. The city is a prominent cotton market and is the financial centre of the most extensive stock interests in the Southwest. San Antonio is surrounded by many acres of irrigable farms, with water supplied by numerous artesian wells obtained at an average depth of about 1,200 feet. Truck gardening is here conducted on an extensive scale, largely by Belgian gardeners, and the products are shipped to the northern markets, where they are months ahead of similar products from other sections.

Churches and Education.—San Antonio has two beautiful cathedrals and 55 other churches, divided as follows: 13 Methodist, 12 Roman Catholic, 8 Presbyterian, 5 Episcopalian, 5 Baptist, 3 Lutheran, 3 Evangelical, 2 Jewish, 2 Christian Science, 2 Christian, and 2 Y. M. C. A. The public schools are under the control of a school board elected by the people. There are 21 school buildings, valued at \$500,000, and 150 teachers (including 23 colored), whose annual salaries amount to nearly \$88,000. The total enrolment for 1902-3 was 8,242. There are also located in the city and its suburbs 30 private schools and colleges, making it one of the most important educational centres in the South. These private institutions contain several thousand pupils. The Carnegie Library, established through the liberality of Andrew Carnegie, occupies a building constructed at an expense of \$50,000 on a site valued at \$15,000. It is under the control of a board of trustees; has endowment funds of

\$10,000 invested, the income of which, together with a special tax of some \$5,700 annually levied under a special provision of the city charter, maintains its work.

Government.—The administration of municipal affairs is under a charter granted by the Legislature in 1903. Under the charter a mayor is the chief executive officer, assisted by a council composed of four aldermen at large and one alderman from each of the eight wards into which the city is at present divided. The mayor and aldermen are elected for two-year terms, as are also the city attorney, tax assessor, collector, treasurer, auditor and judge of the corporation court. An excellent paid fire department and a thoroughly efficient uniformed police force are maintained. The assessed valuation of property in the city for taxable purposes in 1903 was \$34,364,000. The total tax rate for State, county and city is \$2.67. Under the State organization there are held in San Antonio three district courts, one of them with criminal jurisdiction, a court of civil appeals of three judges, a county court with probate jurisdiction and two justice of the peace courts, and under the Federal jurisdiction district and circuit courts.

Suburban Attractions.—There are several attractive suburban additions, not strictly included within the city limits, such as West End, Alamo Heights, and the Hot Sulphur Wells. These are all noted for their handsome improvements and beautiful surroundings. The Sulphur Wells Company has an elaborate bathing pavilion where medicinal, Turkish and vapor baths are given, with all the usual massage accompaniments, and a modern, well conducted hotel for its patrons. There are also in close proximity to the city other medicinal, hot sulphur and chalybeate artesian wells, notably the Terrell and Dullnig properties, whose remarkable curative qualities are well established.

Climate.—The altitude of the city is 661 feet above the sea-level at the main plaza; at Fort Sam Houston on the government hill it is 768 feet. The average annual temperature is 68°; mean maximum in summer, 79°; mean minimum in winter, 57°. The air is dry, bracing and aseptic, the average relative humidity being 65°. The summer heat is tempered by a strong current of air which blows for nearly eight months almost constantly from the Gulf, making the summer nights delightful. The winter climate most of the time resembles, in its salubrity and temperature, that of Cairo, Sorrento, or the Riviera, varied at times by a norther, which stimulates like a tonic. The attractions of the climate, the wealth, refinement, and hospitality of its cosmopolitan people, its quaint and artistic beauty, and its interesting historical associations and landmarks make San Antonio one of the most charming, picturesque, and notable cities in the Union.

History.—The first Spanish settlement at San Antonio grew out of the fierce rivalry between Spain and France for the possession of Texas. There were probably temporary military encampments made on the site of the present city by the exploring expeditions of Alonzo de Leon and Domingo Teran, in the latter part of the 17th century; but the real beginning of the city dates from 1716, when the presidio (garrison) of San Antonio de Bejar (or Bexar,

SAN ANTONIO.

1. Court House and Main Plaza.

2. City Hall — Military Plaza.

SAN ANTONIO

pronounced Bá-y-har) was established on the San Pedro Creek, within the present city limits, by Don Domingo Ramon.

Two years later followed the Franciscan mission of San Antonio de Valero, and in 1722 both the presidio and mission are found firmly settled on the Plaza de las Armas, now the military plaza of the modern city. In 1730, under a royal decree issued with a view of colonizing the new military and religious settlement, 15 families were brought from the Canary Islands, the head of each raised to the dignity of a hidalgo, and all located adjacent to the presidio, where, around what was then called the Plaza de las Yslas and now constitutes the main plaza, they proceeded to establish the pueblo (or villa) of San Fernando de Bejar. The mission of San Antonio de Valero was afterward, in 1744, removed half a mile farther east to the site still occupied by the historic chapel of that mission, known as the Alamo, and forever hallowed as the scene of the desperate and tragic struggle of 6 March 1836. From these various names of the presidio, mission, and pueblo, respectively, there has been evolved by some gradual blending process the modern name of San Antonio de Bexar, the affixed name having, under the State organization, been finally given to the county.

While Texas was a Spanish and Mexican province, San Antonio, called indiscriminately in those days San Antonio and Bejar, was most of the time the capital and always an important military station. During the long war of the revolution of Mexico against Spain, the old city witnessed many scenes of fierce strife and cruel bloodshed. Revolutionists and royalists engaged in bitter contests for the possession of the city, amidst scenes of unparalleled atrocity. In 1811 the head of Nicolas Delgado, a prominent adherent of the revolutionary party, was stuck upon a pole on the main street, after his cruel execution by order of the Spanish governor, Salcedo. On 29 March 1813, the battle of the Rosillo was fought a few miles from the city, in which the royalist army, under Governor Salcedo, was defeated, with the loss of 1,000 men, by Mexican revolutionists and American adventurers under Gutierrez and Kemper. San Antonio at once fell, and a junta of revolutionary chiefs ordered butchered immediately in cold blood, in revenge for the execution of Delgado, the governor, Manuel de Salcedo, Governor Herrera of New Leon and 15 other Spanish officers who had surrendered. On 4 June 1813, General Elisondo with a royalist force of 1,500 was defeated on the heights of the Alazan, one mile west of the city, after a desperate battle, by the revolutionists and Americans under Gutierrez and Colonel Perry.

The famous Spanish general, the Marquis of Arredondo, now marched on San Antonio with a new army of 2,000 men, and 18 Aug. 1813, met the republican forces commanded by Toledo and Perry, near San Antonio, on the Medina, and, after a furious contest, defeated them amidst frightful carnage. Arredondo immediately entered the city with his triumphant army, and proceeded to make the most cruel exactions and bloody reprisals upon the patriot population. Private property was confiscated; 600 citizens were crowded into narrow and unwholesome

prisons, where many died through suffocation; others were at once shot, including all the male members of the Delgado family, not sparing even a boy of nine years; hundreds of women of the best families were imprisoned in the Quinta and compelled to grind corn for Arredondo's army. These bitter contests and periodical revolutions nearly ruined the city; and it was not until the independence of Mexico was finally won in 1821 that its prosperity began to revive. By 1823 its population had increased to nearly 5,000.

In 1835 the revolution of Texas against the dictatorial government of Santa Anna (pronounced Sant' Anna) broke out. A Texan force of 800 men under Bureson and Milam advanced upon the city, then under the command of General Cos, with an army of 1,400 men, and, after a siege of a month, the city was gallantly stormed by the Texans, losing in the assault their courageous leader, Ben Milam. On 10 Dec. 1835 Cos surrendered his entire command, with 21 pieces of artillery, and large stores of ammunition and supplies. During the succeeding winter the city was held by a small force of Texans under the command of Wm. Barret Travis, assisted by such heroic spirits as the renowned frontiersman, Davy Crockett of Tennessee, James Bowie, who had lived several years in San Antonio and had married there Governor Veramendi's daughter, and the chivalrous Colonel Bonham of South Carolina. The dictator, Santa Anna, in February 1836, completed his vast preparations for retaking San Antonio, and marched from Monclova with a force of nearly 6,000 men, the *élite* of the Mexican army. Learning of his near approach, Travis, with 145 men, subsequently increased by volunteers to a total of 179 men, retired from the presidio on the military plaza and established his little command in the abandoned mission-fortress of the Alamo. Santa Anna took possession of Bejar 23 Feb. 1836, and rapidly completed the investment of the Alamo, surrounding the mission on all sides. He had three brigades of infantry under Generals Sesma, Tolsa, and Gaona, a cavalry command under Andrade, and ample siege artillery directed by General Ampudia. The hardy Texans had not only their deadly rifles to depend upon, but also 14 pieces of artillery which had been mounted by their Mexican predecessors on the church itself and on the walls surrounding the rectangular court of the mission. These walls have long since disappeared, but the site of this court is the northern part of the present Alamo plaza. Here, then, for 10 days, took place the most memorable, thrilling, tragic, and sanguinary siege in American history; 179 indomitable American frontier riflemen against an army of 6,000 brave and disciplined troops, led by veteran officers. After many desperate assaults and bloody repulses, on 6 March 1836, four storming columns of 2,500 picked troops, led by Cos, Duque, Romero, and Morales, amidst death-dealing volleys and horrible carnage from the murderous rifles and artillery of the Texans, finally succeeded in scaling the walls. The heroic defenders fought desperately hand to hand, from wall to courtyard and courtyard to buildings, until the last man perished, there being no survivors of the dreadful massacre but two

SAN ANTONIO—SAN BERNARDINO

women, two children, and two servants. Santa Anna's total losses in this desperate siege were estimated by Alcalde Ruiz, who superintended the burial of the dead, at 1,600, of which over 600 were killed or died of wounds.

It was on this sacred spot, thus baptized by the blood of heroes, that San Antonio elected to receive President McKinley on the occasion of his visit in 1901, and there to tender the Chief Magistrate of the country the enthusiastic welcome of its people. In 1840 65 Comanche Indians came into the city to enter into negotiations with Texas commissioners for a treaty of peace. A row broke out in the council house over the surrender of white prisoners; fierce fighting began in the building and continued into the plaza and streets until 32 Indian warriors were killed and all the rest of the party captured. Seven Texans were killed and eight wounded in this bloody contest. In the fall of 1840, 18 dead bodies were brought in from the edge of town and laid out in the court-house. Nineteen young men had gone out riding for pleasure and had been surprised by a sudden attack of Indians and all had been killed but one, and their bodies left stripped and horribly mutilated.

Mexico still kept up hostilities against the new republic, and 11 Sept. 1842 a Mexican army of 1,300 men under General Adrian Woll surprised the city and captured it, making prisoners of 52 of the most prominent citizens, including the venerable judge of the district court and the entire bar of lawyers. They were driven on foot in front of mounted guards, a cruel and toilsome march of over 1,000 miles, and imprisoned at hard labor, chained together in couples, for nearly two years in the castle of Perote, in the state of Vera Cruz. Woll, who had remained in San Antonio with his main army, was badly defeated a few days later by Colonels Hays and Caldwell and 220 Texans, in a desperate battle on the banks of the Salado, five miles east of the city, and was obliged to beat a hasty retreat into Mexico.

Military Post.—From the close of the Mexican War to the present time—save during the Civil War—San Antonio has been a military station for troops and generally also the headquarters of the army in Texas. The present military post of Fort Sam Houston and headquarters department of Texas, located on a commanding site in the northeast part of the city, occupying some 310 acres, is one of the largest in the United States, and its construction has cost upward of \$1,000,000. The government is now (1904) expending \$500,000 on additional grounds and quarters, and when these improvements are completed a full garrison will be maintained of one regiment of twelve companies of infantry and band, two batteries of field artillery and one squadron of four troops of cavalry. A United States arsenal for storage of ordnance supplies and the manufacturing and repairing of equipment is situated in the southwestern part of the city.

Population.—The city has shown a marvelous development since the Civil War. Its growth, by the Federal census, has been as follows: (1870) 12,266; (1880) 20,255; (1890) 37,673; (1900) 53,321. In 1903 the census bureau's official bulletin has estimated the popu-

lation of San Antonio to be 58,016, nearly 8,000 ahead of any other Texas city.

Bibliography.—Corner, 'San Antonio de Bexar'; 'San Antonio' (1890); 'Bancroft's account of the Storming of Alamo and other references to San Antonio; 'Fall of Alamo' (pamphlet); 'Memoir of Mary A. Maverick,' one of the first white women to live in San Antonio; Spanish documents and reports in Bexar archives, touching Arredondo's victory and operations and various points in early history.

EDWIN H. TERRELL,

Former United States Minister to Belgium.

San Antonio, a river in Texas, which has its rise in Bexar County, formed by the confluence of the Medina River and Leon Creek. It flows east through three counties, a distance of about 200 miles, and enters Espritu Santo Bay, an inlet of the Gulf of Mexico.

San Bernardino, sãn bër-nâr-dë'nô, Cal., city, county-seat of San Bernardino County; on the Southern Pacific and the Santa Fé R.R.'s; about 70 miles from the Pacific coast, where the transcontinental railroads break through the mountains. Many electric lines connect the city. It was settled in 1851 by Mormons; was incorporated as a town in 1868 and chartered as a city in 1886. It is west of Mount San Bernardino, in a rich agricultural and mining region, where fruit grows in abundance. The chief industrial establishments are the Santa Fé railroad shops, lumber mills, grain elevators, and factories in which are made crates for the shipment of fruit. There are about 1,400 men working in the railroad shops and on the trains. The city makes extensive shipments of fruit, grain, and lumber. San Bernardino is a famous health resort both summer and winter, on account of the equable climate, the beautiful scenery, and the variety and abundance of fruit. The principal public buildings are the court-house, the hall of records, the hotels, banks, the seven churches, the Southern California State Hospital for Insane, and an orphan asylum. The educational institutions are Saint Bernardine of Sienna Academy, a high school, public and parish schools, and a private business college. The five banks have a combined capital of \$355,000, and deposits amounting to \$2,000,000. The government is vested in a board of trustees elected every four years. Pop. (1890) 4,012; (1900) 6,150. Since 1900 there has been a large increase in the population.

R. C. HARBISON,
Editor 'The Sun.'

San Bernardino, (1) a range of mountains in the southwestern part of California; an extension of the Coast Range. (2) A mountain peak of the San Bernardino Range; the highest mountain of the Coast Range, and the peak which has given name to the group of mountains to which it belongs. The height is 11,604 feet.

San Bernardino, a strait of the Philippines between the extreme southeastern point of Luzon and northwestern Samar, connecting the Pacific Ocean with the Visayan Sea. It is of commercial importance as forming the eastern end of the Verde Passage between the United States and Manila.

SAN BLAS—SAN FRANCISCO

San Blas, bläs, Mexico, in the territory of Tepic, situated on the Pacific coast southeast of the mouth of the Rio Grande de Santiago. It is the terminus of the Mexico-Guadalajara Railway, and an important port. The industries are ship-building and lumbering. Pop. 2,000.

San Carlos, kär'lös, Chile, town in the province of Nuble, in the northern part of the state, on the main railway of Chile, 15 miles northeast of Chillan. Pop. 7,051.

San Carlos, Philippines, pueblo, province of Pangasinán, Luzon, on a tributary of the Agno River, 10 miles southeast of Lingayén. It is the centre of four main highways, and near the Manila & Dagupan Railroad. Pop. 23,950.

San Carlos, Order of. See ORDERS, ROYAL.

San Cristobal de los Llanos, krës-tó'bäl dë lōs lā'nōs, or **Ciudad de las Casas** (City of Las Casas), Mexico, largest city of the state of Chiapas, lies northeast of the capital, Tuxtla-Gutiérrez. It occupies a high (1,981 metres), fertile, and beautiful valley on the eastern slope of the central mountain range. It is the see of an archbishop, and has a cathedral, several convents, seminario conciliar, or university, a grammar school, and a hospital, and a handsome capitol. It has an active trade, especially in coffee; it also has manufactures of earthenware and coarse textiles. The chief occupation, however, is cattle-raising. The town was founded in 1528, on the site of the ancient Zacatlan, and named in honor of the celebrated priest Las Casas. Pop. 16,050.

San Diego, dē-ā'gō, Cal., city, port of entry, county-seat of San Diego County; on San Diego Bay, and on the Atchison, T. & S. F., the Coronado, the National City & O., the San Diego, C. & E., and the San Diego, P. B. & L. J. R.R.'s; about 120 miles southeast of Los Angeles. It has steamer connections with the principal Pacific ports of the United States, Hawaii, Japan, and the Philippines. Its landlocked harbor and facilities for interior transportation rank it next to San Francisco as the most prominent port in California. The climate is remarkably equable and salubrious, and it is a favorite health resort. It is the commercial centre of a region in which are produced large quantities of nuts, fruit, and honey. It has flour and planing mills, machine shops, carriage and wagon works, and several other industrial establishments connected with the harvesting and sale of the natural products of which large shipments are made each year. The principal public buildings are the government building, the library, Saint Joseph's Sanatorium and Home for the Aged, several bank buildings, the churches and schools. The educational institutions are Academy of Our Lady of Peace, Saint Anthony's Old Mission Indian Training School, a high school, public and parish elementary schools, and a public library.

The bay was discovered in 1542, but the first mission in California, founded by the Franciscan Fathers, was established here in 1769. The city was laid out in 1867. Several ruins from the old mission days are of interest. On a sand-spit enclosing the harbor is a village of fine

residences called Coronado after the well-known hotel. Pop. (1890) 16,159; (1900) 17,700.

San Domingo, sän dō-mēng'gō. See SANTO DOMINGO.

San Domingo Indians, a Pueblo tribe of New Mexico. See QUERES.

San Felipe, fā-lē'pā, Chile, an agricultural town in the province of Aconcagua, 60 miles northeast of Valparaiso, in the fertile valley of Aconcagua. Pop. (1903) 11,400.

San Felipe Indians, a Pueblo tribe of New Mexico. See QUERES.

San Fernando, fēr-nän'dō, Chile, the capital of the province of Colchagua, and a railway junction, 80 miles south of Santiago. Pop. (1895) 7,447.

San Fernando, Philippines, (1) Pueblo, province of Cebú, on the east coast, 16 miles southwest of Cebú, the provincial capital; pop. 18,200. (2) Pueblo, province of Pampanga, Luzon; on the Manila & Dagupan Railroad, five miles northeast of Bacolor. It is the railroad shipping point for Bacolor, with which it is connected by highway; and is an important centre of the sugar industry, containing sugar mills and warehouses. It also has an extensive wholesale and retail trade in groceries and drugs; pop. 13,270. (3) Pueblo, capital of the province of Unión, Luzon; on San Fernando Bay; 45 miles north of Dagupan. It is on the coast highway, and also on the projected route for the continuation of the Manila & Dagupan Railroad. It has also frequent communication with Manila by sea. Fishing is an important industry; pop. 13,270. There are three smaller pueblos of the same name: (a) pueblo, province Ambos Camarines, Luzon, a road centre with good trade; pop. 3,270; (b) pueblo, Ticao Island, province of Masbate, also known as Bután; pop. 2,367; (c) pueblo, province of Zambales, Luzon, on Bancal Valley highway; pop. 453.

San Fernando, Spain, on the Isla de Leon, seven miles southeast of Cadiz, in the province of Cadiz; is a fortified town built in modern style. It has two churches, two hospitals, a naval academy and workshops, an extensive arsenal, a fine observatory, and an iron foundry. It has numerous domestic industries and a brisk trade in salt. Pop. (1897) 28,951.

San Francisco, sän frän-sis'kō, the largest city in California, and the largest on the western coast of America, or in the United States west of the Mississippi River, ninth in rank as to population in the United States; seventh seaport in commercial importance; is situated on a very hilly peninsula between the Bay of San Francisco and the Pacific Ocean; on the south side of the strait known as the "Golden Gate"; lat. 37° 48'; lon. 122° 27'. It is the principal seaport on the Pacific coast of the United States, possessing the only commodious harbor, excepting that at San Diego, south of Puget Sound. The Bay of San Francisco forming this harbor is entered by a strait about three miles long and one to two and a half miles wide, navigable for the very largest ships regardless of tides. The harbor itself is completely sheltered from dangerous winds on all sides; it is about 90 miles long and from 5 to

SAN FRANCISCO

15 miles wide, and contains excellent anchorage ground and abundance of deep water. It is supplied with dry-docks and every facility for the care of vessels. The city is connected with regular lines of steamships: (1) with all ports on the Pacific coast of North and South America, the distances in nautical miles to the principal points in the North being: Portland, Ore., 653; Seattle, Wash., 804; Vancouver, B. C., 833; Juneau, Alaska, 1,608; Sitka, Alaska, 1,784; the distances to the principal ports to the South being: San Pedro, port for Los Angeles, 393; San Diego, Cal., 482; Mazatlan, Mexico, 1,478; Acapulco, 1,836; Guaymas, 1,954; Panama, 3,473; Valparaiso, 6,606; (2) with the Atlantic seaports and Europe *via* Cape Horn, the distance being: to New York, 13,380; to Hamburg, 14,076; (3) with Hawaii, Japan, China, and the Philippines, the distances being: Honolulu, 2,100; Yokohama, 4,525; Shanghai, 6,000; Hong Kong, 6,100; Manila, 6,250; Singapore, 7,850; (4) with Samoa, New Zealand, and Australia, the distances being: Apia, 4,200; Auckland, 5,930; Sydney, 7,210. The city is also connected by rail with all points north and south on the Pacific coast, and all points in the Middle West and east of the United States, the distances being by shortest mail route: to Seattle, 808 miles; to Los Angeles, 482 miles; New Orleans, 2,490 miles; to Chicago, 2,357 miles; to New York, 3,269 miles.

History.—The site of San Francisco was first visited by Europeans in the autumn of 1769. Under date of 12 Nov. 1775, Bucareli ordered a fort, presidio, and mission founded on the Bay of San Francisco. The expedition to carry out this order left Monterey 12 June 1776, and arrived on the peninsula 27 June. Part of the equipment was sent by sea on the San Carlos, and arrived on 18 August. The ceremony of taking formal possession was held on 17 September. The ceremonies attending the founding of the mission at San Francisco were held on the 9th of the following October. Vancouver, in his 'Voyage Round the World' (iii. 9), describes the settlement as it appeared in 1792. The presidio represented the military authority, while the pueblo and the mission stood for the civil and religious factors respectively. The earliest towns of California were organized under the laws of Philip II. And "when a pueblo was once established, no matter how or by whom composed, and officially and legally recognized as such, it came immediately within the provisions of the general laws relating to pueblos, and was entitled to all the rights and privileges, whether political, municipal, or of property, which the laws conferred upon such organizations or corporations" (Cal. Rep., 15, 541); and "among these rights was the right to four square leagues of land, in the form of a square, or in such other form as might be permitted by the nature of the situation" (Cal. Rep., 35, 432). Since San Francisco was bounded on three sides by water it was impossible for the town to have four square leagues of land in a square; a line was, therefore, drawn across the peninsula from east to west, and "the four square leagues (exclusive of the military reserve, church buildings, etc.) north of this line, constitute the municipal lands of the pueblo of San Francisco" (Cal. Rep., 16, 230). Before 1834 the territorial governor and the mili-

tary commandant of the presidio conducted the government of the town. The former imposed license fees and taxes, and the latter acted as a judge of first instance. A little later an *ayuntamiento* was formed, composed of an *alcalde*, two *regidores*, and a *syndico*. Between 8 Jan. 1838 and February 1840 the *ayuntamiento* was abolished, and the government of the town passed into the hands of justices of the peace. After the American occupation the *ayuntamiento* was re-established. Commodore Montgomery, after he had raised the flag of the United States at San Francisco, appointed Lieutenant Washington A. Bartlett to be the first *alcalde* of San Francisco under the new regime. Before the American occupation the *alcaldes* acted as judges of first instance, and they in a large measure made the law which they executed, "at least, they paid but little regard either to American or Mexican law further than suited their own convenience, and conduced to their own profit." In 1847, a common council of six persons was elected, and held its first meeting in September of that year. With this the *alcalde* assumes some of the functions of a mayor. He presided at the meetings of the council, and could give a casting vote in case of a tie, but could not participate in the discussion. At this time the police force of the town consisted of two elected constables. The next year, 1848, gold was discovered. After the news had become known, the town appeared as if it had been suddenly stricken with a plague. "Its houses were left unoccupied and unprotected; its former trade ceased; its lots fell to a small part of their value; its two weekly newspapers, 'The Californian' and 'The California Star,' were suspended in May and June; and the town, deserted by the bulk of its inhabitants, was at one time without a single officer clothed with civil authority" (Moses, 'The Establishment of Municipal Government in San Francisco,' 35). But in October 1848 an election was held and the town government was reconstituted. At an election held on 1 Aug. 1849 there were 1,516 votes cast, and John W. Geary, candidate for the office of first *alcalde*, received the whole number. On the condition of the town at this time see John W. Geary's address to the council.

The town was incorporated 15 April 1850. California had already adopted a constitution but it had not been admitted into the Union. The first municipal election under the charter was held 1 May 1850. The common council held its first meeting on 9 May, and proceeded at once to plunder the city treasury. It proposed to fix the salary of the mayor at \$10,000 a year; and at the same sum the salaries of the recorder, the marshal, and the city attorney. The other officers, including the members of the council, were to have salaries ranging from \$4,000 to \$6,000 annually. After the admission of California to the Union as a State, the city was re-incorporated 15 April 1851, and the essential forms of the pre-existing government were retained. When the mail steamer Oregon brought the news that California was admitted to the Union the inhabitants were "half wild with excitement."

"Business of almost every description was instantly suspended, the courts adjourned in the midst of their work, and men rushed from every house into the streets

SAN FRANCISCO

and towards the wharves, to hail the harbinger of the welcome news. When the steamer rounded Clark's Point and came in front of the city, her masts literally covered with flags and signals, a universal shout arose from ten thousand voices on the wharves, in the streets, upon the hills, house-tops, and the world of shipping in the Bay." And "at night every public thoroughfare was crowded with the rejoicing populace. Almost every large building, all the public saloons and places of amusement were brilliantly illuminated—music from a hundred bands assisted the excitement—numerous balls and parties were hastily got up—bonfires blazed upon the hills, and rockets were incessantly thrown into the air, until the dawn of the following day." (*Annals of San Francisco*, 293.)

In its early history the city suffered from several fires. These occurred 24 Dec. 1849, 4 May 1850, 14 June 1850, 17 Sept. 1850, 4 May 1851, and 22 June 1851. Two effects of these fires were the use of better materials in building and the formation of various hook and ladder, engine, and hose companies. They also called attention to the fact that the city was full of criminals who were making profit out of the fires. This fact and the recognized inefficiency and corruption of the city government led a large number of citizens to unite and organize the famous "Vigilance Committee," which flourished in 1851. In August 1850 the Society of California Pioneers was organized. Its declared purpose was "to cultivate the social virtues of its members, to collect and preserve information connected with the early settlement and conquest of the country, and to perpetuate the memory of those whose sagacity, enterprise, and love of independence induced them to settle in the wilderness, and become the germ of a new State." The great production of gold, while it led immediately to the abandonment of the city, was the first important ground of its prosperity. As the output of the mines became more and more abundant, prices rose, imports multiplied, and the population increased; but in 1854 the rise had culminated and the flood of gold began to decline. It then became clear that speculation had outrun safe limits, and there followed a severe crisis in mercantile affairs. By 1856 the crime and corruption which were rife in the city had become intolerable to those who wished to live in a decent and orderly community. Affairs reached a critical stage when Mr. King, editor of the *Bulletin*, was murdered by James P. Casey. His vigorous denunciation of crimes and the criminals who infested the city had given great offense. This act was the final incentive to action. The memory of the Vigilance Committee of 1851 was revived, and a new organization effected. On Monday Mr. King died, and on Tuesday Casey and another murderer by the name of Cora, who had killed United States Marshal Richardson, were tried by the executive committee of the recently formed organization. On Wednesday Casey and Cora were hanged in front of the vigilance headquarters. After several months of efforts in defiance of the law the committee disbanded, leaving the city rid of many criminals and purged of much of its political corruption. Although there was a decline in the yield of gold in the years between 1854 and 1860, there was at the same time a marked extension of agriculture; and by this the continued prosperity of the State and the city was assured. Then followed the marvelous development of the silver mines. They brought a sudden increase of wealth, and

led to a large amount of exciting speculation. San Francisco reaped the principal harvest from the silver mines of Nevada. A small group of its citizens acquired immense fortune from this source. Their wealth may be compared with that of another small group of San Franciscans who became very rich as the chief leaders in the overland railway enterprise.

General Description.—San Francisco has 47 square miles of territory, or about 30,000 acres, within the municipal limits. Many of the streets, especially in the northern and western parts of the city, are very steep, and the hills are mounted by cable cars, a system invented or first applied here by A. S. Hallidie. The present total mileage of street car tracks is 280. The finest residences are on "Nob Hill" and "Pacific Heights," both districts commanding superb views of the Bay and the Golden Gate, and in Van Ness Avenue, a broad street, 125 feet wide, running north and south near the geographical centre of the city. The commercial district is in part on made ground facing the harbor on the eastern side of the peninsula and on the comparatively level ground to the southeast. The mission district to the south and in the centre of the peninsula, named from the old Spanish mission situated there, is also a favorite residence quarter. Market Street, a broad thoroughfare 120 feet wide, runs from the water front by a gradual ascent into the interior of the peninsula in a southwesterly direction. The streets to the north of Market Street cut the city into rectangular blocks, running north and south and east and west, hence at acute angles to Market Street. Those to the south of Market Street are parallel to or at right angles to that street. The city is thus cut into two distinct portions locally known as South of Market Street and North of Market Street. The district to the south is occupied by manufacturing establishments and the homes of laborers, that to the north is occupied by shops of the better sort and by the homes of the clerks, the merchants, and the capitalists.

Parks.—San Francisco has six large and many small parks, 28 in all, which are carefully kept and rendered especially attractive by their palms and semi-tropical flowers. As there is no winter frost, the plants and trees in the parks are in almost constant foliage and grow to unusual perfection. The largest and finest park is Golden Gate Park, which occupies 1,014 acres. It begins about the centre of the city, and extends in a broad sweep to the ocean on the west. It is laid out in beautiful winding boulevards over and around the hills. It contains a museum, a large music stand, a Japanese tea garden, a children's playground, a chain of lakes, a buffalo paddock, a deer paddock, an aviary, and bear pen. At the northwestern corner of the peninsula, overlooking the ocean, lie the extensive private grounds known as Suto Heights, and on the rocky shore not far off the sometime celebrated Cliff House, which has commended itself to visitors not merely for its café but also as offering an excellent view of the rocks where the seals are accustomed to rest in the sun. Nearby is also the extensive bathing establishment known as Suto Baths, to which the water is admitted directly from the ocean and held and warmed in immense tanks made of concrete. The baths are 500 feet long

SAN FRANCISCO

and 250 feet wide, and hold 1,804,962 gallons. The "Presidio," the military reservation of the United States, is on the northeastern corner of the peninsula, and embraces 1,500 acres. The reservation contains the barracks, officers' quarters, and other buildings needed for the troops of the Department of California.

Climate.—The climate of San Francisco is very equable, frost and snow appearing so rarely as to be practically unknown. On one occasion, 31 Dec. 1882, snow fell three inches deep and lay on the ground for about 24 hours, which is the only real snowstorm known. In summer the temperature is kept low by the cool winds from the ocean. Only 14 times in 30 years has the temperature risen above 90° F. Once in June 1891 it reached 100°. The average of maximum temperatures in June, July, August, and September is about 70°; that of the minimum temperatures in the same months is about 56°. The greatest daily variation is about 43°. The lowest temperature on record was in January 1888, which was 29°. The range of temperature during the entire year is 60°, that is from the coldest night in winter to the warmest day in summer. The mean temperature for July is 59.5°; January 46.1°; for the year about 56°. The greatest daily variation is about 30°. Rain falls in the winter months only. Showers begin in October. The heaviest storms come in December and January, but the rains usually cease in the beginning of April. Very rarely, however, rain has been known in May, June, July, August, September, and October. The average rainfall is 28.5 inches. The greatest annual rainfall was in 1889-90, amounting to 45.85 inches; the least in 1850-1, 7.4 inches; the next lowest in 1897-8, 9.38 inches. There are on the average 70 days in the year on which some rain falls. Of the remaining 295 days, 175 are clear, 67 fair, and 53 cloudy without rain. The prevailing winds are from the southwest from April to September, and from the north and southeast in the other months. Southwest winds bring in fog from the ocean, and there are on the average about 66 foggy days each year.

Municipal Government and Public Service.—San Francisco has a combined city and county government. Legislative power is vested in a board of 18 supervisors elected at large. A mayor, elected for two years, has the veto power, appoints the board of public works (three members), police commissioners (four), civil service commissioners (three), health board (five), board of education (four), fire commissioners (four), election commissioners (five), park commissioners (five). Appointments to the public service are made under civil service rules. The auditor, treasurer, assessor, tax-collector, coroner, and recorder are elected by the people, as is also the county clerk. The waterworks, the gas and electric systems, and the street railways are all in the hands of private corporations. The police department has 652 men, 22 stations, and costs \$1,000,000 per annum. The fire department has 72 stations, 38 engines, 10 truck companies, and 7 chemical engines. It costs \$800,000 per annum. The school department employs 1,045 teachers, of whom 935 are women, and 110 men, has 75 day schools, 7 evening schools, with 88,000 pupils. There are also two richly endowed schools of technology; the de-

partments of law, medicine, dentistry, pharmacy, veterinary science and art belonging to the University of California are also in the city. On the island of Yerba Buena, within the city limits, is the naval training school of the United States government.

Public Buildings.—The Union Ferry Depot, where the boats land which connect San Francisco with the railway systems across the Bay, was erected by the State Harbor Commissioners in 1896, at a cost of over \$1,000,000. It is 659 feet long, 156 feet wide, contains the railroad ticket offices, waiting rooms, the California State Board of Trade, Pacific Commercial Museum, and the State Mining Bureau. The United States Appraiser's Building is built of brick, four stories high, cost \$1,050,000, and contains internal revenue offices, secret service and marine offices, as well as the United States circuit and district courts, the court of appeals, and the offices of the appraiser, and the Coast and Geodetic Survey. The City Hall, an imposing structure, covering about four acres, cost the municipal treasury \$6,000,000. The dome, 134 feet high by 115 in diameter, rises 335 feet above the sidewalk. The United States mint ranks second in the country. It is kept constantly in operation coining the gold produced on the Pacific coast. In 1902 it coined \$35,072,500 in double eagles, \$4,695,000 in eagles, \$1,695,000 in half eagles, \$1,530,000 in standard silver dollars, \$730,335 in half dollars, \$381,153 in quarter dollars, and \$207,000 in dimes. In 1901 the amount of gold coined into eagles and half eagles was much larger. In that year the total coinage was \$81,072,490.20. The public library has 150,000 volumes; is at present in the City Hall; it has seven branches and six delivery stations. The people recently voted \$1,647,000 in bonds for land and building for a new library, and Andrew Carnegie has offered \$750,000 more.

Other Buildings.—The city has 59 hotels, not including apartment houses run on the hotel plan. Of these the most famous is the Palace Hotel, occupying a block in Market Street. There are in the city 18 hospitals, 21 orphan asylums, 22 homes for the aged, 16 theatres, 44 social clubs, and 25 athletic clubs. There are 178 churches, 42 of which are Roman Catholic.

Manufactures.—Until the recent discovery of crude petroleum in large quantities in California, San Francisco, in common with the rest of the State, suffered under a handicap in manufacturing on account of the lack of fuel. Most of the coal used in the city came from Puget Sound and British Columbia; some was brought even from Wales, Pennsylvania, and Australia. The difficulty is now removed, and oil at 75 cents per barrel, the prevailing price, is the equivalent of coal at \$3 per ton. There is, furthermore, little or no iron in California, and that raw material has to be imported also. Yet the iron industry thrives. The ability to compete successfully with other places more favored was advertised by the remarkable exploits of the United States battleship Oregon and the speed of the armored cruiser Wisconsin, both built in San Francisco. The foundation of the iron industry was originally the need for mining machinery, and the experience gained in solving the problems which the construction of mining machinery in California presented stood this industry in good stead and prepared it to

SAN FRANCISCO

meet competition from outside. San Francisco now supplies mining machinery to meet demands from all parts of the world, from Alaska to South Africa. Like the iron industry, but with a less difficult handicap to overcome, the other manufacturing industries of San Francisco stand in close relation to the extractive and agricultural industries natural to the locality.

There were in 1900 4,002 manufacturing establishments in San Francisco, employing \$80,103,367 of capital, 4,041 salaried officials at \$4,619,033 per annum, and 41,978 wage-earners at \$22,037,527 per annum. Of the laborers 31,722 were men earning \$19,106,879, 9,321 were women earning \$2,734,984, and 935 were children earning \$195,664. The material used cost \$79,492,952, and the products were worth \$133,069,416. Some of the industries having a product amounting to or exceeding \$2,000,000 are the following: Sugar and molasses refining, \$14,211,516 in 1903. This is the largest single industry. San Francisco being the nearest port of entry for the raw sugar coming from the Hawaiian Islands much of it is refined here. Slaughtering and meat packing come next with \$9,991,591. This industry is supplied by the herds of cattle, flocks of sheep, and the hogs which are raised in the valleys and interior of California. Foundry and machine shop products represent the third industry in size, with \$8,366,967. The Union Iron Works employs about 4,000 men. The Oregon, the Charleston, the Olympia, the San Francisco, the Monterey, the Ohio, the Wisconsin, and other ships of the United States navy were built here. The Risdon Iron Works is another establishment employing a large number of men. The canning of fruits and vegetables is another large industry employing several thousand persons during the season, and turning out a product worth about \$3,000,000 in 1900, and \$3,700,000 in 1903. Leather working industries, including boots, shoes, gloves, saddlery, is important with a product of \$4,000,000. The manufacture of grain sacks involves about \$2,000,000. The sacks are demanded for the shipment of wheat principally, none of which is handled in bulk. There is a considerable output of bakery products, \$2,601,027. Another industry of mark is the manufacture of pastry products, notably crackers and macaroni, \$2,602,027. Fish canning is not a large industry in San Francisco itself, but the great Alaskan fisheries and canneries are operated under the management of San Francisco houses, and stand to her industrial credit. They send into San Francisco upward of 2,000,000 cases of salmon alone each year, worth about \$6,000,000. The same is true of the manufacture of gunpowder, dynamite, and other explosives, which is carried on on a large scale from headquarters in San Francisco, although the factories are safely located among the hills across the Bay, where explosions can do little damage. The same is to be said of the Selby Smelting Works, where much of the product of California's mines is refined.

Population.—In 1900 San Francisco had a population of 342,782; in 1890, 208,997; in 1880, 233,959; in 1870, 149,473; and in 1860, 56,802. The census returns of 1850 were destroyed by fire before they became of record. In 1903 the population was about 360,000. Of the total population in 1900, 184,866 were males, 157,916

were females, an excess of about 27,000 males. There were only 1,654 negroes in the city. Foreign-born were 116,885, or 34.1 per cent. There were in the city 13,954 Chinese, and 1,781 Japanese. The number of the latter has largely increased since 1900. The greatest number of foreign-born came from Germany, 35,194. The city contains many Jews, some of whom are prominent in mercantile affairs. Of the total population only 84,998 were of native parentage, 257,784 being of foreign parentage, and of the native whites only 83,558, or 24 per cent, were of native parentage. Only 3.1 per cent are illiterate.

Trade and Commerce.—Most of the foreign commerce of the United States on the Pacific passes through San Francisco. Much of that attributed to other ports terminates in San Francisco. A large part of the imports and exports of domestic produce from California and neighboring States and Territories also passes through the city, and much Californian and other Pacific coast produce is gathered at San Francisco and shipped out by rail. San Francisco has, in consequence, extensive wharves and warehouses, and a large coastwise trade. In 1902 San Francisco imported \$36,000,000 worth of goods from foreign countries by sea, and exported by sea to foreign countries and Atlantic seaports goods amounting to \$47,600,000. The principal countries to which San Francisco sent her exports were Great Britain, \$13,250,000; Belgium, \$685,000; China and Japan, \$10,000,000; Hawaiian Islands and Australia, \$8,000,000; Central America and Mexico, \$4,000,000; British Columbia, \$1,120,000; South Africa, \$738,000. The largest imports of foreign merchandise came from Japan, \$9,000,000; China, \$7,000,000; East Indies, \$3,500,000; Central America, \$2,900,000; Great Britain, \$2,500,000. San Francisco also ships away by sea about \$15,000,000 in gold and silver each year, and half as much again by rail. The greater part of the treasure shipped away by sea goes to Hong Kong, Japan, and India. If the treasure shipped is included, the total exports for 1902 amount to \$62,500,000. In many years San Francisco receives in treasure more than she sends away, most of it coming from Australia, as that country often pays for wheat she herself has bought or her creditor, England, has bought, by sending gold to San Francisco. The long distances from San Francisco to other great ports make it possible for the sailing ship to hold a large part of this trade. In 1902 there were entered at the San Francisco Custom House from foreign and Atlantic ports 488 sailing vessels with a total tonnage of 657,963 tons and 420 steamships with a total tonnage of 923,757 tons. The principal articles exported were in 1903: Wheat, 8,928,909 bushels, worth \$6,720,606; wheat flour, 872,941 barrels, worth \$3,159,543; barley, 6,379,540 bushels, worth \$3,524,993. These shipments vary with the crop from year to year. It took 215 ships to carry away the grain in 1902. The shipment of California canned fruits amounted in 1902 to 2,141,650 cases of two-dozen two and a half pound tins, of which 640,000 cases went by sea; 12,186,573 pounds of dried fruits were also shipped by sea. In 1902 San Francisco received 16,410,541 gallons of California wines and 559,010 of California brandies. Of wine exported 6,636,186 gallons went by sea. This was

SAN FRANCISCO—SAN JACINTO

worth \$2,500,000, and most of it went to eastern ports of the United States. San Francisco also received in 1902 1,644,491 cases of canned salmon, of which 800,000 were exported by sea. San Francisco also ships about 20,000 flasks of quicksilver each year. The principal imports are tea from China and Japan. In 1902 the quantities were: Tea from China, 2,226,584 pounds, worth \$287,530; Japan, 3,554,620 pounds, worth \$581,215, together 5,781,204 pounds, worth \$868,745. The total imports of tea from all sources were, in 1900, 15,000,000 pounds, but in 1902 only 6,045,806. Most of the sugar produced in the Hawaiian Islands, 315,000 tons, is carried to its destination *via* San Francisco. Coffee imported from Central America was, in 1901, 43,614,350 pounds; in 1902, 27,556,592 pounds; rice from China and Japan, in 1902, 29,426,059. San Francisco is the leading whale-oil port in the world. About 20 vessels engaged in whaling visit the port every year. In 1902 they brought in 10,976 barrels of oil, 110,662 pounds of bone, and 15,566 pounds of ivory. The trade in coal is no longer increasing owing to the competition of oil. In 1900 1,889,128 tons of coal were imported; in 1902, only 1,445,598. Pig iron to the amount of 28,766 tons was imported by sea in 1902. The largest item of shipment by rail is wool, annually about 26,000,000 pounds. The bulk of the fresh fruits shipped from California do not pass through San Francisco, but large quantities of dried fruits are sent from the city.

Finance and Banking.—The property of San Francisco is assessed for purposes of taxation at \$564,070,301, of which \$261,960,506 is land assessed at about 50 per cent of its true value; \$128,159,408 is buildings assessed at about the same rate as the land; \$122,147,473 is personal property, but the greater part of the personal property in the city evades assessment. The sum of \$33,599,059 is money and solvent credits which are heavily assessed, and \$18,203,855 represents San Francisco's share in the State assessment of railroads. The ratio of taxation is \$1.637 on each \$100 of assessed valuation, of which \$0.561 is for the State and \$1.076 for city and county purposes. The amount to be raised was \$4,557,600. San Francisco has no debt, but the people in 1903 voted to issue \$1,000,000 in bonds for a city and county hospital, \$7,250,000 for a sewer system, \$3,595,000 for school houses, \$1,621,000 for streets, \$697,000 for jails, \$1,647,000 for library, \$741,000 for children's play grounds, and \$623,000 for other parks.

[On 18 April 1906 the city was visited by a severe earthquake, followed by a disastrous fire. The earthquake wrecked many of its largest and most handsome buildings, and the fire destroyed a large portion of the city, including the entire business section. Loss estimated above \$200,000,000. — *Ed.*]

Bibliography.—Books on the early history of San Francisco: Dwinelle, 'The Colonial History of San Francisco'; Soule, 'The Annals of San Francisco'; Hittell, 'History of the City of San Francisco'; Moses, 'The Establishment of Municipal Government in San Francisco.'

BERNARD MOSES,
University of California.

San Francisco, a bay on the coast of California; a land-locked arm of the Pacific Ocean. The channel connecting the bay proper with the

ocean is called the Golden Gate. The bay, including San Pablo at its northern point, is 55 miles long, and varies in width from 3 to 12 miles. It is the finest bay on the Pacific coast of the United States. There are a number of islands; Alcatraz, a fortified island, is four miles from the mouth; Angel, Buena, or Goat, and Yerba are the largest. San Pablo Bay, on the north, is nearly circular in form, about 10 miles across. The Straits of Carquinez connect Suisun Bay with San Pablo. Suisun Bay is about eight miles long and four miles wide. A number of other smaller bays furnish harbor advantages for several villages and towns. Nearly all the drainage of California enters the ocean through this bay. San Francisco (q.v.), Oakland (q.v.), and a number of smaller places are on its coast. The history of this bay belongs with the history of California, but especially with the history of the beautiful towns and cities that are on its shore.

San Francisco Mountains, a group a little north of central Arizona. They are on the Great Colorado Plateau, and are the highest mountains in Arizona. Challenger Peak is 12,794 feet and San Francisco Mount 12,562 feet above sea-level, or about 5,000 feet above the plateau. The group seems to have been formed by volcanic action and by circumdenudation. Lava is found on the summits and slopes of the peaks. From the summit of the San Francisco peak over 100 craters of extinct volcanoes are visible. This peak has a curious formation; it is composed of Triassic sandstone, on a Carboniferous foundation, with a volcanic cone. See **ROCKY MOUNTAINS**.

San German, *sān hēr-mān'*, Porto Rico, city, near the southwestern coast; 35 miles southwest of Arecibo. It was settled in 1511. It is in a fertile agricultural region, the prosperity of which has, however, declined. It is a picturesque town, with narrow old-fashioned streets; it contains several churches, a Dominican convent, hospitals, and a seminary. An efficient public school system has been established under the American control, and a new graded school building built. Pop. city (1899) 3,954; pop. municipal district, 20,246.

San Gil, *hēl*, Colombia, in the department of Santander, is situated on a branch of the Rio Suarez, 30 miles south of Bucaramanga. It occupies a lofty eminence with an altitude of 1,140 metres. Tobacco, and coffee are cultivated and there are woolen manufactures. Pop. 14,000.

San Isidro, *ē-sē-drō*, Philippines, pueblo, capital of the province of Nueva Ecija, on the Grande de la Pampanga River. It is a well-built town, at the intersection of several main highways which connect it with Manila, with several points on the Manila & Dagupan Railroad, and with other important towns. It is in a fertile agricultural region and has a considerable trade. Pop. 9,480.

There are two smaller pueblos of the same name: (1) pueblo, province of Pangasinán, Luzon, six miles west of Lingayén, on the main highway; pop. 2,530; (2) pueblo, province of Zambales, Luzon, 50 miles north of Iba, on the main road; pop. 2,870.

San Jacinto, *sān ja-sīn'tō*, **Battle of**, in American history, a notable battle of the Mex-

A SYMBOL OF AMERICAN MASTERY OF THE PACIFIC.

THE FIGURE OF VICTORY ON THE MONUMENT ERECTED IN SAN FRANCISCO TO COMMEMORATE THE BATTLE OF MANILA BAY.

ican War that decided the independence of Texas. It was a desperate engagement between a Mexican force of 1,600 in command of Santa Anna, and 783 Texans led by Sam Houston, 21 April 1836. The Mexicans were defeated and utterly routed. The scene of this event was on the banks of the San Jacinto River, 17 miles southeast of the present city of Houston.

San Joaquin, sãn hō-ä-kên', Philippines, pueblo, province of Iloilo, island of Panay; 31 miles southwest of Iloilo, the provincial capital. It is on the coast highway. Pop. 13,920.

San Joaquin, a river of California which has its rise in a small glacier southeast of the Yosemite Valley, near Mount Lyell, on the east slope of the Sierra Nevada. It flows southwest about 100 miles; then in Fresno County it changes its course to a northwest direction to its confluence with the Sacramento River, then flows west into Suisun Bay. In Fresno County it receives the waters of Tulare system of lakes through King's River, after which it passes through the Sanjon, or Big Salt, Slough. It is about 350 miles long, and is navigable for 50 miles to Stockton all the year, and in winter and spring about 200 miles farther. The valley through which the San Joaquin flows is noted for its fertility.

San José, hō-sä', Cal., city, county-seat of Santa Clara County; on the Coyote and the Guadalupe rivers, and on the Southern Pacific railroad; 47 miles southeast of San Francisco, eight miles from San Francisco Bay, and 28 miles north by east of Santa Cruz. It is connected by railroad with Santa Clara and Monterey, both on the Pacific, and with San Francisco by three lines of railroad and by water.

The first settlement was made about 1770 and the pueblo of San José was established in 1782. It was the State capital under the first constitution of California. The completion of the overland railroad, in 1869, and the further development of transportation facilities, have aided greatly in promoting the prosperity of the city. The form of the city is that of a parallelogram; the streets are wide, well shaded, and clean. The four public parks, the excellent roads extending out into the valley, the equable climate, all contribute toward making San José a desirable residential city. It is situated in a fertile agricultural region, the beautiful Santa Clara Valley, famed for the variety and amount of its fruit. There are large canneries, packing-houses, and shipping establishments connected with the fruit industry, also flour mills, grain elevators, lumber mills, woolen factories, basket and box factories, a foundry, machine shops, yards for marble-cutting and granite polishing, tanneries, and several other industrial establishments. The annual output of the farm and fruit products is valued at \$6,500,000.

The principal public buildings are the government building, which cost \$200,000; the city-hall, in the Plaza; the court-house and Hall of Records, opposite Saint James Park; the Y. M. C. A. building, the churches, schools, and charitable institutions. There are 32 churches, representing 12 different denominations; five religious societies not having churches, and several missions, among which are the Florence Night Mission and Christ's Rescue Mission.

The educational institutions are the State Normal School, in Washington Square, a park of 28 acres; the University of the Pacific (M. E.); Notre Dame College (R. C.), for young women; Academy of Notre Dame (M. E.); Notre Dame College (R. C.), for boys; Notre Dame Institute (R. C.), a training and technical school for orphans; a public high school, six public kindergartens, public and parish elementary schools, two commercial colleges, four private schools, and a public library.

The charitable institutions are the Pratt Home for Old Ladies, the O'Connor Sanatorium, the San José Sanatorium and Home, Josephinum Orphanage, and the Home of Benevolence, maintained by the Ladies' Benevolent Association. Numerous medicinal mineral springs are in Alum Rock Park, several miles east of the city; area, 400 acres.

The annual amount expended for municipal maintenance and operation is about \$280,000. In 1900 the national bank had a capital of \$300,000, and the six state banks a combined capital of \$1,590,000. Pop. (1890) 18,060; (1900) 21,500.

San José, Costa Rica, capital of the republic, on an elevated plateau 3,868 feet above sea-level, about 15 miles northwest of Cartago (the ancient capital), with which it is connected by rail. It is in a rich agricultural district, and is a centre of commerce, on the international railway from Puerto Limon to Punta Arenas. The most conspicuous buildings are the palaces of the president, and the bishop, and the National Palace; the University, to which is attached a medical school and a museum; the restored cathedral, and the National Theatre, a monument of artistic beauty, containing Italian marbles, pillars, columns, statues, and frescoes, and in its elaborate decorations resembling the Library of Congress at Washington. It cost almost \$1,000,000. There is a good school system and the city is progressive. The merchants are mostly foreigners. The railroads, banks, and electric-light plants were largely built by English capital. The French are the chief coffee-growers; the United States are mainly interested in the railroads, mines, cattle ranches, and the banana industry. Coffee is the principal product. San José is becoming a health resort for Isthmian workers. Pop. (1900) 21,500.

San José, Guatemala, the chief port of the republic, on the Pacific Ocean. It is the starting point for the railroad trains to the capital, and a steamer station. The exports are cochineal, indigo, sarsaparilla, wood, flax, coffee, sugar, cotton, hides, and rubber. Pop. 1,500.

San José, Philippines, pueblo, province of Batangas, Luzon; on the Malaquintubig River, 10 miles north of Batangas, the provincial capital. It is on the main highway, and on the line of a projected railroad, and is a military and telegraph station. Pop. 10,000.

There are also several smaller pueblos of this name: (1) pueblo, province of Bulacán, Luzon; destroyed by the Spaniards in the insurrection; pop. 2,397; (2) pueblo, province of Ambos Camarines, Luzon, on the main highway, eight miles southeast of Nueva Cáceres; (3) pueblo, island of Corregidor, 27 miles

southwest of Manila; chief town of the island with good anchorage; pop. 574; (4) pueblo, de Pampanga River, 11 miles northeast of San province of Nueva Ecija, Luzon, on the Grande Isidro; a road centre; pop. 852.

San José de Buenavista, dā bwā-nā-vēs'tā, Philippines, pueblo, capital of the province of Antique, Panay; on the west coast. The town has a good harbor, carries on an active trade by sea with Iloilo, and is connected by highway with the other towns of the province. Pop. 5,621.

San José de Cucuta, dā koo'koo-tā. See CUCUTA.

San José de Lagonoy, dā lā-gō-noi', pueblo, province of Ambos Camarines, Luzon; 22 miles northeast of Nueva Cáceres. It is the most important town of the sub-district of Lagonoy, which is largely isolated from the rest of the province. Pop. 9,000.

San José Scale. See SCALE INSECTS; ORANGE PESTS.

San Juan, hoo-ān', or **San Juan de la Frontera**, dā lā frōn-tā'rā, Argentina, (1) capital of the province of the same name, east of the River San Juan, on the eastern slope of the lower Cordilleras, north of Mendoza. It is the see of a bishop. The principal buildings are the bank, national college, normal school, large seminary, hospital, and custom house. There is some export trade in wine and cattle. Pop. (1901) 11,000. (2) The province covers an area of 33,715 square miles. On the west the Cordilleras are interspersed with fertile valleys, on the east are found salt steppes or pampas. In the Andes lofty peaks rise to the height of 5,580 (Cerro Gordo) to 6,798 (Meredario) metres. East of the Rio Jachal are high mountains, then follows the chain of the Sierra Huerta. The principal streams are Rio Vermegio and Rio Sanjon: on the southern frontier extends the large lake of Guanacache. Gold and copper mines are operated. The climate is mild, and the country well watered. Grapes, olives, and wheat are extensively cultivated. Pop. (1900) 94,991.

San Juan, Philippines, pueblo, province of Unión, Luzon; on the west coast, four miles north of San Fernando. It is on the main highway. Pop. 10,211. There is also a smaller pueblo of the same name in the province of Bohol. Pop. 5,428.

San Juan, or **San Juan de Porto Rico**, Porto Rico, city, capital of the island; built on a small island adjacent to the northeastern coast, connected with the mainland by a bridge. It was founded in 1511 by Ponce de Leon, and was strongly fortified. It was attacked by the Dutch in 1625 and on several occasions by the English, the last time in 1797, when a large force under Abercrombie laid siege to the city; its fortifications, however, rendered it impregnable. In 1898 it was occupied by American troops, and remains the seat of government for the island under American rule. The main part of the town is enclosed by mediæval ramparts and defended by Morro Castle, at the entrance of the harbor, forts Sant Elena and San German, and the citadel of San Cristobal. Within the walls the city is laid out in regular squares; the houses are substantially built and the streets

well paved. Sanitation was neglected under Spanish rule, but after the American occupation the best sanitary measures were strictly enforced, and the general health of the city greatly improved. It contains a number of notable public buildings, including the bishop's palace, a large cathedral, the old government building, the city hall, the casa blanca, the custom house, a military hospital, an arsenal, and a theatre. It has a trolley car system which connects it with the pretty suburban towns, Santurce and Rio Piedras. The harbor is one of the best in the West Indies, affording anchorage for the largest ships. The entrance, however, is very narrow and difficult for navigation. The public school system of graded schools includes a high school, which is open to pupils from all parts of the island. There are also several special schools established by the government, including night schools, an industrial school, an experimental kindergarten, and a school for trained nurses. Pop. (1899) 32,048.

M. OLMEDO,

Secretary Porto Rico Board of Trade.

San Juan, a range of mountains in the southern part of Colorado, one of the Rocky Mountain chains. Some of the peaks are over 14,000 feet in height.

San Juan, a river of Argentina, in the province of San Juan, which has its source in the Andes, is joined by the Mendoza, Diamante and Atuel, and flows into the Colorado, by which it reaches the ocean south of Bahia Blanca. It is about 250 miles long.

San Juan, Rio, Central America, a river forming the outlet of Lake Nicaragua, and flowing southeastward on the boundary between Nicaragua and Costa Rica into the Caribbean Sea. Part of it would have formed a link in the interoceanic waterway if the Nicaragua Canal had been decided on. It is 130 miles long, and for the greater part of its course is a broad, deep and tranquil stream. It is, however, completely blocked at five places by rapids, of which the Machuca Rapids are the largest. The river enters the sea through a large delta, one arm of which forms the harbor of Greytown, though the bar is too shallow for large vessels.

San Juan, or **Haro Archipelago**, Northwest America, a group of islands, lying between Vancouver Island and the mainland of the State of Washington, U. S., which cover an area of 300 square miles. Their possession was in dispute between England and the United States, as the Oregon Boundary Question of 15 June 1846, contained an ambiguous meaning. The matter was settled (1872) in favor of the United States by the decision of Wilhelm I. of Germany.

San Juan Islands, a group belonging to the State of Washington. They begin in the Strait of Georgia and extend south into Puget Sound. The largest islands of the group are San Juan, Oreas, Lopez, and Shaw. In 1859 these islands were claimed by both the United States and Great Britain, and both American and British garrisons were on the islands. See SAN JUAN QUESTION.

San Juan Hill, Battle of. See SANTIAGO DE CUBA.

SAN JUAN QUESTION—SAN LUIS POTOSI

San Juan Question, in American history, an early boundary line dispute between the United States and Great Britain. In negotiating the treaty of 1846, by which the 49th parallel, from the Rocky Mountains to the sea, was made the boundary, a controversy arose concerning the course of the line through the channel which divides Vancouver Island from the mainland. The Americans contended for the Canal de Haro, the British for the Rosario Strait. To avoid conflict, it was decided that both nations occupy the island of San Juan at opposite ends. In 1872 the German emperor, acting as arbitrator, decided for America.

San Juan Bautista, bow-tēs'tā, Mexico, the capital of the state of Tabasco, situated on the Rio Grijalva near the centre of the state. It is built on low and level ground, has street-car lines and several pretentious buildings, such as the government palace, a theatre, and several churches. It is the trade depot for the interior of Tabasco and northern Chiapas. Pop. (1895) 9,604.

San Juan de Bocboc, dā bök-bök', Philippines, pueblo, province of Batangas, Luzon; on Tayabas Bay at the mouth of the Sinturis (or Lanay) River. There are two towns, the old town built directly on the bay, the new town further inland on the river. Many horses are raised in the surrounding region. Pop. 14,017.

San Juan del Mezquital, dēl mäs-kē-täl', Mexico, a town in the northwestern part of the state of Zacatecas. Pop. (1895) 7,113.

San Juan de Nicaragua, dā nē-kā-rā'gwā. See GREYTOWN.

San Juan del Norte, dēl nōr'tā, or **San Juan de Nicaragua**. See GREYTOWN.

San Juan del Rio, dēl rē'ō, Mexico, a town in the state of Querétaro, situated about 30 miles southeast of Querétaro. It is surrounded by beautiful gardens, and there are important silver mines in the neighborhood. Pop. (1895) 9,040.

San Juan del Sur, dēl soor, Nicaragua, a port on the Pacific coast in the southwestern corner of the republic. It has a safe harbor and is the commercial outlet for the products of southwestern Nicaragua. It has submarine cable connection with Mexico and Panama, and is a station for regular steamers. The terminus of the proposed Nicaragua Canal would have come a little to the north of the town.

San Juan de Ulúa, dā oo-loo'ā, or **Ulloa**, Mexico, a fort defense in the harbor of Vera Cruz, standing upon a small island of its own name. Here Cortes made his first landing in 1519. The fort was built in the 17th century and was of great strength. It has figured conspicuously in the history of Mexico.

San Lucar de Barrameda, loo'kär dā bär-rä-mā'thā, Spain, a seaport, province of Cadiz, Andalusia, at the mouth of the Guadalquivir, 18 miles north of Cadiz. The most conspicuous buildings are: several convents and the palace of the Duchess of Montpensier, containing valuable art treasures; the ruins of a Moorish castle; churches; townhouse and an English hospital, which dates from 1517. There are good schools directed by religious orders generally. The chief occupations of the inhabitants are fishing and the culture of grapes, olives, tropical

fruits and vegetables, and there is considerable trade in sherry wines. The chief imports are coal from England; sulphur and vegetables from France: exports, salt, wine, fruit, and oats. Columbus embarked from this point on his third voyage, and Magellan on his voyage of 1519. Pop. (1897) 23,377.

San Luis, loo-ēs', or **San Luis de la Punta**, Argentina, (1) Capital of the province of that name, at the southern extremity of the Sierra of San Luis, on the Chorillo, 480 miles northwest of Buenos Ayres on the transcontinental railway. It has a national college, primary schools and a branch bank; also water supply. The chief industries are the manufacture of *ponchos*, and trade in horses, hides and wool. It was founded in 1597, consists of adobe huts, and is surrounded by forests of ferns. Pop. (est.) 10,000. (2) The province is situated in the central west of the republic, with an area of 28,535 square miles. At the northeast terminates the Sierra de Cordoba; through the northeast extends the Sierra de San Luis rich in copper and precious metals, which are, however, little exploited. In the south extend salty pampas. The climate is dry and healthful, marked by great extremes. The rivers are not navigable; transportation facilities are poor, and there is little industry. Pop. (1900) 91,403.

San Luis Obispo, ò-bēs'pō, Cal., city, county-seat of San Luis Obispo County; on the Southern Pacific railroad; about nine miles from Port Harford on San Luis Obispo Bay, an arm of the Pacific Ocean, and about 200 miles south by east of San Francisco. It is in an agricultural and stock-raising region. The industries are connected chiefly with the farm and dairy products and the cultivation and shipping of fruit. The educational institutions are a high school, Immaculate Heart of Mary Academy, public and parish schools. The five state banks have a combined capital of \$720,000. Pop. (1890) 2,995; (1900) 3,021.

San Luis Potosi, pō-tō-sē', Mexico, an inland state. See MEXICO—THE STATES OF.

San Luis Potosi, Mexico, capital of the state of San Luis Potosi and fourth largest city in the Republic; 326 miles from Mexico City by the National railway, 477 miles from the United States border at Laredo, Texas, and 275 miles from the Gulf of Mexico at Tampico by the Mexican Central railway; altitude 6,250 feet above the sea. It is the center of an important mineral and smelting interest, extensive ore deposits existing in almost every direction, and is the home of the greatest silver-lead reduction works in the world,—the smelting plant of the Compania Metalurgica Mexicana, with a capacity of 1,000 tons daily, and requiring the services of 1,400 men, in all departments. In 1904 this smelter reduced 214,207 tons of minerals, producing 167,823 kilograms of silver, 1,352 of gold, 10,167 of lead and 3,558 of silver. As a distributing and general business center it is regarded as one of the most important and promising in the Republic. The opening of the port of Tampico has proven very beneficial to its commercial interests. Its manufacturing industries include clothing, furniture, cotton goods, tallow, and other articles of commercial importance. It has a street railway,

telephone service, and an excellent electric lighting system. The governor's palace of rose colored stone is an imposing building, and the Cathedral is one of the notable ones of the country. A University—The Instituto Científico—in which the professions and exact sciences are taught, is the principal educational institution of the city. There are also a scientific museum, with a library of over 15,000 volumes, and five other libraries, with a total of some 10,000 volumes. A fine statue of the patriot Hidalgo, occupies a prominent place in the Alameda or principal public square. This city is the seat of one of the most important Catholic Archbishoprics in the republic. The only local bank of issue is the Bank of San Luis Potosi, with a capital of \$1,100,000; but there are branches or agencies of the National Bank and the London and Mexico Bank, both of Mexico City. The city was founded about 1550 and has played an important part in the Mexican civil wars; in 1863 was the seat of government under Juarez; later was occupied by Bazaine and recovered by Juarez in 1867. Pop. (1906) about 75,000.

San Marcos, mār'kōs, Texas, town, county-seat of Hays County; on the San Marcos River, and on the International & G. N., and the Missouri K. & T. R.R.'s; 30 miles southwest of Austin. It became the county-seat on the organization of the county in 1848. It is in an agricultural region, cotton and corn being the chief products; stock-raising is also carried on in the vicinity. The town contains steam cotton-gins, and cottonseed-oil mills, also a United States fish culture station. There are two national banks with a combined capital of \$130,000. A group of boiling springs is located within the town limits. It has a public high school, established in 1891; and contains the grounds of the Texas Chautauqua Association. It is also the seat of the Coronal Institute, a secondary school established by the Methodist Episcopal Church South in 1879, and of the Lone Star Business School. Pop. (1890) 2,330; (1900) 2,292.

San Marino, mā-rē'nō, Europe, the smallest republic in the world, comprises an area of 38 square miles, enclosed by Italian territory, among the terminating spurs of the Apennines near the Adriatic coast. The government is peculiar and eminently democratic; the legislature is elected from the ranks of nobles, citizens and peasants. The executive is always of a dual nature, chosen every six months. The town, standing on a mountainous crag 2,200 feet high, was built round a hermitage dating from 441, and is surrounded by a great wall with forts. But one road enters the town. Borgo is an aristocratic suburb at the foot of the hill. Silk is the principal manufacture. There are numerous massive and stately buildings including the governor's palace, and churches, besides several schools, a museum, theatre, town-hall and convents. Agriculture is the chief pursuit. The city counts about 2,000 inhabitants. The state, about 11,000.

San Marino, Order of. See ORDERS, ROYAL.

San Martin, José de, hō-sā' dā sän mār-tēn', South American general: b. Yapeyu, Argentina, 25 Feb. 1778; d. Boulogne, France, 17 Aug. 1850. He was educated in Spain and entered the army in 1791. In 1811 he attained

the rank of lieutenant-colonel, but resigned and sailed for Buenos Ayres in 1812, where he offered his services in the cause of independence. He defeated the viceroy Vigodet on 13 Jan. 1813 at San Lorenzo, and the next year, being appointed commander-in-chief of the army of Upper Peru, prepared to attack the Spanish forces by an approach through Chile. An army of invasion was drilled for two years at Mendoza, whence San Martin began 17 Jan. 1817, his famous march over the Andes, leading his army through the Uspallata Pass. On 12 Feb. 1817, he gained the victory of Chacabuco, and captured and occupied Santiago 15 February. He was defeated on 19 March 1818 at Cancha Rayada, but repulsed the royalists on 5 April at the Maipo, and drove the Spaniards from Chile. He next invaded Peru, and captured and occupied Lima, 12 July 1821. On 27 July he proclaimed the independence of Peru and on 3 August was appointed protector. He resigned his office to the Peruvian Congress, 22 August, leaving Bolivar to complete the independence of Peru. He then went to France and lived there till his death.

San Miguel, sän mē-gēl', Salvador, the capital of a department of the same name on the Rio Grande, nine miles east of the active volcano of Saint Miguel (7,775 feet), and 70 miles southeast of San Salvador. It is an active commercial and agricultural centre, noted for its great annual fair. Indigo is an important article of commerce. The climate is malarious. Pop. (1901) 24,768.

San Miguel de Allende, dā āl-yēn'dā, Mexico, a manufacturing city in the state of Guanajuato, on the Rio de la Lara, and on the Mexican National Railroad, 34 miles north of Ceyala. Woolens, saddles and weapons are the chief articles produced. Pop. 39,000.

San Miguel de Mayumo, dā mā-yoo'mō, Philippines, pueblo, province of Bulacán, Luzón; on the San Miguel River; 26 miles north of Bulacán. It is on the main highway at the junction of several others; and the river is navigable for native craft. It is the commercial centre of a fertile agricultural region; excellent timber is obtained on the surrounding mountains and iron is mined at Sibul, eight miles distant. The climate is especially healthful, and there are medicinal springs in the vicinity of the iron mines. The town suffered considerable damage during the insurrection on account of its proximity to insurgents' hiding places in the mountains. Pop. 20,460.

San Miniato, mē-nē-ā'tō, Italy, in the province of Florence, 21 miles west of the city of Florence, on the Arno. The ancient cathedral dates from the 10th century and is adorned with many interesting monuments. Glass, olive oil, hats and leather are manufactured. The town has considerable historical interest, especially as being the cradle of the Napoleon family. Pop. 8,000.

San Nicolas, ne-kō-lās', Philippines, (1) Former pueblo of the province of Cebú, incorporated as a part of the municipality of Cebú, the provincial capital in 1901. Pop. 17,800. (2) Pueblo, province of Ilocos Norte, on the Laoag River; three miles south of Laoag. It is on the coast highway. Pop. 9,578. (3) Pueblo, prov-

ince of Pangasinán, near the Agno River; 34 miles east of Lingayén. It is connected with Lingayén and also with towns to the south by highway. Pop. 10,204.

San Nicolas, or San Nicolas de los Arroyos, dā lōs ār-rō'yōs, Argentina, a town in the province of Buenos Ayres, situated at the head of the delta of the Paraná, some distance below Rosario. It is an important railroad centre and a station for ocean steamers. It has electric light and street railways, large beef-packing houses, flour-mills and distilleries. The chief exports are wool and cattle products. Pop. of commune (1895) 18,706.

San Pablo, pā'blō, Philippines, pueblo, province of Laguna, Luzon; 17 miles south by west of Santa Cruz. It is on the main road from Santa Cruz to Tayabas, at the junction of other highways. It is the centre of an area of volcanic elevations, with five small mountain lakes in the vicinity. There are indications of valuable mineral deposits. Pop. 19,540.

San Pablo Bay. See SAN FRANCISCO BAY.

San Pedro, pē'drō, Cal., city in Los Angeles County; on San Pedro Bay, an inlet of the Pacific Ocean, and on the San Pedro, L. A. & S. L., and the Southern P. R.R.'s; about 25 miles south of Los Angeles. The harbor, enlarged and otherwise improved by the government, is one of the good harbors of the Pacific coast. The breakwater, 8,000 feet long, cost over \$3,000,000. The harbor when the improvements are completed (1903) will have a clear depth of 30 feet, permitting the largest vessels to enter the inner harbor. San Pedro is in an agricultural region and near sections in which there is considerable mining. Its chief industries are connected with exporting grain, fruit, and minerals. Pop. (1890) 10,000.

San Pedro, Paraguay, a town situated on a branch of the Paraguay River, about 100 miles north of Asunción. It is accessible for small steamers, and exports maté. Pop. about 6,000.

San Pio Quinto, pē'ō kēn'tō, a port on the western coast of Camiguin Island, north of Luzon, extending two miles inland, and three miles wide. It is sheltered by Pont Island lying in the middle of the entrance with a channel on each side. Near the entrance to the south is a boiling spring of salt water; a stream of fresh water enters this harbor. It is one of the principal cruising stations of the United States navy in the waters of the northern Philippines.

San Rafael, rā-fā-ēl', Cal., town, county-seat of Marin County; on San Pablo Strait, and on the North Pacific Coast and the San Francisco & North Pacific R.R.'s; 15 miles north of San Francisco. It is the centre of a stock-raising dairying, and agricultural region; and has frequent communication with San Francisco both by railroad and ferry. It is situated near Mount Tamalpais and is a well known health resort. It contains Saint Vincent's Male Orphan Asylum. It has a public high school, with a library of about 1,800 volumes (1904); and is the seat of San Rafael Institute, the Dominican College (for girls), a Roman Catholic secondary institution, the Hitchcock Military Academy, and the Mount Tamalpais Military Academy. Pop. (1890) 3,290; (1900) 3,879.

San Remo, rā'mō, Italy, in the province of Porto Maurizio, seaport, 30 miles northeast of Nice, on the Mediterranean, in the famous Riviera district, and a much frequented health and pleasure resort. The town is terraced, the ancient upper town with narrow and crooked streets lined with lofty buildings forming a strong contrast to the modern edifices of the lower town. Pop. (1901) 21,440.

San Sebastian, sā-bās-tē-ān', Spain, capital of the province of Guipuzcoa on the Bay of Biscay, 42 miles northwest of Pampeluna, is a port, and a natural and fortified stronghold. It has been the summer resort of the Cortes since 1886. The principal buildings are the churches of San Maria and San Vicente, a nunnery, the court-house, the schools of navigation, commerce, etc., theatre and hospitals. In the environs, on the Bay of La Concha, is the royal palace. The industries of the town have greatly developed, and include saw and flour mills, breweries, manufactures of preserves, soap, candles, glass, and paper, and there is considerable trade in English and French goods. Corn and other articles are exported. San Sebastian is an aristocratic watering place, bathing, bull-fights, gambling, and local festivities attracting many visitors. Historically it has played an important role, and has sustained several sieges, the most memorable in 1813, when Wellington took it by storm. Pop. (1900) 37,812.

San Stefano, stēf'a-nō, **Treaty of**, a peace treaty of the Russo-Turkish war; concluded 3 March 1878, at San Stefano, a port on the Sea of Marmora. By its terms Bulgaria was to become a principality, extending from the Danube to the Ægean, and Rumania, Servia, and Montenegro were recognized as independent. Russia was to receive a war indemnity of 300,000,000 rubles, and the Dobrudja, Kars, Batum, and other possessions. The congress held at Berlin, in June and July, 1878, greatly altered the provisions of this treaty, effecting peace on somewhat more moderate terms.

San Vicente, vē-sān'tā, or **San Vicente de Austria**, Salvador, 40 miles northeast of the capital, lies almost central in the Republic close to an extinct volcano of its own name. It is an attractive town; its handsome church is the only conspicuous building. It occupies a fertile region and the chief occupations are tobacco and indigo planting; and the manufacture of the former. The annual fair is much frequented. The town suffered from an earthquake in 1899. Pop. (1901) 17,832.

Sanaa, sā-nā', or **Sana**, Arabia, the capital of Yemen, lies in a high and well-watered valley, 260 miles north of Aden and 140 miles northeast of Hodeida on the Red Sea. It is of great antiquity, massively built and surrounded by a wall. Each street is arranged with reference to business confined to that locality, according to Asiatic custom. The principal mosque is of recent construction, an oriental building with fine domes and minarets. The chief manufactures are gold and silver articles, gunpowder, sword-blades, etc. Trade is in coffee — the great staple — dried fruit and raisins. Sanaa was long the capital of the independent Imams of Yemen, but in 1872 came under Turkish rule, since when

its commercial importance has declined. Pop. 45,000, of whom about 20,000 are Jews.

Sanatō'rium, a place or building to which people resort for the sake of their health, the term being specifically applied to military or civil stations on the mountains or table-lands of tropical countries, with climates suited to the health of Europeans. Recently a movement has been set on foot for the equipment of open-air sanatoria for consumptive patients.

Sanborn, sǎn'bĕrn, Alvan Francis, American journalist: b. Marlborough, Mass., 8 July 1866. He was graduated from Amherst in 1887 and has filled several journalistic positions, among them that of Paris correspondent of the Boston *Evening Transcript* 1899-1902. He has published 'Moody's Lodging House and Other Tenement Sketches' (1895); 'Meg McIntyre's Raffle and Other Stories' (1896); 'Paris and the Social Revolution' (1903).

Sanborn, Franklin Benjamin, American philanthropist and author: b. Hampton Falls, N. H., 15 Dec. 1831. He was graduated from Harvard in 1855, became active in politics as a member of the Free Soil party in New Hampshire and Massachusetts, was for a time secretary to the Massachusetts State Kansas committee, and aided John Brown in the invasion of Harper's Ferry after having vainly opposed the scheme. From 1863 to 1868 he was editor of the Boston 'Commonwealth'; in October 1863 became secretary of the Massachusetts State board of charities, the first established in America; and in 1865 assisted in the organization of the American Social Science Association, of which he was until 1897 secretary. With Bronson Alcott (q.v.) and W. T. Harris (q.v.) he founded the Concord school of philosophy in 1879; and he was also an organizer of the National prison association (1871), and the National conference of charities. Among his publications are: 'Life and Letters of John Brown' (1885); biographies of Thoreau (1882), Alcott (1883), and Dr. Howe (1891); 'The Personality of Thoreau' (1902); and 'The Personality of Emerson' (1903).

Sanborn, John Benjamin, American military officer: b. Epsom, N. H., 5 Dec. 1826. He was educated at Dartmouth College, studied law, was admitted to the bar in 1854, and in that year removed to Saint Paul, Minn., where he engaged in law practice. At the outbreak of the Civil War in 1861 he was adjutant-general and quartermaster-general of Minnesota and assisted in the organization of the troops sent to the front. In 1862 he went to the front with the rank of colonel. He commanded a brigade at Iuka, was engaged at Corinth, Port Gibson, Raymond, Jackson, Champion Hills, and at the siege and assault of Vicksburg. He had been commissioned brigadier-general of volunteers in 1863, and in October 1864 took command of the district of southwest Missouri. He bore the unique record of never having been defeated in action and with the exception of the assault of Vicksburg, never failed of complete success. He conducted a campaign against the Indians in 1865, amicably adjusted the Indian difficulties the next year, and in 1867-8 was a member of the Indian Peace Commission. He served in the Minnesota legislature for several terms.

Sanborn, Katherine Abbott ("KATE SANBORN"), American author and lecturer: b. Hanover, N. H., 11 July 1839. She earned her first money by writing, at the age of 11, and at 17 engaged in teaching. She lectured on literary topics for 20 years, was teacher of elocution at Packer Institute, Brooklyn, and for several years occupied the chair of English literature at Smith College. She has published: 'Home Pictures of English Poets' (1869); 'Round Table Series of Literature Lessons' (1884); 'The Vanity and Insanity of Genius' (1885); 'Adopting an Abandoned Farm'; etc.

San'cho, an instrument of the guitar species, made of hollowed wood and furnished with a long neck. It is strung with the tough fibres of a creeping plant, and is tuned by means of sliding rings.

Sancho Panza, sǎn'kō pǎn'za (Sp. sǎn'chō pǎn'tha), the faithful squire of Don Quixote (q.v.), who accompanies his master upon his travels, but who takes a prosaic view of the incidents colored and distorted by his master's illusions. He is famous for his shrewd proverbs.

Sanchuniathon, sǎn-kū-nī'a-thōn, or **Sanchoniathon**, alleged author of a history of Phœnicia and Egypt, entitled 'Phoinikika,' and published by Philo (q.v.) of Byblus, a grammarian of the 2d century, as a Greek translation from the Phœnician. According to Philo, Sanchuniathon was a native of Berytus, a Phœnician town near his own native place, and flourished during the reign of the Assyrian queen Semiramis. Others speak of him as a Phœnician living before the Trojan war. Some critics maintain that no such person ever existed, and that the work attributed to him was the composition of Philo himself, or, as others think, of Eusebius. A fragment of the work is preserved in Eusebius, who quoted Sanchuniathon as evidence in corroboration of certain biblical statements which Porphyry had assailed. The Greek fragments still extant were published by Orelli (1826) and by C. Müller (1849), and were the occasion of much keen controversy. The conclusion arrived at by Renan is that a Phœnician of the time of the Seleucides, whose real or feigned name was Sanchionathon, wrote in Phœnician, a work on history and mythology, and that a free translation of this was afterward made by Philo of Byblus.

Sancroft, sǎng'krōft, William, English prelate: b. Fressingfield, Suffolk, 30 Jan. 1617; d. there 24 Nov. 1693. He was graduated from Cambridge in 1637, was appointed dean of York in 1664, took orders in the English Church, and shortly afterward became dean of Saint Paul's Cathedral. In 1678 he was consecrated archbishop of Canterbury, but in 1688 on refusing to publish the declaration of the liberty of conscience ordered by James II., was committed to the Tower for trial. He was acquitted, but after the Revolution refused to take the oath of allegiance to William and Mary, was deprived of his see, thereafter living in seclusion in his native town until his death.

Sancti Spiritus, sǎnk'tē spĕ'rĕ-toos, Cuba, city, province of Santa Clara, 50 miles south-east of the city of Santa Clara. It was founded in 1514, being one of the seven original towns of the island established by Diego Velasquez. It

is connected by a branch road with Las Tunas, on the south coast, and with the main railroad system of the island; but has little commercial importance. Its situation is unhealthy; its streets are narrow and crooked, but were improved somewhat during American occupation of Cuba, nine streets being completely re-made. It contains two hospitals and a college. Pop. (1899) 12,696.

Sanctification, a theological term in the definition of which divines Protestant and Catholic differ widely. For the former, sanctification is totally distinct and separable from justification: for Catholic theologians, sanctification and justification are inseparable and hardly even in thought distinguishable one from the other. Calvin (Inst. Book 3, ch. ii.) the Lutheran symbol 'Solida Declaratio' (ch. *de fide justif.* §7), and Luther and Melancthon in many places, teach that justification is simply a judicial act of God's free grace liberating the sinner from *condemnation*, while original sin still persists in man's nature and in all his powers inward and outward, to be weakened, not extirpated, by the communication of the Holy Spirit: thus sanctification is a process which begins after justification. Justification in the teaching of the Catholic Church is defined by the Council of Trent (Sess. 6, ch. vii.) to be "not only remission of sins but also *sanctification* and renovation of the inner man through the free acceptance of grace and gifts"; and in another place (Sess. 6, ch. v.) the Council teaches that "justification is a transference out of that state in which man is born a son of Adam, into the state of grace and adoption of the children of God, by the Second Adam, Jesus Christ, our Saviour." From which it appears that in Catholic theology sanctification is inseparable from justification, which depends upon it; and that "the sinner is justified and sanctified by the one same act"; *uno eodemque actu homo peccator justus sanctusque efficitur* (Perrone, 'Praelect Theol.,' tr. *de Gratia*, Pt. 2, ch. i.).

Sanctuary, Privilege of, the exemption of certain places and of criminals taking refuge in them from the ordinary operation of the law of arrest: called also privilege of asylum (q.v.). The six cities of refuge mentioned in the Book of Numbers xxxv., were to afford the privilege of sanctuary to "any one that killeth any person unawares." That institution in Israel and the institution of asylum among the heathen nations gave rise to the similar institution of sanctuary in Christendom. The privilege of sanctuary was accorded to certain churches in the time of Constantine; afterward, through the period of the empire, eastern and western, and throughout the Middle Ages, it was recognized as attaching to all churches. In England a person accused of felony might take refuge in a sanctuary, and then before the coroner, within 40 days, take oath of abjuration entailing perpetual banishment into a foreign Christian country. Statutes of the time of Henry VIII. greatly curtailed the privilege of sanctuary, and the statute of 21 James I. totally abolished it. But the privilege of sanctuary against civil process still persisted, attaching to certain places, parts or supposed parts of royal palaces, as Whitefriars ("Alsatia"), the Savoy, and the Mint: these were secure refuges for debtors till 1697,

when their privilege was abolished by the statute 8 and 9 William III. All religious sanctuaries in Scotland were done away at the Reformation; but the Abbey and Palace of Holy Rood with its precincts, including the hill of Arthur's Seat and the Queen's Park still afforded protection against civil process for debt; and the privilege still exists in form, though in fact it never has to be invoked since the abolition in 1880 of imprisonment for debt.

Sanc'tus, or **Tersanctus**, a passage in the liturgical service of the Catholic Church, eastern and western, and in part still retained in the Anglican Book of Common Prayer: it is the final passage of that part of the liturgy (and of the Anglican communion service) which is called the Preface. The name Sanctus or Tersanctus (thrice holy) is given to it because of the word sanctus (holy) thrice repeated, with which it opens: *Sanctus, sanctus, sanctus, Dominus Deus Sabaoth*, etc., that is, "Holy, holy, holy, Lord God of Hosts, heaven and earth are full of Thy glory. Hosanna in the highest. Blessed he that cometh in the name of the Lord. Hosanna in the highest." In the prayer book only the first clause is used, followed by "Glory be to Thee, O Lord Most High. Amen."

Sand, *sând* (Fr. *sând*), **George**, assumed name of Amantine Lucile Aurore Dupin, French author: b. Paris 5 July 1804; d. Nohant, Berri, 7 June 1876. Until 14 she was brought up at the Château of Nohant near La Châtre (department of Indre), mostly under the care of her grandmother, a great admirer of Rousseau and Voltaire, who was at constant feud with her mother about her upbringing. In these circumstances she grew up somewhat wild, and it was agreed to send her to a convent. The English Augustine convent in Paris was selected, and here she remained from 1817 to 1820. In 1822 her parents obliged her to marry M. Dudevant, son of an officer and baron of the empire. Mme. Dudevant's married life proved unhappy, and in 1831 she left Nohant for Paris with L. S. J. Sandeau, a young lawyer. She obtained her livelihood at first by painting fancy articles such as cigar-cases, but began to work at literature in collaboration with Sandeau. After some minor productions in the 'Figaro,' she and Sandeau brought out in the 'Revue de Paris' a novel called the 'Prima Donna' and another 'Rose et Blanche.' These works were published under the pseudonym, formed by abbreviation, of Jules Sand. They excited little attention, but the genius of Mme. Dudevant had been recognized by Henri Delatouche, under whose patronage her first independent novel, 'Indiana,' appeared (1832), and who suggested the pseudonym George Sand. 'Indiana' had a brilliant success, but excited much criticism by its extreme views on social questions.

This was also the case with many others of her works: 'Valentine,' 'Lélia,' 'Jacques,' 'André,' 'Leone Leoni,' 'Simon,' 'Mauprat,' 'La Dernière Aldini,' 'Lavinia,' 'Metella,' and others, appeared within the first few years after her début. She visited Italy with Alfred de Musset (q.v.): and lived eight years with Frédéric François Chopin (q.v.), the composer. These relations also influenced or occasioned some of her works (as 'Elle et Lui,' 1858). In 1836 she obtained a judicial separation from her

husband, with the care of her children. She took an active interest in the revolution of 1848, and contributed considerably to newspaper and other political literature.

Her works no longer occupy the place they once did. The style is neutral, not careless, but also with no distinction. There is little originality, and small analysis. Despite Dowden's protest, the process was evidently more or less of a mechanical one, composing from 10 to 5 daily in business-like fashion; beginning with no idea of a plot and no character study; evolving things as the pen hurried along. In this manner books were made with the regularity of the rotation of crops. In smallest compass as published by Lévy of Paris, they fill 120 volumes. Small wonder that the author in a few years read them as if they were the works of others. They have, it is true, imagination; but it does not vitalize; it makes literature of a sort, but not literature which, like that of the great names, stands a second perusal. Perhaps the author is at her best in descriptions of French landscape. English critics apparently attacked her work from the first, for we find a National Reviewer using of 'Lélia' the words "incoherent," "foolish," "useless." But while this exaggeration has been tempered by a juster appreciation, it is true that the great body of such an output, its declamation, its doctrinaire views, its lack of harmony, have been found tedious despite the style. Consult the biography by Caro (1887) and Thomas.

Sand, a mass of unconsolidated mineral grains of practically uniform size, large enough to be detected with the unaided eye, but too small for the grains to be readily picked up by hand. In composition sand varies greatly, from grains of pure silica or pure calcium carbonate to a complex mixture of many minerals. Pure silicious sand is in most cases primarily derived from the disintegration of igneous or other rocks, containing silica, which remains behind after the removal of other minerals more subject to chemical disintegration. The separation is usually accomplished by the waves of the seashore, and in general it may be said that the longer the sands are subject to wave activity, the more complete will be the sorting process. Calcareous sands result mostly from the grinding up by the waves of shells, corals, etc., or of limestone beds; and may be of all degrees of purity. On the shore, the sands are kept firm by the water held between the grains by capillary attraction. If this evaporates, the sands are driven inland by the winds, piled up into sand-dunes, and often convert extensive districts into sand-deserts. (See DESERT.) River sands derived from crystalline or metamorphic rocks often carry gold or other precious metals in the forms of grains or nuggets. Sands washed by temporary streams from glaciers or glacial moraines and deposited in front of the ice, build up sand-plains, which are the chief source of sands and gravels in glaciated regions. See GLACIAL DEPOSITS.

Sand-badger, or **Hog-badger**, a small East Indian badger (*Arctonyx collaris*), which gets its first name from its customary station and burrowing habits, and the second from its pig-like rooting snout. Another frequently heard name is "balisaur." It frequents stony ground and occupies natural crevices and dens

when these are handy, but elsewhere digs rapidly and deeply burrows in which it spends its days for the most part, waiting until night to go abroad in search of its small prey. Its general habits are like those of its type. See BADGER.

Sand-blast, an invention for the use of sand as a blast in cutting and engraving glass, stone, metals, etc. The sand is blown against the article to be cut by a blast of air or steam, which quickly cuts away the unprotected surface, leaving in relief that part of the surface guarded from the effect of the sand by patterns of iron or other substance harder than that which it is desired to efface. The sand-blast attracted much attention when first introduced, and it has been used largely in the preparation of soldiers' tombstones, and other large contracts of a similar character.

Sand-bur, either of two very dissimilar plants. One, also called the buffalo-bur (*Solanum rostratum*), is a weed, native to the western plains of the United States; it is the original food of the potato-bug, and is working eastward, its seeds having traveled at first, perhaps, in the coats of the bison. It has even crossed to Europe, by some means. The sand-bur is an annual, densely pubescent, and prickly-armed plant, having the characteristic star-shaped flowers of the potato, although yellow in hue. The calyx is densely prickly, and surrounds the berry in fruit, the prickles becoming as long as the berry itself. Sand-bur seeds occur among fodder-seeds grown in the West, but careful cultivation will subdue this weed. The plant is light and bushy, and is blown over the prairies as a tumble weed.

A grass (*Enchurus tribuloides*) is also called "sand-bur," and is commonly found near seashores or in waste land, in the eastern half of the United States, where it is becoming a noxious weed in some places. It has robust stems, partly decumbent from an annual root, and branches freely. The leaves are flat, and the floral involucre are crowded in terminal spikes on a rough stem, and form spiny burs, which stick easily to clothing or the hair of animals, and so may be carried long distances.

Sand-cake, or **Sand-dollar**, a name along the New England coast for one of the flat, dollar-shaped, villous sea-urchins of the genus *Echinarachnius*; several species are to be found on sandy bottom near shore, and others are numerous in greater depths, affording some food to cod, flounders and other bottom-feeding fishes. See CAKE-URCHIN.

Sand-crack, a crack or fissure in the hoof of a horse, due to a disease generally referred to the coronet, sometimes to the laminae covering the pedal bone, specifically to the membrane which secretes an essential adhesive substance entering into the constitution of the hoof. The crack generally extends from the coronet toward the sole. In the fore feet the inner quarters are most frequently attacked; in the hind feet, the toes. There are various forms of sand-crack, the most common of them being usually called quarter-crack. See Hoof.

Sand-darter, a genus (*Ammocrypta*) of small fresh-water fishes (see DARTER), whose species, especially *A. pellucida*, common in the mid-continent streams, buries itself in the sandy

SAND-GROUSE—SAND WHEEL

bottom with astonishing quickness and completeness.

Sand-grouse, a family (*Pteroclidæ*) of birds related, on the one hand, to the pigeons (*Columbæ*), and, on the other, to the grouse (*Gallinæ*). The sand-grouse inhabit the plains and sandy deserts of the tropical regions and countries of the eastern hemisphere. The legs are longer than in grouse, the tail and wings pointed and the general aspect dove-like. The best-known species are the *Pterocles alchata* and the *P. arenaria*. Both of these birds occur in southern Europe. They fly well, and feed upon seeds and insects. The eggs are four or five in number, and the nest is constructed in a rough fashion on the ground. Other species inhabit Asia and Africa. Pallas' sand-grouse has been made the type of a different genus, *Syrhaptes*, in which the tarsi are feathered and the anterior toes united in a common integument, as well as feathered to the claws, the hallux absent. It is a native of the plains of Central Asia, where it occurs in vast numbers. Much interest was excited in 1863, and again in 1888, by great numbers of these birds invading Europe. They crossed the North Sea and were found in considerable numbers throughout Britain, and as far north as the Faroes. They even bred in Great Britain in one or two cases. Smaller invasions occurred in other years. Sand-grouse are classed as game-birds in the regions in which they occur and especially in India.

Sand-hill crane. See CRANE.

Sand-hopper. See AMPHIPODA.

Sand-launce, or **Sand-eel**, a small teleost fish of the family *Ammodytida*, which is represented on all the colder coasts of the world by some ten species, but whose relationships are undetermined. They have the shape of eels, from 6 to 12 inches long, according to species, but are distinguished by the fact that the tail-fin is well developed, and is distinct from the dorsal and anal fins, while it is also forked at its extremity. The skin is silvery in appearance, but destitute of true scales. The lateral line runs along the side of the back. The dorsal fin begins just behind the head, and extends nearly to the caudal fin. The anal fin extends to about one third or one half the length of the body. Several species are to be found on both coasts of North America.

Sand-Martin. See BANK-SWALLOW.

Sand, Musical. See MUSICAL SAND.

Sand-paper, an abrading agent made by coating paper or thin cotton cloth with glue and dusting fine sand over it with a sieve. Sand-paper is intermediate between glass paper and emery paper in its action on metals, but is less energetic than glass paper in its action on wood.

Sand-pike, a fish, the sauger (q.v.).

Sand Pipe, cylindrical hollows, often of great depth, and filled with sand and gravel. They are characteristic of all rocks, but have been particularly described from the white chalk of England and France, where Lyell has found them up to 12 feet in diameter and over 60 feet deep. They are analogous to pot-holes formed along mountain streams through the gyrating motion of the water in an eddy. The

holes are cut by loose rocks kept in constant circular motion by the water. Analogous hollows, termed glacial pot-holes or moulins, are also formed where a superglacial or englacial stream plunges down a crevasse and sets the rocks at the bottom of the crevasse in motion, thus often cutting to great depths. These holes, or pipes, are afterward filled with sand and gravel either by the stream or upon the melting of the ice. These holes have also been attributed by Lyell to the chemical action of water charged with carbonic acid gas, which was derived from the decaying vegetation of the soil through which the water passed.

Similar deposits of sand, generally solidified into sandstones or quartzites, are not infrequently found in the older rocks of all countries. These are generally masses in the form of dikes penetrating sedimentary or crystalline rocks, often to a great depth. Many of these sandstone dikes were formed at a very early period in the earth's history, when the fissures were formed either through solution, atmospheric disintegration, or in some cases through earthquake shocks.

Sand-shark, a small voracious shark of the family *Carchariidæ*, which is mainly extinct, the three existing species occurring chiefly in the Atlantic, where *Carcharias littoralis* (J. & E.) occurs numerously on the American coast between Cape Cod and Cape Hatteras; it is doubtfully different from the one frequently seen along the European coast. These sharks are similar to the mackerel sharks (*Lanuridæ*), and reach a length of five or six feet.

Sand-sucker, a local name in California for a familiar fish, the whiting (q.v.).

Sand-wasp, any of many solitary wasps which burrow in sand or loose earth, and leave their eggs there in well-provisioned cells. There are numerous species in all parts of the world. See WASP.

Sand Wheel. The removal of fine waste, sand and slime, from mills where ores are crushed and concentrated, may call for the use of special devices, one of which is the sand wheel. If the mill stands on a hillside such refuse can usually be washed down troughs, called launders, to lower ground where it may accumulate. If the mill site is level land, and the mill handles a large amount of rock, then the refuse must be lifted that it may flow to a settling place. Various types of elevators and conveyors are used for this purpose. The sand wheel, though bulky, has the merits of simplicity and few wearing parts, and is simply a development of the water wheels used since ancient times for irrigation purposes in eastern countries. At ore mills in many parts of the world sand wheels may be seen, notably at the great gold mines of the Transvaal, where are some over 50 feet in diameter.

A giant sand wheel, one of the largest ever erected, now handles the mingled sand and water from the great crushing and concentrating plant of the Calumet & Hecla Mining Company, at Lake Linden, Mich. This mill treats an enormous tonnage of copper-bearing rock and the resulting waste is run into the lake, where the accumulations of years now cover many acres. That the waste might be lifted higher to flow over the old deposits the new wheel was erected.

It is 65 feet in diameter, elevates the water and waste to a height of 50 feet, and has a capacity of 75,000,000 gallons in 24 hours.

It was constructed by the Robert Poole & Son Company, of Baltimore, Md. In the general principles of design involved the wheel does not differ materially from other segmental iron and steel wheels of large diameter, but is of interest from its size. The axle, a hollow cylinder made of Krupp's crucible cast steel, was forged at Essen, Germany, but finished at Baltimore; it is 27 feet long, 32 inches in diameter at the middle and has a 16-inch hole through the centre. This axle weighs 42,000 pounds.

The axle journals are 25 inches in diameter and 42 inches long. Fitted to either end of the axle is a massive gun-iron hub, weighing 20,000 pounds, and from these hubs radiate 40 four-inch steel rods, or spokes to the inner face of the rim. The inner end of each spoke is fitted with a thread, nut and lock-nut by which the requisite tension is given for securing and truing the rim. The outer end of each rod is turned into an eye, and fastened to a steel flange on the rim by an eye-bolt. The rim is built up in 20 segments. It consists of two concentric rings, an inner, or main, ring of box-shaped cross section to which the spokes are attached, and an outer, or toothed ring fastened through inwardly projecting flanges to the inner rim by bolts and keys. On the periphery of this outer rim are gear teeth, accurately milled in two rows, staggered. Each row of teeth is 12 inches wide, making the effective width 24 inches. And there are 26 teeth in each segment or 520 in all.

To each side of the sectional rim is rivetted a triangular plate iron box, carrying on its inner side 275 buckets, making 550 in all, each bucket measuring 4 feet, 3½ inches, by 3 feet, 4 inches. The wheel makes about 4 revolutions per minute and the peripheral speed of the buckets is about 12 feet per second, but the buckets are set at such an angle that the peripheral speed prevents their discharge till they are near the top of the wheel. The tangential strains due to the loads of sand in the buckets, are taken up by a system of tangent tie-rods which extend from the lugs, already referred to, on the rim, to the periphery of a tangent hub which is keyed to the centre of the axle, between the two outer hubs. These tie-rods are arranged in pairs and in opposite directions so that, although the load at the periphery may exert either a right-handed or a left-handed strain, no transverse bending strain is brought upon the main spokes of the wheel. The tension of the tangential tie-rods is adjusted by means of turnbuckles placed at the centre of each rod. The wheel, with buckets attached, is nearly 12 feet wide across the face. It is driven by an electric motor of 750 horsepower through a pinion wheel 37 inches in diameter having a shaft carrying a wheel that engages a pinion on the motor shaft. The wheel dips into a pit 100 feet long, 12 feet wide and 30 feet deep that receives the sand and water. From this pit the refuse is scooped up and discharged into a launder at an elevation of about 50 feet. For protection against the elements, the winter climate being severe, the wheel is housed in a building high enough to cover it entirely.

S. SANFORD,
Engineering & Mining Journal.

Sandal, a kind of covering for the feet used among the ancient Jews, Greeks, and Romans, and which we find to be of the highest antiquity. It usually consisted of leather, or of a thick cork sole covered above and beneath with leather and neatly stitched on the edge. It left the upper part of the foot bare, and was fastened on by means of straps, crossed over and wound round the ankle. In later times sandals became articles of much luxury, being made of gold, silver, or other precious material, and beautifully ornamented. See **BOOTS AND SHOES**.

Sandal-wood, a fragrant wood furnished by the genera *Santalum* and *Fusanus*, of the *Santalaceæ*. The principal source of the genuine sandal-wood is a small evergreen tree (*Santalum album*), partly parasitic in growth, with opposite entire leaves, and thyrses of yellowish flowers which resemble those of the privet. It grows wild, and is now also cultivated, in the dry regions of southern India, and on the mountains of the Malay Archipelago.

The trees are mature in about 20 years and are then cut down, the trunk being then about a foot in diameter. The felled trunks are left on the ground in order that the white ants may eat off the useless sapwood, the insects leaving the aromatic heart wood untouched. When thus cleaned the sandal-wood is sawn into small pieces, and then dried slowly to improve the fragrance and to prevent splitting. This heart wood is yellowish-brown, very hard and close-grained and made odorous by the presence of an oil, which is still more abundant in the root. The oil is distilled from the roots and chips, and is largely used as a perfume, especially in India, and also as a medicine; it is said to have replaced copaiba in the treatment of diseases of the mucous membrane. The heart wood is used especially by the Chinese for carvings, fans, boxes, etc., not only because of its lasting perfume, but because it repels insects; it was employed in India during the 5th century at least, and is still a necessary article in various Buddhistic ceremonies, in cremations, for caste marks, and for incense. It was probably one of the ingredients of the Levitical incense and the almug of Scripture. Sandal-wood was originally obtained only in India, but other species (*S. freycinetianum* and *S. pyrularium*) were found in Hawaii, and in other Pacific islands, and led to a trade so high-handed that many deaths ensued, and the supply of trees was nearly exhausted.

Another small leguminous tree (*Pterocarpus santalinus*) furnishes the red sandal- or sanderswood, having a heart wood, first dark-red, but becoming brownish on exposure, and used as a dyestuff, giving reddish-brown hues to woollens. Powdered, it was employed to color foods, and was considered by Hindu physicians to be astringent and tonic. Various inferior qualities of sandal-wood are obtained from *Bucida capitata*, the *Mvoborineæ* and other trees.

San'darach, a friable, dry, almost transparent resin, which is imported from Morocco, in pale yellow tears, somewhat harder than mastic. It exudes from the bark of the small coniferous sandarach-tree, also called the tear tree (*Callitris quadrivalis*), a native of the north of Africa, and a characteristic tree of the Atlas

GIANT SAND WHEEL FOR THE CALUMET AND HECLA MINING COMPANY.

Diameter, 65 Feet; Weight, 50 Tons; Number of Buckets, 550.

Mountains. The Australian species of *Callitris* furnish a similar resin. Sandarach is not used in great quantity. Although a medicine in high repute at one time, and later used for a pounce-powder, to prevent ink from spreading when writing over an erasure, its chief employment now is in the making of varnishes, the same as mastic. The mahogany-colored wood of the sandarach tree is highly balsamic, extremely durable, and is utilized by cabinet-makers and mosque-builders; it is said to have brought fabulous prices in Pliny's time.

San'day, William, English biblical scholar: b. Holme-Pierrepont, Nottinghamshire, 1 Aug. 1843. He was educated at Oxford, took orders in the Anglican Church, and has been Lady Margaret professor of divinity and canon of Christ Church, Oxford, from 1895. He is the author of: 'The Authorship and Historical Characters of the Fourth Gospel' (1872); 'The Gospels in the 2d Century' (1876); 'Inspiration' (1893-6); 'The Catholic Movement and the Archbishops' Decision' (1899), etc.

Sandbags, in fortification and other military operations, are coarse canvas bags, about 30 inches long and 15 inches thick, filled with sand, and much used in cases where cover for troops is required to be speedily obtained.

Sand'by, Paul, English painter: b. Nottingham 1725; d. London 9 Nov. 1809. He was one of the earliest painters in water colors in England, and has been styled "the father of the water color school," but began life as a teacher of boys and only resolved on an artistic career after his appointment to the staff of the military drawing department of the Tower of London (1741). In 1747 he was draughtsman for the government survey of the Highlands of Scotland, which gave him a good opportunity for sketching the scenery. In 1752 he made 70 drawings of Windsor Castle and Eton, and afterward accompanied Sir Joseph Banks on a tour of Wales. In 1768 he was appointed drawing-master at Woolwich Academy, and became one of the most fashionable art teachers of his day. His 'Views of the Encampment in the Parks' (1780) illustrate his style. He outlined his subjects with a pen, and then washed them in with colors in a very simple and direct way. His best works are those in body colors, which are tinted with richness, depth, and refinement, and are not conventionalized by the bold pen outline. As a caricaturist, he is known by his ridicule of Hogarth's 'Line of Beauty,' and his caricature portraits, such as those of 'Lords North and Thurlow.' He was a member of the Incorporated Society of Artists, and one of the original members of the Royal Academy, founded 1768.

Sand'au, Léonard Sylvain Jules, lā-ō-nār sēl-vān zhūl sān-dō, French dramatist: b. Aubusson, Creuse, 19 Feb. 1811; d. Paris 24 April 1883. He came to Paris in 1831 in company with George Sand, and for two years they lived and worked together, contributing to 'Figaro' and collaborating on a novel 'Rose et Blanche' (1831) published as the work of "Jules Sand." The intimacy was ended in 1833 when he made a visit to Italy. He returned to Paris the next year, however, and resumed his literary career. He became librarian of the Mazarin

Library in 1853 and curator in 1859, having the year previously been elected to the French Academy. He was joint author with Augier of 'Mlle. de la Seiglière' and 'Le Gendre de Monsieur Poirier.'

Sandeman, sǎn'de-man, Robert, Scottish religious leader: b. Perth, Scotland, 1723; d. Danbury, Conn., 1771. He studied at Edinburgh, and afterward engaged in the linen trade. On marrying the daughter of the Rev. John Glass (founder of the Glassites), he adopted his pastor's views in opposition to all church establishments and became an elder in his congregation. He soon after published a series of letters, in which he endeavors to show that a justifying faith means nothing more than a simple assent to the divine mission of Christ. Sandeman went to London in 1760 and managed to gather together a congregation of his own followers, who were called Sandemanians. The Glassites or Sandemanians number at present less than 2,000 throughout the world. In 1764 Sandeman accepted an invitation to New England, and became the author of some theological tracts, letters, discourses, etc., besides his 'Letters on Theron and Aspasio.' The Sandemanians revived the love-feast (to take place in each other's houses); the kiss of peace; the support of the poor members by the community; washing each other's feet; community of goods; they maintained the unlawfulness of saving money; etc. They still have a slender following at Danbury, Conn. The most noted personage professing the Sandemanian faith was the great scientist, Michael Faraday (q.v.), who lived and died in that communion.

Sandema'nians. See SANDEMAN, ROBERT; RELIGIOUS SECTS.

San'derling, a sandpiper (*Calidris arenaria*), peculiar in lacking the hind toe. This bird averages 7 to 8 inches in length, and is colored in winter, gray on the upper, and white on the under parts; the spring plumage differs in exhibiting reddish tints, marked with black. It is nearly cosmopolitan, breeding in the Arctic regions of both hemispheres, and migrating to the southern parts of South America and Africa, though many winter in the southern States. The food consists of worms, crustacea, etc. These birds chiefly inhabit the sandy tracts of the sea-beach, and the estuaries of rivers, but are common about large bodies of water in the interior also, and associate with other species. The flesh is nutritious and pleasant to the taste, and the bird is a favorite with gunners in quest of shore-birds.

Sanders, sǎn'dérz, Frank Knight, American Biblical scholar: b. Batticotta, Jaffna, Ceylon, 5 June 1861. He was graduated from Ripon College, Wis., in 1882, was instructor at Jaffna College 1882-6, and studied Semitic languages at Yale 1886-7. He was Woolsey professor of biblical literature at Yale 1893-1901, and since the last named year has held the chair of biblical history and archaeology at the Yale Divinity School. He has published with C. F. Kent 'The Messages of the Earlier Prophets' (1898); 'The Messages of the Later Prophets' (1899).

Sanders' Raid into East Tennessee. On 12 June 1863 Col. W. P. Sanders, with 1,500 mounted men and two guns, left Mount Vernon,

Ky., to destroy the East Tennessee & Virginia Railroad. Crossing the Cumberland River he surprised a body of 400 Confederates at Montgomery, Tenn., on the 17th, capturing 105 officers and men and a large amount of supplies. Avoiding the Confederates at points on the way, he struck the railroad at Lenoir on the morning of the 19th, captured three guns and about 65 prisoners, burned the depot and other buildings, containing five guns, 2,500 stand of small arms and ammunition, and then destroyed the railroad to within a short distance of Knoxville. Leaving a regiment south of the city to demonstrate on it, Sanders, with the rest of the command, passed around the place during the night, struck the railroad north of it, burned the bridges, and on the morning of the 20th made a strong demonstration on Knoxville by the Tazewell road. Artillery-firing and skirmishing continued an hour, during which Sanders captured two guns, 30 prisoners, and some horses, and then followed the railroad to Strawberry Plains, destroying all bridges, including one over the Holston 1,600 feet long, near which, after a sharp engagement with the bridge-guard, he took 140 prisoners, five guns, and a train of cars loaded with supplies. At daylight 21 June he started up the railroad for the Mossy Creek bridge, destroying the road at several points, and also the bridge. Large quantities of stores and 120 prisoners were captured. He now left the railroad to return by Rogers' Gap, avoiding forces sent to intercept him. The gap was found blocked by fallen timber and guarded by infantry and artillery, and adjoining gaps were found similarly obstructed. With the enemy in his front and closing on his rear, he found but one way to escape, and that by a trail impassable for artillery. He abandoned his guns, after destroying them and their ammunition, and by a wood road moved through Smith's Gap, three miles from Rogers', driving a cavalry regiment from it, and after a hard march in the Cumberland Mountains, in which some of his men took wrong roads, he reached Boston, Ky., on the 23d with a loss during his raid of two killed, four wounded, and 13 missing. He had captured 10 guns and 10,000 small arms and paroled 461 prisoners. Consult: 'Official Records,' Vol. XXIII.

E. A. CARMAN.

Sander'son, Sibyl, American opera singer: b. Sacramento, Cal., 1865; d. Paris, France, 16 May 1903. She studied music in Paris and made her debut at The Hague in 1888 in Massenet's 'Manon.' The composer then wrote for her 'Esclarmonde,' which she sang in Paris. She also appeared in 'Le Mage,' 'Thais,' in the 'Lakme' of Delibes, and in 1894 sang the part of the heroine in Gounod's 'Romeo et Juliette' at the Grand Opera. She appeared in New York in 1895 and in 1901, but without any great success. Though she sang in various cities of Europe her greatest successes were won at Paris.

San'dersville, Georgia, city, capital of Washington County, on the South Carolina & Georgia Railroad; 120 miles northwest of Savannah. It is situated between the Oconee and Ogeechee rivers, in a fertile cotton region, and has a considerable export trade in cotton. It has a high school for colored pupils established in 1890. Pop. (1890) 1,760; (1900) 2,023.

Sand'ford and Merton, The History of, a famous book intended for juvenile reading, by Thomas Day, published 1783-9. Portraying English social ideas of more than 100 years ago, it can hardly be regarded at the present time, as other than a literary curiosity. It is named for two school boys whose adventures are related in the most priggish fashion. Morals are tediously drawn from every incident of their daily lives, and from the stories which they read in their lesson books. Not the least remarkable feature of the book is the polished language used by these children of six years of age.

Sandham, sänd'am, **Henry**, American artist: b. Montreal, P. Q., 24 May 1842. He engaged in business until 1881, though he had studied and practised art from an early period. After that date he visited England and France for further study, and finally settled in Boston. He is a painter of portraits, landscape and genre, and has given much attention to illustration. He was made a member of the Royal Canadian Academy in 1880. His 'Dawn of Liberty' (1886) hangs in the Lexington, Mass., town hall.

Sandhurst, sänd'herst, England, in Berkshire, about five miles southeast of Wokingham, is notable for the Royal Military College, established here in 1812. Students enter by competitive examination. The course extends over one and one half years and comprises all subjects relating to military tactics, law, history and geography, gymnastics, etc. At its completion the cadets enter the infantry or cavalry with the rank of second lieutenant. Pop. (1901) 2,386.

Sand'pipers, small limicoline birds of the family *Scolopacida*, but not clearly distinguished, either in ornithology or in common practice, from the snipes (q.v.), although attempts have been made to erect them into one or more sub-families, *Tringina*, etc. Most of the group collect about the typical genus *Tringa*, and as a whole the sandpipers may be said to be intermediate between the snipes and the plovers. The bill is snipe-like in its form and sensitiveness, but is much shorter, while the legs are generally longer than in the true snipes, and the tail-feathers are not cross-barred, and sandpipers are further distinguished from the snipes and allies by the well-marked seasonal changes of the plumage. From the plovers the sandpipers may be at once known by the straight and slender bill, and by the possession of a well-developed hind toe, with the single exception of the sanderling (q.v.), as well as by numerous other characters. The true sandpipers are all birds of small and some of diminutive size. Like most of the plovers they are, with few exceptions, gregarious, and frequent the shores of sea, lake and river in large flocks, but they differ from the plovers and resemble the snipes in their mode of procuring food; they probe the soft mud with their slender sensitive bills, and extract from it various kinds of worms, crustaceans and larvæ. Most of the species breed in the north and perform extensive migrations. The simple nests are built on the ground, and the eggs are almost invariably four, and of a strongly marked pyriform shape well adapted to prevent them from rolling away. The young are fully covered with down and are active as

SANDPIPERS

soon as freed from the egg shell. Very nearly all of the sandpipers belong to the northern hemisphere during the breeding season, and as they are especially prone to wander during the migrations, a large proportion of the Old World species have occurred as more or less regular stragglers in North America. Our fauna includes about 25 species exclusive of the related phalaropes, willets, godwits, tattlers, and curlews (qq.v.), all of which, except the last, are by some writers comprised within the sandpiper group.

Some of the species are treated in other parts of this work under the names knot, dunlin, robin-snipe, sanderling, etc. Among other important species are the stilt sandpiper (*Himantopus mexicanus*), which might well be classed as a snipe because of the length of the bill, which is often distinctly curved. The legs are unusually long, and small webs occur between the bases of the front toes. This species is about 9 inches long, and the plumage is much mottled, black, white, tawny and reddish, with a general dark effect in the breeding season; but during the fall and winter grayish and ashy from the absence of black and reddish. The stilt breeds on the shores of Franklin and Hudson bays, and appears in the United States in July and August, but, except in Florida, is rare. It winters as far south as Argentina. The purple-sandpiper (*Tringa maritima*) has the short legs unusually well feathered and the front toes unusually long and margined, the hind toe very short. In its winter dress the plumage is characterized by the distinctly purple gloss of the dark upper parts, the lower being chiefly white. It is a circumpolar species and breeds in the far north, in Iceland, Greenland, Nova Zembla and beyond, and may even winter in Arctic regions. It seldom enters the United States until December, and ordinarily winters in the New England and Middle States, seeking rocky sea-shores in small parties. A few also occur about the Great Lakes and the species is nowhere abundant. A closely related species is the pectoral sandpiper (*T. maculata*), the jack-snipe, grass-snipe or krierer of gunners, the last name in imitation of its call. It is about nine inches long and is readily distinguished from the last by the deeper grooving of the bill, the naked lower half of the tibial portion of the leg and the thickly streaked breast; and from similarly colored species by its larger size. This species is abundant along the Atlantic coast during August and September when the old birds, accompanied by the young of the year, are journeying from their arctic summer home to the pampas of Argentina and Patagonia. In habits this is more a snipe than a sandpiper, as it frequents the salt meadows and grassy margins of pools, and seldom flocks on the sand beaches or associates with related species, though often found in the company of plovers. The spring flight northward follows the Mississippi Valley and few are found at this season along the sea-shore. The male is larger than the female and has remarkable courting habits. As he struts and crosses in front of the female his oesophagus is inflated like that of a pouter pigeon, and at the same time a deep resonant note is produced. The least sandpiper (*T. minutilla*) is in form and color an almost exact miniature of the last, being not over six inches long and the smallest

of the group. It is also known as the stint or peep, and is a typical sandpiper, breeding in British America and frequenting the sea-shore in large flocks along with other species in April and May and in augmented numbers again in August and September. It is, however, found inland, as well, in suitable localities throughout North America and spends the winter from our southern borders to Patagonia. A constant associate of the least sandpiper, which it resembles in distribution, habits and appearance so closely that the two are frequently confounded, is the semipalmated sandpiper (*Ereunetes pusillus*). It may, however, be easily separated by the well-marked webbing between the front toes. Passing over the godwits, willets, and yellow-legs, which form a somewhat distinct group of large species, the well known and much appreciated Bartramian sandpiper, upland plover or grass plover (*Bartramia longicauda*) next requires notice. This species is about one foot long and approaches the tattlers in the cross-barred tail-feathers and unusually long gape which extends below the eye, while the tail is remarkably long and the grooving of the bill is absent from the terminal fourth. The sexes are alike and no seasonal changes occur. It is found in summer and breeds throughout North America, chiefly east of the Rocky Mountains, and spends the winter in upper South America. Unlike most of the group this is an upland bird, preferring dry plains and grassy fields to the vicinity of water. It arrives in early May and shortly after builds a nest of a few straws and grasses in a slight depression on the ground and lays four pyriform eggs of a clay color very thickly spotted all over with small discrete spots of brown and purplish gray. After the breeding season it leaves the meadows for cultivated fields and feeds very largely on crickets and grasshoppers, though other insects and berries are also eaten. This species flies high and swiftly and, unlike most sandpipers, will perch on fences and even trees. It has a peculiar wild cry which is heard by night as well as day. In the east the upland plover, by which name it is best known, is seen chiefly singly or in pairs and families, but in the great grass regions of Kansas and Texas, where it is very abundant, large flocks are formed. A species somewhat closely related to the upland plover in form and habit is the buff-breasted sandpiper (*Tryngites subruficollis*) which is about 8 inches long, breeds in the interior of British America and is nowhere very common during the migrations through the United States. Another related species is the well-known greenish spotted sandpiper or pee-wee (*Actitis macularia*) found everywhere throughout North America along small streams, as well as on the shores of lakes and the sea, and breeding throughout its summer range. To most people it is the most familiar species of all the sandpipers, and requires no description.

To the gunner most of these and other species of sandpipers are classed along with many of the plovers, yellow-legs, curlews, etc., as shore and bay birds, all of which are shot along the entire coast line during the autumn migration. These birds flock to the exposed shores to feed at ebb tide and are gregarious and attracted by their own or kindred species feeding on the beaches. The gunner places wooden decoys, cut and

painted in rude imitation of the various species, at some favorable point and conceals himself behind a blind of seaweed or brush within range of his stool of decoys. As the birds pause over the latter to examine them, often in compact flocks, a single shot will often kill several, and large bags used to be secured during a single tide; but these birds have been so continuously persecuted that a dozen or two of the larger and medium sized species is now considered ample reward for a day's shooting. Species which, like the pectoral sandpiper, frequent the pools on the salt meadows are also caught by tramping, or tolled within range of a blind by imitating their calls. The sport afforded by the upland plover is of a quite different and more worthy sort. These birds are extremely wary and difficult to approach, and, as they do not flock in the east, may be brought within range only by a most careful approach, while their flight is so rapid as to require the best exertions of a quick and accurate shot. On the prairies of the West this same species is sometimes shot from a wagon, of which the birds are less suspicious. For the table most of the sandpipers are highly prized, and few delicacies surpass a well-turned upland plover.

Consult: Baird, Brewer, and Ridgway, 'North American Water Birds' (Boston 1884); Sanford, 'The Water Fowl Family' (New York 1903).

Sandrart, sänd'rärt. **Joachim von**, German artist and art critic: b. Frankfort-on-Main, 2 May 1606; d. Nuremberg 14 Oct. 1688. He studied painting and copperplate engraving under eminent painters and engravers at Utrecht and also traveled in England where he was employed by Charles I. and the Duke of Buckingham, and Italy (1627) where he became, at Rome, the intimate friend of Claude Lorraine. Among other pictures, he painted 'The Death of Seneca' for the king of Spain, and a 'Nightpiece' in the style of Honthorst; besides furnishing the illustrations for 'Galeria Giustiniana' (1631). He executed under commission from Urban VIII. several portraits and pictures for the churches in Rome and made a number of sketches in central Italy for M. Zeiter's 'Itinerarium Italiae' and Gottfried's 'Archontologia Cosmica.' On his return to Frankfort he painted for Maximilian I. of Bavaria in the gallery at Schleissheim 'The Twelve Months,' and 'Day and Night.' He subsequently inherited the estate of Stockau, near Ingolstadt, assumed a title and henceforth gave a good deal of his time to art literature, painting also some portraits of the nobility. His masterpiece is 'The Company of Archers assembled to do Honor to Maria de Medici when she visited Amsterdam,' now in the town hall of that city. But his works on art are so important that they have almost obscured his fame as a painter. These books include 'Deutsche Akademie der edlen Bau-, Bild- und Malereikünste' (1675-9); 'Admiranda Sculpturae seu Statuarie Veteris' (1689); and 'Insignium Romae Templorum Prospectus Exteriores et Interiores.'

Sandringham, sänd'ring-am, England, in Norfolk, 7½ miles northeast of Lynn, is an estate comprising 7,000 acres. It was purchased in 1862 by the Prince of Wales, now Edward VII., who erected a mansion in Elizabethan

style as a country residence. It is surrounded by a charming park of 200 acres. The "Norwich gates," the dairy, and the cottages are interesting features.

Sandrocottus, sän-drō-kōt'ūs, the Indian king to whom Megasthenes was sent by Seleucus Nicator in 306 as his ambassador. Megasthenes improved the opportunity to collect materials for his historic work in four books 'Indica,' which is the most important work of Greek antiquity upon that subject. According to this author Sandrocottus reigned over the Gangaridæ and Prasii, nations of the Ganges Valley. After the death of Alexander he extended his dominion over the whole of northern India, subduing even the Macedonians whom Alexander had put in possession of the Indus Valley and the Punjab. Seleucus received 500 war elephants from the Indian conqueror on confirming the cession of this territory, and left Megasthenes as his ambassador at the court of Sandrocottus. This monarch, originally a robber chieftain, may now safely be identified with Chandragupta, whose accession is celebrated in the Sanskrit drama 'Mudrarakshasa.' His capital was Pataliputra (Gk. Palibothra), modern Patna, a city situated in Bengal on the banks of the Ganges, and there he established the Mauryan dynasty. Consult: Schwanbeck, 'Megasthenis Indica' (1846); Müller, 'Fragmenta Historicorum Græcorum' (1841-70); McCrindle, 'Ancient India as Described by Megasthenes and Arrian' (1877).

Sands, Benjamin Franklin, American naval officer: b. Baltimore, Md., 11 Feb. 1811; d. Washington, D. C., 30 June 1883. He entered the navy as midshipman in 1828, was commissioned lieutenant in 1840, and served in the Mexican War. In 1851-9 he was engaged in the coast-survey service, receiving promotion to commander in 1855. In 1862 he was commissioned captain. In 1862-5 he was senior officer in command of the blockade off Wilmington, N. C., participated in both attacks on Fort Fisher, was in command of the blockade off the coast of Texas from February to June in 1865, and raised the flag at Galveston, the last post held by the Confederates. He was commissioned commodore in 1866, was superintendent of the naval observatory at Washington in 1867-73, commissioned rear-admiral in 1871, and placed on the retired list in 1874.

Sands, Henry Berton, American surgeon: b. New York 27 Sept. 1830; d. there 18 Nov. 1888. He was graduated from the College of Physicians and Surgeons in 1856, and later studied abroad. On his return from Europe he became demonstrator of anatomy at the College of Physicians and Surgeons; in 1869 was appointed professor of anatomy, and in 1879 professor of the practice of surgery, holding the latter position till his death. He was attendant or consulting surgeon for several different hospitals, but gradually gave up his hospital work to give his attention to a rapidly increasing private practice. He became one of the foremost surgeons of the city, and was called for consultation in President Garfield's case. His publications include 'Aneurism of the Sub Clavian, treated by Galvano Puncture' (1869); 'Es-march's Bloodless Method' (1875); 'Treatment of Intussusception by Abdominal Method'

(1877); 'Question of Trephinery in Injuries of the Head' (1883); and 'Rupture of the Ligamentum Patellæ and its Treatment by Operation' (1885).

Sands, James Hoban, American naval officer: b. Washington, D. C., 12 July 1845. He was graduated from the United States Naval Academy in 1863 and was assigned to the North Atlantic blockading squadron. He was present at the evacuation of Charleston, participated in both attacks on Fort Fisher, and was promoted lieutenant in 1866. In 1865-8 he was on duty with the Indian squadron, took part in the skirmish with the savages on the island of Formosa, and in 1868 received rank as lieutenant-commander. He was promoted commander in 1880, captain in 1894, was in command of the cruiser *Columbia* at Santiago in 1898 and later joined the expedition to Porto Rico. He became rear-admiral in 1902 and is at present (1904) commandant of the navy yard at League Island, Pa.

Sands, Robert Charles, American author: b. Flatbush, Long Island, 11 May 1799; d. Hoboken, N. J., 17 Dec. 1832. He was graduated from Columbia in 1815, admitted to the bar in 1820, but devoted himself almost exclusively to literature. He established and edited in 1824 the 'Atlantic Magazine' which later became the New York 'Review,' and in 1825-7 was associated with William Cullen Bryant in editing it. From 1827 until his death he was on the editorial staff of the *Commercial Advertiser*. He wrote with Bryant and Verplanck a series of essays published in the form of an annual, 'The Talisman' (1828-30), in which appears one of his longest poems, 'The Dream of the Princess Papantzin.' He also wrote: 'Historical Notice of Herman Cortes,' in Spanish (1828); 'Life and Correspondence of Paul Jones' (1831); 'The Dead of 1832,' poem (1832); etc.

Sandstone, consolidated sand. The grains of a sand, chiefly silica, may be compacted by pressure alone, forming easily workable free-stone, but generally they are held together by some cement, as (1) iron oxide, which coats the grains and cements their adjoining portions, forming a brown-stone; (2) silica, which fills in the interstices between the grains, and generally causes secondary enlargement of each grain in such a manner that the new quartz forms a continuous crystal (as far as optical properties, etc., are concerned) with the old quartz grain, the rock thus becoming a solid mass of crystalline quartz; (3) lime; or (4) clay, forming calcareous and argillaceous sandstones respectively. Impure quartz sandstones may be argillaceous, calcareous, feldspathic, glauconitic or micaceous, according to the admixture. When derived from unassorted disintegration-products of crystalline (feldspathic) rocks, they are called "arkoses." Sandstones composed wholly or in large part of comminuted coral or shell sand, cemented by infiltrated calcium carbonate, have been called "calcareenites," and make up extensive beds of clastic limestones to which the name sandstone is commonly applied by the quarrymen. Such lime-sandstones may analyze as high as 99.6 per cent calcium carbonate. Ordinarily the term sandstone is applied to quartz sandstones whether pure or impure.

Sandstone very commonly shows lines of stratification or bedding, where exposed in section, and a cross-bedding structure is very common, the various minor layers of a bed being inclined in different and often opposite directions. All sandstones of shallow-water deposit may show ripple marks, rill marks, wave marks and impressions and traces of various animals, while æolian sandstones may show fine bedding and wind rippling, together with great diversity in thickness. Fossils are not uncommon in sandstones, but only their impressions generally remain in the more porous rocks.

In the United States quartz sandstones are widely distributed geographically and geologically. Among the more important commercial deposits are the following: The Cambrian sandstone of New York (Potsdam sandstone), Wisconsin, Minnesota, Michigan, etc. (St. Croix sandstones) and the Rocky Mountain region, as well as early Cambrian sandstones of the southern Appalachians; the Ordovician (St. Peter's) sandstone of the Upper Mississippi; Medina (Silurian) sandstones of New York and Pennsylvania; the Oriskany, Hamilton and Portage (Devonian) sandstones of New York, mostly used for flagging purposes; the Waverly (Lower Carboniferous) sandstones of Ohio, which furnishes the bulk of all the whetstones and grindstones of the country; the Pottsville and lower Coal-measures sandstones of Pennsylvania, West Virginia, etc.; the red-sandstones of the Connecticut Valley; New Jersey and Nova Scotia (Jura-Trias); and the Dakota (Cretaceous) sandstone of the West.

"Old Red Sandstone" is the term applied to the continental (non-marine) type of deposit formed during the Devonian era in Great Britain and Ireland. This consists of a mass of red sandstone shales and conglomerates from 10,000 to 16,000 feet in thickness and containing igneous rocks aggregating 6,000 feet thick near the middle. From it many remarkable fish-remains have been obtained. New Red sandstone was used for the red sandstone of Permian and Triassic age in Great Britain.

San'idine, or **Glassy Feldspar**, an important rock-forming mineral. It is a variety of orthoclase, is found in tabular or square-prismatic crystals, often Carlsbad twins, frequently quite vitreous in appearance. It occurs only in the recent eruptive rocks such as obsidian, phonolyte, trachyte and rhyolite. Its best known locality is the Drachenfels, Germany.

Sandusky, sän-dūs'kī, Ohio, city, port of entry, county-seat of Erie County; at the mouth of Sandusky River, on Sandusky Bay, and on the Baltimore & O., the Cleveland, C. & St. L., the Pennsylvania, the Lake Erie & W., and the Lake Shore & M. S. R.R.'s, about 55 miles west of Cleveland. A number of electric railroads enter the city from Cleveland, Toledo, Lorain, Norwalk, and other places. Johnson's Island, near by, was used as a place of confinement for Confederate prisoners during the Civil War. Cedar Point, Put-in-Bay, Kelley's Island, Middle Bass, Pelee, and Gibraltar islands are all favorite fishing resorts and easy of access during the summer months.

Industries.—The city has steamer connections with all the principal ports on the Great Lakes, and considerable trade with Canada. The city is in a fertile agricultural region, in

SANDUSKY—SANDY HILL

which the chief products are grapes, peaches, apples, grain, and vegetables. Fishing is an important industry of the city; the annual amount sold in the local market and shipped is \$1,500,000. The annual amount of wine shipped is about 2,000,000 gallons. The chief industrial establishments are factories in which are made baskets and crates for the shipment of grapes and peaches; cooperages in which are made casks for the wine shipments; wagon and carriage works, machine shops, corrugated paper, window glass, and underwear factories, carpenters' tools and hoe works, electric dynamo and steam turbine works, structural iron and cement works, and furniture factories. There are large coal and lumber yards. The United States hatcheries at Put-in-Bay and State hatchery at Lakeside foster the fish industry. Sandusky makes the major portion of the crayon which is used in the United States and which is exported. There are three daily and four weekly newspapers. In 1900 the valuation of the output of the industrial establishments in Sandusky was \$3,190,342.

Banks.—There are four banks, two national and two State, having a combined capital of \$650,000.

Public Buildings, Schools, Churches, etc.—The principal public buildings are the government building, county court-house, county infirmary, jail, municipal buildings, and a bonded warehouse. The State Soldiers' and Sailors' Home has accommodations for 1,600 persons. There are, belonging to this home, 37 buildings, constructed of blue limestone, at a cost, exclusive of grounds, of \$700,000. Sandusky has 22 churches, 61 schools and 8 public school buildings, 6 parish school buildings and a public library.

History, Government, and Population.—The city was first settled in 1817, and was incorporated as a city in 1845. The Indians on 16 May 1763 captured Fort Sandusky and massacred the entire garrison with the exception of Ensign Paully, the commander. In 1782 the Indians defeated a force of 480 men under the command of Colonels Williamson and Crawford. The municipal affairs are administered by a mayor, council, and president, elected under the charter of 1902. Pop. (1895) 18,471; (1900) 19,636.

JOHN T. MACK.

Sandusky, a bay indenting the northern part of Ohio, an inlet of Lake Erie. It is 20 miles long and five miles wide, and forms an excellent harbor. In some places large groves extend almost to the water edge.

Sandusky, a river in Ohio; it has its rise near the west boundary of Richland County; flows west to the centre of Wyandot County, then north, and discharges its waters into Lake Erie through Sandusky Bay. It furnishes water-power for manufacturing purposes for several cities and towns on its banks, chief of which are Bucyrus, Upper Sandusky, Tiffin, and Fremont.

Sandwich, Edward Montagu, 1ST EARL OF, English naval officer: b. England 27 July 1625; d. at sea off Solebay (Southwold), England, 28 May 1672. He entered the army in 1645, fought on the side of Parliament at Marston Moor, Naseby, and other places, was appointed a member of the council of state in 1653 and in 1656 became conjoint general of the sea with Blake. In 1660 he joined the forces of Charles, assisted

in the restoration of the monarchy and was created Earl of Sandwich in that year for his services. He was appointed rear-admiral in 1664 and in 1665 participated in the victory at Lowestoft. He was sent as ambassador to Madrid in 1666, and when hostilities with Holland were resumed in 1672 he was made second in command of the fleet. He was killed in the naval action off Solebay in that year.

Sandwich, John Montagu, 4TH EARL OF, English politician: b. 3 Nov. 1718; d. London 30 April 1792. He was educated at Cambridge, traveled extensively in the Mediterranean countries, and in 1739 returned to England where he took his seat in the House of Lords and became a political follower of the Duke of Bedford. He was appointed lord commissioner of the admiralty in 1744 and was shortly afterward appointed captain in the Duke of Bedford's regiment. His promotion in the army was rapid, although his military duties were only nominal, his time being occupied by his duties at the admiralty and his frequent missions abroad, yet at his death he was senior general on the list. He was plenipotentiary at the conference of Breda in 1746 and in 1747 became 1st lord of the admiralty board. In 1751 he was dismissed from service, but in 1755 was appointed joint vice-treasurer and receiver of the revenues of Ireland. He was appointed ambassador to Madrid in 1763, but before he could depart on his mission was made one of the principal secretaries of state. While in this office he took part in the famous prosecution of John Wilkes. In 1768 he became postmaster-general and in 1771 was nominated 1st lord of the admiralty, an office he held for 11 years. His own gain and party interest were made of paramount importance and to the insufficient equipment of the navy was justly laid much of the disaster which the British navy encountered in those years. His administration was on the whole disastrous; perhaps no man of the 18th century was held in more bitter contempt in England than he. He lived a practically retired life after 1782.

Sandwich, England, a cinque port and market-town in Kent. Saint Clement's church is an example of early Norman architecture, and Saint Peter's, dating from the reign of King John, has been restored and contains fine mediæval monuments. Pop. (1901) 3,174.

Sandwich Islands. See HAWAII.

Sandy Hill, N. Y., village in Washington County; on the Hudson River, and the Glens Falls Feeder, the Delaware & Hudson and the Hudson Valley R.R.'s; about 52 miles north of Albany. There are rapids in the Hudson and Baker's Falls about 70 feet in descent, which serve to furnish good water-power. Sandy Hill is in an agricultural region, and in the vicinity are quarries of the well-known Kingsbury building stone. The chief industrial establishments are lumber mills, brick yards, furnaces, machine shops, paper and pulp mills, wall paper print works, and the extensive bag factories of the Union Bag and Paper Trust. There are large shipments of stone, farm products, and manufactures. The three National banks have a combined capital of \$150,000. The village has an excellent high school, public graded schools, and a public library founded in 1867, also a public park. It is one of the two county seats of Washington County (Salem the other), has

a court house and jail; also county clerk's office removed there (1905) from Argyle. Between Sandy Hill and Fort Edward in the Union Cemetery is located the grave of Jane McCrea (q. v.); also that of Major Duncan Campbell of Inverawe, killed at the Battle of Ticonderoga, 1758. Pop. (1900), 4,473; (1905), 5,321.

JAMES A. HOLDEN.

Sandy Hook, N. J., a low, sandy peninsula in Monmouth County; about 18 miles south of New York. It begins at the Navesink Highlands and extends north six miles; its width is less than a mile. On the west side of the peninsula is Sandy Hook Bay. At the northern extremity is a beacon light, and, about a mile south of this point, is a lighthouse, 90 feet in height. At the outermost point is Fort Hancock. On the peninsula is a government proving-ground for ordnance and armor-plate.

Sandys, sän'dīs or sändz, **Frederick**, English painter: b. 1 May 1832. He is well known as a magazine illustrator, and among his principal paintings are 'King Pelles' Daughter bearing the Vessel of the Sangrael' (1862); 'Vuren' (1863); 'La Belle Ysonde' (1863); 'Morgan le Fay' (1864), and many portraits in oils and crayon.

Sanford, Henry Shelton, American diplomatist: b. Woodbury, Conn., 15 June 1823; d. Healing Springs, Va., 21 May 1891. He studied for a time at Heidelberg University and in 1847 entered the diplomatic service and became attached to the Saint Petersburg legation. The next year he was acting secretary to Andrew J. Donelson at Frankfort, and during 1849-54 secretary of legation at Paris. He was United States minister to Belgium, 1861-9, and rendered service of the utmost importance during the Civil War. He negotiated the Scheldt Treaty of navigation and commerce, and the first postal convention with France. In 1877 he was a founder of the International African Association (now the Independent State of the Kongo) and secured the recognition of its independence by the United States. In 1885 he was a delegate to the International Kongo Conference at Berlin, and in 1889 a delegate to the Anti-Slavery Conference at Brussels. In 1870 he founded the city of Sanford, Fla., and in later years gave much attention to its development.

Sanford, Fla., city in Orange County, on Lake Monroe, an expansion of the Saint John's River, and on the Florida, T. & K. W., the Sanford & St. P., and the Savannah, F. & W. R.R.'s, 125 miles south of Jacksonville. The land was sold to Gen. H. S. Sanford in 1870, and he surveyed and cleared the site of the city, and built a saw mill, shops, etc. It is at the head of navigation for large steamers, and exports oranges and other fruits, and early vegetables. It contains railway car shops, machine shops, fruit preserving and cigar factories. There is a public high school. Pop. (1890) 2,016; (1900) 1,450.

Sanford, Maine, town in York County; on the Mousam River, and a branch of the Portland and Rochester railroad; 30 miles southwest of Portland. The land was purchased from the Indians in 1661, and the project of laying out a town was formed as early as 1676, but no permanent settlement was made till after 1730, —the exact date being uncertain. The chief

manufacturing industries include shoe factories, woolen and worsted mills, flour and grist mills, saw and lumber mills; the census of 1900 reported a capital of \$3,246,015 invested. A large electric power shop derives power from the river, and supplies the factories, and lights for the town. There is a high school established in 1874, and a public library which was founded by a library association in 1898, and became a free public library in 1900. The census of 1900 showed that Sanford was the second largest town in the State and exceeded 7 of the 20 cities in population. Pop. (1890) 4,201; (1900) 6,078.

Sanfuentes, sän-foo-än'täs, **Salvador**, Chilean poet: b. Santiago, Chile, 2 Feb. 1817; d. there 17 July 1860. He was the author of various dramatic, historical and poetical works among which are: 'Caupolicán,' drama in verse (1835); 'El Campanario' (1838); 'Chile, from the Battle of Chacabuco to that of Maipo' (1850); 'Teudo' (1858); etc.

Sāngá Sāngá, sāng-ā' sāng-ā', one of the larger islands of the Tawi Tawi group, lying southwest of the island of Tawi Tawi, from which it is separated by a very narrow channel; length northeast to southwest, seven miles; width, three miles; area, 14 square miles. The island is low, and heavily wooded; a little land on the southeast coast is under cultivation.

Sangallo, sāng-gāl'lō, **Antonio da**, Italian architect: b. Florence 1455; d. there 1534. He built in Montepulciano the church of the Madonna di San Biagio; the palaces Cervini and Bellarmini; in San Savino the palace of the cardinal di Santa Prassede, in Arezzo the Church of the Annunziata and the Citadel in Civita Castellana.

Sangallo, **Antonio da** (CORDIANI), Italian architect, nephew of the preceding: b. Mugello, near Florence, 1485; d. 1546. He designed and built the church of Madonna di Loreto, at Rome; the Porta di San Spirito; the church of San Spirito; the palace Sacchetti; the palace Farnese; all in the same city. He also enlarged the Vatican and executed the famous fountain at Orvieto and had a share in building the Pilgrims' Church at Loreto. He was also successful in the construction of fortifications.

Sangallo, **Juliano da**, Italian architect; (brother of Antonio the Elder): b. Florence 1445; d. there 1516. At Florence he built the monastery of Santa Maria Maddalena de Pazzi and the Palace Condi; in Prato, the church of Madonna delle Carceri; in Cajano the Villa Poggio for the Medici. He also constructed the fortress at Ostia; and in Rome he built the façade of Santa Maria dell' Anima; the monastery of San Pietro in Vincoli; and the flat roof in the church of Santa Maria Maggiore. He also constructed the citadel at Pisa. Consult: Redtenbacher, 'Die Architektur der Renaissance' (1886).

Sangamon, sāng'ga-mōn, a river of Illinois; its head-waters are in Champaign and McLean counties. It flows southeast to Sangamon County where it unites with the South Fork of the river, and changes the direction of its course, flowing northwest, then west, then northwest and enters the Illinois River by two channels. Total length, 225 miles. The confluence of the main stream (North Fork) and the South

Fork is six miles east of Springfield, and the mouth of the river is about 44 miles west-north-west of Springfield.

Sang'er, Adolph L., American lawyer: b. Baton Rouge, La.; d. New York 3 Jan. 1894. He was graduated from the Columbia College Law School in 1864; and in the practice of his profession won rapid success. In 1870 he was appointed one of the commissioners of the United States Deposit Fund, and in 1885 was elected president of the Board of Aldermen of New York by a plurality of 25,000 votes. He was a presidential elector of the State of New York in 1880 and 1884, and 1886 was appointed commissioner of education, serving for three terms, and elected president of the board in 1893. He was one of the leaders of the Order of "B'nai B'rith," was president of the Board of Delegates of American Israelites, and for some years vice-president of the Union of American Hebrew Congregations.

Sanger, Joseph Prentiss, American soldier: b. Utica, N. Y., 8 May 1840. He served in the Union army through the Civil War, attaining rank as brevet major in 1865, and in 1871 commanded a battery in the Brooklyn "Whiskey Riots." He occupied the chair of military science, tactics, and law at Bowdoin in 1871-5, was a member of the military commission to inspect foreign arms and equipments in 1875-7, and in 1898 was appointed acting inspector-general, and brigadier-general of volunteers. In 1899 he assumed command of the district of Matanzas, Cuba. In 1901 was appointed chief-of-staff and inspector-general in the Division of the Philippines, and in 1902 was made director of the Philippine census.

Sanger, William Cary, American legislator: b. Brooklyn, N. Y., 21 May 1853. He was graduated from Harvard in 1874 and from the Columbia Law School in 1879. In 1895-7 he was a member of the legislature, was lieutenant-colonel of volunteers in the Spanish-American war, and assistant secretary of war 1901-3. He has published: 'The Reserve and Auxiliary forces of England and the Militia of Switzerland' (1903).

Sangir (säng-gēr') Islands, Malay Archipelago, a group midway between the northeast extremity of the Celebes, and the southern extremity of the Island of Mindanao in the Philippine group. The largest islands of the group are Great Sangir, Siau (Siave, Siauw), and Tagulanda. The former is the most northerly and contains the volcano of Aboe (4,000 feet), whose eruptions of 1812, 1856 and 1892 caused great destruction and appalling loss of life. All of the islands are mountainous, partly volcanic, and well cultivated. From the craters of the volcanoes of Siau and Roang, constantly issue clouds of sulphur, and earthquakes are frequent. The chief products are rice, pisang, sago, and coconut-oil. Edible birds' nests abound in the smaller islands, yielding considerable profit. The exports are copra, nuts, and nutmegs. The natives are Malays. They adopted in the 15th century the Mohammedan faith, but were afterward converted to Christianity by the Portuguese. The islands constitute a dependency of the Netherlands, and through the missionaries schools have been built. The islands are governed by Padschas or Princes. Pop. 76,900.

Sangraal, säng-grāl'. See **GRAIL**, **THE HOLY**.

Sangre de Cristo, sän'grä dā krēs'tō, a range of mountains in the south central part of Colorado. See **ROCKY MOUNTAINS**.

Sangster, säng'stēr, Margaret Elizabeth Munson, American editor and poet: b. New Rochelle, N. Y., 22 Feb. 1838. In 1858 she was married to George Sangster, engaged in writing for different periodicals and in 1871 became associate editor of 'Hearth and Home.' In 1873-9 she was editor of 'The Christian at Work,' and in 1889-99 she was editor of 'Harper's Bazaar.' Since 1899 she has been a staff contributor to the 'Ladies' Home Journal.' Her works are marked by a high religious purpose and an earnest desire to brighten and beautify everyday life. Her juvenile works include: 'May Stanhope and Her Friend'; 'Little Knights and Ladies'; etc. Among her most noted poems are: 'Our Own'; 'The Sin of Omission'; 'Are the Children Home?'; and her other publications include: 'Poems of the Household' (1883); 'Home Fairies' (1887); 'Winsome Womanhood' (1900); 'Lyrics of Love' (1901); 'The Little Kingdom of Home' (1904).

Sanguina'ria, a monotypic genus, the bloodroots (q.v.) of the *Papaveraceæ*, indigenous to eastern North America, and often cultivated for ornament. It prefers sheltered places in woods, where it can grow in leaf-mold. The thick, palmately lobed leaf is lapped around the bud, which swiftly outgrows its protector, loses its two fugacious sepals, and opens into a star-shaped flower with several fleshy white petals, and a mass of golden stamens in the centre. The flower closes again at night, or on shady days, since it blooms in the earliest, cool days of spring. The leaves continue to grow during the summer, and become nearly seven inches long. The seeds are contained in spindle-shaped capsules. The whole plant is very brittle and succulent and when broken, especially at its thick fleshy rootstock, an acrid red juice flows copiously forth. This juice has caused the plant to be called bloodroot, and it was considered, by the doctrine of signatures, to be a cure for blood-diseases; later it became officinal, as a cathartic, emetic and expectorant. The sanguinaria is also called red puccoon, or Indian paint, because the aborigines used it as a stain for their skins, and as a dyestuff.

Sanhedrim, sän-hē'drīm, the supreme judicial tribunal of the Jews, existing in and before New Testament times. According to rabbinical tradition the institution of the Sanhedrim is to be traced to the time of Moses and the events mentioned in Num. xi. 16, 17, but this view is now generally rejected, and the time of its institution referred to a much later date. The most probable opinion is that it consisted of 71 members, including the president. From incidental notices in the New Testament we learn that the members were drawn from three different classes: "the chief priests," consisting partly of those who had previously filled the office of high-priest, and partly of the heads of the 24 classes into which the priests were divided: "the elders of the people," that is, the heads of tribes and family associations; and "the scribes," or those learned in the law. The Sanhedrim sat

originally within the temple precincts every day from the conclusion of the morning sacrifice until the evening sacrifice; excepting on Sabbaths and festivals. At its head was a president, who bore the honorable title of *nasi* or prince. The jurisdiction of the Sanhedrim, as the supreme tribunal of the Jews in civil as in ecclesiastical matters, was very extensive. It was the final court of appeal from all inferior courts; and, in addition to this, it alone had the right of judging in matters affecting a whole tribe, of determining questions of peace or war, of trying the high-priest or a disobedient member of its own body. It pronounced also upon the claims of prophets and upon charges of blasphemy. Its jurisdiction was not confined to Palestine, but extended to every place where the Jews had settlements (Acts ix. 2). According to the Jerusalem Gemara the power of inflicting capital punishment was taken away from this tribunal 40 years before the destruction of Jerusalem, and this accords with the answer of the Jews to Pilate (John xix. 37), "It is not lawful for us to put any man to death." It might indeed pass sentence of death, but it required the confirmation of the Roman procurator before such sentence could be executed. The forms of procedure in the court seem to have been characterized by a general spirit of fairness. Different kinds of evidence were carefully weighed, and the agreement of at least two witnesses was necessary to procure a sentence of condemnation. The place of meeting of the Sanhedrim was eventually changed to a portion of the court of the Gentiles, and, after several other changes, its seat was finally established at Tiberias. Besides the high council there were also inferior courts or lesser sanhedrims in the country towns, composed of persons of the same classes, and in contradistinction to these, the metropolitan council was termed the Great Sanhedrim. After the destruction of Jerusalem by the Romans these courts were abolished.

Sanhita, sǎn'hǐ-tǎ, the Hindu designation of that part of the sacred writings of the Brahmins, which contains the mantra or hymns.

Sanitary Commission. See UNITED STATES SANITARY COMMISSION.

Sanitary Engineering, the branch of civil engineering which relates to structures and operations for promoting and guarding the health of communities. It deals with the means of providing cities and towns with pure and wholesome water, with the means for the removal in underground channels of the spent water supply called sewage, as well as of such ground water and rain water as may be necessary, with the means of removing the various waste products and refuse by cartage, such as garbage, ashes, and street sweepings. It also deals with the subjects of ventilation, water supply, sewerage, drainage, water purification, sewage and refuse disposal and street cleaning. In other words, sanitary engineering embraces the design and construction of all works contributing to public health and comfort, and all means of preventing offensive conditions due to a large number of persons living closely together, as in cities or towns.

In all cases the sanitary engineer, as is true of the civil engineer, should have for his fur-

ther purpose the construction of his works so as to bring about the desired result at the least cost, when considering both the first investment and the operating expenses.

The relations of the public health to this branch of engineering are made plain in the article SANITARY SCIENCE. With the rapid advance of practical knowledge along the latter lines, the profession of sanitary engineering, while resting upon the same foundations as civil engineering, has in recent years gradually called for an increased practical knowledge of vital statistics, of chemistry and biology as applied to its special branches. It is not necessary for the sanitary engineer to be a trained analyst, or accomplished in the details of state medicine, but he should be in touch with the general progress in these subjects, if his work is to be on the highest plane of excellence. This necessity will be better appreciated after noting a brief review of the leading phases of sanitary engineering.

In biblical days, pure mountain water in some instances was collected and conveyed through gravity aqueducts to cities and towns. There are some cases to-day, even in civilized countries, where substantially the same procedures as used many centuries ago are still applied. Generally speaking, however, the rapidly increasing density of population, the wide differences in climatic, geological and topographical conditions, and the improvements made in materials and methods of construction, have rendered necessary a vast elaboration of the early principles, in order to furnish the essential basis upon which modern water supplies under various conditions are built and operated. This is true to a greater degree of sewerage works, which have come to the attention of the American engineer within the past 30 years; and to a still greater degree in the case of works for the purification of sewage and water, and the disposal of garbage, which have even more recently furnished practical problems in this country.

In the field of water supply engineering there are some instances where pure mountain waters can be readily obtained; some where the supplies can best be obtained from underground sources; others where the most available supplies are obtained from rivers near at hand, which require purification and pumping to reservoirs of artificial construction; and still other instances where large cities have at hand only small streams, upon which it is necessary to build large dams to store water during the rainy seasons to serve the needs of the community during times of drought.

Before the development and general acceptance about 1880 of the germ theory of disease, comparatively little attention was given to the sanitary character of water supplies. Although the danger of sewage pollution was then recognized by some, its full significance was not appreciated, especially in the case of watersheds where the population was largely rural in its nature, until there were encountered disastrous typhoid fever epidemics, as at Plymouth, Pa., Lowell and Lawrence, Mass., New Haven, Conn., etc. In recent years there has been a marked awakening to the needs of pure water supplies in America, as shown by the consideration given this subject by a majority of the larger cities, and by the practical accomplishments reached in some instances. Compared

with the European water supplies, there is yet wide room for improvement in this country, as our prevailing standards are much below those established in northwestern Europe. Thus, in Germany it is an edict of the Imperial Board of Health, following the cholera epidemic in Hamburg in 1892, that no surface water shall be used as a public water supply without first being filtered in a satisfactory manner. In Europe generally this view is held, and the benefit is shown by the fact that the death-rate from such water-borne diseases as typhoid fever is only one fifth to one third of what it is in American cities.

As to the so-called mountain streams, the rapid increase in population in this country makes it each year more and more difficult to obtain even comparatively pure municipal water supplies from sparsely inhabited watersheds. In the case of small cities and towns this can still be done in some instances, but usually it necessitates the purchase of many properties situated on the watercourse, and a systematic patrolling of portions of the remaining area, in order to guard constantly against pollution. This latter procedure is especially effective in conjunction with large storage reservoirs in which self-purification takes place, as in the case of the New York and Boston supplies.

A ground water supply, where the conditions are favorable, yields as good a water from a sanitary standpoint as can be obtained. This results, of course, from the efficient filtration which takes place under the conditions of nature, as the rainfall percolates through the earth and reaches the underground natural reservoirs from which it is drawn. In this country the most notable ground water supply is that which furnishes about half of the supply for the city of Brooklyn, and aggregates a daily quantity of about 50,000,000 gallons. Long Island is essentially a large territory of sand, the pores of which afford facilities for the storage of large volumes of rain-water in this naturally formed reservoir, and from which water can be obtained continuously during ordinary dry weather in daily quantities equal to at least 400,000 gallons per square mile. These conditions are unusual, and there is no other instance where such a large volume of underground water is obtained. Many small cities and towns, however, obtain a satisfactory supply from underground streams, which flow through valleys containing deep layers of porous sand and gravel. With varying conditions in the geological formation, these underground supplies naturally present marked differences in the quality of water obtained therefrom. In some instances the ground water is very highly charged with lime and magnesia, thus making the water too hard for acceptable use by the consumers, and especially by those who use it for steam raising purposes. Under these conditions the sanitary engineer has sometimes to consider the chemical aspect of the problem, and to recommend plans for the softening of the water, such as is the case with the well water supply at Winnipeg, and in many places in the southern part of England, where water is obtained from wells driven into the chalk cliffs.

Another feature which the sanitary engineer has to consider with regard to ground waters is the presence of iron dissolved from the materials in which the underground water is stored, and

which causes it to deposit iron rust, which is seriously objectionable because of the stains it produces in laundry use. This feature can be eliminated by aerating the water and passing it through filters, as is done at Reading, Mass., Red Bank, N. J., West Superior, Wis., and a number of places in the northern parts of Germany and Holland.

Water derived from rivers flowing near cities and towns forms one of the principal sources of supply in America. In early years raw river water supplies were fairly satisfactory in their hygienic condition. But with the rapidly increasing population, river pollution has become so great that now it is rare for a town or city of any size to obtain a fairly satisfactory supply from river water when taken in its raw condition.

In the Southern and Western country there is the added difficulty of the well-known mud-diness, due to the large quantities of silt and clay entering the rivers from soil erosion, and which for many months at a time make the waters decidedly turbid and dirty. To remove this silt and clay constitutes one of the principal tasks of the sanitary engineer. This, as is described in *WATER SUPPLY ENGINEERING*, is accomplished by sedimentation and filtration, and in the last few years a large number of the more important cities have projected, or are building, improvements of this nature.

The cities situated upon the Great Lakes at one time obtained from them clear and pure water quite readily. In the instance of several of the larger cities, however, the time has arrived or is rapidly approaching when there is serious difficulty in obtaining pure water from the lakes in its raw condition, owing to the amount of sewage which reaches the water supply intakes. Usually the pollution is from the city's sewers, but in some instances it is from those of neighboring cities. The earlier intakes, located half a mile or so from shore, were presumably in many cases capable of yielding as pure water as now can be obtained from intakes four miles or more distant from the shore. That the time is approaching when filtration of the lake supplies is becoming desirable, if not necessary, is shown by the consideration given to that subject by the cities of Chicago, Cleveland and Buffalo.

In the northern, and especially in the northeastern, section of the country, water supplies are frequently obtained from small streams, upon which it is necessary to store water in large impounding basins in order that portions of the rainfall of wet seasons may be made available for seasons of drought. This has developed many problems for the sanitary engineer to consider, especially the care necessary in the selection and preparation of reservoir sites to guard against various vegetable growths, such as give rise to objectionable tastes and odors. The storage of water for long periods of time in such basins naturally results in sedimentation, and in bleaching should the water be colored, which improves the quality of the water so far as its appearance and sanitary aspects are concerned, and which incidentally brings about safety through the long interval which elapses as the water passes through the basins, thus bringing about the death of many objectionable germs which enter the reservoir.

The number of filtration works for municipal

SANITARY ENGINEERING

water supplies is rapidly increasing each year, and eventually it is fair to assume will include every important surface water supply in America, as is now the case in the most developed parts of Europe. There are now in this country over 200 filtration plants, the great majority of which are plants of the so-called rapid or mechanical type, which were built at first in a not very durable manner and are lacking in many appurtenances now recognized as essential to good works. While American engineers can design and build good filtration plants, it is an unfortunate fact that up to the present time the filtration plants in America, of both the slow or sand type and the rapid or mechanical type, have not, generally speaking, been well operated, although there are exceptions to this rule in the case of filtration works of each type. The proper operation of waterworks systems to provide palatable and pure water at all times, especially in connection with purification or filtration works, is of exceeding importance, and will require the aid of engineering talent. In this field there appears a favorable opening for many young sanitary engineers. In addition to the sanitary aspect of waterworks engineering, the engineer has frequent occasion to use his judgment and knowledge concerning other lines of hydraulics, including the flow of streams, the construction of dams and reservoirs, pumping stations and distributing systems which will afford suitable quantity of water and pressure not only for domestic use but also for fire purposes.

A sewerage system has for its purpose the collection and removal of the foul waters of a community. The term "sewerage" is applied to the system of collecting pipes and underground channels. It begins in the houses at the various receptacles where water is used for cleansing purposes, extends through the streets and ends at one or more places where this dirty water, which we call sewage, is finally discharged. Sewage contains a small quantity of organic and mineral refuse matter in a condition to be easily and rapidly decomposed. In round numbers it contains less than one part of organic matter and one part of mineral matter to every thousand parts of water. Although this organic matter is so greatly diluted, it is nevertheless capable of causing considerable trouble. It decomposes rapidly, and then putrefaction sets in with the accompaniments of offensive odors, due largely to the growth and activity of those lower forms of life called bacteria. Fresh sewage has no strong or offensive odor. It smells like dish water, and no worse odor than this prevails at the outfall, or points of discharge, in a system of sewers that is not very large but is well planned and carefully maintained and operated.

It is one of the tasks of the sanitary engineer to cause sewage in its flow through the sewers to be discharged both quickly and completely, so as to allow no sewage matters to be retained in the sewers. To this end it is necessary that the pipes be given a grade, or pitch, which will cause the sewage to flow with a good velocity and keep on moving with its suspended matter without interruption, from the starting point at the house to the place of final disposal. It is also necessary to see to it that the curves, bends, junctions, etc., are so designed and built that they will not operate to retard the flow nor allow accumulations of solid matter to remain at various points where they will decompose and

give rise to objectionable odors. To avoid trouble from bad odors it is also necessary to have an open and free communication from the sewers of the houses and streets to the outer air, so that there can either be a free escape or free admission of air, as the case may be, and so that a constant atmospheric pressure is maintained on both sides of all traps to the system.

Due to the variation in the volume of liquid flowing through the sewers at different times of the day, it is impossible to avoid entirely some incidental deposits of solid matters upon the walls of the sewers, and accordingly it is essential from time to time to flush the sewers, that is, to cause a materially increased flow of water intermittently to pass through them, either by natural or artificial means.

The removal of ground water and storm water forms another of the tasks of the sanitary engineer. In some cases they are removed in the same sewers as is the domestic sewage. Then we have a so-called combined system of sewerage. In others there are separate systems for removing the storm water and the sewage. Where cities are situated on very flat areas, drainage is one of the most important municipal works, as at New Orleans, where extensive drainage canals and pumping stations are in operation to collect the rainfall and discharge it into Lake Pontchartrain.

There were very few well-built sewers in this country, prior to 1875, and no city which was equipped with a thorough system. Since 1880 great progress has been made in this branch of sanitary engineering in America, partly due to the fact that American cities, as regards sanitary matters, were far behind the European cities, notably in England and Germany, and partly due to the rapid growth of many communities in this country. Prior to a generation ago the subject of sewage disposal and sewage purification made little demand upon the sanitary engineer, for the reason that invariably the sewage was discharged into the nearest watercourse, and, generally speaking, serious nuisances did not result under the conditions then existing. With the development of sewerage facilities in this country and the increase in population, this subject began to press for attention. In Europe there were a few isolated cases where sewage had been used for purposes of irrigation for 100 years or more, but it was not until the middle of the 19th century that it became the object of careful study in Europe, especially in England.

The first method of purification for the disposal of sewage was that of irrigation, that is, the application of sewage to land to facilitate the raising of crops. In some places, as Paris and Berlin, and many places in England, this is still done with considerable advantage, although in no instance does the income received from the sewage farms equal the capital charges upon their purchase and adaptation for irrigation purposes. In many places, also, it is very difficult and expensive to secure adequate areas of suitable land within any reasonable distance of the community having to dispose of the sewage. This condition resulted about 1850 in England in various efforts to secure those constituents of sewage which may be used for fertilizing purposes in a manner so that they could be placed upon the market. Various chemical treatments to facilitate this end were developed and pat-

ented, until there was suggested a chemical treatment for the disposal of sewage which involved the use of one or more of nearly every chemical which was then manufactured on a commercial scale. Although all efforts then and since failed to establish any method by which the fertilizing properties of sewage could be availed of with commercial success, this proposition now and then still comes to the attention of the sanitary engineer. The cause of the impracticability of this feature lies in the great dilution of the sewage matters and the expense of handling so much other material to get in available form so little nitrogen, potash and phosphorus. The problem of sewage disposal has been and will continue to be one for the sanitary engineer to solve at the least expense necessary for getting rid of the sewage in a manner so that there will be no sanitary objection to the procedure. Of course this results in different methods for application to problems under the wide range of conditions surrounding the problem.

After 1870 chemical precipitation processes in various forms were introduced throughout Europe, especially in England, where the density of population and the small size of the streams first forced the attention of engineers to this general subject. In some instances chemical precipitation, which can remove under favorable circumstances about 50 per cent of the objectionable organic matter and about 90 per cent of the total suspended matter, was adequate for local conditions. In this country chemical precipitation works were built about 1890 at Worcester, Mass., and were earlier projected for Providence, R. I., although many delays occurred in the carrying out of the works for the latter city. A few small cities also adopted this method of purification, but it seems to have had no widespread development in America, nor are there indications that such will be the case in the future. In England, chemical precipitation methods have in many cases outgrown their usefulness, due to the fact that they are not capable of producing a sufficient degree of purification, and the time is ripe when other and more efficient methods must be considered to supplement chemical precipitation works if the latter are to be used at all. Thus, at Worcester, Mass., several acres of sand beds have been built by which further to purify the effluent of the chemical precipitation works. In New England, generally speaking, sufficient areas of porous land (glacial drift formation) are available, so that the cheapest and best method of sewage purification is afforded by the application of the sewage to land for short periods at a time, between which the land is thoroughly cleansed by the entrance of air. This is called intermittent filtration.

There are two aspects to the problems of sewage disposal. One refers to conditions when it becomes necessary to purify the sewage so as to protect the body of water into which it is discharged, if this is to be used for drinking purposes farther down stream. The other relates to the prevention of over-polluted bodies of water to a degree that results in nuisances from bad odors. In Massachusetts the first of these aspects of the problem of sewage disposal has been developed further than elsewhere in America. Intermittent sand filters have been adopted in numerous cases to purify the sewage with

sufficient thoroughness so that the streams into which the filtered sewage is discharged may be used for drinking purposes. Thus the sewage of the small cities and towns of Natick, Framingham, Marlboro and Westboro is purified to protect the water supply of the city of Boston.

In many cases, however, this is not feasible, and it is necessary to discharge the sewage of a city into a relatively large stream, for a time at least, and let those towns and cities situated on the same stream lower down purify such portion of the river water as they need for their water supply. The practicability of this proceeding depends of course upon a large number of local conditions.

The prevailing method of sewage disposal in America is by dilution in the most convenient water course. Seaboard cities find this method to be generally satisfactory, particularly if the sewage is first carefully screened so as to free it from those particles which would float and be unsightly. Some inland cities can also dispose of their sewage in this manner satisfactorily, but there are others where more or less trouble results at times of low stream flow, and these troubles are bound to increase as the cities grow in size. Many of them are gradually shaping things somewhat toward the ultimate adoption of some form of purification works, but generally the expense is so great that material progress is slow, and it may perhaps only be accelerated by the action of the courts.

Sewage purification works require a continual municipal expense which usually results in comparatively little benefit to those who have to bear it. Accordingly, where land treatment is not available, cities are anxiously awaiting the results of new methods by which the cost of works of artificial construction will be lessened as compared with those of earlier designs. This is true not only in America but also in Europe, where improvements are needed in many cases.

A few years ago much was heard by the sanitary engineer of this country concerning the merits of the so-called septic process and of contact beds made of coke or broken stone, which procedures have been much studied in England since 1895. These methods are intimately associated with biological processes by which the bacteria convert putrescible organic matter into harmless and stable mineral matter. While these processes are not so effective or economical as was at first claimed for them, they have much merit and are worthy of careful consideration, especially in those sections of this country where engineers find no porous land near at hand and when some artificially constructed works become imperative. The disposal of trade wastes is becoming an important factor in some of the industrial centres, and this problem is one which in future years is bound to come more and more within the attention of the sanitary engineer.

In Europe, progress in sanitary engineering commenced at an earlier date than in America, largely because the population abroad was much denser. The need for improvements resulted in laws which compelled the installation of better sanitary works at a rapid rate. In this country the States of Massachusetts, New York, Ohio, and a few others, through their boards of health, have a general supervision of questions

SANITARY SCIENCE AND PUBLIC HEALTH

of water supply and sewerage, so far as the sanitary aspects of new or additional works are concerned. This has been generally helpful, and eventually will probably be extended to practically all of our States. The rules, regulations, etc., of the State sanitary authorities on these matters is a feature of the subject which the sanitary engineer has to consider, as well as the decisions of courts where these form a precedent relative to the sanitary problem under consideration.

Another branch of municipal works to which the attention of the sanitary engineer is beginning to be drawn is the cleaning of streets and the disposal of garbage and other municipal wastes which cannot be removed by water carriage in underground channels. They include ashes, street sweepings, dry rubbish and kitchen garbage, all of which require collection by special cartage. In small communities the disposal of this refuse is not very difficult or expensive, but in the large cities it is frequently a perplexing and expensive undertaking. It is also a very important sanitary matter, as disease, bad odors and general discomfort result from improper and ineffective attention to these matters. Especially difficult is it in America to get a satisfactory disposal of kitchen garbage.

Reduction or utilization processes, by which oil, grease and other commercial products are obtained, have been tried in many cities, but only a few have been operated under conditions to give satisfaction to all concerned. The cremation process, so largely used in European cities, has been tried in some cities, but under conditions placing this process at a disadvantage. This is true not only of the type and arrangement of the furnaces used, but particularly in the matter of their operation. With few exceptions these matters have not as yet been in the hands of the engineer, but there is every reason to believe that before long this branch of municipal sanitation will receive on the part of the educated engineer the same skilful attention as the older branches of sanitary work.

Speaking generally, the accomplishments in sanitary engineering in America since 1875 have been marked by furnishing cities and towns with good water supplies and with efficient sewers and drainage. Improvements in this line began at a later date here than abroad, and in many ways the Europeans are still in advance as regards the carrying out of the well established principles of this subject, although the contributions and experiences of Americans have added much to its general knowledge, especially as applied to the conditions here existing. In no field of civil engineering does there appear a more promising opening for study and practical activity than in the sanitary branch. See also

SANITARY SCIENCE. RUDOLPH HERING,

Hydraulic Engineer and Sanitary Expert.

Sanitary Science and Public Health.

The term sanitary science is conveniently employed to cover that body of organized knowledge which has to do with health, either personal or public. It is not an exact science like mathematics, but rather one of the inductive sciences like physics, chemistry, and biology, of which last it is a subdivision. Like the other inductive sciences it depends upon observation, generalization, and verification, and includes a body of established doctrines which have been

reached by these processes. From another point of view sanitary science is the science of health, and is, therefore, etymologically equivalent to hygiene. Until quite recently the term sanitary science was used in Great Britain largely to the exclusion of the term hygiene, while in Germany the reverse was and still is the case. The present tendency in America appears to be to employ both terms, with somewhat different meanings attached to each, although the fact that large numbers of medical and scientific men have brought home with them from Germany the term hygiene is unquestionably having its influence in favor of this term in America as well as in Great Britain. The probability is that for the next few years at least both terms will be used, perhaps somewhat indiscriminately, sanitary science and sanitation being applied to the more familiar and more practical aspects of hygiene, such as water supply, milk supply, and food inspection, and especially to its more engineering aspects; while the term hygiene will probably be more often employed for the less familiar, and especially for the more medical and physiological, aspects of the science of health.

Definitions.—In point of fact there is to-day a real and practically important distinction between the two terms. Hygiene in its broadest aspect undoubtedly includes everything relating to health and covers therefore both personal and public hygiene. Of late years, however, with the development of its engineering aspects (sanitation) on the one hand, and its physiological aspects (especially serum therapy) on the other, there has come about a real and practical differentiation between hygiene and sanitation, the former being largely in the hands of physicians, the latter largely in the hands of sanitary engineers. This differentiation has furthermore a sound biological basis; for if we regard health as the normal operation of the human mechanism and disease as its abnormal operation, then it is easy to see how some diseases may be warded off by increasing the efficiency (and especially the vital resistance) of that mechanism, while others may be prevented by an adequate control of the environment. Smallpox, for example, may be warded off by vaccination, a purely physiological or medical, and therefore on our classification "hygienic" process. Typhoid fever, on the other hand, is at present to be prevented chiefly by proper control of the environment,—for example, by the purification of water supplies, the purification of sewage, and the protection of the purity of food supplies such as milk and oysters, "sanitary" problems dealing directly with the environment, and only indirectly with the individual or person. We may, therefore, advantageously employ both terms, namely, hygiene and sanitation (the basis of which latter is sanitary science), keeping hygiene more particularly for procedures directly affecting or dealing with the bodies of the people themselves, and sanitation for procedures dealing directly with the environment and only indirectly with the human mechanism. If, however, the term hygiene be preferred for the whole subject, then obviously the engineering, environmental or "sanitation" aspects of it fall under the subdivision "public hygiene" or "public health," and the remainder under "personal hygiene" or personal health. A good illustration of the present practical

SANITARY SCIENCE AND PUBLIC HEALTH

usage of these terms is afforded by the letter of instructions addressed by the President of the United States to the Panama Canal Commissioners, under date of 8 March 1904, in which the following paragraph occurs:

There is one matter to which I wish to ask your special attention,—the question of sanitation and hygiene. You will take measures to secure the best medical experts for this purpose whom you can obtain, and you will of course make the contractors submit as implicitly as your own employees to all the rules and regulations of the medical department under you.

It is important at the outset to form ideas as clear and definite as possible of the nature of health and disease, terms which though constantly used are often but little understood. We shall probably not go far wrong if we accept the dictum of Huxley that "the characteristic of modern as contrasted with ancient physiology is the conception of the human body as a physical mechanism" and regard the latter as an intricate piece of machinery subject to all the conditions and limitations to which any machine is exposed. If around this essentially mechanical view of the human body we throw that other modern conception, the "environment," that is to say, if we picture to ourselves the human body as a mechanism not only deriving energy from its environment, and doing mechanical and other forms of work, but giving back to the environment heat and waste products (an idea which lies at the very basis of modern physiology), we shall readily arrive at a clear, consistent and helpful conception of the human mechanism and its workings, from which we can readily pass on to clear and logical ideas of health and disease. For in that case we have only to think of the body as a piece of mechanism with all its parts in good working order, or, in other words, sound, normal, and whole, and working in a favorable environment, and to this condition to apply the term *health*. Conversely we may regard any condition of the mechanism in which one or more of its parts (organs) is seriously out of order, unsound or abnormal, or working under unfavorable conditions, as a condition of disease. In the normal, sound or healthful condition the parts of the organism work together with ease, but in the unsound or abnormal condition this may not be the case, and "dis-ease" may be the result. In short, the word *health* (related to the modern word *hale*, old English *hole*) actually means hale-ness or whole-ness, in which form it appears for example in the scriptural phrase "They that be whole need not a physician."

Health and Disease.—Sanitary science then regards health and disease very much as biology regards life, as a special state or condition, and the essential basis of health as sound and proper construction and operation of the human mechanism under favorable conditions. The sources of health are plain. They are obviously good timber, good construction and wise operation or management of the human mechanism to which we must add favorable external surroundings or environment. In so far as sound and normal, or unsound and abnormal, mechanisms are inherited, they are clearly for the most part beyond the control of sanitation and hygiene, but in so far as health and disease are dependent upon good care, management or operation, and especially in so far as they are dependent upon favorable external conditions or environment,

they are obviously to a greater or less extent subject to our influence and control; and herein lies the broad and practical field of the applications of sanitary science. If, for example, observation and experience have established the fact that certain trades are more than usually dangerous, then it is the privilege and the duty of the professors of sanitary science to verify and make known these facts. If it can be shown that certain climates are destructive of health and of life, while other climates conduce to good health and longevity, then it is the duty of students of sanitary science to establish and proclaim this fact. If, as appears from the results of innumerable investigations, polluted water and polluted milk are apt to convey the germs of typhoid fever, these facts may be verified, made known and acted upon.

For the purposes of sanitary science diseases may be roughly classified into two grand divisions, namely, (a) those which are due to defects of material or construction and may hence be described as *constitutional*, and (b) those which proceed more directly from external sources and are plainly due to mechanical injuries, parasites, poisons or other external or *environmental* conditions. These last the sanitarian may hope in part at least to control, while the former, being largely hereditary, are for the most part beyond his reach. It should not, however, be overlooked that the materials and construction of the mechanism may suffer damage from the action of slight or long-continued external influences, or that some so-called "constitutional" diseases may be really environmental in origin.

Causes of Disease.—Turning now to the obvious external causes of disease, with which in this article we shall chiefly deal, we may quickly dispose of those which are plainly chemical, mechanical or physical (burning, crushing, freezing, gunshot wounds, dagger thrusts, earthquakes, lightning and the like) of plainly external origin and preventable only by removing or avoiding the cause. In the same way we may set aside deaths by drowning or execution (hanging, electrocuting, etc.), and even suicide in so far as this is produced by external conditions such as loss of friends, loss of property, etc., and not from internal or constitutional defects or changes. Another group of obvious external causes of disease is that series of phenomena which comes under the head of poisons coming in or acting from the environment, such as arsenic, strychnine, morphine, nicotine, caffeine, chloral, alcohol, cocaine, etc. Disturbances of the mechanism due to the entrance of these essentially foreign bodies are only too familiar and are obviously readily preventable by removing or avoiding the cause. There still remains to be dealt with, however, one great class of external causes which may be roughly grouped together under the head of living agents of disease or parasites; including in this term not merely the coarser and more obvious parasites such as tapeworms, fleas, lice, mosquitoes and trichinæ, but also those far more elusive and dangerous micro-organisms, the microbes, bacteria, or disease-germs. Some of these have been dealt with elsewhere (see BACTERIA, MOSQUITOES, PARASITES, TRICHINÆ, TAPESWORMS, etc.), but with the relations of these parasites (and more especially of the microbes) to the health of individuals and

SANITARY SCIENCE AND PUBLIC HEALTH

of communities, namely, the public health, we have still to deal.

The Germ Theory.—One of the most fruitful discoveries of the 19th century was the fact that some diseases of previously unknown origin, such as some of the more common fevers—typhoid fever, diphtheria, Asiatic cholera, and tuberculosis—are due to the entrance into the body from the environment of certain micro-parasites, microbes, or micro-organisms. When to this discovery was added another, namely, that these micro-parasites are capable of living for longer or shorter periods outside of the bodies of plants and animals, in the environment of man, and especially in earth, air, water, milk and other materials intimately associated with human life, it became easy to understand, what had up to that time been an insoluble mystery, not only how certain diseases are caused, but also how they are spread among the people and, at the same time, how they may be controlled and even overcome. The whole problem of the prevention, not only of individual cases of disease but of those wholesale attacks of disease upon communities which had long been known as epidemics, plagues and pestilences, now became possible, and one of the most promising fields for the improvement of the health of communities as well as of individuals in the 20th century lies in a further elucidation, along the lines thus marked out, of the precise methods by which diseases are caused and conveyed, and consequently how they may be prevented. To this end not only further knowledge is required, but also an education of the people at large in the elements of sanitary science, so that diseases anywhere arising may be restricted as nearly as possible to their places of origin and there by the arts of disinfection blotted out and exterminated. Once the principle has been clearly recognized that there exists a large class of diseases (known as the infectious and contagious diseases) all of which are probably due to the entrance into the bodies of animals or plants of living external agents, called germs, microbes, micro-organisms or micro-parasites, together with the additional fact that these germs or micro-organisms, microbes, micro-organisms or micro-parasites find their way from person to person either directly ("contagion") or indirectly in devious ways through the environment ("infection")—it becomes a fascinating study to detect and discover the precise routes by which infection and contagion travel, the material vehicles by which the germs in question are conveyed; the conditions of their "longevity" or endurance in the environment under various conditions; their resistance to agents of destruction, such as cold, heat, acids, alkalies and other disinfectants; their distribution from person to person, from community to community, and sometimes even from nation to nation, as they move in or are carried about by water, milk or other food materials; by insects such as flies, fleas and mosquitoes; by wind in the form of dust; by emigrants traveling from country to country; by letters through the post-office; and by linen through laundries, sweatshops, clothing establishments, or otherwise.

Owing to the obscurity pertaining to most epidemics, plagues and pestilences, strange and unusual phenomena were formerly associated with them as causes. Terms such as "miasms,"

"effluvia," "telluric influences," and the like, were commonly used to describe causes of disease not very many years ago, but to-day these have practically disappeared. As a result of the new points of view described in the foregoing paragraphs, infection and contagion are no longer regarded as obscure, mysterious influences, such as strange atmospheric conditions, earthy exhalations or intangible gaseous emanations from swamps or forests, but rather as due to the aggressive activity of specific organisms entering the body and causing within it definite and peculiar alterations. Like bullets, daggers, slivers and other extraneous bodies coming from the environment, these are material, tangible, and recognizable causes of disease, natural rather than supernatural, and simply microscopic rather than macroscopic.

The search for the agents of disease had not, however, continued long before it began to be recognized that the invasion of the body by germs of whatever sort is, to all intents and purposes, an attack upon it by parasites, and once this became clear it was evident that, as in other cases of parasitism, the process is essentially a struggle between the invading parasite upon the one hand and the resisting organism on the other. We now know that the process by no means consists of an active attack upon a passive subject, but is rather a battle or a struggle between host and parasite (for example, between man and microbe), in which the physical, physiological conditions of the host tend on the one hand to overcome and destroy the parasite; while the parasite on the other hand attacks and injures the host in various ways, often by mechanical injury of tissue, and especially by the excretion in the course of its own vital activity of products essentially poisonous or *toxic* to the host. In the case of diphtheria, for example, the diphtheria bacillus first invades the throat of its host or victim, and, having established itself there, feeds and multiplies upon the surface-layers of the epithelium producing meantime a violent poison known as the "toxin" of diphtheria, which substance so damages the cells of the host in the vicinity as to allow a free exudation of lymph, and this, quickly coagulating, produces the white patches of the throat characteristic of this disease. But this is not all. Some of the toxin is also absorbed into the general circulation of the host and produces fever and other general constitutional symptoms of a grave character. Meantime the tissues of a strong and healthy host actively produce what are known as "antibodies" or "antitoxin," a substance capable of neutralizing the toxin either in the body itself or even in a test-tube; and it is owing to the possibility of causing some of the lower animals, especially horses, habituated to the diphtheria toxin, to produce antitoxin in their blood that we have been enabled to secure from these animals this beneficent remedy for use in cases of diphtheria in human beings. In consequence of discoveries of this sort a field of splendid promise has been opened up for 20th century hygienists, along the lines of *serum-therapy* (as it is called), that is to say, the production of various blood serums rich in antidotes (blood antitoxins) for the poisons generated by the microbes of specific diseases. See ANTITOXIN; IMMUNITY; SERUM-THERAPY; TOXIN.

SANITARY SCIENCE AND PUBLIC HEALTH

Practical hygiene and sanitation, and especially public health work, may thus proceed along either of the two lines indicated, namely, (a) reinforcement of the organism in its struggle with infectious microbes, or (b) exclusion of the microbes and their destruction in the environment. The latter is commonly known as "sanitation" as opposed to serum-therapy or "hygiene." It deals rather with the control of the extrinsic environment than with the control of the intrinsic living mechanism, and it is therefore largely connected with problems of sanitary engineering. See SANITARY ENGINEERING.

Public Health.—If, instead of dealing with the individual, we deal with groups or masses of individuals in the form of communities, such as families, villages, towns, cities, states and nations, all the difficulties (and these are by no means few) connected with individual hygiene become enormously multiplied and complicated. It is sufficiently difficult to understand the phenomena of personal health or personal hygiene, but when the problems of the individual under varying conditions dealing with a variable environment are multiplied and complicated by the introduction of those of other individuals with the inevitable effects which these produce upon the common environment, it will easily be seen that the public health problems with which we have to deal are by no means either simple or easy of solution. We need in the first place a precise knowledge of the quantity of life (that is, the population) with which we have to deal, and if over against this we set the total amount of dying within a particular period and then determine the death-ratio (or death-rate), we shall have at least a crude and general measure of the sanitary condition of the community. But if we determine simply the general death rate, we shall not have gone far enough, for it is now well understood that the death rate is profoundly influenced by factors other than disease, such for example as the birth rate, a high birth rate naturally leading under present conditions to a high death rate. It becomes necessary then in any scientific examination of public health problems to go behind the general death rate and to study other conditions. (One of the most important of these is the so-called specific death rate, that is to say, the death rate in any given population from particular diseases such as tuberculosis, typhoid fever, pneumonia and the like; for it not infrequently happens that in the presence of a fair general death rate the mortality from typhoid fever (for example) may be excessive. In determining population the census is of the first importance (see CENSUS) and a well-regulated census should furnish not merely the total number of the living but the "age periods" of the population, inasmuch as the mortality at different ages varies widely, and no safe conclusions concerning the sanitary conditions of a population can be drawn without careful reference to the constituents of that population at the different age-periods. Space will not permit here a detailed treatment of the sources of error to which students of sanitation, morbidity, death rates and the public health are exposed in various other directions, but which reference to any of the leading works upon vital statistics will readily disclose.

Epidemics.—From the practical point of view there is no more interesting subject connected

with the public health than the rise, progress and decline of epidemics, the study of which now forms a special science known as epidemiology. From time immemorial civilized communities have been ravaged by plagues, pestilences and epidemics, which have at times enormously increased the death rate, as in the famous black death (see BLACK DEATH, PESTILENCE, PLAGUE), and thus made serious inroads upon the public health. With the disappearance of such diseases as typhus (ship fever, jail fever) and of scurvy, both of which formerly destroyed thousands even among civilized peoples, attention has of recent years been fixed more particularly upon the bubonic plague, which after a long absence from Europe, has reappeared in great intensity in China and India, and has even threatened the shores of England and the United States. Asiatic cholera, which made a dramatic although brief appearance in the great commercial city of Hamburg, Germany, in 1892 has since been kept at bay in civilized countries. Typhoid fever, however, still remains a curse of even highly civilized communities, largely owing to the fact that it is readily conveyed by food and drink, such as oysters, milk and water, while its specific germs appear to be more than usually hardy or resistant. Tuberculosis, popularly called "the great white plague," and which has always been credited with a very large proportion of the total mortality in all communities, still destroys larger numbers of people than any other one disease. Probably there was never a time (except perhaps in the middle of the 19th century in Great Britain) when a more general scientific, professional or popular interest has been felt in public health problems, and especially in the particular disease last mentioned, than to-day. As a result of the immense progress which has been made in our knowledge of the methods of dissemination of infectious and contagious diseases; and doubtless also in part because of the general improvements which the 19th century has witnessed in housing, heating and ventilation, and the better protection of the health of individuals as well as communities, a distinct decline in the death rate is apparent and a correspondingly greater longevity. It is impossible to determine how much influence should be credited to general improvements, the result of a higher degree of civilization, but after making all deductions it probably still remains true that life is safer and longer to-day than ever before, largely because of a better knowledge of the causes of disease and a better practice of the arts of hygiene and sanitation among the people. The discoveries which have been made in respect to the principal infectious and contagious diseases affecting the human race have within the last 50 years been so extensive and so extraordinary that the names of these diseases have become almost household words, and the methods of dealing with them have become familiar, not only to physicians, but to sanitary experts, trained nurses and the intelligent public in general; and inasmuch as knowledge of this sort lies at the basis of effective promotion of the public health, we may briefly describe the more marked features of some of these diseases and especially the methods of their dissemination and control.

Before we do this, however, we may point

out the remarkable fact that certain diseases which only two or three centuries ago ravaged the human race have been to-day almost completely exterminated from the higher civilizations. The most important of these is probably the *bubonic plague*, which in one form or another appeared in Europe down to the 19th century under the various names of the black death, the plague, and pestilence. This disease is characterized (among other features) by swelling of the lymphatic glands, which turn black and suppurate, being then known as buboes, but it was not until the last decade of the 19th century that these buboes were found to be loaded with microbes (bacilli) capable of producing the disease in certain of the lower animals. Very late in the 19th century this plague, which had previously been for many years almost unknown in Europe and had never, so far as known, visited America, suddenly spread both westward and eastward from China, and menaced the coasts of Europe and America. It has, however, for the most part been successfully held in check, and is no longer greatly dreaded. Its method of dissemination is believed to be by means of rats and fleas, rats being very susceptible to the disease, and fleas which have bitten rats being supposed to be capable of transferring the bacilli to human beings. This point, however, is not yet fully established.

Another disease formerly very prevalent in highly civilized communities, which has within the last century or two practically disappeared, is *typhus fever* (spotted fever, jail fever, ship fever, etc.). This disease, which for a long time was not separated from typhoid fever in classifications of disease, and which resembles it closely, but differs from it in the fact that it frequently causes extensive eruptions and is also lacking in the characteristic ulceration of the bowels which is the distinctive feature of typhoid fever, was formerly greatly dreaded, but, doubtless owing to the improved sanitation (greater cleanliness) of crowded places such as jails and ships, has practically disappeared from among the most highly civilized peoples. How far better food and air have aided in the good work it is impossible to say.

Smallpox, a disease formerly so prevalent that, according to one authority, "scarce one in a thousand escaped it," and so much dreaded that the pesthouse in the early American towns and cities, a constant as well as a repulsive feature, was regarded almost with terror by many of the inhabitants, has of late years been almost exterminated in the most highly civilized countries, and wherever sufficient pains have been taken to hold it in check by means of vaccination and re-vaccination. In the German army, for example, this disease is now extremely rare, apparently for the reason that vaccination and re-vaccination are most carefully attended to. The only serious danger from smallpox to-day is that communities which are unfamiliar with the horrible character of the disease and its ravages because of its scarcity, may come to rely upon improved sanitation or other supposed safeguards and neglect vaccination which, according to all experience, is the only trustworthy defense against this extremely infectious and contagious disease. This danger is aggravated somewhat by the mistaken zeal of

the so-called anti-vaccinationists, who, fixing their attention upon the occasional injuries consequent upon vaccination rather than upon the enormous saving of life which has resulted from its use, maintain a propaganda against it, and seek to have vaccination entirely done away. However earnest and honest these persons may be, there can be no doubt in the minds of those who will take the trouble to review all of the evidence, that their contentions are largely unfounded.

Typhoid fever, a diarrhoeal disease, ever since its clear recognition, about 1840, as a malady distinct from typhus fever, has gradually come to be recognized as one of the most insidious diseases of civilized societies. Its ravages among the uncivilized are doubtless excessive, and even among highly civilized societies it is far more frequent than it ought to be, apparently because the bacilli which characterize and cause the disease are capable of maintaining their life outside the human body in the environment of man for a somewhat longer period and under somewhat more trying circumstances than are the germs of many other diseases. These bacilli are, for example, fairly resistant to cold and to dryness, and, although they are not known to produce spores, they are apparently able to persist for a long time (in greatly diminished numbers) in sewage, water, ice, and upon fruits, vegetables and other articles of food. In milk under certain circumstances they may even multiply, and a very large number of epidemics of typhoid fever has been traced to infected milk. The same thing is true of drinking-water, and, since 1894, when an extensive epidemic of this disease, due to infected oysters, occurred among the students and others in Wesleyan University, in Middletown, Conn., many investigations have been made, both in Europe and in America, tending to show that raw oysters are not infrequently grown near the mouths of sewers and that such oysters may readily convey the germs of this disease. Furthermore, since it has become known that the bacilli of typhoid fever occur not only in the bowel discharges, but also in the urine, and even in the sputum of persons sick of this disease, it has become easy to understand the fact that it is often really as well as apparently contagious, although of course in far less degree than the eruptive diseases, such as smallpox, measles and scarlet fever.

Malaria and malarial fever had long been associated in the popular mind with swamps, but until 1880 no germ characteristic of these diseases (which are really one and the same) had been discovered. In that year Laveran, a French investigator in Algiers, discovered in the red blood-cells of persons sick of the disease certain animal parasites, protozoan in character, which appear to be not only the constant accompaniment, but the sufficient cause of the disease. Quite recently Ross in England, Celli in Italy, and various other observers have proved beyond reasonable doubt that these germs are conveyed from one human being to another by means of certain female mosquitoes, belonging to the genus *Anopheles*, without the bite of one of which containing the microbes, the disease does not appear to be transferable. The life history of these parasites has been worked out thoroughly, and to-day it is universally believed that malaria is caused

by the parasites mentioned above, which spend only a portion of their normal life in their human host, and the remaining portion in the bodies of mosquitoes of the genus *Anopheles*. The importance of this discovery can scarcely be overestimated, for although formerly, as already stated, malarial fever was associated with swamps, no one could tell precisely how; while to-day it is easy to see that if swamps contain infected malarial mosquitoes they may be dangerous sources of disease for human beings. On the other hand, it had long been observed that it was not swamps *per se* which produced malaria, inasmuch as thousands of swamps had never been brought under suspicion. This circumstance is now interpreted as due to the fact that whatever mosquitoes may have been present in the swamps in question must have been of some other genus incapable of transmitting the disease; or else, if of the right genus, then these *Anopheles* had never become infected by biting human beings suffering with malaria. The practical importance of these discoveries in regard to malaria cannot easily be exaggerated, for malarial fever has long been the dreaded pest of the engineer, and such enterprises as the digging of the Panama Canal have been enormously hampered by the prevalence of malarial and other fevers. Nowadays it suffices to make sure that all sleeping huts or houses are covered with nettings which shall keep out mosquitoes, and that if possible the breeding places of these pests shall be either drained and altogether done away or else petiolized, that is, treated with oil of some sort which shall interfere with the breeding of mosquitoes.

Tuberculosis has long been recognized as one of the worst diseases afflicting the human race. It is characterized by certain cheesy masses called tubercles, which may be formed either in the lungs or upon the membranes of the brain, in the lymphatic glands, or even within the tissues of the face, the disease in this last case being known as *lupus* (a wolf), and causing serious disfigurement. In 1882 Dr. Robert Koch discovered within these cheesy masses small microbic rods or bacilli to which he gave the name by which they are now universally known, of the *Bacillus tuberculosis*. These bacilli frequently occur in the sputum of tuberculous patients, and if this sputum is cast out upon the streets or in public places, it may become dried and disseminated in various ways, for example in dust. The bacilli are believed to be disseminated also by the coughing of fine moist particles from the lungs of tuberculous patients into the air; by milk derived from the tuberculous udders of tuberculous cows; by kissing—as when, for example, a tuberculous mother kisses her young child; by the hands,—as when a tuberculous patient, coughing upon his hand, afterward, without having washed it, touches the hand of another, or articles of food which are eaten raw; and in a great variety of other ways. Here also much is being done by boards of health and other sanitary organizations which seek to control the spitting nuisance, by physicians who educate tuberculous patients to use destructible spit-cups, handkerchiefs, and the like; by sanatoria, that is, establishments intended especially for the benefit and cure of cases of *incipient* tuberculosis, and by a campaign of education consisting largely in the dis-

tribution of literature bearing upon the disease. Among the most noted sanatoria for tuberculosis in the world are those at Davos Platz, in the Italian Alps, and at Saranac Lake, in the Adirondacks. More recently state sanatoria have begun to be established, the first in America being that of the State of Massachusetts, at Rutland, Mass. It was formerly thought necessary for incipient tuberculous cases to be removed to Colorado or other high, dry localities, but to-day it is commonly felt that, however desirable a removal of this kind may sometimes be, it is not always wise, and that the essentials of a good sanatorium (which are largely fresh, dry air and good feeding) may often be found near a large city, the first institution of this kind to be established (namely, the Sharon Sanatorium at Sharon, Mass., only 16 miles from Boston, upon a slight elevation and a dry, sandy soil) having proved eminently successful.

Diphtheria, or malignant sore throat, has of late years come, unhappily, to be quite common, and is rightly much dreaded. The causative germ of the disease was discovered and described by Loeffler, a pupil of Koch, in 1884, since which time it has been very widely studied, and has been found to do its damage by producing in the bodies of its victims, or even when growing in beef tea, a highly poisonous substance known as its toxin. Until 1892 no remedy for it was known, but in that year von Behring of Germany announced the discovery of that remarkable antidote for the disease, now universally known as *diphtheria antitoxin* (see above). Behring was led to his magnificent discovery by reflecting upon the fact that some animals are immune to diphtheria and by discovering that the blood of such immune animals is capable of neutralizing the poisonous character of the toxin produced by the germs of diphtheria. The manufacture of diphtheria antitoxin is now a large industry, sometimes carried on under private and sometimes under state or municipal control. There can be no question that its use has largely diminished the mortality from this disease.

There are many other diseases such as leprosy, scarlet fever, measles, and pneumonia, a knowledge of which has of late years become more precise and practical, but these cannot be referred to within the limits of this article.

Engineering Enterprises, such as drainage and sewerage, water supply, the filtration of water, the purification of sewage, the cleaning of streets, and garbage collection and disposal, have had much to do in the past, and will doubtless have much to do in the future, with improvement of the public health; and there is every reason to hope that the general death rate may continue to diminish, as it has diminished, in the past, largely by virtue of these enterprises. In addition, however, much remains to be done; the more crowded sections of cities—the so-called slums—require the most careful supervision to prevent overcrowding, bad ventilation and accumulation of noxious or even toxic wastes. The milk supplies of cities are as yet very largely in a primitive state so far as the production of milk is concerned, and it will become necessary in the near future either to improve radically the conditions of its production or else to abandon almost altogether the use of uncooked milk. Vegetables, fruits and berries, which are eaten in the raw

state, such as celery, lettuce, radishes, watercress, cherries, and strawberries are peculiarly exposed to infection either by handling or because they are frequently treated with manure-water during the process of growth, and such water is not infrequently polluted and infected. The dangers from oysters have already been referred to. How far uncooked or underdone meats are dangerous is uncertain, although it is well known that uncooked ham and other lean meat of hogs has frequently caused trichinosis, an infection due to minute parasitic worms.

Illuminating Gas, particularly water gas, which contains a large percentage of carbonic oxide (CO), has an important bearing on the public health, not when properly burned or by its products of combustion, but because of leaks in the mains or the service pipes, or about the fixtures by which it is distributed. Many deaths occur annually from this source, and the use of water gas should be accompanied by special precautions.

As for the effect of *public gymnasias, playgrounds* and other open places in cities or other crowded communities little need be said, inasmuch as it is impossible to determine their precise value. There can be no question, however, as to the general wisdom or advantage of such things in modern cities. Isolation hospitals for infectious diseases are gradually being established in our larger cities, and are filling a long-felt want. Best of all, the recent improvements in transportation are making it possible for large numbers of persons to live near, rather than within, cities, and suburban life is becoming as characteristic a feature of modern life as is city life itself. Unfortunately this remedy for the evils of city life applies only to the fairly well-to-do, for the very poor will probably always find it easier, cheaper and more exciting to live closely crowded in the congested centres of population, where work is most abundant and where the incidental diversions of a varied and noisy city life may be had free of cost.

The public health problem is very largely, but not exclusively, a problem of the life of crowded communities. Yet something needs to be said concerning the *sanitation of farms* which, while they ought to be the healthiest places in the world, are by no means always such. Damp or even wet cellars, bad ventilation, overheating and poor feeding; defective sanitary arrangements, shaded houses, and unwholesome surroundings, or close association with domestic animals, such as dogs, cats and poultry or swine, too often make farm life unsanitary, and boards of health having in charge the sanitation of States or Territories should give attention to these problems as well as to those of more crowded communities. *Railway sanitation, steamship sanitation*, and the more technical aspects of the work of boards of health, such as *disinfection, scavenging, quarantine, isolation, vaccination* and the like, are nowadays subjects of great public consequence and are fully treated in special works or memoirs, reference to some of which will be found at the end of this article.

There are few more interesting matters relating to the public health than the control of the adulteration of foods and drinks. In spite of the increase of general intelligence, flaming advertisements of quack medicines too often disfigure the pages of the newspaper press and

testify to the enormous use of patent medicines, drugs, etc., by the public at large. In many States special laboratories are maintained for the investigation of foods and drinks, and stringent laws exist for the regulation of their adulteration and sale. One of the most striking facts which these have disclosed is that many of the so-called compounds, tonics, sarsaparillas and other patent foods or medicines are rich in alcohol, some of them containing as much alcohol as many kinds of wine or beer. Some which profess to contain certain ingredients are totally lacking in them, and others which profess to cure the alcohol habit or the morphine habit actually contain alcohol or morphine respectively, occasionally in large quantities. The revelations which proceed from these State laboratories are sometimes startling, and any one interested in the public health should inform himself upon this subject, as he may readily do by turning, for example, to the 'Annual Reports of the State Board of Health of Massachusetts.'

State and Municipal Laboratories are thus an important and modern adjunct to the public health work of boards of health. In the best of these means are provided for the rapid and certain diagnosis of doubtful cases of diphtheria, typhoid fever, malaria, hydrophobia, glanders, anthrax and some other infectious diseases. In them also analyses of milk, water, ice, sewage, vinegar and other liquids, of illuminating gas and of air, and of substances subject to infection or adulteration may be made; foods and drinks may be examined; materials for pavements or buildings may be tested and a great variety of useful operations conducted, all tending to a better knowledge of local sanitary conditions. It is doubtful if any arm of the public health service is to-day more important than this. Largely in consequence of all these and many other efforts now making for the improvement of the public health, human life is probably to-day safer and happier than it has ever been before, and the outlook for further progress is very bright. See SANITARY ENGINEERING.

Bibliography.—Buck, 'Treatise on Hygiene and the Public Health'; Sedgwick, 'Principles of Sanitary Science and Public Health' (1902); Harrington, 'Manual of Practical Hygiene for Students, Physicians and Medical Officers'; Palmberg, 'Treatise on Public Health and Its Applications in Different European Countries'; Blyth, 'Manual of Public Health'; Abbott, 'Hygiene of Transmissible Diseases'; Baker, 'Municipal Engineering and Sanitation'; Chapin, 'Municipal Sanitation in the United States'; the annual reports of the state boards of health of Massachusetts and Connecticut; monthly bulletins of the state boards of health of Massachusetts, Connecticut, Vermont, Michigan, etc. The principal periodicals are: 'Public Health Reports,' Washington, D. C.; 'Public Health,' London; 'The Journal of State Medicine,' London; 'Journal of the Sanitary Institute,' London; 'Revue d'Hygiène,' Paris; 'Zeitschrift für Hygiene und Infektionskrankheiten,' Leipzig; 'Archiv für Hygiene,' Munich and Berlin; 'Deutsche Vierteljahrsschrift für öffentliche Gesundheitspflege,' Brunswick.

WILLIAM T. SEDGWICK,
Professor of Biology, Massachusetts Institute of Technology.

Sanjak, sän'jāk, from the Turkish signifying "a standard," the name of the subdivision of a Turkish province, administered by a *mutessarif* or governor of the second rank.

San'key, Ira David, American evangelist: b. Edinburgh 28 Aug. 1840. He engaged in business at New Castle, Pa., 1855-71. In the latter year he joined the late Dwight L. Moody (q.v.) in evangelistic work and continued with him for many years, conducting the singing at the meetings and furnishing solos. His religious music attained great popularity. He compiled 'Gospel Hymns' (1875-95); 'Sacred Songs and Solos' (1873); 'Winnowed Songs' (1890); 'Young People's Songs of Praise' (1902).

Sankhya, sāng'khyā, the name of the chief philosophical system of India. Its doctrines are attributed to the sage of Kapila, fabled to have been a son of Brahma and an incarnation of Vishnu. It teaches the eternity of matter and spirit independent of a Supreme Being, and propounds a code of 25 principles, by the observance of which eternal happiness or complete exemption from every kind of ill may be obtained by the faithful. Sankhya philosophy is supposed to date from a period anterior to the 8th century B.C.

Sannazaro, sän-näd-zä'rō, **Jacopo**, Italian poet: b. Naples 28 July 1458; d. there August 1530. His 'Arcadia,' a series of idyls, although like his other Italian poems, the work of his youth, still retains its reputation. His poetry attracted the notice of King Ferdinand and his sons Alphonso and Frederick, and the latter, companion of their journeys and campaigns, who ascended the throne in 1496, gave him the villa of Mergellina, with a pension of 600 ducats. Sannazaro wrote sonnets and *canzoni* in Italian, several Latin poems, elegies, eclogues, epigrams, and a longer poem, 'De Partu Virginis,' in three books. His elegance of expression, no less than the poetical beauty of his thoughts, give him a distinguished place among the modern Latin poets. There is a 'Life' in Italian by Crispo (1723).

Sans-culottes, sänz-kū-lōt' (French, "without breeches"), the name given in derision to the Jacobins or popular party by the aristocratical in the beginning of the French Revolution of 1789. Like the epithet *gucux* bestowed on the patriot party in the Netherlands, and like that of *Methodists* bestowed on the friends of Wesley, it was adopted by those to whom it was first applied by way of contempt. At the time when the most exaggerated principles of democracy prevailed *sans-culottism* became a term of honor. In the French republican calendar the *jours complémentaires* were at first called *jours sans-culottides*.

Sans Gene, sän jän, **MADAME**, a name given to the wife of Marshal Lefebvre, Duke of Dantzic who was elevated from the ranks by Napoleon I. The term itself signifies "without constraint," or, in its application to a person, one who lives outside social conventions or restraints either through ignorance or defiance of the usages of good society. Madame Lefebvre was well suited to bear this sobriquet, having being first a washerwoman, then a *vivandière* when her husband served in the ranks, and finally

the butt of much ridicule when raised to the courtly position her husband's rank entitled her to fill. She, however, often triumphed over her conditions by natural shrewdness and a high-strung temper. The character possessed great dramatic possibilities which Sardou utilized in 1893 in a play for Mme. Rejane. The part has been played in English by Ellen Terry and Kathryn Kidder.

Sans-Souci, sän soo-sē (French, "without care"), Potsdam, Prussia, a royal suburban park containing besides two modern palaces, the one-storied palace built by Frederick the Great, 1745-7, near the site of the mill kept by the independent miller, hence styled "sans souci," who had successfully opposed the monarch's attempts to remove his building.

Sansevieria, sän'sēv-ī-ē'rī-ā, a botanical genus of the *Hamoderaceæ* of tropical Africa and the East Indies, named in honor of the Prince of Sansevero, a Neapolitan. It includes tender foliage plants useful in window gardening, since much sunshine is not necessary for their welfare, and they are easily propagated by division or leaf cuttings. The sansevierias have thick rootstocks, bearing tufts or rosettes of rigid, sometimes stem-like leaves, from 1 to 4 feet long; and, in the species cultivated in America these are sword-shaped, terete or oblanceolate, dark-green and banded more or less with grayish-white. The flowers have long and slender perianths, are white, and clustered among dry bracts in a dense raceme, rising from the centre of the group of leaves on a tall naked stalk. Bowstring hemp, used in India, is the long, durable fibre, also called Moorva and Marool, which is obtained from the East Indian *S. zeylanicum*.

Sanskrit Literature. Sanskrit is the Anglicized form of *saṁskṛtā* (from *saṁ*, a preposition of intensifying force in compounds, and the root *kr* "to make," cognate with Latin *creare*), "the adorned" or "perfected," that is, "speech." It is employed to designate the second period in the literary development of the Aryans in India. For the first period, see VEDIC.

Distinction of the Two Periods.—The difference between Vedic and Sanskrit literature is not merely one of time, but extends to matter, spirit and form. The literature of the first period is religious, that of the second in spite of a marked tendency to moralize is profane. The purpose of the first period is practical, its primary object being to obtain happiness in this world. The second period in consequence of the doctrine of transmigration is filled with the idea of the misery of all existence, and its purpose is artistic, to satisfy an intellectual want. As the literature of the first period was practical, a natural prose style had been developed in the Brāhmaṇas. The artistic purpose of the second period led to the almost total abandonment of prose in favor of verse, often to the detriment of subjects requiring exact treatment, for example, the law. Prose when employed is either mingled with verse as in parts of the epic, the drama, fairy tales and beast fables; or so artificial as in the *kāvya*s or prose romances, that conform to the rules of poetics; or so awkward and obscure, as in the grammatical and philosophic treatises, as to be hardly worthy of being called prose.

Striking as these differences are, they are in reality less important than the less obvious changes that have taken place in the language. Hence it is quite appropriate that, while the first period is named from its literature, the second is named from its language—the Sanskrit.

Development of the Language.—The difference between the language of literature and that of everyday life, is always of cardinal importance, but nowhere is it more strongly marked than in India. That it existed even at the time of the composition of the hymns of the Rig Veda, is unquestionable. The language in which the "hieratic" hymns are composed is no spoken language, but an artificial dialect that was transmitted from generation to generation in the families of the priestly singers. This is shown by the fact, that in spite of varying authorship, there is nothing like dialectic variation within this class of hymns. It is evidenced also by the way in which forms of different periods appear side by side; by the unthinking repetition of phrases; by incorrect uses of words and forms; by false formations and by the way in which the necessities of the metre are allowed to determine the choice of synonymous forms. The language of the priests themselves may have approximated to this type with the omission of the most archaic and poetic elements; but the language of the masses of the people must have been very different. Positive proof of this is afforded by the fact, that some words in the Rig Veda show already the phonetic peculiarities that are characteristic of the mediæval dialects. Such words must have originated in the language of the lower classes and thence made their way into the literary language. They show that the language of the lower classes had already advanced far in its development. The differences between this hieratic type of language and that of the popular hymns have generally been interpreted as due to differences in time; and attempts have been made to assign the different hymns to different periods on this basis. It has recently been shown, however, that the forms that have been considered evidences of later date are frequently prehistoric and hence, certainly, as old if not older, than the forms of the hieratic language; and that the language of the popular hymns is not a continuation of the language of the hieratic hymns, but that we have in these types parallel dialects, whether their difference be geographical or, as seems more probable, due to their employment by different social strata. The language of the Brāhmaṇas and Sūtras again is a continuation of neither of these types, but must be considered as an adaptation to literary purposes of the language spoken by the Brahmins at the time and place of their composition, under the influence of the literature that already existed.

Finally, there was fixed in the grammar of Pāṇini a type of language closely related to that of the Sūtras. This eminent grammarian from the northwestern part of India, whose date may be assigned to the 4th century B.C., represents the culmination of the grammatical studies that had their beginnings in the Brāhmaṇas. Of predecessors he mentions no less than sixty-four; but the success of his grammar has led to the disappearance of their works. His grammar became the standard for the classic language so absolutely, that from this time the language is fixed—there being no further development

of language but only of style. This language is called the Sanskrit, that is "the adorned" or "perfected" in opposition to the Prakrit or plebeian dialects. That it was not the pure creation of the grammarian's brain but based on actual spoken usage is evident; for some of the rules of his grammar would have no significance except for a spoken language, and there are early traces of dialectic variation. We are expressly told that in the 2d century B.C. the inhabitants of the Āryāvarta or "land of the Aryans" that is the country between the Himālaya and the Vindhya Mountains, were the speakers of the standard Sanskrit. But this does not apply to all the inhabitants of that district. The distribution of the dialects in the drama probably continues a much earlier tradition; here men of the two upper castes speak Sanskrit, those of the lower castes and all women speak Prakrit. As all converse with one another, and the production—the same applies to the recitation of the epics—must have been intelligible to the audience it follows that Sanskrit must have been intelligible even to those who did not speak it, and that its speakers must have understood also the vernaculars. Its position must have been like that of Latin in the Middle Ages or that of Hebrew among the Jews and such is its position in India at present. In it the whole of the classic literature is composed, so that we have the spectacle of the literature of a nation under the domination of a single grammar for centuries, in a way that is without parallel in the history of the world. This language and literature spread throughout the Indian peninsula and further south to Ceylon, to Borneo, Java, and the Philippines, into further India, Burma, and Siam, and, owing to the influence of Buddhism, into central Asia, Tibet, China, and Japan.

With regard to the differences between the classic language and the various forms of Vedic it is to be noted that the phonetic status of the language has remained almost exactly the same, that there has been no important addition to the formative or inflectional elements, but that the change has consisted partly in dropping forms that seemed superfluous, partly in settling the usage in favor of one form, for which two or more forms of synonymous value had previously existed; and finally that the vocabulary has been increased by new formations made with the means that were already at hand. The nature of these changes also shows that we are dealing with a literary language. The natural development of the language of the Aryans in India is to be seen only in the speech of the lower classes. The existence of these vernaculars by the side of the literary language is attested, as has been noted, from the time of the Rig Veda. In literature they appear only with the rise of the two great heresies Jāinism and Buddhism. These in their oldest phases employ the Prakrit and Pāli dialects, afterward they too resorted to Sanskrit, so that Prakrit remained in literature only in certain parts of the drama in which it had a traditional right. From these mediæval dialects were evolved in turn the modern dialects, the literary employment of which begins about the 11th century of our era.

Sanskrit Literature.—By Sanskrit literature is meant, therefore, the literature which is composed in the language that conforms to the grammar of Pāṇini. Certain parts of the Epics are

no doubt older than that grammar, but it is impossible to tell exactly which these parts are, and moreover in the later working over of this material the tendency has been to bring it into harmony with the classic standard. It will be seen, therefore, that there is no sharp chronological line that can be drawn between the two periods; because on the one hand the beginnings of the classic literature go back to the time before Pāṇini and on the other the later monuments of the Vedic literature were produced after that date. The wealth of the classic literature is enormous, every department except history being well represented, and it will not be possible to give more than the briefest mention of the most important authors and works.

Epic Poetry.—Two classes of works are to be distinguished: Itihāsas, Ākhyānas or Purāṇas, "ancient tales," and the Kāvya or artificial epics. The chief representatives of each are the Mahābhārata and the Rāmāyaṇa. The first is a heterogeneous mass of about 100,000 distichs. The main story is the strife of two Aryan tribes, the Kurus and the Pāṇḍavas. To this only about one fifth of the poem refers. The remainder consists of episodes and didactic disquisitions chiefly on the duty of the warrior class that have changed the poem from an epic to a dharmācāstra or legal text-book. The Mahābhārata itself recognizes the nature of its origin, when it gives as its author Vyāsa, "redactor." It is known to have reached its present form by 500 A.D. and probably had become a dharmācāstra by the beginning of our era, while the epic nucleus may be some five centuries earlier than that date. The eighteen Purāṇas that have been preserved are of much later date. Their original character has been changed by abridgement or omission of the ancient tales and the substitution of didactic elements. They are all sectarian, generally Viṣṇuite. The Rāmāyaṇa, a poem of some 24,000 distichs, is for the most part the work of a single poet Vālmiki. Its subject is the story of Rāma, especially the abduction of his wife Sītā by the demon Rāvaṇa who carried her to his stronghold Lankā in Ceylon, from which she was rescued by Rāma with the help of Hanuman king of the monkeys. In the later additions Rāma is made into an avatar of Viṣṇu. The story has been interpreted as a historical allegory, but is more probably merely mythological. The main portion of the work is probably older than the formation of the epic kernel of the Mahābhārata. The Kāvya, or artificial court epics, extant range from the time of Kālidāsa (the beginning of the 5th century) to the 12th century, though there is epigraphic evidence to show that this style of poetry originated before our era and continued in vogue. Of these the most important are the Raghu-vaṇṇa, 'The Family of Rāma' and the Kumārasambhava, 'Birth of the Wargod,' of Kālidāsa. As Kāvya are also classed certain prose romances of the 6th and 7th centuries—the best known being the Daṣa-kumāra-carita of Dandin or "the Adventures of the Ten Princes."

Lyric Poetry.—Long lyric poems are rare. Such are Kālidāsa's Meghadūta, or 'Cloud Messenger,' in the 115 stanzas of which an exile implores a cloud to bear to his wife the message of his love; and the highly poetical description of the seasons from the point of view of a lover, by the same poet entitled, Ritu-saṁhāra, 'Cycle

of the Seasons.' More frequently each stanza is a poem in itself: these are published in collections frequently styled Ḍaṭakas, 'Centuries.' Religious lyric poetry is represented by similar collections. Famous in both departments was Bhartṛhari (of the 7th century).

Drama.—This is the department in which Sanskrit literature has reached the highest point of merit. Noteworthy are the resemblances to the Elizabethan drama, the absence of tragedy, the mixture of prose and verse, and the employment of different dialects, mentioned above. The origin of the drama is obscure, but there is no reason to assume Greek influence. Etymology points to the original prominence of dancing. Combined with song and pantomime it constitutes the germ from which by the addition of the dialogue—at first extemporized—the drama was evolved. The first and greatest of the dramatists is Kālidāsa and his masterwork is the Ḍakuntalā. Besides this have been preserved the Vikramorvaṇi and Mālavikāgnimitra. Bhavabhūti of the 8th century is the next in fame: of his works remain, the Mālati-mādhava, Mahāvira-carita, and Uttara-rāma-carita. Between these in time are the Mṛcchakatikā, 'Clay Cart' and the Ratnāvalī, 'Pearl Necklace,' attributed to the kings under whose patronage they were brought out.

Fairy Tales and Fables.—This department is historically most interesting because of its deep influence upon the mediæval and modern literature of Europe. Characteristic is the human-like role assigned to the animals; the mingling of prose with poetry of a gnomic character and frequently of a high order of merit; and the system of arrangement, story being set in story as in the Arabian Nights. The source of the beast fables is the Jātakas or Buddhist birth stories, the chief character being identified with Buddha in a previous existence. Works of this class are called Nīti-cāstras or 'Text-Books on Good Behavior,' being intended for the political and ethical training of princes. They have been recast by the Brahmans in the interests of their religion. Of these the oldest is the Pañca-tantra, so called from its five books. Its existence in the 6th century is proved by its translation at that date into Pehlevi. From it chiefly is derived the Hitopadeṣa, 'Book of Good Counsel,' the manuscripts of which go back to the 14th century. The most important collection of fairy tales is Somadeva's Kathā-sarit-sāgara, 'Ocean of the Streams of Stories,' of the 11th century.

The works of Sanskrit literature relating to the sciences and arts, grammar, lexicography, metrics, poetry, rhetoric, philosophy, law, astronomy, mathematics, medicine, music, painting, sculpture, and the technical arts, cannot come within the scope of this article. For works of reference, see under VEDIC.

GEORGE MELVILLE BOLLING,
Associate Professor of Greek, and Assistant Professor of Comparative Philology and Sanskrit,
Catholic University of America.

Sansovino, sän-sō-vē'nō, **Andrea**, Italian sculptor: b. Monte San Savino, near Montepulciano, 1460 (whence he was familiarly known as SANSOVINO, his real name being CONTUCCI); d. 1529. He was a pupil of A. Pollaiuolo and early formed his style on that of Leonardo da Vinci. It was under their influence that he produced

such reliefs as the 'Coronation of the Virgin'; 'The Annunciation'; and the 'Pietà.' In 1491 he was summoned by the king of Portugal to Lisbon where for nine years he exercised his art as sculptor and architect. Returning to Florence in 1500 he carved the group of 'Christ's Baptism' over the east portal of the Baptistery, which exhibited a nobility of form and expression unparalleled at that period, although he never completed the group. A statue of the Madonna and one of John Baptist for the cathedral at Genoa were his next works, and afterward he accepted a commission from Pope Julius III. to execute the tombs of Cardinals Basso and Sporza for the choir of Santa Maria del Popolo. In these sepulchral monuments we see that the high-water mark of the 15th century art is reached; they are the most masterly sculptures of their kind that Rome possesses. In 1512 he completed his 'Saint Anne with Two other Saints' in the church of San Agostino in Rome. He was then entrusted by Pope Leo X. with the decoration of the church at Loreto (1513-29). Among the reliefs there the 'Annunciation'; the 'Nativity'; and the statue of 'Jeremiah' are his own works; the rest of the decorations were produced under his direction by various artists. Nothing can be finer than the blending of classic severity with the freshness of Renaissance life in these figures which exhibit the results of a pure study of nature. Expression and action are full of deep feeling, yet not so emphasized as to overstep the line of modesty.

Sansovino, Jacopo Tatti, Italian sculptor and architect; b. Florence 1479; d. Venice 27 Nov. 1570. He took his name from the great artist who had been his teacher, and began his career in Florence where his first works of note were his statue of 'Jacob' in the cathedral and his marble 'Bacchus' in the Bargello. Belonging also to this early period is a 'Madonna and Child' in the church of San Agostino at Rome. In 1527 he went to Venice where his genius being quickly recognized he was appointed architect to the Republic. His untiring labors from that time to his death have left his stamp both on the sculptural and architectural monuments of Venice. He is a brilliant example of the Italian artist in the noonday splendor of the Renaissance and in his architectural creations unites play of fancy and elegance of proportion with the most impressive and monumental dignity. His preeminence as a sculptor is not so evident; his plastic work is often unpleasing and evidences a failure to master either the principles or the materials of his art, so that his work appears mannered and mechanical. His greatest successes in architecture are the Corner Palace (1532); the library of Saint Mark's, a splendid example of Italian Renaissance (1536); the Mint; and the churches of San Martin, San Giorgio dei Greci and San Giuliano. The 'Burial of Christ' and the 'Resurrection,' are fine reliefs on the bronze doors of the Sacristy of Saint Mark's, and among other plastic works of his are a sitting figure of 'Saint John' in Santa Maria dei Frari; the statues of 'Hope' and 'Love' on the tomb of the Doge Venier in San Salvatore; and the gigantic figures of 'Mars' and 'Neptune' in the Doge's palace. Consult: Rosenberg in Dohme's 'Kunst und Künstler.'

Sant, James, English painter; b. Croydon 1820. He was a pupil of John Varley and Sir Augustus Calcott, and studied in the schools of the Royal Academy for four years. As a portrait painter he has been eminently successful and was appointed during the last reign Painter-in-Ordinary to Queen Victoria. Among his best-known and most popular pictures are 'Little Red Riding Hood'; 'Infant Samuel'; 'The Boy Shakespeare'; 'The Walk to Emmaus'; etc.

Santa Ana (săn'tă ä'nă) **Indians**, a Pueblo tribe of New Mexico. See QUERES.

Santa Ana, Cal., city, county-seat of Orange County, on the Southern Pacific and the Southern California R.R.'s; 30 miles south-east of Los Angeles. It was founded in 1869. It is the commercial centre of Santa Ana valley, one of the most fertile sections of California; oranges and fruits of all kinds, vegetables, wheat and sugar beets are produced in this region, and there are also large peat-beds in the vicinity. The principal industries include a fruit and vegetable cannery, flour mills, large lumber and planing mills, and soda-works. Santa Ana is connected by a local railway with Newport Beach, 10 miles distant, a popular seaside resort. There is a public high school, established in 1889, and a public library; the Orange County Business College is also located here. The city owns its waterworks, the supply being derived from artesian wells. Pop. (1890) 3,628; (1900) 4,933.

Santa Ana, Philippines, formerly a pueblo of the province of Rizal, constituted a district of the city of Manila in 1902. It is the centre of extensive vegetable gardening for Manila markets. Pop. 2,200.

Santa Anna, sãn'tă ä'nă, or **Ana, Antonio Lopez de**, Mexican general and politician; b. Jalapa 21 Feb. 1795(?); d. Mexico City 20 June 1876. He entered the army at 15, and attained public prominence as a supporter of Iturbide in 1821. The following year, after having expelled the royalists from Vera Cruz, he took command in that city, where he led a revolt (2 Dec. 1822) which hastened the retirement of Iturbide, who had made himself emperor. After the defeat of the Federal party in 1823 Santa Anna retired to his estate; but he emerged again in 1828 in support of Guerrero's claims to the presidency, in which the latter supplanted Pedraza. In 1829 the Spanish invasion furnished Santa Anna a favorable opportunity, and as minister of war and commander-in-chief at the head of the Federal forces he compelled Barradas to capitulate at Tampico, 11 September. He soon joined with Bustamante in overthrowing Guerrero, and setting up the former in his place, but also, in 1832, led in the overthrow of Bustamante himself, and the restoration of Pedraza. In 1833 Santa Anna was chosen president, and soon after renounced the party of the Federalists and put himself at the head of the Centralists, who desired the centralization of power in the executive government. His popularity with the army was not shared in by the nation at large, which feared that he was aiming at imperial power. On 11 May 1835 he defeated an insurgent army on the plains of Guadalupe, and as the blow was fatal to the republicans he was shortly afterward named dictator. The Federal constitution was abolished,

SANTA BARBARA—SANTA BARBARA ISLANDS

and the governors of the several states became dependent upon the central power. Texas, however, having long nourished a revolutionary feeling, now broke out into rebellion. Santa Anna attacked San Antonio in February 1836, stormed the Alamo (q.v.), and massacred its defenders, 6 March, and going forward pursued the Texans under Sam Houston (q.v.), by whom, however, 21 April, at the battle of San Jacinto (q.v.) he was routed and taken prisoner. He secured his release by a treaty recognizing the independence of Texas, which, however, was repudiated by Mexico, that country also suspending his dictatorship. He was permitted to go to the United States, and after his return to Mexico in 1837 lived in retirement for a year, but offered his services to his country against the French in 1838, and taking command of the troops, repelled the assault on Vera Cruz (5 December) and forced the enemy to retire. In this engagement he lost a leg, a casualty which, however, contributed to restore him to popular favor. He again became a leader of the Centralists, and from October 1841 to June 1844 was virtual dictator under the title of president. The new constitution of 12 June 1843, under which he was formally elected president, increased his dictatorial powers, the exercise of which led to a fresh revolution, resulting in his overthrow. He was taken prisoner in January 1845 and banished. But on the eve of the war with the United States, he was recalled (July 1846), and was first appointed generalissimo by the provisional government and in December was made provisional president. At the opening of 1847 he led an army of 20,000 against the American troops under General Taylor, and fought the battle of Buena Vista (q.v.) 22-23 February, in which he was defeated. On 18 April he was attacked and defeated at Cerro Gordo (q.v.) by General Scott. Immediately after the battle of Chapultepec (q.v.) the City of Mexico fell and was entered by the Americans (14 September). Santa Anna, escaping from the city, briefly continued a desultory warfare; but on 5 April 1848, having resigned the presidency, he received permission to retire from the country and sailed for Jamaica, going thence to Venezuela. In 1853 he was recalled and elected president for one year, but after setting up an odious despotism, he proclaimed himself (December 1853) president for life, with the title of Serene Highness and the right of nominating his successor. Revolution followed in March 1854, and when he saw that his cause was lost Santa Anna fled from the capital (9 Aug. 1855) and found refuge in Cuba, Venezuela, and Saint Thomas. In this absence he was tried and condemned for treason, and his estates were confiscated. He returned to Mexico during the French occupation (1864), but was not permitted to remain. In 1867 he again returned, but was once more exiled and went to live in the United States. Finally, after the death of Juarez and the amnesty of 1874, he was permitted to reside in his own country, where his career ended in poverty and obscurity. Consult: Wilson, 'Mexico' (1856). See MEXICAN WAR; MEXICO; TEXAS.

Santa Barbara, bär'ba-ra, Cal., city, county-seat of Santa Barbara County; on Santa Barbara Channel, an arm of the Pacific Ocean; and on the Southern Pacific railroad; about 360 miles southeast of San Francisco. It has

regular steamer communications with San Francisco, San Pedro, San Diego, and other Pacific ports. The Santa Ynez Mountains shelter the city from the north winds, and the ocean breezes serve to make the temperature equable and salubrious all the year. The number of health seekers who visit the place in winter has given it the name "American Montone." It was visited, in 1603, by Sebastian Vizcaino. In 1782, Governor Felipe Neve established a presidio which was maintained until the arrival of General Frémont.

Santa Barbara is in a remarkably fertile agricultural region, and has important interests in stock-raising, fruit growing, and in the shipment of olive oil, petroleum, wool, and various minerals. In the vicinity are mineral springs which are noted for their medicinal properties. The excellent bathing places are not the least of the attractions. In the city and around, the roses are conspicuous, often covering the houses. Four miles distant, at Montecito, is the great grape vine, the Parra Grande, which yields annually 8,000 pounds of fruit. The broad fields of pampas grass, the groves of walnut, olive, orange, prune, and other trees, the long avenues of magnolias, the great leaved bananas, the tall calla and other flowers which cover the fields in profusion, seem to vie with clear skies in making Santa Barbara an ideal residential city. The educational institutions are Santa Barbara Collegiate School, a high school, public and parish graded schools, several private schools, manual training schools, kindergartens, and three libraries. In connection with Saint Vincent's orphanage is a school. The four banks have a combined capital of \$260,000. Within a mile of the city is the place where the Spanish priest Junipero Serra founded a mission in 1786. There are still standing and in use by Franciscan monks, his church with its two towers, the refectory, the dormitory, and the quaint old garden. Pop. (1890) 5,864; (1900) 6,587.

Santa Barbara, Honduras, the capital of the department of Santa Barbara, situated on the Santa Barbara River, 65 miles southwest of Puerto Cortés. It is a comparatively well built town, manufactures sombreros and spirits, and is a commercial depot for the products of the surrounding country destined for Puerto Cortés. The latter is reached by a high-road and, for a part of the way, by rail. Pop. between 5,000 and 8,000.

Santa Barbara, Philippines, pueblo, province of Iloilo, island of Panay, between a branch of the Janipaán River on the north and the Tigón River on the south, 12 miles north of Iloilo, the provincial capital. Pop. 13,000.

There is also a smaller pueblo of the same name, province of Pangasinán, Luzon, 12 miles east of Lingayén; at the crossing of two roads. Pop. 7,595.

Santa Barbara, a channel, or arm of the Pacific Ocean, between the northern islands of the Santa Barbara group and the mainland of California. It varies in width from 20 to 30 miles.

Santa Barbara Islands, a group off the coast of California; about 20 miles distant from and nearly parallel with the mainland coast. They are nine in number: San Miguel, Santa Rosa, Santa Cruz, Anacape, Santa Barbara,

SANTA BARBARA DE OCAMPO—SANTA CRUZ

Santa Catalina, San Clemente, San Nicolas, and San Juan. From San Miguel on the north to San Clemente is about 175 miles.

Santa Barbara de Ocampo, dā ō-kām'pō, Mexico, a town in the state of Tamaulipas, situated 45 miles south of Ciudad Victoria. It lies in a fertile river-plain at the foot of the eastern Sierra Madre, and is the centre of a rice, sugar and fruit-growing district. Pop. (1895) 9,079.

Santa Catalina, kā-tā-lē'nā, an island of California, one of the Santa Barbara Islands; separated from the mainland by San Pedro Channel and Gulf of Santa Catalina. The island was discovered in 1542 by Juan Rodriguez Cabrillo, a Portuguese explorer in the service of Spain, and was named by him San Salvador. The explorer Sebastian Vizcaino visited the island 60 years later and gave it the present name, in honor of Saint Catharine of Sienna. The island is 25 miles long, with an average width of four miles; area, about 55,000 acres. It is hilly and well-wooded and has many deep gorges. Avalon (q.v.) is the only town on the island. The surrounding waters abound with fish. The island is a favorite resort, especially from June to October.

Santa Catharina, kā-tā-rē'nā, Brazil, a southern maritime state bounded on the north by the state of Paraná, on the east by the Atlantic, on the south by the state of Rio Grande do Sul, and on the west by the Argentine territory of Misiones; it includes the fortified island of the same name and several smaller ones on the coast; area, 28,620 square miles. Desterro (q.v.), officially Florianopolis, is the capital. A series of valleys run west to east, formed by spurs of the boundary mountain range, and the state is watered by the rivers São-Francisco, Aracary, Tapeçu, Tijuca, Tubarão and numerous streams all falling into the Atlantic. The soil, though in the lower lands sometimes sandy, is fertile, the climate mild, and the seasons regular. Sugar, rice, mandioca, millet, beans, onions of immense size, and garlic are the chief cultivated products, considerable quantities of which are exported to Rio de Janeiro. The indigo and cochineal plants grow spontaneously, and wheat and flax give good returns. The state is well wooded, producing excellent timber and gold, silver, iron, coal, and petroleum exist. The forests are infested by ounces, coatis, monkeys, pigs, and other animals. Birds are numerous, including several varieties of humming-birds; and the lakes and rivers are frequented by innumerable geese and other water-fowl. Pop. est. (1904) 350,000, including 50,000 Germans.

Santa Clara, klä'rā, Cal., town in Santa Clara County, on the Southern Pacific railroad, 40 miles southeast of San Francisco. It was settled by the Franciscans in 1777, became a town in 1852, and received a new charter in 1867. It is the centre of a rich agricultural and fruit-raising region, and has a number of fruit-packing establishments; it also contains several mills and a tannery. It is connected with San José, the county-seat, by a narrow-gauge railroad and electric street railway. The public school system includes a high school, and there is a public library. The town is also the seat

of Santa Clara College, a Roman Catholic institution founded in 1851, and the Notre Dame Academy, a Roman Catholic convent school, and the University of the Pacific (q.v.) is nearby. The government is by a board of five trustees, three of whom are elected every two years. Pop. (1890) 2,891; (1900) 3,650.

N. H. DEMING,
Editor Santa Clara Journal.

Santa Clara, Cuba, (1) City, capital of the province of Santa Clara; on the Cuba railroad; 155 miles east-southeast of Havana. It was founded in 1689. Formerly it was the eastern terminus of the railroad from Havana, but in 1902 the railroad system was extended to the eastern end of the island. It is the centre of a fertile agricultural region, is the second largest inland city of Cuba, and has considerable commercial importance, which is increasing with the development of the railroad facilities. Silver has been mined in the vicinity, but not successfully; an excellent quality of asphalt is obtained and exported; and illuminating gas for lighting the city has been manufactured from this asphalt; petroleum is also reported in the vicinity. The city is well built, the streets are wider than is usual in the older Cuban cities, and municipal sanitation has been improved since 1898. The location is naturally healthful and favorable for further commercial development. Pop. (1899) 13,763.

(2) Province in the central part of Cuba, bounded on the east by Puerto Principe and on the west by Mantanzas; area, 9,560 square miles. The surface is undulating, with ranges of hills in the east and south, the highest peak rising 2,900 feet. It has rich agricultural lands; the production of sugar is the chief industry, the province containing some of the largest sugar plantations and factories in the island. Tobacco, coffee, and fruits are other products of commercial importance; wax and honey are obtained; and the timber is abundant and valuable, there being 307,910 acres of public forests in the province. There are also excellent grazing grounds and cattle raising is a profitable industry. The mineral resources are second only to those of the province of Santiago de Cuba, but not so well developed; asphalt, copper, gold and silver are found. The Cuba Railroad traverses the province from east to west, and there are short branch roads; there are few good highways, however, and the need of improvement in transportation facilities is felt. Pop. (1899) 356,357.

Santa Cruz, sän'tā kroos, **Andres**, Bolivian soldier and politician: b. La Paz, Bolivia, about 1794; died Saint Nazaire, France, 1865. He was of partial Indian descent, entered the Spanish army and rose to the rank of colonel. He was captured by the patriots in 1820, persuaded to adopt their cause, became a general in the army, and led an invasion of Upper Peru in 1823. In 1826-7 he was acting president of Peru under Bolivar and in 1829 he was elected president of Bolivia for a term of 10 years, receiving also the title of grand marshal. His measures were progressive and the country en-

SANTA CRUZ—SANTA CRUZ DE LA SIERRA

joyed great prosperity under his administration. From the first he adhered to his purpose of uniting the Pacific coast republics, and his successful invasion of Peru in 1836 was followed by his proclamation of the Peruvian-Bolivian confederation. In 1839 a Chilean army invaded Bolivia and defeated Santa Cruz at Yungay. He resigned and left the country, whereupon the confederation was dissolved. He was afterward engaged in Europe on various diplomatic missions for Bolivia.

Santa Cruz, sǎn'tǎ krooz, Cal., city, county-seat of Santa Clara County; on the Bay of Monterey, and on the Southern Pacific and South Pacific Coast R.R.'s; 60 miles south of San Francisco. It was first settled in 1791 by Franciscan missionaries, and was incorporated as a city in 1876. It is in a fruit-raising region; the chief manufacturing establishment in the city is a powder factory; other manufactures of importance include lead, bitumen, and leather; and there are also lumber and planing mills, a soap factory and a box factory. The city is beautifully situated on land rising gradually from the bay, the climate is equable and pleasant, and it has become one of the most popular health and tourist resorts of central California. A bathing beach, picturesque drives, and a large public park overlooking the bay add to the attractions of the place. The public buildings include a court-house, a hall of records, the city-hall, and the public library. The city has a public high school and parochial schools; and is the seat of the School of Holy Cross (a Roman Catholic convent school), and of the Catherwood's Business College (coeducational). The city is governed by a mayor and a council of four, elected every two years. Pop. (1890) 5,596; (1900) 5,659.

Z. BARRET,

City Editor of 'The Sentinel.'

Santa Cruz, sǎn'tǎ kroos, Mexico, a town in the state of Guanajuato, situated in a fertile agricultural district a few miles southeast of Guanajuato. Pop. (1895) 7,444.

Santa Cruz, Philippines, pueblo, capital of the province of Laguna, Luzon; on southeast shore of the Bay Lagoon (Laguna de Bay), at the mouth of the Santa Cruz River; 34 miles southeast of Manila. It is connected by highway with Manila, Batangas, Cavite, and Tayabas, and carries on an important trade. It is also the terminus of a projected railroad from Manila. The region is famous for the manufacture of palm wine or brandy, the sale of which was a government monopoly under Spanish rule. The town is well built and contains fine municipal and ecclesiastical buildings. Pop. 13,140.

There are also three smaller pueblos of the same name: (1) Pueblo, province of Dávao, Mindanao, on Dávao Bay, 15 miles south of Dávao; it has an excellent harbor of good depth; pop. 720; (2) pueblo, province of Ilocos Sur, Luzon, 34 miles south of Vigan; on the main highway; pop. 5,876; (3) pueblo, province of Zambales, Luzon, on seacoast; 32 miles north of Iba; on the main highway; pop. 4,600.

Santa Cruz, sǎn'tǎ krooz, or **Saint Croix**, sǎnt kroi, the largest of the Virgin Islands, Danish West Indies, lying 60 miles southeast of Porto Rico; area 84 square miles. It is hilly,

except in the southern part; well-watered, and fertile, and has a larger proportion of land under cultivation than the other islands of the group. Sugar is the chief product; tobacco, cotton, and fruits are also cultivated. Some cattle are raised. The chief articles of export are sugar and rum. The climate is at times unhealthy, the temperature varies from 54° to 72°. Earthquakes and hurricanes are frequent. The capital and residence of the governor is Christianstadt; and in the island is another small town called Frederikstadt. The island was discovered by Columbus in 1493, and was occupied by the Dutch, the English, the Spaniards, and the French; ceded to Denmark by France, it was occupied by the English in 1807, but finally restored to Denmark by the Treaty of Paris. It was included in the treaty of 1902 for the purchase of the Danish West Indies by the United States, which was rejected by the legislature of Denmark. Pop. (1901) 18,567. See WEST INDIES, DANISH.

Santa Cruz Islands, or **Queen Charlotte Islands**, Melanesia, an archipelago in the Pacific Ocean, belonging to Great Britain, and situated in lat. 10° S. and lon. 166° E., north of the New Hebrides, and east of the Solomon Islands. The group comprises several large and a number of small islands, with a combined area of 362 square miles. The larger islands are volcanic and mountainous. Most of them are surrounded by coral reefs, and nearly all the small islands are of coral formation. The climate is hot, humid and unhealthy, but the soil is very fertile, and the vegetation luxuriant. The inhabitants, who are chiefly Melanesians and still uncivilized, are supported partly by their plantations of coco-palms, partly by fisheries and by trading with neighboring islands. The archipelago was discovered in 1595 by Mendaña. Since 1898 it has been an administrative dependency of the Solomon Islands. The population is about 7,000.

Santa Cruz de Napo, sǎn'tǎ krooth dǎ nǎ'pó, pueblo, province of Marinduque, Philippines, on the northeast coast, 18 miles east of Boac. The town lies about a mile and a half from the shore, and three miles from the anchorage ground. It is a port of entry for coasting vessels, and the anchorage is well protected; there is difficulty, however, in landing at the point nearest the town. Santa Cruz is surrounded by a fertile agricultural country; it is not as well built as Boac, the provincial capital, but its situation is more advantageous owing to the superior harbor. Pop. 15,800.

Santa Cruz de la Sierra, sǎn'tǎ kroos dǎ lǎ sē-ēr'rá, Bolivia, (1) Town, capital of the department of Santa Cruz de la Sierra; on the Piray River, on the eastern slopes of the Andes. The town was founded in 1575, and originally bore the name of San Lorenzo de la Fontera. The houses are mostly one story high, built with timber and earth, with large balconies and uneven roofs. (2) Department, the easternmost department of Bolivia, bounded on the north by the rivers Beni, Mamore, Itenez, and the Brazilian province Matto-Grosso; on the east by the river Paraguay and the Brazilian territory; on the south by the Pilcomayo and the desert of Gran Chaco; on the west by the departments Cochabamba and Chuquisaca; area, 126,340

SANTA CRUZ DE TENERIFFE—SANTA FÉ

square miles. It is mostly level, except in the western part, where it reaches the Andes. It is drained by the Rio Mamore and the Rio Beni, and their tributaries. The central region is mostly heavily wooded, with some open marshes and plains. It is thinly populated, the most of the towns being in the western part and along the rivers. The soil between the mountains and the central forests is fertile and yields sugar, coffee, cacao, and rice. Some cotton cloth is manufactured and gold is mined in the mountain district. Pop. (estimated) 209,850.

Santa Cruz de Tenerife, sán'tā krooth dā tēn-ē-rif', Canary Islands, city, capital and commercial port of the Canary Islands, on the northeast coast of the island of Tenerife. Many of the houses are handsome, and of one and two stories high; but the majority are low. The streets are well paved, and lighted by electricity. There is a square, surrounded by wooden edifices, and adorned with a colossal statuary group representing the apparition of the Virgin of Candelaria to the Guanches, the original inhabitants. Besides the custom-house and the military hospital, there are scarcely any public buildings; the church of San Francisco is the finest. The harbor, which is very secure, has a magnificent mole, of modern construction; other works, including a breakwater, have recently been constructed. Tomatoes, bananas, potatoes, wine, brandy, and cochineal are the chief articles exported; and the imports consist largely of English, French, Spanish, and German manufactures, with coal, grain, flour, etc. Pop. 16,000.

Santa Fé, sán'tā fā, or **Santa Fé de la Cruz**, Argentina, (1) Capital of the province of the same name, near the junction of the Salado with the Paraná, 299 miles by rail northwest of Buenos Ayres. It stands on an eminence which is prominent in a district otherwise level. The Cabildo, the most important building, stands on the plaza or main square. Santa Fé is the seat of the governor, legislature, and the bishop. There are several churches and monasteries, also a normal school for teachers. Hides and timber form the chief articles of trade. The principal industrial works are: a foundry, macaroni and oil factories, and tile works. Pop. (1900) 22,500.

(2) The province of Santa Fé covers 50,916 square miles, and has a rapidly increasing population. There are vast numbers of cattle, sheep, and horses on extensive farms, and 3,688,118 acres of land are planted in cereals. Pop. (1900) 536,236.

Santa Fé (Holy Faith, contracted from LA VILLA REAL DE SANTA FÉ DE SAN FRANCISCO), New Mexico, city, capital of the Territory, and county-seat of Santa Fé County; on Santa Fé Creek, the Denver & R. G., the Santa Fé Central, and a branch of the Atchison, T. & S. R.R.'s, the latter connecting with the main line at Lamy, 18 miles southeast; it is 21 miles east of the Rio Grande, and 58 miles northeast of Albuquerque. Chartered as a city in 1890.

Principal Features.—The streets in the older part are narrow and crooked, and are occupied chiefly with one-story adobe houses, but in the more modern portion the streets are broad and straight and are improved with good business houses and neat residences, many of them of stone and brick. A public park, known as the

Plaza, occupies a square in the middle of the city, in which are two monuments and a memorial fountain. The city contains also a monument to Governor Perez, who was assassinated in 1837, and another to Kit Carson who lived at Taos. Santa Fé is the seat of a Roman Catholic archbishopric, and until 1897 the military post known as Fort Marcy was situated there. The city contains the oldest national bank in New Mexico (capital \$150,000), and has a public high school and four ward schools. In addition to a Territorial library with 4,500 volumes, there are three public and school libraries with 5,300 volumes. An English daily, an English weekly, and two Spanish weeklies are published. The rooms of the New Mexico Historical Society contain interesting historical and archaeological collections. Santa Fé is beautifully situated at an altitude of 6,998 feet, in the midst of an agricultural and mining region, and its principal business consists of supplying the immediately surrounding country with merchandise. Water for domestic purposes, for local irrigation, and electric power, is supplied by reservoirs above the city on Santa Fé Creek. There are commodious hotels, but no street railways. Owing to its unsurpassed climate Santa Fé has become a popular resort for health-seekers, and its deep historical interest attracts many tourists; but as a business centre it has steadily declined since the building of the first railroad brought the overland trade via the Santa Fé trail to a close and diverted much traffic to Albuquerque. Pop. (1880) 6,635; (1890) 6,165; (1900) 5,603.

Buildings, etc.—By reason of its long political and ecclesiastical importance Santa Fé contains by far the most interesting and some of the finest buildings in the Southwest. First in historical importance is the "Palace," a massive-walled, one-story structure of adobe, a block in length, and facing the Plaza on the north. (See illustration under NEW MEXICO.) It was doubtless erected early in the 17th century, and originally was square, with a large court in which the Spanish garrison was quartered. The building formed the headquarters of the Spanish and Mexican provincial governments successively until 1846, when Gen. Kearny took possession of New Mexico for the United States. Diego de Vargas, the reconqueror of New Mexico in 1692, and Zebulon Montgomery Pike (after whom Pikes Peak was named), with many others of note, were imprisoned therein, and Gen. Lew Wallace finished his 'Ben Hur' in one of its rooms while governor of the Territory. Next in importance, perhaps, is San Miguel Church, a plain adobe structure, largely destroyed by the Indians in 1680, restored in 1710, and greatly modified within recent years. The cathedral, a fine modern sandstone edifice, is built around a parish church known as the Parroquia, which was probably erected on the site of a still older church, built by Fray Alonso de Benavides in 1622-7, but destroyed in the revolt of 1680. The Cathedral contains handsome carved stone reredos originally erected in the former Capilla de los Soldados (built in 1730 on the south side of the Plaza) by Governor Marin del Valle and his wife in 1761. Of interest also in the history of Santa Fé are the Rosario Chapel, said to occupy the spot where Vargas made his vow before the surrender of

SANTA FE TRAIL—SANTA MARIA

the city in 1692; the Garita, formerly a military outpost at which the leaders of the rebellion of 1837 were executed, and long the site of a cemetery; the earthworks of Old Fort Marcy, north of the city, erected during the Mexican War; and an ancient dwelling mistakenly believed to antedate the Spanish conquest. The Territorial Capitol, of brick and stone, completed in 1900, at a cost of \$200,000, is an attractive building. There are also a Federal building, a Territorial penitentiary (cost \$150,000), a county court-house, Saint Vincent's Hospital, Saint Vincent's Sanatorium, Saint Vincent's Orphanage, an Industrial School for the Deaf and Dumb, the Allison Presbyterian Mission (opened 1881), the Government Indian School with 300 pupils, Saint Catharine's Indian School (R. C.), San Miguel College (R. C.), and Loretto Academy (R. C.). Besides the cathedral there are two other Roman Catholic churches, a Protestant Episcopal church, an English and a Spanish Presbyterian church, and an English and a Spanish Methodist Episcopal church.

History.—Santa Fé was established, on the site of at least one prehistoric Indian pueblo, by Juan de Oñate in 1605; it is therefore the second oldest white settlement in the United States, Saint Augustine, Fla., alone exceeding it in point of age. (See *NEW MEXICO*.) The prospects of the town during its first few years were not encouraging. In 1617, there being only 48 colonists and soldiers in the province, which was surrounded by predatory tribes, the king, in response to an appeal for aid, rendered the desired succor, and by 1630 Santa Fé contained 250 Spanish inhabitants. In 1623 Fray Alonzo de Benavides, custodian of missions, began the erection of a church, which was finished five years later, probably on the site of the present cathedral (see above). On 10 Aug. 1680 the Pueblo Indians, led by a native named Popé, arose in rebellion against the Spaniards, killed 400 of the 2,500 colonists, soldiers, and priests, and laid siege to the capital until the 20th, when Governor Otermin and a thousand survivors who had taken refuge in the Palace, made a sortie, killing 300 of the Indians and capturing 50, who were afterward hanged, and on the following day started on a long overland journey to El Paso, Texas. Santa Fé remained in possession of the Indians until September 1692, when Governor Vargas recaptured the town with but little opposition, and late in the following year it was resettled with about 800 new colonists. Hostilities were renewed during the winter, but the Indians were soon overpowered and 70 of the participants hanged in the Plaza. There were several proposals to move the seat of the provincial government in the 18th century, but nothing was accomplished. French-Canadian trappers found their way to the Rio Grande by the middle of the century, followed by a brisk trade between New Mexico and Chihuahua, and, early in the 19th century, between the province and the American frontier, Santa Fé being the western entrepôt. This trade, which became known as the "commerce of the prairies," was conducted over the Santa Fé trail, first from Kaskaskia, Ill., later from Franklin and Independence, Mo., and increasing from \$15,000 in 1822 to \$750,000 in 1844. During the rebellion of 1837 Gov. Perez, the chief justice, and other officials were

killed, and a Taos Indian installed as Governor, but he was succeeded in 1838 by Manuel Armijo, who thwarted an attempt by 300 Texan rangers to invade Santa Fé in 1841. On 18 Aug. 1846 Gen. S. W. Kearny took possession of the town in the name of the United States, issuing a proclamation to that effect on the 22d. An adobe fort and blockhouse were erected on the northern heights and named in honor of Secretary of War Marcy, and under its embankments 200 Missouri volunteers were buried during the winter of 1846-7. Charles Bent, the first American civil governor, was murdered at Taos in January 1847; in the same year the first legislative assembly was held at the capital, the first newspaper was established, and a saw-mill erected. In 1848 the treaty of peace with Mexico was proclaimed from the Palace, the *New Mexican* (still published) was founded, and the Roman Catholic vicariate-apostolic of Santa Fé was established. New Mexico becoming organized as a Territory of the United States 3 March 1851, Santa Fé was established as its seat of government on 14 July. On 3 March 1862, during the Civil War, Santa Fé was abandoned by Union forces and occupied a week later by Confederates, but it was again evacuated on 8 April and occupied by the Federals on the 11th. The first railroad entered Santa Fé 9 Feb. 1880.

Smithsonian Institution, Washington, D. C.

Santa Fé Trail, The. See **ROADS AND HIGHWAYS**.

Santa Fé de Bogotá, dā bō-gō-tā', and **de Guanajuato**, dā gwā-nā-hoo-ā'tō. See **BOGOTÁ** and **GUANAJUATO**.

Santa Maria, mā-rē'ā, **Domingo**, Chilean politician: b. Santiago, Chile, 4 Aug. 1825; d. there 1890. He was graduated from the University of Santiago, admitted to the bar in 1847, interested himself in political matters, and in 1851-2 was involved in an insurrection which caused his banishment for a year. On his return he was elected to congress, made a reputation as an orator, and in 1858-9 was again banished. He was minister of finance under Perez in 1863-4, and in 1868 was appointed to the supreme court. He afterward served as minister of foreign affairs, of the interior, and of war under Pinto, and gained great popularity by his measures during the war with Bolivia and Peru. He was elected president in 1881 for a term of five years, successfully terminated the war, subdued the Araucanian Indians, and by his able administration of affairs retained his popularity throughout his term of office. He was afterward president of the senate.

Santa Maria, Philippines, (1) Pueblo, province of Ilocos Sur, Luzon, 15 miles south of Vigan. It is on the main highway, and several cart roads lead from here to the interior. In December 1900, 2,150 insurrectionists surrendered here, and took the oath of allegiance to the United States. Pop. 10,030. (2) Pueblo, province of Zamboanga, Mindanao, also called **BIASONGAN**, on the western sea-coast at the mouth of a river; 56 miles north of Zamboanga. It has a well-sheltered harbor. The surrounding region is heavily timbered with valuable woods, and one of the largest saw-mills in the southern Philippines has been erected here.

SANTA FE.

1. The so-called "oldest dwelling house in the United States."
2. The old Palace at Santa Fe.

SANTA MARIA DE PANDI—SANTANA

Two smaller pueblos have the same name: (1) pueblo, province of Pangasinan, near the Agno River, 32 miles east of Lingayen; pop. 3,940; (2) pueblo, province of Zamboanga, Mindanao, in the extreme southwest, 3 miles northwest of Zamboanga, the provincial capital; pop. 2,200.

Santa Maria de Pandi, dā pān'dē, Philippines, pueblo, province of Bulacán, Luzon; on the Santa Maria River, three miles from its mouth; six miles northeast of Bulacán. It was almost entirely destroyed during the insurrection, as it was the military centre of the insurrectionists, and was burned by American troops; it is, however, being rebuilt. It is in a productive rice and fruit region, has good roads, and is near Manila and the Manila & Dagupan railroad; there are also facilities for river transportation. Pop. 10,510.

Santa Marta, mār'tā, Colombia, capital of the department of Magdalena, stands on the north coast near the mouth of the Magdalena River. The surroundings are attractive but not salubrious. It has a good harbor, is an episcopal see, and has a noteworthy cathedral. Pop. 6,000.

Santa Maura, mow'rā, or **Leucadia**, Greece, an island of the Ionian group off the western coast, from which it is separated by a canal. It covers an area of about 180 square miles, is mountainous, the ranges running north and south and terminating in the white cliffs from which the island derives its name. The eastern portion is unproductive; the west and north are fertile, producing vines, pomegranates, olives, citrons, almonds and some corn. The chief source of wealth consists in the bay-salt, about 8,000 tons of which are exported annually. Bee-culture is carried on, but agriculture is the principal industry; navigation and fisheries also occupy a considerable number of the inhabitants. Cape Ducato (q.v.), formerly Leucates, at the extremity of the peninsula on the southwest, is the high rock (200 feet) where once stood a temple of Apollo, also known as Sappho's or the Lover's Leap. It was also the scene of several early Grecian tragedies. Amaxichi is the principal town, on the northeast, with about 6,000 inhabitants. Nearby is the fortress of Santa Maura. Pop. (1896) 29,892.

Santa Rosa, rō'zā, Cal., city, county-seat of Sonoma County; on Santa Rosa Creek, and on the California Northwestern and the Southern Pacific R.R.'s; about 60 miles north by west of San Francisco. Settlements were made in the vicinity about 1850, but the place was not laid out nor incorporated until 1854. It received its name partly from the profusion of roses which are found here all the year. It is in a most productive agricultural region noted for its fruits, vegetables, grain, and hops. It has also large stock-raising interests, and considerable attention is given to dairying. The chief industrial establishments are large fruit drying and canning works, flour mills, machine shops, soap factories, a brewery, and carriage works. The principal public buildings are the county courthouse, jail, city buildings, 10 churches, and the educational institutions. The court-house and the other county buildings cost originally \$200,000. The Baptist Church was built entirely

from the timber of one of the giant redwood trees from the Guerneville forest, all of the lumber being supplied by the one tree. Many trees shade the broad streets, which are clean and well kept. The surface of the city is almost level.

The educational institutions are a high school, the Ursuline Academy, Santa Rosa Ladies' College, the Pacific Methodist College, opened in 1861, public and parish schools, several private schools, and a library. The four banks have a combined capital of \$770,000. The water-supply is excellent, a gravity water-system being in use. The government is vested in a mayor and council. Pop. (1890) 5,220; (1900) 6,673.

Santa Rosa, rō'sā, Philippines, pueblo, province of Laguna, Luzon; on the west shore of the Bay Lagoon; 20 miles west of Santa Cruz. It is on the main road and on the line of a projected railroad. Pop. 9,450.

Santa Rosa, Order of. See ORDERS, ROYAL.

Santa Rosalia, rō-sā'lē-ā, Mexico, a town in the southern part of the state of Chihuahua, on the Mexican Central Railroad. It is noted for its hot sulphurous springs. Pop. about 8,000.

Santa Tecla, tāk'lā, or **Nueva San Salvador**, Salvador, a city situated a few miles southwest of San Salvador. It is built amid romantic surroundings at the southern base of the capital. When the latter was destroyed by an earthquake in 1854 an unsuccessful attempt was made to remove the seat of government to Santa Tecla. The city is connected by a highroad with the port of Libertad, and has a thriving commerce. Pop. about 14,000.

Santal Parganas, sän-tāl' par-gün'as, India, a district in the Bhagalpur division of Bengal, bounded on the north and partly on the east by the Ganges. Area 5,456 square miles. Pop. 1,755,000. The capital is Dumka. The district is named from the Santāls, who form the most characteristic portion of its inhabitants, and are also found elsewhere in India. They are one of the aboriginal races belonging to the Dravidian stock, are dark-colored, and mostly profess a religion of their own, in which the worship of a chief deity and subordinate deities and a sort of ancestor worship play a chief part. They live chiefly by hunting, and are exceedingly fond of flute-playing, dancing, and singing.

San'tals, or **Santhals**. See SANTAL PARGANAS.

Santana, sän-tā'nā, **Pedro**, West Indian soldier and politician: b. Hinch, Santo Domingo, 29 June 1801; d. there 14 June 1864. He was a lawyer and a wealthy land-owner living quietly on his estates until 1844 when the Dominicans revolted against Haiti. He joined their cause, was appointed brigadier by the junta, and speedily rose to the chief command of the insurgent army. He was elected president for four years in November 1844 and administered the affairs of the government with great success, endeavoring to promote agricultural interests and to increase the resources of the country. In 1849 he was called to the command of the army, defeated the invader Soulouque, deposed President Jimenes and ruled as dictator until the election of President Baez in October 1849. He was re-elected president in 1853, and again

repulsed the invasions of Soulouque in 1855 and 1856. He resigned in 1857 and was succeeded by Baez, but after the revolt of 1858 again assumed the government. He had strongly favored annexation to the United States in 1849 but the movement had been defeated by Baez, and now, in despair of bringing the government to a satisfactory basis, he ceded it to Spain. He was given rank as lieutenant-general in the Spanish army and retired to his estates, but when the insurrection against Spanish authority broke out he marched to Azua, where he at once crushed the rebellion. When, however, the insurrectionary spirit became general he again retired to his estates where he died shortly before the end of Spanish rule. His last days were embittered by the hatred of many of his countrymen who regarded him as a traitor, but he is now generally recognized as a thoroughly honorable and upright man who acted solely from disinterested motives, while his courage is held unquestioned even by his enemies.

Santander, sän-tän-där', **Francisco de Paula**, Central American soldier and statesman: b. Rosario de Cúcuta, New Granada, 2 April 1792; d. Bogotá 5 May 1840. In 1810 he engaged in the war for independence, fought in the ensuing campaign, in 1817-18 was with Bolívar, and assisted the Liberator to gain the battle of Boyacá (7 Aug. 1819). For his services he was promoted general of division. In 1821 he was elected to the vice-presidency of Colombia, with Bolívar as president. While the latter was absent in the southern Isthmus and Peru (1822-7), he administered the government with much ability. Re-elected in 1827, he became the leader of the opposition to Bolívar, and when the latter (1828) arrogated to himself dictatorial powers, Santander was deposed, and sentenced to death on an unsupported charge of attempted assassination of the dictator; and though the sentence was later commuted to exile, he was deprived of all rank. The Colombian republic ended in 1831, Santander was elected president of New Granada in 1832, and after the close of his term (1837), served also in the congress. His administration was one of order and progress, and laid the basis of the republic of New Granada, the modern Colombia. He was among the wisest leaders of the time, and wrote a justification of his political course in 'Apuntamientos para las Memorias de Colombia y Nueva Granada' (1837).

Santander, Colombia, a department situated in the north central part of the country, between Venezuela and the Magdalena River. Area about 16,000 square miles. The greater part is occupied by the eastern cordillera of the Colombian Andes, which runs lengthwise through the department. The range is cut near the middle by the deep valley of the Sogamoso River. Only the uplands are inhabited; the lowland along the Magdalena is an unhealthy and densely forested wilderness. The chief products are sugar, coffee, cocoa, tobacco and cotton. The mountains, however, are rich in minerals including iron, copper and coal. Pop. estimated at 555,600.

Santander, Spain, (1) Capital of a province of that name, and one of the chief ports of the Peninsula, 207 miles by rail north of Madrid,

near the Bay of Biscay. The principal modern buildings are the town-hall, theatre, market, barracks, bull-ring, clubs, civil and military governors' residences, the Institute and other schools, custom-house and hospitals. There are numerous open squares and magnificent promenades, notably that of 'Paseo del Sardinera,' which leads to the bathing establishment. The higher and lower town are direct antipodes in point of architecture and general construction. The Cathedral of Gothic type, has a fine crypt containing a Moorish font. The chief features of the city are its quays and factories,—1,800 women are employed in the tobacco factory; there are ship-yards, paper-works, foundries, extensive breweries, sugar refineries, manufactories of sails, hats, candles, vermicelli, phosphorus, sulphuric acid, fish-curing establishments, etc. The industries, trade, and fishing of Santander are flourishing and important. The harbor conditions have been greatly improved. Extensive acreage has been reclaimed from the sea, and recently built on, a fine esplanade has been constructed, with public gardens and a new quay. The principal export is iron ore, chiefly sent to Great Britain and to Germany. Other exports are wine, flour, provisions, etc. The imports amount to much more, and consist of manufactured articles from England, France, etc., embracing machinery, textiles, foreign produce, timber, petroleum, etc. Women do the lifting of cargoes. Santander was probably the ancient Roman *Portus Blendium*. The town was sacked by Soult in 1808. Pop. (1900) 54,694.

(2) The Province of Santander, on the north coast of Spain, covers an area of 2,113 square miles. It is enclosed on all sides but the north, with lofty summits and traversed by railroads of various kinds. It possesses extensive forests and important mines of iron and lead; it also produces large quantities of grain. The industries of mining, silviculture and agriculture are steadily improving. Live stock is abundant and valuable, especially in the highlands. Pop. (1900) 276,003.

Santayaria, sän-ta-yä-rí-a, **George**, American educator and author: b. Spain 1863. He was graduated from Harvard in 1886 where he has since been assistant professor of philosophy. His published works are: 'Sonnets, and Other Poems' (1894); 'The Sense of Beauty' (1896); 'Lucifer' (1899); 'Interpretations of Poetry and Religion' (1900); 'The Hermit of Carmel, and Other Poems' (1901).

Santee, sän-tē, a river in South Carolina, formed by the junction of the Wateree and Congaree rivers, which unite near the centre of the State. It flows southeast and enters the Atlantic Ocean by two channels. The length of the main stream is about 150 miles; it is navigable to Columbia on the Congaree and to Camden on the Wateree. The lower part of its course is through large forests, from which is obtained the pitch pine, and near the coast through swamps and marches.

Santerre, sän-tär, **Antoine Joseph**, French revolutionist: b. Paris, 16 March 1752; d. there 6 Feb. 1809. He was a brewer by trade and through his wealth and generosity possessed of much influence. His brewery in the Faubourg

Saint-Antoine was used as a meeting place for the Jacobins and he exerted much authority over their movements. He commanded a battalion of the national guard in the storming of the Bastille in 1789, was conspicuous in the riots of the Champ de Mars, in the attack on the Tuileries in 1792, and in the insurrection of August in that year. He rose to be commander-in-chief of the national guard and a field-marshal. In 1793 at the head of an army of 20,000 men he was defeated at Coron, was recalled and arrested as an Orleanist, and did not gain his release until the fall of Robespierre, after which he retired to private life. There is no evidence to substantiate his classification as one of the extremists of the Revolution. Consult Carro, 'Santerre, sa Vie politique et privée' (1847).

Santiago, sän-tê-ä'gō, capital of the Republic of Chile, situated at the base of the Cordillera of the Andes. It occupies an area of eight square miles in a fertile plain about 2,000 feet above sea-level, and is divided into two districts by the Mapocho River, which is crossed by many iron bridges. The most important part of the city is that which lies between the river and the Alameda de las Delicias, a very wide avenue with many rows of fine trees. Cerro Santa Lucia, a hill rising to a height of more than 200 feet above the gabled or flat house tops, is made an attractive place of public resort by gardens and an open-air theatre. Other distinctive features are Cousiño Park and the Agricultural School Farm, each 320 to 330 acres in extent; the former devoted merely to outdoor recreation while the latter is the most useful centre of public instruction in Chile. Established in 1842, this School Farm (*Quinta Normal de Agricultura*) now includes the Agricultural Institute and Training-School, botanical gardens and conservatories, a zoological garden, the Museum of Natural History, Veterinary Institute, institutes of Vegetable Pathology and Animal Vaccine, and the Chemical Laboratory. Noteworthy buildings are: Congreso Nacional, the Moneda (residence of the president of the republic), Cathedral and Archiepiscopal Palace, National Library (100,000 volumes), City Hall, Palace of the Courts of Justice, University, National Conservatory of Music, Municipal Theatre, Astronomical Observatory, Museum of Fine Arts (where annual exhibitions of painting and sculpture are held), Central Railway Station, Palace of the Exposition, and many luxurious private residences. District and private schools, and those maintained by religious bodies, are attended by 25,000 pupils; the National Institute (secondary instruction) by 1,200; Commercial Technical Institute, 500; Professional School for Girls, 500. The university provides instruction in medicine (its best faculty), law, engineering, etc. There are also normal schools, a good School of Arts and Trades, Institute of Pedagogy, and schools of the fine arts. The Board of Public Hygiene exerts an excellent influence for the control of diseases which were formerly prevalent. The water supply is good and abundant. Santiago has a mild climate: frosts are not unknown, though snow rarely falls. Industrial establishments are: flour and wood-working mills, foundries, breweries, tanneries, etc. There are seven national and three foreign

banks; electric street cars and a belt-line railway; and railway service for communication with the coast. The state shares with four private companies the task of maintaining the telegraph service. There are two telephone companies. The municipality has an income of about \$2,000,000 for public expenditures. Population (1903) approximately 320,000. On 16 Aug. 1906 the city was visited by a severe earthquake, followed by fire. See also CHILE.

MARRION WILCOX,
Authority on Latin-America.

Santiago de los Caballeros, dā lōs kă-bäl-yā'rōs, Santo Domingo, city; on the Yaquí del Norte River; 80 miles northwest of the city of Santo Domingo, 20 miles south of Puerto Plata. It is connected with Puerto Plata by railroad, and also with the east coast by a continuation of the road originally extending from Sanchez to Concepcion de la Vega. It is situated in the Vega Real, the most fertile agricultural section of Santo Domingo, and is the largest and most prosperous inland city of the country. Pop. 10,000.

Santiago-de-Compostella, dā-kōm-pōs-tēl'yā, Spain, a city on the Sar, in the province of Coruña, 32 miles south of the City of Coruña, romantically situated on a slope of Monte Pedroso. It is the seat of a university, and of an archbishopric. The cathedral, completed 1128, is well preserved and has a remarkable interior; other notable buildings are the episcopal palace, the hospital, the town-house, the college of Tonseca and the great convent of Saint Martin (overhanging a ravine), formerly one of the wealthiest Benedictine establishments and now a barrack. In the large square or Plaza the bull-fights take place. There are many promenades, fountains, and mineral springs in the vicinity, besides pastures and fertile valleys, which produce grain, hemp, fruit, etc. The local industries are distilleries, breweries, soap, chocolate, linen, crystal, paper, and small silver articles. There are good schools and a fine library in the University. Pop. (1897) 24,335.

Santiago de Cuba, dā koo'bā or kū'ba, the largest and most eastern province of Cuba; area 12,468 square miles. It is very mountainous; the general trend of the mountains is from southeast to northwest, the river Cauto, the largest river of the island running from east to west, divides the mountain system; the ranges to the north are very confused and irregular, the best defined range is that of the Sierra Maestra, near the southern coast. The valleys and sea-coasts are very fertile; sugar, coffee, cocoa, and tobacco are the chief products; bananas and coconuts are cultivated, and vegetables and fruits may be raised with little care or supervision. Mahogany, ebony, and other valuable hardwoods grow in abundance in the interior, and are exported; the census of 1899 reported 519,194 acres of forest land under public ownership. Santiago has more mineral wealth than any other province of the island; iron, manganese, and copper are mined in quantities of commercial importance. Good grazing lands are found in portions of the province, and stock raising is an industry of increasing importance. The development of Santiago de Cuba has been retarded

SANTIAGO DE CUBA—SANTO DOMINGO

by lack of transportation facilities, but with the increase of railroads following American occupation, opportunity is afforded for further exploitation of the large resources. Pop. (1899) 327,716.

Santiago de Cuba, chief city of the province of the same name, situated on a fine bay about six miles from the southern or Caribbean coast of the island of Cuba. It is the centre of the mining district, and has a large foreign trade, though the places of business are unpretentious or even shabby. Many of the dwelling-houses are a single story in height: their gardens, the Alameda, some points on the slopes of the surrounding mountains and the shores of the bay are especially attractive. A noteworthy building is the old cathedral, fronting on the Plaza de Armas. The mean temperature in winter is 82° F., and in summer 88°. It was formerly regarded as an exceedingly unhealthy town, yellow fever being prevalent throughout the year; but a marked improvement in this respect was effected through the sanitary reform measures carried out under the direction of the military government (army of the United States) after the war of 1898. The total population, as shown by the War Department census, in 1899, was 43,090. Of that number 15,258 were native whites, 3,440 foreign whites, 24,276 colored, and 116 Chinese. Married persons numbered 6,396; those living together as husband and wife by mutual consent, 3,299; illegitimate children, 5,824 (white 1,208, colored 4,616). Inhabitants 10 years of age or over who could neither read nor write numbered 10,527. Occupations were as follows: 1,419 were engaged in agriculture, fisheries, or mining; 3,063 in trade or transportation; 6,381 in manufacturing or mechanical industries; 429 in professional service; 5,449 in personal service; 26,349 were without gainful occupation. Number of occupied dwellings 7,574. The city has a good water-supply, furnished to 94 per cent of the dwellings, etc., through an aqueduct called El Paso de la Virgen. Santiago was founded in 1514; from 1522 to 1552 it was the capital of the island. For subsequent events, and especially the important naval and military operations in 1898, consult Marrion Wilcox, 'A Short History of the War with Spain.' See also CUBA.

Santiago de Cuba, Military and Naval Operations at. For an account of these events of the Spanish-American war, see UNITED STATES, *War with Spain*.

Santiago del Estero, dël ës-tā'rō, Argentina, (1) Capital of the province of that name, lies in a fertile valley on the right bank of the Rio Dulce. Its chief buildings are the cathedral, national college, primary schools and bank. It has extensive orchards. The town was founded in 1553. Pop. 10,000.

(2) The province of Santiago del Estero is situated in the north-central part of the republic, covers an area of 39,764 square miles, and consists of a broad plain with several low ranges in the west, and a few salt marshes in the south. The streams are the Salado and Dulce rivers. Irrigation is necessary; sugar, corn, wheat, grapes, cotton and tobacco are grown, and stock-raising is an important industry. The chief occupation is wool-weaving. The

forests contain valuable woods. The climate is hot. Pop. (1900) 180,612.

Santiago de las Vegas, dā lās vā gās, Cuba, a town in the province of Havana a few miles south of the capital, on the Havana-Guanajay Railroad. The town lies on elevated ground, and is a suitable place for the acclimatization of foreigners. It is regularly built, with two plazas and a handsome church. The tobacco industry is predominant. Pop. (1899) 7,151.

San'tiam, a tribe of the Kalapooian stock of North American Indians formerly residing on Santiam River, a tributary of the Willamette, in Oregon. They are now at Grande Ronde reservation, Oregon, numbering only 24 in 1902.

Santillana, sän-tël-yä'nä, **Iñigo Lopez de Mendoza**, MARQUIS OF, Spanish poet and statesman: b. Carrion de los Condes, Spain, 19 Aug. 1398; d. Guadalajara, Spain, 26 March 1458. He was the son of the grand admiral of Castile and heir to immense estates of which he was deprived until he was 18, when he came into their possession. He waged a long and successful war against Aragon and the Moors, and in recognition of his services was made Marquis de Santillana by Juan II. of Castile. After the death of that king in 1454 he retired from political life and devoted himself to literature. His best-known work is 'Los Proverbios,' or 'Centiloquia' (1496), a collection of 100 proverbs made at the desire of the king for his son, later Henry IV. He wrote: 'Dialogo de Bias contra Fortuna' (1448); 'Comedieta de Ponza'; etc. His works were edited by Amador de los Rios.

Sant'ley, Charles, English baritone: b. Liverpool 1834. He studied music in England and Italy and made his debut in opera at Covent Garden in 1857. He won a great success as Hoel in the opera 'Dinorah' in 1859 and in the part of Rhineberg in 'Lurline' in 1860. He has been especially devoted to Italian opera and has sung in the large capitals of Europe, in Australia and South Africa. He published 'Student and Singer' (1892).

Santo Domingo, sän'tō dō-mēng'gō, called also HAITI, the second in size of the West Indian Islands. Its greatest length is about 400 miles; its greatest width 160 miles; its area is estimated at 28,249 square miles. But, as Robert T. Hill says, "The horizontal area encircled by its waters is trebled by the verticality of the mountains;" and certainly the problem of maintaining good order upon the island is more than trebled in difficulty by the same natural features. It seems entirely possible that if such a system of highways and railways as the English have constructed in Jamaica (q.v.) were established in Santo Domingo, the long period of almost unceasing political disturbances and revolutions, in both the Dominican Republic and the Republic of Haiti, would gradually come to an end; otherwise there can never be offered a convincing demonstration of the important fact that this island, which falls behind all others in achievement, excels nearly all others in the world—certainly the neighboring members of the Greater Antilles—in natural fertility and in diversity of climate. (See DOMINICAN REPUBLIC for particulars in regard to physical geography, geology and mineral resources, history,

population, etc.) The impression commonly received by intelligent travelers and students is shown in the following quotations: "Taken altogether and looked at in its natural aspects, no spot on earth can be more lovely, and it is safe to say that probably no extent of territory contains within itself, under proper auspices, so many elements of prosperity, worldly success, and happiness as this island." Again, Santo Domingo is referred to as "beautiful, majestic, and fruitful . . . waiting only the assistance of law and sound government to take its proper place in civilization." But it is unreasonable to expect "law and sound government" or the beneficent effects of "proper auspices" before the interior regions have been made accessible, and inland communities connected with one another. Difficulties which the Haitians have encountered, in their portion of the island, are enumerated in the 'North American Review,' July 1903. But the greatest obstacle still to be overcome is that one which the author of the present article has mentioned (in 'Harper's Weekly,' editorial, 'The Paradox of Santo Domingo,' 12 March 1904), substantially as follows: The inhabitants have always been exceedingly turbulent because their territory has always been exceedingly mountainous. They are politically disunited—not occasionally, but as their chronic misfortune—because those natural features which are the very type of permanence, the impassable mountain barriers, scatter the people among small communities in isolated areas. They are abnormally prone to revolutions, like the Colombians, not owing wholly or even mainly to personal characteristics that differentiate them from the inhabitants of the somewhat more peaceful Southern republics, but because Santo Domingo, more than all the other Latin-American countries excepting Colombia, has from the beginning been afflicted by that kind of topography which forbids the widely scattered political groups ever to draw near to each other socially and commercially, thus developing identical interests. Now, although the cause of the trouble is found in the extreme rugosity of the island—the island itself being, in fact, nothing but the culmination of the Antillean continental uplift that formed eastern Central America as well—no careful student of West Indian history will conclude that the deplorable effect must be accepted hopelessly, as though it were an immutable condition. On the contrary, it is just as certainly possible to do away with the effect as it is certainly impossible to remove the cause: a paradoxical statement which must stand at the beginning of any sound policy that may be framed in the United States, in Santo Domingo and Haiti, or in Europe, for the redemption of the island; otherwise all efforts will be made in vain. We must remember that upon no other portion of the New World have highly civilized powers in the past tried more earnestly to impress by force of arms the lesson of respect for the rights of other nations; and that the armies of those polite foreign powers gave over the attempt as futile only after prolonged exertions and bitter suffering inflicted and sustained. Long ago France, Spain, and England, "once for all," learned by experience what we, surely, may learn by a little exact and dispassionate study. Santo

Domingoans and Haitians do not especially need the lessons that our navy or army could teach. Neither do they especially require missionaries or schoolmasters; since the religious and secular instruction already provided for them is not without merit. But as an indispensable preliminary to all genuine progress, a complete system of highways and railways must be built. We do not suggest in this any visionary or impracticable scheme. England constructed such a system of inland communications in mountainous Jamaica, and the negroes and half-breeds of Jamaica have been well-behaved during a long, severely trying period of financial distress that the smaller island has passed through since the price of sugar began to decline. The experiment has, therefore, been made elsewhere, under similar conditions, and the results are satisfactory: that is, good order has been maintained with ease in Jamaica, despite its mountains and its mixed, chiefly black, population. As we are dealing at present with the elements of the subject, the question of a protectorate, a colonial government, or any kind of foreign control in Santo Domingo should be excluded. The people of the little eastern and western republics there may or may not be able to gain facilities for communication without losing their independence: if there were good roads through the central Despoblado district that now holds them apart, the two nations would coalesce, and foreigners who should furnish capital for building roads of all kinds would hold a perilous claim. The certainties are these: Civil and electrical engineers can do more than the best army and navy in this field, by accepting the rough prohibition of the mountains as a challenge to their skill. The pacific course in this grave matter is confessedly difficult, and no whit spectacular; but we may save time and trouble if we realize now that the way of the engineers is the *only* way; that the infliction of an unmitigated punishment, with which no reasonable hope of correction and amendment can be associated, would be an un-American proceeding. (See also DOMINICAN REPUBLIC, subtitle *Railways*, etc.) Among the physical characteristics, next in order of interest stand the deep indentations in the coast-line, especially the Bay of Samaná in the northeast, the Gulf of Gonaïves in the west, and the scarcely less important bays in the north and south. Adjacent islands deserving special mention are: Île de la Tortue, or Tortuga, near the northwestern promontory, famous as the headquarters of the buccaneers in the 17th century; Gonave Island, northwest of Port-au-Prince; and Beata, Saona, and Vache islands, off the southern coast. All of these have shared the geologic history of the main island, from which they appear to have been separated in a relatively modern epoch. MARRION WILCOX,
Authority on Latin-America.

Santo Domingo de Basco, dā bās'kō, Philippines, pueblo, Batanes Islands, province of Cagayán; on the northwest coast of Batan Island. It is the chief town of the group and is well built, with several fine buildings. It has a good anchorage in Santo Domingo Bay; the inhabitants are chiefly engaged in the coasting trade and in fishing. Pop. 3,000.

SANTO TOMAS—SAO LEOPOLDO

Santo Tomás, tō-mās', Philippines, pueblo, province of Batangas, Luzon; 26 miles north of Batangas. It is on the main road to Manila and on the line of a projected railroad, near the boundary of Laguna. It has good schools. Pop. 10,770.

There is a smaller pueblo of the same name in the province of Union, Luzon, 22 miles south of San Fernando; at the head of the port of Santo Tomás on the main road. Pop. 6,480.

Santo Tomas, a mountain of the Philippines, in the southern part of the province of Union, east of Agoo. It is 7,418 feet in height, the highest peak in the province. On its western side the land slopes rapidly to the coast.

San'tonin, a proximate principle ($C_{15}H_{18}O_2$), the active principle of *santonica*, possessing acid properties, obtained from wormseed, the seed of a species of southernwood. It is colorless, crystallizable, and soluble in alcohol, and in the fixed and volatile oils, is bitter, and is one of the most efficacious vermifuges for roundworms.

Santorin, sän-tō-rēn', Thera, or Calliste, Greece, the largest of one of the island groups in the Aegean Archipelago, 60 miles north of Crete. The eastern slope is covered with vineyards; the western shores are precipitous, with deep ravines and volcanic indications. The towns occupy the lofty heights overlooking precipices. The wines of the island are the chief staple, and are called *vino-brusco* and *vino-santo*. Various eruptions have occurred in the vicinity which from time to time have changed the surrounding topography. Pop. 12,000.

Santos, sän'toos, Brazil, in the state of São Paulo, and 34 miles by rail from the capital of that name, is the chief port. It stands on the island of San Vicente, in a bay of the South Atlantic, and is very well built. Churches crown Monserrate, and it has several monasteries, a city-hall, custom-house and two hospitals, an arsenal, several banks, gas and water supply. Its harbor though small, is deep, and the emporium of an extensive trade—especially for Brazilian coffee, besides sugar, tobacco, hides, lard, tobacco, etc. The imports are European and American manufactures. Yellow fever is endemic. It is the terminus of the main railway system of Brazil. Pop. (1900) 41,000.

Santos-Dumont, sän-tōs dü-môn', Alberto, French aeronaut: b. San Paulo, Brazil, 20 July 1873. He was educated chiefly in France, and has resided in Paris since the death of his father, a coffee planter. Having experimented in aeronautics he made an ascent on 4 July 1898 from the Jardin d'Acclimation, Paris, in a spherical balloon 18 feet in diameter. At this time he was engaged upon the construction of a dirigible balloon which he completed so as to make the trial ascent on 20 September. It proved itself dirigible, but the experiment ended in disaster owing to the insufficiency of the air-pump. A second and a third machine were constructed, the latter being cigar-shaped, 66 feet long and 11½ feet in greatest diameter. It carried a 4½ horsepower petroleum motor to work a 5-foot propeller making 2,500 revolutions a minute. It was steered by a rudder of silk and bamboo having an area of about 25 feet. This machine ascended from Vaugirard, 13 Oct. 1899, sailed to the Champs de Mars, encircled the Eiffel Tower several times, proceeded to Auteuil and

finally landed at the maneuver grounds at Bagatelle. He continued experiments with new balloons, and on 18 Aug. 1901 his balloon collapsed and fell to the roof of the Trocadero Hotel. On 19 Oct. 1901 he won the Henri Deutscher prize of 100,000 francs offered for a trip from the Aero Club at Saint Cloud around the Eiffel Tower and back to the point of departure in less than an hour. The actual time employed was 29 minutes and 30 seconds, the return being made against a strong wind. In 1902 he went to Monte Carlo with the design of crossing the Mediterranean and after making several ascents suffered an accident which precipitated himself and his balloon into the bay of Monaco.

São Francisco, sän frän-sēs'kō, a river of Brazil, which rises in the Serra da Canastra, in the southwest of the province of Minas Geraes, flows north-northeast through that province and the province of Bahia, then turning east forms the boundary between the provinces of Pernambuco and Alagoas on the north and Bahia and Sergipe del Rey on the south. It falls into the Atlantic 50 miles north-northeast of the town of Sergipe del Rey by two mouths, one to the north, called Aricari, so shallow as to be scarcely navigable even by canoes; and the other to the south, hence called Francisco do Sul, much larger and deeper, but unfortunately encumbered at its mouth by a large bar about six miles broad, covered with a heavy surf, and with seldom more than four feet of water on it. It is a large and majestic river, with a course which has been estimated at 1,600 miles, but, in addition to the bar at its mouth, has numerous rapids and cataracts, which make its continuous navigation impossible; those at Paulo Affonço, about 190 miles inland, are about 60 miles in length. Its principal affluents are, on the right, the Paraopeba, Guacuih or Vethas, Jequitahí, and Verde; and on the left the Andaia, Borrachudo, Abaité, Paracatu, Urucaia, Carininha, Correntes, and Grande.

São João da Barra, sän zhō-on' dā bär'rā, or **São João da Parahyba**, Brazil, a town on the Atlantic coast of the state of Rio de Janeiro, at the northern end of the state. It is the port of Campos, with which it has railroad connection. But since Campos became connected by rail with Rio de Janeiro, São João has lost its importance, as the port is only an open roadstead. Pop. 5,000.

São João del Rey, dēl rā'ē, Brazil, a town in the state of Minas Geraes, situated 75 miles southwest of Ouro Preto, on the railroad running west from Barbacena. It was founded as a gold-mining town, but the gold has been exhausted, and the chief wealth of the town now comes from cattle raising and the manufacture of cloth. Pop. 10,000.

São Leopoldo, lā-oo-pōl'dō, Brazil, a town in the state of Rio Grande do Sul, situated on the railroad 18 miles north of Porto Alegre. The town has two churches, a Jesuit college, and two high schools. It has had a considerable industrial and commercial development. Agriculture, viticulture and cattle-raising are carried on successfully in the surrounding country, and the town manufactures leather-goods. The products of the town have amounted to over \$6,000,000 annually, most of them going to Porto

Photo. by Burr McIntosh.

ALBERTO SANTOS-DUMONT.

Allegre, which, besides the railroad connection, can be reached by steamboats on the Rio dos Sinos. The town was founded by German immigrants, and most of the inhabitants are still Germans. It was almost totally destroyed during the civil war of 1846. Pop. (commune) 30,000.

São Luiz De Maranhão, loo-êzh dā mā ran yān. See MARANHAM.

São Paulo, pow'loo, a state of Brazil, bounded on the north and northeast by Minas Geraes and Rio de Janeiro, on the southeast and south by the Atlantic Ocean and Paraná, and on the west by Matto Grosso. Area, 112,278 square miles, including a large section of fertile but unsettled land near the Paraná River, which forms part of the western boundary. The principal mountains are between the capital of the state and Santos, the Mar range (average height about 3,250 feet); and, farther toward the interior, the Mantiqueira range. Adjoining the coast is a comparatively narrow strip or zone, low-lying and tropical in its characteristics; but an abrupt ascent leads from this to the plateau which extends westward to the Paraná, sometimes cut by the valleys of the river system, sometimes rough and mountainous, but in general maintaining an altitude which ensures a temperate climate. In fact, the winters in the southern part of the state are decidedly cold, frosts occurring many times during a single season; and at the capital the temperature occasionally falls below 32° F. The fertile red soil of the plateau is peculiarly adapted to the cultivation of coffee; and the importance of this product is shown by the following official (Brazilian) statistics: During 1899 the exports of the state of São Paulo were valued at 268,671,867 *milreis* (value of *milreis* in U. S. currency, \$0.546), coffee entering into that amount for the sum of 249,559,450 *milreis*. The relative value of minor products appears more clearly in another statement: During the first six months of 1900, the exports through the port of Santos amounted to 89,705,641 *milreis*, as follows: animals and animal products, 359,284; minerals and mineral products, 63,124; vegetables and vegetable products, 89,293,233, and in the last item coffee is represented by 88,594,682 *milreis*. The railway system of this state, with that of the neighboring Rio de Janeiro (q.v.), is the best in Brazil. A notable piece of engineering is seen on the line which crosses the Cubatão range at a height of more than 2,500 feet. The principal cities are the capital, São Paulo, and the leading port, Santos. The growth of the city of São Paulo during recent years has been so rapid that current estimates of the increase of population, the number of new buildings, etc., appear to be untrustworthy. Its manufacturing industries are diversified, and its new prosperity has given it many of the features of a modern city. Santos (pop. 41,000) is built on an island, a narrow channel separating it from the mainland. Its harbor and general sanitary conditions have been improved by important works recently completed. Taubaté is a growing town in the eastern part of the state, and Campinas the most important place in the northern districts. Two of the main causes of the prosperity of this state—which is generally regarded as the most progressive part of Brazil—are successful agriculture and undertakings to improve the

means of communication. The third cause has been immigration. From 1827 to 1896, inclusive, 700,211 immigrants reached the state, 493,535 coming from Italy and the rest from Portugal, Spain, Germany, Austria, etc. Governor (afterward President) Campos Salles has pointed out that in 1896, when the total immigration to São Paulo numbered 74,918, more than one half (or, exactly, 42,661) came at the expense of the national government, and the rest at the cost of the state. Compare 'United States of Brazil: a Geographical Sketch' (Washington, 1901).

MARRION WILCOX,
Authority on Latin-America.

São Thomé, tō-mā', or **Saint Thomas**, Africa, an island in the Gulf of Guinea belonging to Portugal, and situated a little north of the equator in lon. 6° 30' E., 150 miles northwest of Cape Lopez. Its area is 358 square miles. The whole island consists of a volcanic mountain 7,026 feet high, and heavily forested. The climate is equable, temperate and healthful, and the soil is very fertile. The chief products are coffee, cocoa, oranges, lemons, figs, grapes, pine-apples, vanilla, cinnamon, india-rubber, etc. The exports are valued at over \$3,500,000 annually. Pop. (1900) 37,776. São Thomé forms, with the neighboring island of Príncipe, a Portuguese province. The capital is Cidade, with a safe harbor, and a pop. of 3,000.

Saône, sôn (ancient, ARAR), France, a river which rises at Viomenil, in the department of Vosges, flows southwest through that department, traverses the department of Haute-Saône, and on entering the department of Côte-d'Or, receives the Ognon. Continuing a southwest course, past Auxonne, it receives its most important tributary, the Doubs. It flows past Châlons and Maçon to Lyons, where it joins the Rhone after a course of about 280 miles; of these 190 miles are navigable. The Canal du Centre, Canal de Bourgogne, and Rhone and Rhine Canal, bring it into communication respectively with the Loire, Seine, and Rhine.

Sap, the fluid which circulates in plants, and consists of water carrying various nutritive salts in solution. This water and its contents, "crude sap," so-called, is absorbed by root-hairs and permeates the plant, passing through the woody portions of the vascular bundles, in the newer rings of the "sap-wood," which, in dicotyledons, constitutes a woody cylinder between the bark and the heart-wood or pith. This sap, by some process which is not fully understood, but which is ascribed to root-pressure, transpiration or suction, severally or collectively, carries its raw materials to the chlorophyll granules in the green, growing parts of the plant, where they are metamorphosed into organic substances, and are again taken away through the vast cells to those places where they are needed for the life or propagation of the plant, or are stored for future use. Maple and corn sugar, india-rubber, opium and the milk of certain plants are all saps, and the products of the lactiferous cells. Many plants, such as cacti, and others, living in desert regions, store away water to carry them through the droughts, a fact which is taken advantage of by travelers in thirsty lands.

Sap-green, a yellowish-green pigment which is prepared by mixing the purplish-red

juice expressed from the ripe berries of buckthorn (*Rhamnus catharticus*) with an alkali. The liquid is fermented, evaporated until it has reached a proper consistency, and then suspended in bladders, to harden into a brittle mass. The color is used by water-color painters, paper-stainers and leather-dyers, but is very fugitive.

Sap'ajou, or **Sajou**, a French adaptation of an Indian word, and now applied to several species of American monkeys of the family *Cebidæ*. The sapajous live in flocks in the forests of Brazil, Peru, Guiana, and Colombia, and possess tails of feebly prehensile powers, and feed on fruits, eggs, small birds, etc. They are familiar in habits, become soon domesticated, and are thus in favor among mountebanks, etc., who teach these monkeys to become very expert in performing tricks. Common species of sapajous are the sai (*Cebus capucinus*) and white-throated sapajou or sajou (*C. hypoleucos*).

Sapan', or **Sappan'-wood**, red dyewoods, obtained from two genera of the *Leguminosæ*, but principally from *Casalpinia sappan*. This tree is indigenous to tropical Asia and to the Indian Archipelago, but since it gives a good, red dye, similar to that of Brazil-wood, although somewhat difficult to fix, its cultivation is promoted in the West Indies and Brazil.

Sapi-utan, a small wild ox of Celebes. See ANOA.

Sapindaceæ, sãp-in-dã'sê-ê, a family closely allied to the maples, and containing the soapberry (*Sapindus*), buckeye (*Æsculus*) and litchi-nut (*Nephelium*) and other genera. The species are usually tall trees, with watery juice. The leaves are generally compound, and in the tropics are alternate, evergreen and abruptly pinnate. The flowers are small, but in showy racemes in the buckeyes, sometimes apetalous, sometimes with four or five unequal and imbricated petals, and about the same number of sepals; the stamens are eight, and are situated on a disk; the ovary is 3-celled, becoming in fruit capsular or indehiscent, or composed of several wing fruits, or a drupe, or nut, or berry. The species are mostly found in warm countries. The fruits of several, such as the *Nephelium*, are eaten, but the leaves of many are poisonous. The typical genus *Sapindus* has a very saponaceous fruit, used in the place of soap. In Brazil, a paste called "guarana" is made from the pounded seeds of the sapindaceous climbing shrub, *Paullinia cupana*, and serves for food, for medicine (since it contains caffeine), and for the preparation of a refreshing drink.

Sapodilla, or **Sapodilla Plum**, an evergreen tree (*Achras sapota*) some 20 feet high, with thick, shining leaves, clustered at the ends of the branches, and a milky juice. It is sometimes called bully-tree, also, and is indigenous to tropical America, where it is often cultivated for its fruit. The flowers are small and whitish, and the sapodilla, the fruit, resembles a russet apple in color and size, and has a milky acrid juice, which disappears when over-ripe, leaving the fruit in a sugary condition and with a pleasant, pear-like flavor. It is a valuable food in warm countries, and is sometimes called naseberry. The seeds are large and black, and used as an aperient and diuretic. The juice of the sapodilla is made into chewing-gum, the bark is astringent, and employed as a febrifuge (Jamaica

bark), and the wood is reddish-brown, hard, heavy and durable.

Sap'onin, a glucoside contained in the roots of *Saponaria officinalis* or soapwort and many other plants; also in the fruit of the horse-chestnut, in quillai-bark or soap-bark, etc. By means of boiling alcohol it is readily extracted from the root of soapwort, the alcohol, as it cools, depositing the saponin as an amorphous sediment. It derives its name from its behavior with water, in which it is soluble in all proportions, yielding an opalescent fluid which froths when shaken like a solution of soap, if even ¹/₁₀₀₀th part of saponin be present. Its solution, or an infusion of soapwort, is sometimes employed in place of a solution of an alkaline soap for cleansing the finer varieties of wool from grease. Many preparations for cleaning kid gloves, etc., derive their virtues from saponin.

Sapor I., sãp'pòr, or **Shapur**, shã-poor', Persian king, the 2d of the line of Sassanidæ (q.v.). He reigned from 242 A.D. to 272 A.D. and during this period there was continuous warfare with the Roman Empire. While no permanent increase of Persian territory was made the armies of Rome were subjected to some humiliating defeats. In one of these (260), the Roman Emperor Valerian was taken captive and was held captive until his death. See PERSIA.

Sapotaceæ, sãp-ò-tã'sê-ê, a large genus of trees and shrubs of the heath tribe, indigenous chiefly to the tropics, and principally to the tropical islands. The leaves are entire, alternate and leathery, with flowers clustered in the axils of the leaves, or at the older stem-nodes. The flowers are regular, bisexual, with stamens borne on the corolla, as many, or twice as many, as its lobes; the calyx-lobes are rigid and obtuse, and longer than the corolla-tubes; the fruits are baccate. The *Sapotaceæ* have a milky juice which furnishes true gutta-percha (q.v.). The sapodilla and star apple of the West Indies are fruits produced by this family.

Sappan'-wood. See BRAZIL-WOOD.

Sapphire, a mineralogical name including all highly colored and transparent varieties of corundum (q.v.), except the red, which is called ruby. Sapphire corundum occurs in three forms — as small, distinct crystals, hexagonal or rhombohedral in various modifications; as transparent portions of ordinary corundum; and at times as nodules or small rounded masses enclosed in ordinary corundum, though distinct. Most gem sapphires are of the first kind; but some fine stones have been cut from material of the two latter kinds, especially in the corundum workings in North Carolina, notably the Culsagee mine in Macon County. Sapphires present almost every variety of color, although blue is the most familiar, deep shades being most valued. Other blue gems occasionally seen are blue tourmaline (called Brazilian sapphire), cyanite, and iolite, which is known somewhat as water-sapphire. True sapphires are, however, easily distinguished by their greater hardness (9), and density (3.95 to 4.1). The main sources of sapphire are Ceylon, Cashmere, and the Pailin district of Siam, also the Anakie district of Queensland, Australia. In the United States, sapphires are obtained chiefly in Montana: first from the "bars" or low bluffs, of gold-bearing gravel, along the Upper Missouri River, east of Helena.

and later from a decomposed igneous dike at Yogo Gulch, in Fergus County; also at Rock Creek, Granite County, and Dry Cottonwood Creek, Deer Lodge County. The river bars, and Rock Creek, yield a great variety of rich and delicate colors, as in Queensland, but Yogo Gulch furnishes the deep blue shades most valued, and is being worked very extensively. Small and poorly colored stones are largely sold for watch-jewels. All blue and green sapphires, like rubies, possess marked dichroism, a point important to the lapidary, as the tint of gems from such crystals depends upon the direction in which they are cut. See GEMS.

Sappho, sāf'ō, Greek poet: b. Mitylene, or Eresus, Island of Lesbos. She was the greatest of ancient poets of her sex and flourished between 630 and 570 B.C., being a younger contemporary of Alæus. Little is known certainly of the events of her life. On account of political commotions she left Lesbos for Sicily. But in later years she returned to Mitylene where she became the centre of a female coterie, a school of poetry of which the famous Erinna was a member. She was the author of various poems; hymns, odes, elegies, epigrams — of which only two complete pieces, an ode 'To Aphrodite' and 'To a Maiden,' together with some fragments, have come down to us; these display intense feeling, glowing imagination, and a high finish. One of them is quoted in full by Longinus in his treatise 'On the Sublime.' She is said to have invented several metres; at least one still bears her name, and has been used by such ancient poets as Horace and such modern ones as Canning in his 'Needy Knife-grinder.' There is an edition of the extant fragments with translations and memoir by H. T. Wharton (1885).

Sappho's Leap. See CAPE DUCATO.

Sapræ'mia. See BLOOD-POISONING.

Saprolegniaceæ. See FUNGI.

Saprophytes, a class of plants living on the carbonic compounds resulting from the decay of organic life. They sometimes contain chlorophyll, but generally do not, and since organs of assimilation are therefore not necessary, the leaves in many kinds are reduced to mere scales. This habit of existing only on decaying organisms makes the higher saprophytic plants very difficult to transplant. Algæ are often saprophytes, making use of the decaying refuse of the sea; and fungi, especially the molds and dung-loving genera as *Splachnum*, are the most generally known cryptogams acting as scavengers in this manner. Even the globular alga, the "red snow" (*Sphærella nivalis*), exists on the corpses of insects, pollen-grains, and other decaying materials drifting across the snow. Certain other saprophytes attach themselves to the bark of trees, not to suck the juices of the host in the manner of parasites, but to subsist on the decaying bark, and on the organic dust and material in solution washed down by the rain and stopped by the projecting mass of the plants. Many saprophytic plants living in the cracks of rocks, have only the humus collected in tiny pockets, and the supply of dissolved organic matters in percolating water, to draw upon. Some orchids, as the coral-roots (*Corallorhiza*), that have no true roots, but a thin-skinned rootstock, which absorbs nutriment directly; the familiar Indian

pipes (*Monotropa*) and others, spring from the humus of decaying leaves, in close connection with the hyphæ of fungi. The meadow pastures support such saprophytes as the true mushroom (*Agaricus campestris*), the moonwort (*Botrychium lunaria*) and the blue and violet flowered gentians. See BOTANY; FUNGI.

Sap'sucker, the popular American name of several small woodpeckers, but properly restricted to the yellow-bellied woodpecker (*Sphyrapicus varius*), an Eastern species represented in the Rocky Mountain region by variety *nuchalis* and along the Pacific coast by variety *ruber*. This woodpecker is of moderate size; is black and whitish above; black on breast; rump black and white mixed; belly more or less yellowish; sides streaked with dusky; crown red in the adult; chin scarlet and throat black in the male, but both white in the female. This bird illustrates well the curious tendency toward increase of red in plumage toward the Pacific coast. In variety *nuchalis*, the nuchal band is red instead of brown, extending the chinred by so much; in specimens from Nevada, the scarlet area is still larger; and in the Coast form (*ruber*) the whole head, neck and breast are red, sometimes obliterating the normal pattern. This woodpecker is migratory, spending its summers and breeding only in the cooler parts of the United States and northward, and going South in midwinter. Its habits differ from those of other woodpeckers mainly in its custom of drilling a great number of holes in the bark of trees, to get at and eat the new wood and sugary sap lying beneath it. In many cases serious harm is done to fruit trees by the great number of chains of holes so bored, although many harmful insects are also devoured. See WOODPECKERS, and consult authorities cited thereunder.

Sapucaia (săp-oo-ki'a) or **Paradise Nuts**, the seeds of *Lacynthis zabucayo*, or sometimes those of *L. ollaria*, belonging to the *Myrtaceæ* and closely allied to the Brazil nut. The trees grow abundantly in the northern part of South America and are more than 75 feet high. The nuts are superior in flavor to, and more wholesome than, the Brazil nuts, having a sweet almond-like taste. They are about two inches long and an inch in thickness, with a corky shell furrowed lengthwise, and are found in hard urn-shaped fruits, six inches across and with a woody wall half an inch thick. These curious capsules, which are very hard and have a lid which fits the top closely, but which falls off when quite ripe, are called monkey-pots, a name given also to others of the genus, perhaps not only on account of the shape of the capsule, but because monkeys are said to be very fond of the seeds, which are scarce for this reason. An edible and soap-making oil, which soon grows rancid, is expressed from sapucaia nuts.

Sara, sā'rā, Philippines, pueblo, province of Iloilo, Panay; in the district of Concepción, two miles northwest of the town of Concepción. Pop. 10,950.

Sar'aband, a dance, said to be derived from the Saracens. Its character is grave and expressive. It originated in Spain, where it was formerly danced to the castanets. Handel, Bach, and other masters, frequently wrote tunes of this description for the harpsichord or clavichord.

SARACENIC ARCHITECTURE—SARAGOSSA

Saracenic Architecture, the style adopted by the followers of Mohammed in building their mosques, palaces, and tombs. Originally the Arabs possessed no distinctive architectural style, and the style which they at length made their own was developed by architects belonging to the countries which they had conquered. This style is chiefly represented in Egypt, and North Africa, Persia, Spain, Turkey, and India, but the Saracenic architecture of Spain is generally called by the distinctive name of Moorish. The prominent features of Saracenic architecture vary with the style whether Indian, Mohammedan, North African, or Spanish, but may be characterized as the dome, and the pointed arch. The domes generally rise from a square base, sometimes in groups of three or more, are graceful in form, and frequently enriched externally with colored tiles or other decorations. The minarets are towers of considerable height, rising in stages or stories, each with a balcony, and are most frequently octagonal, sometimes cylindrical, rising, however, from a square base. The arch is of the pointed variety, this form having been used by the Arabs in Egypt before the rise of the Gothic in Europe. It is sometimes of the horse-shoe form (see ARCH). Externally the tops of walls are often finished off with an upright cresting, which may be regarded as an ornament taking the place of a cornice. Flat surfaces are frequently ornamented with a profusion of scroll work and conventional foliage, often in intricate and beautiful designs. Stucco is much used in ornamentation. The mosque el-Aksah at Jerusalem, reconstructed by Abd el Malek in 691 A.D., shows evidence of the Christian art of the time in its basilica of seven aisles. In Egypt the Saracenic art began with the mosque which Amru erected at Old Cairo in the 21st year of the Hegira (642 A.D.). Subsequently repaired and altered, it may now be considered as a good specimen of Moslem architectural art when freed from Christian influence. But the perfected Saracenic art dates from the building of a mosque at Cairo by Ibn Toolon in 876 A.D. This building is nearly square (390 feet by 455) with a central court, around which on three sides are ranges of arcades, while on the side toward Mecca there are five. It is built of brick covered with stucco. The mosque and tomb of Kaid Bey erected in 1463 outside Cairo is one of the most graceful specimens of Saracenic architecture. When the Turks captured Constantinople in 1453 they appropriated the Christian churches of the city, the most important of which was Saint Sophia. Such was their appreciation of this Byzantine building that they adopted its architectural style with modifications in all the mosques which they subsequently built there, and all the Saracenic building within the bounds of the old Byzantine empire is founded on Byzantine models. Byzantine, modified by Persian thought, would be the best definition of Saracenic art, excepting in India, where the Moslem building was carried on under a Renaissance influence of a special kind. The finest of these was built by Suleiman in 1550 A.D., and occupies nearly a square, being 225 feet by 205. In Persia the Saracenic architecture is supposed to be a development of the old Babylonian or Assyrian. The ruined mosque of Tabreez, one of the finest of its kind, belongs to the Mogul

dynasty, and was begun by Ghazan Khan in 1294 A.D. In form it resembles a Byzantine church, but it is chiefly remarkable for the decorative results obtained by mosaic of glazed bricks and tiles in brilliant colors. The most splendid of Saracenic buildings in Persia was built during the dynasty of the Sufis by Shah Abas (1585-1629) in his capital of Ispahan. This was the Maidan or bazaar, a large rectangular area enclosed by an arcade two stories in height, and to which was attached the great mosque or Mesjid Shah and other buildings. This latter building is 223 feet by 130, the centre compartment being surmounted by a double dome, whose external height is 165 feet. Taken as a whole the Maidan Shah, with its gates and mosques, superbly decorated, is one of the most effective specimens of Saracenic architecture. See ARCHITECTURE.

Saracens, sār'a-sēnz, a people mentioned by Ammianus Marcellinus as inhabiting the northern district of Arabia Felix. At the period of the Crusades the term was employed to designate all infidel nations, against which crusades were preached; and in course of time it became the generic name of all the Arabian tribes who embraced Mohammedanism, and extended their conquests in Asia and Africa.

Saragossa, sār-a-gōs'a, **Maid of**, Spanish heroine: d. Ceuta, Spain, 1857. Her name was Augustina, and she was a vivandière in the Spanish army. During the siege of Saragossa (1808-9) she distinguished herself on several occasions in battle, and was made sub-lieutenant. Her praises are sung by Byron in 'Childe Harold,' canto i. 54-56.

Saragossa, or **Zaragoza**, thā-rā-gō'thā (ancient CÆSAR-AUGUSTA), Spain, (1) Capital of a province of its own name, and of the ancient kingdom of Aragon, situated on the River Ebro, in a fertile plain, 174 miles northeast of Madrid. The town is highly picturesque with its forest of towers, cupolas and spires, the houses of solid masonry highly ornamented, a city of castles and palaces. Many of the chief buildings were destroyed by the French invaders. Others deserving notice are the exchange (1551); the Torre Nuevo; the old citadel, Aljaperia, built by the Moors; hospitals, numerous churches and charitable institutions, town-house, new university, schools of medicine, theology, etc., many monastic institutions, theatre, baths, museum, bull-ring and botanical gardens and promenades. Agriculture is the principal occupation of the inhabitants and the industries include machinery and iron foundries, tanneries, carriages, preserves, breweries, glass, candles, soap, liqueurs, distilleries and porcelain. Some of the articles referred to are imported besides rice, dried cod, bar-iron, timber and dye-stuffs. The exports consist chiefly of chocolate, paper, cast-iron, wool, hats, dyed silks, soap, and especially wheat and flour—mainly to Catalonia. Saragossa was the Salduba of the Celt-Iberians, but the walls are all that remain of the ancient city. It renounced paganism at an early period, and Aulus Prudentius, the first Christian poet, was born here in 348 A.D. It suffered from various wars, and in 1808 sustained two memorable sieges, costing 60,000 lives, but finally capitulated to the French. Pop. (1900) 99,118.

SARAH — SARATOGA SPRINGS

(2) The province of Saragossa contains 6,607 square miles. The highest elevation is 7,700 feet. On the northwest are the spurs of the Pyrenees. The Ebro, Jalon, Huerva, Aguas, Arva and Gallego and part of the Aragon are the chief streams. The lower mountain slopes are covered by forests. The soil in the plains is fertile, producing wheat and other cereals, flax, hemp, oil, wine, etc. Silkworms are reared, sheep are bred. The growing industries include paper, leather, soap, brandies, liqueurs, machinery, various kinds of carriages, railway material, pianos, beds, glass, bronze, chocolate, jams, woolen and linen goods and foundries. Several railways and a canal connecting the Atlantic and Mediterranean are the chief ways of communication. Pop. (1900) 421,823.

Sarah (Heb. "Princess"), the daughter of Terah, half sister and wife of Abraham, who in her 90th year bore to him a son, Isaac, according to the promise of God. She died in Hebron at the age of 127 years. See ABRAHAM.

Saranac (sär'a-nāk) **Lake**, N. Y., village in Franklin and Essex counties; on Lake Saranac, and on a branch of the New York Central & Hudson River and the Chateaugay R.R.'s; about 70 miles south by east of Malone. The village is in a part of the Adirondack region noted for its healthfulness and the beauty of the scenery. The hunter and lumberman settled here in 1860-70, but the railroad brought the health and pleasure seekers in great numbers. In the vicinity are the Trudeau and the Gabriel sanatoria for consumptive patients. The principal public buildings are the hotels, the churches and the schools. The government is vested in a village president and a board of trustees. Pop. (1890) 768; (1900) 2,594.

Sarasate, sä-rä-sä'tā, **Pablo de**, Spanish violinist; b. Pamplona 10 March 1844. In 1856 he entered the Paris Conservatory, where he studied the violin under Alard and harmony under Reber. In 1857 and 1859 he won prizes there, and afterward achieved a signal European success. During his second visit to the United States (1889) he added to his already secure reputation by brilliant exhibitions of his skill in the leading cities. The technique which shows his mastery of the violin is made the vehicle of a fine interpretative power revealing the genius of the musician. His own compositions include 'Spanische Tänze,' 'Zigeunerweisen,' national airs, and many fantasias on airs from the opera.

Saratoga, sär-a-tō'ga, a lake in Saratoga County in New York State, about four miles east of Saratoga Springs. It is a favorite place for regattas; it has a straight-away course three miles long and is wide enough to accommodate eight racing sculls abreast. In one of the intercollegiate regattas, held here, 16 college crews competed, and had ample room. A steam railroad and electric cars extend from the "Springs" to the lake. In the summer it is a favorite resort for fish and game dinners.

Saratoga Springs (from an Indian word meaning "Hillside of the Great River"), N. Y., village in Saratoga County; on the Delaware & Hudson, the Boston & Maine, the Saratoga & Mount McGregor, and the Adirondack R.R.'s; 38 miles north of Albany and 185 miles north of New York. It is easily accessible

to many of the large Eastern cities, the "Saratoga Special" makes the run from New York in four hours; Boston may be reached in six hours; Albany and Troy, one hour; from Buffalo, Rochester, the Adirondacks, the Green Mountains, the White Mountains, and many other places fast trains are run, especially in the summer season. It is a remarkably healthy place, and all precautions known are used to keep the water pure and the sewerage system free from defects.

The missionaries were the first known white men to visit this region. In 1684 the land now constituting Saratoga and adjacent counties was ceded to the Dutch by the Indians. The first white owner of the now celebrated "Springs" was Rip van Dam, and Sir William Johnson (q.v.) was the first who had the efficacy of the waters tested. In 1774 the first hotel was erected. The "Springs" have made for the place a world-wide reputation. Thousands come to this village, each year, to use the waters, making the village one of the most popular health resorts in the country. Since 1826 the waters have been bottled and sent to various parts of the world. The Saratoga battle-field, the scene of the surrender of Burgoyne to Gates, 17 Oct. 1777, is 12 miles east of the village.

Saratoga is on the southernmost spur of the Adirondacks, at an elevation of more than 300 feet above tide-water. The region around has practically no swamps, nor marshes; the rainfall is moderate, and the winters cold, the summers mild and pleasant. There are but few manufacturing establishments, and the region around is composed largely of productive farms. The mineral springs are about 50 in number, 40 of which are well known. The most frequently visited and the waters of which are most extensively used, are the Congress, Vichy, High Rock, Victoria, Adirondack, Hathorn, Star, Empire, Patterson, Re-Me-Ho, Royal, Red, Magnetic, Columbian, Geyser, and Excelsior. The waters are cathartic, tonic, alterative, and diuretic. The springs are in three groups; one about a mile south of the village, one a mile north of the village and the largest number within the corporate limits. The Saratoga Racing Park is a mile from the centre of the village. A paved sidewalk leads to the entrance gates. Polo Park, the golf links grounds, and other grounds furnish opportunity for outdoor sports. Saratoga Lake (q.v.) is about four miles distant.

The principal public buildings are Convention Hall, which will seat 5,000 and which cost \$100,000; the town hall containing the theatre, a State armory, and the hotels. The hotels of the village have on several occasions accommodated 40,000 guests. On account of its spacious hotels and its convention halls, it is a favorite place for conventions. There are 18 church buildings, representing eight different denominations. The educational institutions are the Temple Grove Seminary, a high school, public and parish elementary schools, several private schools, a public school library, the McMillan Reading Circle Library, the Athenæum, and the Temple Grove Seminary libraries. The charitable institutions are the Saratoga and Saint Faith hospitals, Home of the Good Shepherd, Saint Christina Home, and the Children's Home.

The two national banks have a combined

SARATOGA — SARAWAK

capital of \$225,000 and a surplus of \$200,000. The annual receipts and expenditures are each about \$125,000. The hotels expend during the summer season about \$40,000 for orchestral music. The village expends a large amount on the streets, keeping them clean and in good repair. Pop. (1890) 13,171; (1900) 12,409.

Saratoga, The, a former wooden sailing ship of the United States navy; displacement, 1,025 tons. Sailing ships of this class are fast disappearing from the navies of the world, but for training the young apprentice into an able-bodied man-o'-war's man there is no better school.

Saratoga, Battles of, two battles of the American Revolution, called also the battles of Bemis' Heights, or of Stillwater, fought on ground about 12 miles east of Saratoga Springs and near the Hudson River. Both battles were fought under the same officers, the Americans being commanded by Horatio Gates (q.v.), who was ably served by Benedict Arnold and Daniel Morgan (qq.v.), and the British by John Burgoyne (q.v.). The first battle, 19 Sept. 1777, was indecisive. Burgoyne, having crossed the Hudson on the 13th and 14th, and encamped on the heights and plains of Saratoga, confronted Gates' army on Bemis' Heights at Stillwater, which the Americans had strongly fortified. About 4 P.M. on the 19th the American left wing, under Arnold, was attacked by Burgoyne's right. The engagement lasted until dark, and both sides claimed the victory. The British held the field, but Burgoyne had failed in his attempt to flank the American position. The British loss was more than 500 men, while that of the Americans was under 400. Burgoyne, whose communications with Canada were cut off, was now placed in peril through the capture of his supply-boats by Lincoln in his rear. Having reason, however, to expect that Sir Henry Clinton would come up the Hudson to his assistance, he fortified his position and waited. But in view of the non-arrival of Clinton, of the shortness of his own supplies, and of the difficulty of retreat, Burgoyne was forced to risk another battle. Advancing, 7 October, with 1,500 men and six pieces of artillery, he was attacked on the right by Morgan's riflemen and a New Hampshire brigade, while Arnold, without orders, and in defiance of Gates, pressed to the front and assumed actual command of the Americans, leading them in a determined assault upon the British lines. The Americans were reinforced at the critical moment, the British again and again gave way, and the battle ended in their retreat with loss of their artillery. In this engagement the British general Simon Fraser was mortally wounded, and Arnold received a severe wound in the leg. The Americans, animated by success, pursued Burgoyne's men, assaulted furiously, and gained partial possession of their camp. This battle, like the first, ended with darkness. During the night, while the American forces lay on their arms, Burgoyne withdrew to the heights in his rear, not far to the north, and on the following day, to avoid capture, he retreated to Saratoga. After vainly waiting again for aid from Clinton, being still nearer the end of his provisions, exposed to the American fire, and finding further retreat impracticable, Burgoyne proposed a cessation of hostilities. He refused

Gates' demand for unconditional surrender, and Gates modified the terms, which finally provided that the British should march out with the honors of war, and should freely take passage for England, on condition of not again serving against the American army. Congress failed to ratify this agreement, and the captured British, with the exception of Burgoyne and a few other officers, were held as prisoners until the end of the war. The troops surrendered numbered 5,791. An artillery train of 42 guns, more than 4,500 muskets, and a great quantity of ammunition were taken, and this war-material proved of no small value to the American cause.

JOHN H. CLIFFORD.

Saratov, sä-rä'töf, Russia, (1) Capital of the government of the same name, on the Volga, 459 miles southeast of Moscow, in a fertile valley, surrounded by lofty hills. It is one of the most important and best-built cities of eastern Russia. It occupies terraced slopes, intersected by ravines, dividing the city into three parts. It contains 30 churches, besides a public library; a fine art gallery; an excellent theatre; a school of drawing; primary and technical schools, and is the seat of several important courts and public offices. There are manufactures of cordage, bells, pottery, tiles, soap, tobacco, textiles, etc. The trade is chiefly transit by the Volga, between Moscow and Astrakhan. The industrial works comprise flour-mills, iron and oil works, works for the manufacture of railway plants, and tobacco factories. There are extensive distilleries and manufactures of liquors. Agriculture and gardening are the chief occupation of a section of the population. Pop. (1897) 137,109.

(2) A government of southeast Russia, on the Lower Volga, with an area of 32,624 square miles. The surface is diversified by numerous hills with intervening valleys and many streams, which with a mild climate and good soil contributes to rich pastures and munificent crops. There is a scarcity of timber. The chief exports are corn, hemp, flax, tobacco, hops, and madder. The mulberry is cultivated for rearing silkworms. Most of the inhabitants are Russians, although there are many Finns, Tartars, and Germans, etc. The colonists have much improved industry by their labor and example. Pop. (1897) 2,419,884.

Saravia, sä-rä'vë-ä, Philippines, pueblo, province of Negros Occidental; on the Malagal Grande River, two miles inland; 16 miles north of Bacolod. It is a military station. Pop. 15,000.

Saravoff, sä-rä'vöf, Boris, Bulgarian soldier, leader in the Macedonian revolutionary committee: b. Turkey about 1870. He studied in the military academy at Sofia, obtained a lieutenant's commission in the 1st Bulgarian infantry, in 1895 resigned his commission to devote himself to the cause of the Macedonian revolutionists, and performed many daring exploits in that service. His movements were regarded in Europe with some apprehension, for it was asserted that his design was to organize a great rebellion, seize Constantinople, and become dictator of a new Macedonian state. His death was frequently reported in the press.

Sarawak, sä-rä-wäk', Borneo, East Indies, an independent state, governed by an Englishman with the title of Rajah, and now under

British protection. It is situated on the north-western side of the island, and its coast extends from Cape Datu on the southwest to Brunei Bay on the northeast, having a length of about 400 miles; the inland boundary is mainly formed by the Dutch territories, while in the northeast is the independent sultanate of Borneo proper, also now under British protection. The area of Sarawak is about 50,000 square miles and the population about 500,000. The shore is generally low and undulating, but immediately behind it the ground rises rapidly and becomes mountainous. The principal rivers are the Rejang, Baram, Batang, Lupar, and the Limbang. The climate is equable. The soil is very productive, and sugarcane grows readily even without cultivation. Cloves, nutmegs, and cinnamon thrive well; the more important vegetable productions are coconuts, rice, and sago. Metals, particularly gold, antimony, and nickel, are very abundant, and are worked to a considerable extent. Diamonds and other precious stones are also found, and excellent coal, favorably situated both for working and shipping. The original inhabitants are Dyaks, but are now intermixed with Malays and Chinese. They had made considerable progress in civilization. Owing to misgovernment and marauding expeditions for the purpose of obtaining slaves and other plunder they were in a wretched condition till Sir James Brooke was appointed rajah by the Sultan of Borneo in return for distinguished services in quelling disturbances and restoring order. Under his mild yet vigorous administration a happy change was produced, and extended its benefits beyond Sarawak to the adjoining territories. Sir James Brooke, who died in 1868, was succeeded by his nephew, Sir Charles Brooke. The exports consist chiefly of gutta-percha, sago, edible birds' nests, and antimony, of which last article 2,000 tons are annually shipped to Singapore.

The seat of the government is at Sarawak (formerly called Kuching), on a river of the same name. It consists of a native and a European town; pop. est. 25,000. A six-gun battery commands the reach immediately below the town, and there a number of Chinese houses have been built. The trade of the town is considerable, and is carried on chiefly in large boats, some of them of 100 tons, which sail annually to Singapore with sago and other productions of the coast, receiving in exchange European goods, Javanese cloths, brass-work, and coarse earthenware, made in China.

Sarbiefski, Matthias Casimir (Latinized into *SARBIEVIUS*), Polish Latinist: b. on his father's estate of Sarbiefio, in Massovia 1595; d. Warsaw 2 April 1640. He was teacher in the Jesuit school at Wilna and in 1623 went to Rome where Pope Urban VIII. crowned him as poet and engaged his services for providing the hymns of the revised breviary. On his return to Poland he was appointed court preacher to Vladislav IV. His Latin poems consist of odes, epodes, dithyrambs of such matchless grace and faultless style as justly won for him the title of the "Polish Horace." The whole of his works were published in Antwerp (1632); and by Friedemann in the 'Bibliotheca Poetarum Latinorum' (1840), with a German translation.

Sarcey, sār-sā, Francisque, French journalist and dramatic critic: b. Dourban, 8 Oct.

1828; d. Paris 15 May 1899. After several years spent in general journalistic work he became dramatic critic for 'Le Temps' (1867), and in this position, which he held until his death, was a dictator of dramatic criticism, his word being accepted as final by a large part of the public. He was the author of 'The Word and the Thing' (1862); 'Le Siège de Paris' (1871), which reached 30 editions in its first year; 'Etienne Moret' (1875); 'Comédiens et Comédiennes' (1878-84); 'Souvenirs de Jeunesse' (1884); 'Souvenirs d'Age mûr' (1892); 'Quarante Ans de Théâtre' (1893).

Sarcina, sār-sī'na, a genus of microscopic fungi, consisting of cubic or prismatic masses, made up generally of 8, 16, or 64 rounded, cubic cells, the faces of each cell being divided into four frustules or projections by two light grooves which cut each other at right angles. Each cell has a diameter of about $\frac{1}{100}$ th to $\frac{1}{125}$ th of a line, and consists either of a completely homogeneous mass only, without nucleus or granulations, or of such a mass with four, sometimes two or three nuclei. The cells are separated from each other by rectangular striae. Sarcinae are found sometimes in considerable quantities in the vomitings of persons ill with chronic affections of the stomach, in the faeces of chronic diarrhoea, etc.; they have likewise been detected in the stomachs of rabbits, dogs, tortoises, and other animals; in the urine; in the pus of gangrenous abscesses; in the bones, etc. The appearance of sarcinae in vomitings indicates a particular form of dyspepsia, for which the best known remedy is sulphate of soda, 10 grains to 1 dram, dissolved in water, and taken soon after a meal. The genus *Sarcina* is closely allied to that of *Bacterium*.

Sar'cine, hypoxanthine, $C_4H_7N_3O_4$, a weakly basic organic substance closely related to xanthine and to uric acid. Found in the muscle juice and in many other fluids of the body. Colorless crystalline needles, slightly soluble in cold water, more so in hot. Unites with acids and certain metallic oxides to form compounds many of which are crystalline.

Sarco'ma. See TUMOR.

Sarcoph'agus, originally the name given to a kind of stone that used to be quarried at Assos in the Troad, and which was employed for coffins or tombs: a coffin made of this stone was supposed to possess the property of consuming within a few weeks a dead body laid in it: in Greek *sarkophagos* means flesh-consuming, or flesh-devouring. Sarcophagus is now used only in the sense of coffin or tomb made of stone, or of terra-cotta as in the case of the highly ornate tombs of that material which are found among the remains of ancient Etrurian art. Some of the sarcophagi found in Egypt are contemporary with the pyramids: the earliest are squared or oblong, the later ones, whether plain or ornamented with reliefs, have the same shape as the swathed mummies. Phœnician sarcophagi were modeled like the mummiform sarcophagi of Egypt, and were of marble or basalt; some of them showed the principal contours of the body. Before cremation of the dead came into general use at Rome, the illustrious dead were deposited in massive sarcophagi; celebrated among these is the tomb of the Scipios; under the empire Roman sarcophagi

were very elaborately ornamented after the manner of the Etrurians. In modern times deceased men of great eminence or great wealth are sometimes laid away in stone chests or sarcophagi.

Sarcopsylla, a genus of parasitic fleas which bury their heads in the flesh of their hosts and create bad sores. The most noted species is *S. penetrans*, the chigoe (q.v.). Another species, the chicken-flea (*S. gallinacea*), buries itself in the eyelids of domestic fowls in our southern States and elsewhere.

Sar'cosine, methyl glycocoll, methyl glycine, $\text{CH}_3\text{NHCH}_2\text{COOH}$, a substance discovered by Liebig in the decomposition product of the creatine obtained from meat extract. Later made by the action of methyl-amine on monochlor-acetic acid. A colorless crystalline compound easily soluble in water.

Sard, a translucent, reddish-brown variety of chalcedony, extensively used as a ring-stone. See CARNELIAN.

Sardanapalus, sār-da-na-pā'lūs (ASSUR-BANI-PAL) Assyrian king, ruled 668-626 B.C. He was the eldest son of Esarhaddon, grandson of Sennacherib, and great-grandson of Sargon. His father resigned the throne to him in 668 B.C., reserving only Babylon to himself. The following year the father's death left Assurbanipal sole ruler. Revolts being common upon a change of rulers, the attention of the new Assyrian king was called to the suppression of one in Egypt, where Tirhakah of Ethiopia had overthrown the system of princes tributary to Assyria. Tirhakah was driven southward out of Egypt after a disastrous battle, but his successor renewed the revolt and met with defeat. Thebes was robbed of an immense amount of treasures of art and wealth. Tyre also revolted, but after a prolonged blockade its king submitted. The kings of Arvad, Cilicia and Tabal were put in subjection, and Gyges of Lydia, who besought an alliance with Assurbanipal to aid him against his Cimmerian enemies from the Black Sea region, found he was accepted on terms which implied submission; and when later he assisted Psammetichus in throwing off the Assyrian yoke in Egypt he was destroyed by Assurbanipal. War broke out with Urtaku, king of Elam, who had made a raid upon Accad, ruled by the brother of the Assyrian king. It took a long struggle to complete the subjection of the country but was accomplished finally during the reign of Teumman, Urtaku's usurping successor. After a great victory near Susa, Urtaku's sons were placed over the kingdom as Assyrian vassals. The decline of the empire began when the king's brother, Samas-sum-ukin (or Shamash-shum-ukin), ruler of Babylon, as vassal-king, instigated a revolt which was so widespread as to include Elam, Arabia, Egypt, Chaldaea and other Asiatic countries. Egypt alone under Psammetichus secured her independence. Babylon was taken after a long siege and Samas-sum-ukin perished in the flames of his burning palace. Elam was subjugated and Susa, after being pillaged, was razed to the ground between 646-640 B.C. Assurbanipal celebrated his victories in Arabia by a triumphal procession through Nineveh.

Assurbanipal figures in classical literature under the name of Sardanapalus and there is

described as a mere sensualist. Though cruel and implacable to foes, he was an enlightened despot, and literature and art, particularly architecture, flourished in his reign and attained their highest degree of perfection. The king collected a famous library of all the known cuneiform tablets. The remains of his splendid palace with its priceless library were excavated at Kuyanjek. The tablets now belong to the British Museum, and form the basis of our present knowledge of the civilization and history of Assyria. Consult: Oppert, 'Histoire des Empires de Chaldée et d'Assyrie'; Lenormant, 'Manuel d'Histoire Ancienne de l'Orient' (1869); Rawlinson, 'Five Great Monarchies of the Eastern World' (1879); and the works cited of A. H. Sayce (q.v.).

Sardines (sār dēnz') and Sardine Fisheries.

The name sardine is a general one applied to various small fishes of the family *Clupeidae* as well as, and less correctly, to the young of some of the larger species. "Thus, there are the Spanish sardine of the West Indies and Florida; the California sardine, found along the entire west coast of the United States; the Chile sardine; the oil sardine of India, and the sardines of Japan and New Zealand. But the sardine *par excellence* is the French sardine, so-called from the island of Sardinia, in the Mediterranean, about whose shores the fish are abundant." The sardine or pilchard (*Clupea* or *Clupanodon pilchardus*) is usually about 5 or 7 inches long, of an olive-green color above and silvery on the sides and below, with very large easily displaced scales, only about 30 of which form a complete longitudinal row. The usual French sardines are the yearling fish of what becomes, when full grown, the pilchard of English fishermen, attaining a length of 8 to 10 inches. Geographically it ranges throughout the Mediterranean; in the Atlantic from Madeira to Ireland and in the North and Baltic Seas. They feed on minute crustaceans, larval forms, and floating fish-eggs, the only kind of food for which their nearly toothless mouths are adapted. The pilchard spawns throughout the summer in the open sea, laying about 60,000 buoyant eggs. On the coast of Brittany, where the principal fisheries are located, sardines are now caught throughout the summer, and to a less extent at other seasons, exclusively by means of gill-nets of very fine twine and small mesh which varies, however, to suit the size of the run of fish. They are dyed blue, partly to preserve, partly to render them inconspicuous in the water; and the schools of fish are tolled into them by means of a bait made of the salted roes of various fishes, chiefly cod. The nets are operated from small two-masted boats which never go beyond a few miles from the shore. The catch is brought ashore and a portion is consumed fresh, but the bulk is sold to the canning factories.

The fishes, when bought for curing, are first beheaded and then gutted, and sorted according to size. They are then washed in sea-water, by women, who are said to earn at this work from 12 to 20 francs per week. The fishes are next dried by being suspended on wire screens, nets, or willows in the open air, and are then plunged into a cauldron of the purest olive-oil, which is kept boiling over a furnace. For the cheaper grades peanut or cottonseed oil is used. The sardines are laid in the cauldron on wire

SARDINIA

gratings, two rows deep, and are kept therein until sufficiently cooked, when they are taken out and allowed to drip, the oil-drippings being carefully collected. They are packed in the tin cases, which are filled with oil, and sealed hermetically. Throughout the process the greatest care is exercised to keep the fish in the best condition. The offal and waste of the sardine-curing industry is sold as manure to the farmers.

The sardine fishery is the most important fishery industry of France, employing about 32,000 fishermen and more than 8,000 boats, and yielding an annual product of about 60,000,000 kilograms of sardines, valued at about 9,000,000 francs. About 15,000 persons are employed in the canning factories, of which there are upward of 100, some of which have an annual output of 4,000,000 or 5,000,000 boxes. The better grades are consumed in France, but the United States imports French sardines, chiefly of the cheaper grades, to an annual value of about \$1,000,000. Sardines are also packed to a smaller extent elsewhere in Europe, especially in Spain and Portugal.

In the United States a true sardine (*C. caruleus*) occurs on the coast of California and, judging from the results attained in the canning of small quantities, it promises to rival the French product in delicate flavor and industrial importance. But the principal sardine industry of the United States centres about Eastport, Maine, where the young of the herring is packed. These fish are caught chiefly in brush weirs (see POUND-NET FISHING) and are sold to the canneries, where they are treated in general after the French method with some local modifications. Drying rooms or ovens are employed in place of the open air; when ovens are used the fish are not boiled in oil, but are at once sealed; cottonseed-oil is almost universally employed instead of olive-oil; and various labor-saving devices have been introduced. The product is distinctly inferior to the best or even middle-grade French sardine. Various special grades, put up in mustard, tomato sauce, and spices, are also packed. The output of the 45 canneries in Maine is about 550,000 cases, valued at about \$2,000,000, annually.

Sardinia, sār-dīn'ya, **Island of** (Italian, SARDEGNA), in the Mediterranean Sea, south of the island of Corsica, from which it is separated by the Strait of Bonifacio, not quite 7 miles wide, extends between lat. 38° 50' to 41° 15' N., and lon. 8° 5' to 9° 50' E. It is 152 miles long from Cape Teulada in the south to Longo Sardo in the north, and has a central breadth of about 66 miles. Its total area is 9,306 square miles divided into two provinces of the kingdom of Italy (q.v.), Cagliari and Sassari, the former comprising the districts of Cagliari, Iglesias, Oristano, and Lanusei, and the latter those of Nuoro, Alghero, Ozieri, Sassari, and Tempio, named after the principal urban aggregations. Cagliari is the capital. Before the consolidation

of the Italian kingdom in 1861, Sardinia with its surrounding islands, the principal of which are San Antioco, San Pietro, Asinara, Madalena, Tavolara, and Caprera formed that part of the Sardinian states named the Kingdom of Sardinia. See SARDINIAN MONARCHY.

Topography.—The island is nearly in the form of a parallelogram. In a prehistoric age it was united with Corsica. The interior is generally mountainous, the great chain which traverses Corsica from north to south being evidently, notwithstanding the interruption of the Strait of Bonifacio, continued into Sardinia, where it usually follows the same direction, but occasionally sends out transverse branches east to west. The culminating point is the peak of Genargentu, situated a little to the east of the centre of the island, which attains the height of 6,132 feet. The next highest summit is the peak of Limbarra, 4,330 feet, belonging to the transverse range of that name, and situated in the north. Several other summits reach from 3,000 to 4,000 feet. Between the mountain ridges are several extensive plains, of which the most celebrated for beauty and fertility are those of the Campidano in the south, stretching between Cagliari and Oristano, and of Ozieri in the north. Besides these there are several large sandy or stony districts called *macchie*, of a very sterile nature. The streams are numerous, and add considerably to the fertility of the districts through which they pass, but are of no navigable importance. The Tirso, the largest, pours its waters into the Gulf of Oristano on the west coast. Next to it are the Coguinas, which flows northwest into the Gulf of Porto Torres or Asinara; the Flumendosa, which pursues the earlier part of its course between two mountain ridges, turns southeast, and discharges itself on the east coast; and the Mannu, which falls into the Gulf of Cagliari. The lakes are situated chiefly in the vicinity of the coast, where they form a series of lagoons. Sardinia has a total coast line of 835 miles. The north coast is generally rugged and precipitous, presenting a succession of bold headlands. The principal bay is that of Porto Torres, in the Gulf of Asinara, having a low beach, with lagoons extending along its eastern and southern shores, but rising toward the west into precipitous cliffs, terminating on the mainland in Cape Falcone, and thereafter continued north in the long and rugged island of Asinara. The west coast, stretching south from Cape Falcone, continues steep and rugged, and presents, among other remarkable headlands, that of Cape Argentiera, forming the extremity of a rocky mountain upward of 2,000 feet high; beyond this the coast turns suddenly east, and forms the Bay of Alghero, where the beach becomes lined with hills of fine white sand. To the south of Alghero the sand disappears, and a range of gentle hills, planted with vineyards, lines the shores as far as Poglina, when the coast again resumes its rocky character, presenting a succession of trap cliffs, which extend to Cape Marargiu, and thence to Point Mova, near the town of Bosa. A table-land succeeds, and is continued, though with occasional interruptions, as far as Cape Mannu, a cliff of moderate height. The beach now lowers, and trending east, forms the large and nearly semicircular expanse of the Bay of Oristano, the northern and southern

SARDINIA

extremities of which, Capes San Marco and La Frasca, are above five miles apart. Rocks again appear toward Cape La Frasca, and continue with little interruption to Cape Pecora, from which the coast trends along the base of Monte Ferru to Point Rama, where a remarkable conical rock, called Pan di Zuchero, comes into view. A large open bay, called Porto Paglia, succeeds, and beyond it the coasts become lined by a group of islands, of which Saint Pietro and Saint Antioco form, with their opposite coasts, a spacious harbor, with safe anchorage in every wind. Between the east coast of Antioco and the mainland is the Gulf of Palmas, the northern shore of which consists of a succession of flat islets, which often join at low water, while its southern extremity, after presenting the bare and sloping promontory of Point Piombo, terminates in the still more remarkable headland of Cape Teulada, nearly 900 feet high, and forming the most southerly point of the whole island. A bay of the same name opens between this headland and Cape Spartivento. Turning north from Cape Spartivento a number of rocky islets present themselves, lining a low and marshy beach, which continues almost unbroken till the Island of San Macario is reached, forming the southwest entrance of the Gulf of Cagliari. This gulf, extending from Cape Pula on the west to Cape Carbonara on the east, a distance of about 24 miles, and stretching inland for nearly 12 miles, is in many respects the most important of the island. Besides having the capital situated on its northern shore, it everywhere furnishes excellent anchorage in ample depth, and in the grounds along and behind it exhibits the best specimens of cultivation of which Sardinia can boast. The east coast, from Cape Carbonara northward, stretches nearly in a straight line, the continuity of which is seldom interrupted by indentations. The only bays deserving of notice are those of Orosei and Terranova. The coast-line presents similar features to those which have already been described, low beaches and rocky cliffs often succeeding each other within very short distances. The most conspicuous of all the headlands is that of Monte Santo, a rugged promontory upward of 2,400 feet high, sloping toward the sea, and terminating in bold precipices of limestone, within which is an extensive cave fantastically adorned with enormous milk-white stalactites.

Geology.—The greater part of the rocks are of crystalline texture, and belong to the earliest formations, consisting of granite, overlain by gneiss and mica-schist. Trachyte, basalt, and other rocks of volcanic formation are most largely developed in the northwest, but also occupy a great number of isolated spots throughout the island, and more especially in the southwest, where the adjacent islands of Saint Pietro and Saint Antioco are almost entirely composed of them. In many cases the mouths of ancient craters and the lava-streams issuing from them can be distinctly traced. Sedimentary Silurian rocks break the continuity of the granite on the east, and a large tract in the southwest belongs to the same formation, extending in a southwest direction till it reaches the southern extremity of the island and forms the remarkable promontory of Teulada. The limestones and chalks at the top of the secondary formation are not largely developed, but occupy a number of iso-

lated tracts both in the interior and on the coast. In the latter portion they form conspicuous objects in the northwest, where the cliffs to the north of the Gulf of Alghero are composed of them, and in the east, where they form the great mass of Monte Santo, and contain its celebrated stalactical cave. Tertiary rocks of travertine, marl, and sandstone occupy a considerable tract near the town, and along the Gulf of Sassari, and also in the south, where they form the eastern boundary of the plain of Campidano. That plain itself, however, has a deep covering of alluvium, which partly accounts for its remarkable fertility. Similar tracts of alluvium, though of much more limited extent, are found in the Plain of Ozieri in the north, and along the Gulf of Palmas in the south, and that of Paglia in the southwest.

Minerals.—The mineral riches of the island were well known to the ancients, whose extensive workings can still be traced. Tradition enumerates gold among its metals, but no traces of it can now be found. Lead, however, exists in considerable abundance, and is generally highly argentiferous. Mines of it are profusely scattered over various districts. Zinc ore (calamine) is worked, and as well as lead ore is exported. Copper occurs in several quarters, and occasionally furnishes beautiful specimens of malachite. Quicksilver has been found, and was once partially worked; and both bismuth and antimony are said to exist; iron of excellent quality is plentifully distributed, and is worked in several districts. The other mineral products deserving of notice are porphyry, basalt, alabaster, marble, volcanic enamels, rock-crystals, and a variety of beautiful pebbles, lignite, gypsum, and nitre. Salt, in its mineral form, is found only in the grottoes of Serrenti, but is extensively obtained from the salt-pans along the coast, and forms one of the most profitable sources of royal revenue, for the sake of which it is strictly maintained as a government monopoly.

Climate.—The climate of Sardinia has for many ages borne a very bad name; at certain seasons large districts become so insalubrious as to be regularly deserted by their inhabitants, while in others the mortality is remarkably great. The range of the thermometer is between 34° and 90°, and the mean annual temperature 61° 7'. Hence neither heat nor cold can be said to be in excess. During the hot season, in the low-lying lands, miasmata are continually arising to taint the air, the malignant properties of which become so virulent at night or in the cool of the evening that the natives never quit their homes until an hour after sunrise, and hasten to return before sunset, carefully closing every door and window. The disease which then prevails is known by the name of *intemperie*, and is said to be even more fatal than the malaria by which parts of Italy and Sicily are infested.

Flora and Fauna.—The whole surface of Sardinia has been divided into three portions—one occupied by mountains, which, where not absolutely barren, are covered with forests or clothed with pasture; one occupied by marshes, lagoons, and the almost sterile *macchie*; and one under tolerably regular culture, as arable land, olive-yard, vineyard, etc. See paragraph on *Agriculture*.

SARDINIA

Game of all kinds is very abundant. Wild boars, stags, deer, and muffsions frequent the woods and forests; and foxes, hares, and rabbits are so numerous that their skins furnish a considerable article of export.

Fisheries.—From the extent of seacoast the fisheries naturally form an important branch of industry, which, however, is almost entirely in the hands of strangers. The most valuable fishery is that of the tunny, which is carried on extensively on various parts of the coast. Anchovies and sardines, the latter at one time so numerous as to have derived their name from the island, have become comparatively scarce. Fine mullet, bream, eels, and other fish abound, and are staple articles of consumption and commerce. The coral fisheries, more celebrated in ancient than in modern times, are still carried on on the western and southern coasts, where they employ from 200 to 300 boats, which arrive annually from Naples and Genoa. The *Pinna nobilis* also, the inhabitant of a shell of from 15 inches to 27 inches in length, abounds in the smooth water of shallow bays, as at Porto-Conte and Liscia, and becomes the object of an important fishery, partly on account of the pearls, generally of very indifferent quality, obtained from it, and still more on account of its byssus, or tuft of silky hair, which is about eight inches long, and is spun into gloves, stockings, or other articles of dress.

Ethnology.—The inhabitants resemble the Spaniards rather than the Italians in character. Their demeanor is grave and dignified compared with the vivacity of the Italians, and they are characterized by their unwavering fidelity to their sovereign, their chivalric sense of honor, and their hospitality. They suffered much, however, from long neglect and misgovernment, are ignorant and bigoted, and when they have received an injury are insatiable in their thirst of revenge, the celebrated blood-feuds being still by no means uncommon. With the exception of the inhabitants of Cagliari and Sassari, the two chief towns of the island, the Sardinians have as yet been little influenced by the modern advances of civilization, and in some remote districts the traveler may imagine himself transferred to a period several centuries earlier.

Agriculture.—Much of the land is of remarkable fertility and though, from the imperfect system of agriculture pursued, the average produce does not exceed one in seven or eight, a return of 15 to 20 in some favored districts is not uncommon. The grain thus raised considerably exceeds the consumption of the present inhabitants, and might easily be increased so as to supply three times the number. The whole operations of the farm are conducted in the most antiquated and slovenly manner. The principal crop is wheat, which is generally of excellent quality, and forms an important article of export in the form not only of grain but of flour, biscuit, and macaroni. The culture of barley is more limited, and the quality of the produce is comparatively inferior; maize thrives well, and though not yet a general crop is rising rapidly into favor; beans and pease are extensively grown both for home consumption and export. The vine is well adapted both to the climate and the soil. The produce, however, is more remarkable for its quantity than its quality, all the preparatory processes being conducted in

a careless and imperfect manner. The most esteemed wines are those of the Campidano, Alghero, Sorso, and Ogliastro. Beautiful and extensive olive-grounds are met with in various quarters, but the culture might easily be extended and made much more profitable than it has yet proved to be. The best oil is that of Sassari. The only other crops deserving of notice are tobacco, which is grown to some extent in several districts, but particularly around Sassari, Alghero, and the adjacent villages; linseed, which is produced in the greatest abundance in the neighborhood of Oristano; cotton, for which the soil and climate of the Campidano appear well adapted; madder, which grows wild in many parts of the island, and, though neglected, might easily be cultivated to great advantage; and silk, well fitted to become a staple product, but at present produced chiefly for amusement.

Industries and Commerce.—Manufactures have made very little progress, and are chiefly confined to a few coarse tissues woven by the women at their homes for private use. Tobacco and gunpowder, both, like salt, government monopolies, are manufactured to a considerable extent. The trade consists of the exports of raw produce, the greater part of which have already been enumerated, including corn, wine, brandy, timber, seeds, fish, cattle, lead ore, calamine, salt, tobacco, etc.; the imports include all the ordinary tissues, more especially cotton, colonial produce, hosiery, hardware and metals, hemp and cordage, etc. One great obstacle to the progress of trade was the miserable state of the roads, which long continued impracticable for wheel-carriages. This has been to some extent removed by the formation of a good road, which traverses the island throughout its whole length from Cagliari to Sassari, and of several branch roads to the most important places not on the direct line. Several railways have also been constructed. The coinage, weights, and measures are the same now as those on the mainland.

Language, Education, Religion, Government, etc.—The language consists of a number of dialects differing widely in many of their roots; several of them closely resemble Spanish. It has been estimated that only about eighty in the thousand of the inhabitants are able to read and write, so defective is the state of education, but a steady improvement is being maintained with the rising generation. The people are Roman Catholics. Sardinia now has a provincial government similar to the rest of Italy.

History.—The early history of the island is involved in much obscurity. Its original inhabitants, according to Cicero of Libyo-Phoenician, and according to Strabo of Tyrrhene extraction, were living independent when, about 530 B.C., they were attacked by the Carthaginians, and obliged, after a valiant but ineffectual resistance, to quit the low country and retire into their mountain fastnesses. During the first Punic war the Romans made strenuous exertions to become masters of the island, and ultimately, on agreeing to make peace, obtained a formal cession of it from the Carthaginians. This cession is mentioned by Livy as one of the causes which led to the second Punic war, in which Rome, though finally victorious, was brought to the brink of ruin by Hannibal. Dur-

SARDINIAN MONARCHY

ing the struggles between Rome and Carthage Sardinia often became the theatre of war, and suffered equally from both the powerful states which contended for its possession. At a very early period the inhabitants were converted to Christianity. They passed successively into the hands of the Vandals, the Goths, the Longobards, and Saracens. By the united efforts of the Genoese and Pisans the Saracens were ultimately expelled from the island, and then rival claims were set up for it by its liberators themselves. During the disputes that ensued some of the judges or governors succeeded in establishing themselves as independent princes. In 1297 Boniface VIII. invested the kings of Aragon with Sardinia, and it continued in the possession of Spain till 1708, when it was taken possession of by the British. In 1713, in terms of the Peace of Utrecht, it was yielded to Austria. In 1720 it was ceded by Austria to Victor Amadeus II., Duke of Savoy, in exchange for Sicily. The Duke of Savoy thereafter assumed the title of king of Sardinia, which was finally exchanged in 1861 for that of king of Italy. Pop. (1881) 682,002, of whom 352,388 were males and 329,614 females; (1901) 791,754, giving a density of 85.08 per square mile.

Sardinian Monarchy, a former south European kingdom, comprising Sardinia (q.v.) and its surrounding islands as the nucleate portion with several dependencies on the Continent which included the duchy of Savoy, whence came its kings; the principality of Piedmont; the county of Nice; the duchy of Genoa, and parts of the duchies of Montferrat and Milan. These latter were divided for administrative purposes into eleven divisions—Turin, Genoa, Chambéry, Alessandria, Coni, Novara, Nice, Annecy, Ivrea, Savona, and Vercelli. Previous to the annexation of its territories consequent on the events of 1859 (see ITALY), and the disjunction from it of the duchy of Savoy and the county of Nice, which, in the same year, were ceded to and now form part of France, it comprised in the whole an extent of 28,229 square miles, with a population in 1858 of 5,194,807. In 1860 the revenue was estimated at 149,343,441 francs or \$29,868,688, and the expenditure at 157,805,376 francs or \$31,561,075. The national debt on 1 Jan. 1858 amounted to 677,020,228 francs or \$135,404,046. The army in 1859 numbered 76,172 men, exclusive of the reserve; and the fleet consisted of 29 ships with 436 guns. A new constitution was voluntarily granted by Charles Albert in 1848. It appointed two legislative chambers, guaranteed the freedom of the press, and introduced many important reforms. The Roman Catholic was the religion of the state, but all other forms were tolerated. The last Sardinian king was Victor Emmanuel II., afterward king of Italy, who succeeded to the throne in 1849. The royal title was King of Sardinia, Cyprus, and Jerusalem, and Duke of Savoy. The crown-prince was styled Prince of Piedmont.

History.—The country which formed the Sardinian states was known in ancient times in its southern part by the name of Liguria, and in its northern part, bounded on the north by the Pennine, and on the west by the Graian and Cottian Alps, by the name of Gallia Cisalpina.

Savoy, separated from the other parts, and lying beyond the Alps, was considered as belonging to Gallia Narbonensis. From this remote corner of the territory sprang the present royal house of Italy. In the middle of the 11th century, Humbert, count of Maurienne, a great vassal of Rudolf III. of Burgundy, appears exercising jurisdiction not only over Maurienne, but various other parts of Savoy, the Lower Valais, and Aosta. This jurisdiction was extended to the banks of the Po by Humbert's son, Otho, who died in 1060, leaving two sons, who became successively counts of Savoy. Under Amadeus III., a long series of changes followed, during which the house of Savoy was sometimes brought to the verge of destruction, and at other times attained to such prosperity as to excite the jealousies or fears of neighboring states. One of the counts, called Peter, ruled from 1263 to 1268. He added the canton of Vaud to his dominions, and in many ways improved the fortunes of his house. Henry III. of England, who had married his sister, made him Earl of Richmond, and gave him for residence a palace on the banks of the Thames, which hence took the name of Savoy House. Among Peter's successors the most distinguished are Amadeus V., whose prosperous rule, from 1284 to 1323, procured him the title of Great. Amadeus VIII. at the termination of his long reign of 49 years, in 1440, left his successor in possession of territories which gave him a distinguished place among the sovereigns of Europe. Being, however, interposed between France and Germany, they were often made the battlefield on which these great countries met to decide their quarrels. Notwithstanding this disadvantage, the house of Savoy, at the Peace of the Pyrenees in 1659, by which the wars of the French and Spanish monarchies were terminated, after they had raged for nearly 80 years, found itself under Charles Emmanuel II. as great and prosperous as ever. He was succeeded in 1675 by Victor Amadeus II., during whose reign war between France and Germany again broke out. Amadeus became almost necessarily involved, but played his part so ably, that at the Peace of Utrecht in 1713 he not only added considerably to his continental possessions but obtained possession and was formally crowned king of Sicily. By a subsequent arrangement he exchanged Sicily for the Island of Sardinia, from which he and his successors took the title of king. On his death in 1730 he was succeeded by Emmanuel III., who became involved in the war of the Spanish Succession, and saw his territories laid waste by contending armies. The Peace of Aix-la-Chapelle compensated him by the addition of several important districts, and his own enlightened administration added greatly to the internal resources of his kingdom. He was succeeded in 1773 by his son Victor Amadeus III., who reigned till the French Revolution broke out; and was succeeded in 1796 by his son Emmanuel IV., who, after seeing his continental dominions overrun by the armies of the French, took refuge in the Island of Sardinia in 1799, and three years after abdicated in favor of his brother Victor Emmanuel, who remained in Sardinia till 1814, when he again fixed the seat of government at Turin. Shortly after the Congress of Vienna

added Genoa to his territories. An insurrection led to his abdication in 1821 in favor of his brother, Charles Felix, whose reign of 10 years was marked by some important internal improvements. Having left no male issue, a collateral branch succeeded in the person of Charles Albert, who promulgated the liberal constitution of 1848, the provisions of which are referred to above. The same year saw him at the head of a league intended to expel the Austrians from Italy. The disastrous results led to his abdication in March 1849, in favor of his son Victor Emmanuel II., and very probably to his death in the following July. Under the government of Victor Emmanuel the cause of progress and liberal institutions steadily advanced, some of the more important of the reforming measures being the establishment of universal toleration in religious matters, the suppression, with a few exceptions, of the monastic houses, and an unfettered freedom accorded to the press in the discussion of political matters. Such a development of liberal principles naturally proved extremely distasteful to Austria, whose arbitrary sway, exercised over the adjoining kingdoms of Lombardy and Venice, presented so marked and glaring a contrast. Frequent aggressive attempts were made by her, and pretexes sought for provoking hostilities with Sardinia; but the flame only burst out finally in 1859, when, in the month of April of that year, the Sardinian territories were invaded by an Austrian army. The war which then ensued ultimately issued in the establishment of the present kingdom of Italy, into which the Sardinian states have all been incorporated, with the exception of the duchy of Savoy and county of Nice, which King Victor Emmanuel was obliged, as before mentioned, to cede to France. See ITALY.

Sardis, sār'dīs, Asia Minor, the capital of ancient Lydia, stood at the foot of Mount Tmolus (5,906 feet high), $2\frac{1}{2}$ miles south of Hermus. It was traversed by the Pactolus, which flowed through its market-place. To-day, nothing remains at its site (Sart) but a village and some ancient mounds. It was once a wealthy mart, the luxurious capital of the proverbially rich Cræsus, and carried on an enormous trade between the highlands and the coast. Its principal manufactures were woolen goods and carpets. Its strong citadel was destroyed by the Cimmerian Gauls in the 7th century B.C., by the Athenians in the 6th; by Antiochus the Great, 215 B.C., and by Timur in 1402. An earthquake overturned it in the reign of Tiberius. Xerxes and Cyrus the Great resided here before entering upon their great expeditions. The ancient cemetery is of vast extent, and there are interesting remains of the tomb of Alyattes and of the temple of Cybele.

Sar'donyx, a variety of the mineral quartz, in which layers of sard (q.v.), each of even thickness, alternate with layers of white chalcedony. It was highly prized by the ancients for cameos, intaglios, seal rings and engraved gems.

Sardou, sār-doo, **Victorien**, French dramatist: b. Paris 7 Sept. 1831. He studied medicine and was for a time a tutor of philosophy, mathematics, and history, but soon began his literary career by writing for reviews and encyclopædias.

His first play, '*La Taverne des Etudiants*' (1854) failed at the Odéon in 1854, and for a time he abandoned the theatre. But ere long he was dramatizing again, and he won a popular success in almost every field of the drama save tragedy. In the long list of titles are: '*Les Pattes de Mouche*' (1869); '*Les Prés Saint-Gervais*' (1862); '*Nos Intimes*' (1862); '*Les Vieux Garçons*' (1865); '*Séraphine*' (1868); '*Patrie*' (1869); '*Le Roi Carotte*' (1872), an *opéra bouffe*, set by Offenbach; '*Rabagas*' (1872); '*L'Oncle Sam*' (1873); '*Ferreol*' (1875); '*Dora*' (1877); '*Les Bourgeois de Pont-d'Arcy*' (1878); '*Daniel Rochat*' (1880); '*Divorçons*' (1880); '*Odette*' (1881); '*Fédora*' (1882); '*Théodora*' (1884); '*La Tosca*' (1887); '*Cléopâtre*' (1889); the series on the French Revolution, '*Les Merveilleuses*,' '*Thermidor*' (1891), and '*Robespierre*,' the last written for Sir Henry Irving and not yet (1904) seen in France; '*Madame Sans-Gêne*' (1893); '*Gismonda*' (1894); '*Marcelle*' (1896); '*Spiritisme*' (1897); and '*Paméla. Marchande de Frivolités*' (1898). Several of these from '*Fédora*' onward, were specially written for Sarah Bernhardt (q.v.). In his comedy, Sardou reveals rapid movement, witty dialogue, frequently clever satire on contemporary matters, unconvincing character portraiture, loose construction and improbable episodes. His "historical" dramas aim at the heroic, but are simply grandiose, their connection with authentic history is generally tenuous, their interest largely one of empty mechanical display. The last specimen, '*Dante*,' presented in the United States by Irving in 1903-4, suffered from a lack of coherence. Sardou's dramaturgic skill is great, but his works have no literary value. Consult: Montegut in the '*Revue des Deux Mondes*' (1877); Matthews, '*French Dramatists*' (1888); Sarrazin, '*Das moderne Drama der Franzosen*' (1888); Doumic, '*Ecrivains d'aujourd'hui*' (1895).

Sargassum, the most highly organized genus of the marine algæ, *Fucacæ*, or rock weeds. They are seaweeds which are either attached to stones by a discoid hold-fast or are floating, with long filiform stems, much branched, and bearing long, narrow, leaf-like fronds with distinct midribs. The air-bladders are little, stalked globes, with slender projecting tips, and stand out from the axils of the fronds, like solitary grapes. It is to this characteristic that the generic name remotely refers, and which has given rise to the common names, tropical grapes and grape-weed. Sargasso stems are much employed in South America under the name of goitre-sticks, for the cure of goitre. *Sargassum bacciferum* is the famous gulf-weed, which forms rafts or islands floating together on vast areas of the various oceans, and called "sargasso seas." The one lying in the North Atlantic Ocean, between the Azores and the Antilles, its exact position being determined by the central whirl of the Gulf Stream, is so dense as to be often a hindrance to navigation. It covers a territory nearly equal to the European continent, and was discovered by Columbus on his first voyage, he and the succeeding Spanish navigators calling it the Mar de Sargazo; it is connected by a narrow belt with a smaller sea between the Bermudas and the Bahamas. There is still an-

SARGENT

other sea in the Pacific, and one in the Antarctic Ocean. It is a disputed question whether the weeds have been torn from the shore and blown to their final resting place, or whether they live and propagate themselves on the high seas. At any rate these floating islands furnish a permanent home to many small pelagic animals, and of predaceous animals seeking them as food.

Sargent, sār'jēnt, Aaron Augustus, American diplomat: b. Newburyport, Mass., 28 Sept. 1827; d. San Francisco, Cal., 14 Aug. 1887. He was a journalist at Washington in 1847, removed to California and engaged in mining in 1849, and subsequently established the 'Nevada Journal.' While editing this paper he studied law, was admitted to the bar in 1854, and elected district attorney of Nevada in 1856. In 1860-72 was a member of Congress, sat in the United States Senate from 1872-9 and in 1882 was appointed minister to Germany. He resigned in 1884 owing to controversies arising from the action of the German authorities in excluding American pork, and later declined the mission to Russia offered him by President Arthur.

Sargent, Charles Sprague, American arboriculturist: b. Boston, Mass., 24 April 1841. He was graduated from Harvard in 1862 and served in the Civil War in 1862-5, gaining rank as brevet major. In 1873 he was appointed director of the Arnold Arboretum at Harvard and since 1879 has been professor of arboriculture there. He edited 'Garden and Forest' (1887-97), and has published: 'Catalogue of the Forest Trees of North America' (1880); 'Report on the Forests of North America' (1884); 'The Forest Flora of Japan' (1894); 'Silva of North America' (1891-1902); 'Manual of the Trees of North America' (1905).

Sargent, Dudley Allen, American physical instructor: b. Belfast, Maine, 28 Sept. 1849. He was graduated at Bowdoin College in 1875, and has been for many years physical director at Hemenway gymnasium, Harvard University, and at the Normal School of Physical Training, Cambridge, Mass. He is the inventor of a modern system of gymnasium apparatus and has published 'Universal Test for Strength, Speed and Endurance' (1902). He is president of the American Association for the Promotion of Physical Education.

Sargent, Epes, American poet and dramatist: b. Gloucester, Mass., 27 Sept. 1813; d. Boston, Mass., 31 Dec. 1880. He was educated at Harvard, was for a time connected with newspapers in Boston and New York, and in 1836 began writing for the stage. His plays include the 'Bride of Genoa'; 'Change makes Change'; 'Velasco'; and 'The Priestess.' He published: 'Songs of the Sea' (1847); 'Poems' (1858); 'The Woman who Dared' (1869); his most noted lyric being 'A Life on the Ocean Wave.' His novels include: 'Wealth and Worth' (1840); 'What's to be Done' (1841); 'Fleetwood' (1845); 'Peculiar: A Tale of the Great Transition' (1863). Still other works are 'Life of Henry Clay' (1843); 'American Adventure by Land and Sea' (1847); 'The Critic Criticised' (1856); 'Arctic Adventures by Sea and Land' (1857); 'Original Dialogues' (1861); 'Cyclopædia of English and American Poetry' (1883).

Sargent, Henry, American artist and soldier: b. Gloucester, Mass., 25 Nov. 1770; d. Boston, Mass., 21 Feb. 1845. He studied art in England in 1793-7. In 1799 he entered the United States army, was aide-de-camp to the governor of Massachusetts with rank as colonel in the War of 1812, and later adjutant-general. He served two terms in the legislature and afterward resumed his profession. His first painting, 'The Landing of the Pilgrims,' was ruined by being rolled on a pole of fresh pine, but the work of the same name at Pilgrim Hall, Plymouth, Mass., is said to be a reproduction of the destroyed work. His other paintings include: 'Christ Entering into Jerusalem'; 'The Starved Apothecary'; 'The Tailor's News'; 'The Dinner Party'; a full length portrait of Peter Faneuil at Faneuil Hall, Boston; etc.

Sargent, Herbert Howland, American soldier and military historian: b. Carlinville, Ill., 29 Sept. 1858. He was graduated from West Point in 1883 and assigned to frontier duty. He was professor of military science at the University of Illinois in 1886-7, and at the outbreak of the Spanish-American war was on duty at Washington, organizing volunteer troops, but was shortly afterward ordered to Santiago, Cuba. In 1899 he was sent to Guantanamo and returning to the United States in that year, was subsequently appointed lieutenant-colonel and assigned to duty in the Philippines. He was engaged in subduing the insurgents in the Island of Luzon, took part in the battle of San Mateo, returned to the United States in 1902, and received rank as captain. He has written: 'Napoleon Bonaparte's First Campaign' (1893); 'The Campaign of Marengo' (1897); etc.

Sargent, James, American inventor: b. Chester, Vt., 5 Dec. 1824. He was partner in the Yale and Greenleaf Lock Company in 1857-65, and in the latter year invented a burglar-proof lock. He invented the Sargent time lock in 1873, the automatic semaphore railroad signals, the glass enameled steel tanks and vacuum pumps used by the Pfaudler Vacuum Fermentation Company, and an automatic smoke consumer, in addition to numerous improvements in locks.

Sargent, John Singer, American painter: b. of American parents, Florence, Italy. 1856. He was educated in Italy, France, and Germany, and received his early art training under Carolus Duran. He was elected member of the Royal Academy of England in 1891 and of the National Academy of Design, New York, in 1897. He has lived abroad all his life and has never spent more than a year in the country of his parents. Having had the advantage of being chosen by Carolus Duran as an assistant in the execution of important government commissions, he thoroughly mastered the secrets of French technique before adopting a method and style which are purely his own. His chief works are in portrait and genre. Among his portraits may be mentioned that of 'Carolus Duran'; 'General Leonard Wood'; 'Mr. Joseph Jefferson'; 'Major Francis Lee Higginson'; 'Homer Saint Gaudens'; 'President Roosevelt'; 'Henry G. Marquand'; 'William M. Chase'; 'Carmen-

cita); 'Ada Rehan.' His genres include: 'Fishing for Oysters at Cancale'; 'Neapolitan Children Bathing'; 'El Jaleo.' His most ambitious and original works, however, are the decorations in the Boston Library, which include the now famous 'Frieze of the Prophets.' As a painter his manner is French in brilliant versatility and epigram, but his treatment infinitely superior to the millinery effects of Duran and his school. His portraits reflect clearly the characteristics of his sitter and his intuition is so unerring in detecting the subtlest traits of individuality, that it has been said of one of his great portraits, "It is more like Chase than Chase himself." As a specimen of his wall-painting we may cite that portion of the Boston Library decorations known as the 'Dogma of the Redemption.' It is divided into an upper and a lower panel which would seem to represent Heaven and Earth severally. In the upper panel are the three persons of the Trinity enthroned, with hands raised in blessing, the Father wearing the triple crown, or tiara; each enrobed in a flowing, cope-like garment. In the centre of this picture is set up the cross on which Christ is suffering, while Adam and Eve catch in chalices of gold the blood that drips from his hands. Below the foot of the cross is the pelican, symbol of self-sacrificing love. Above the arms of the cross runs the inscription *Remissa sunt peccata mundi* ("The sins of the world have been remitted"). Across the molding which separates the two divisions of the subject is a monkish distich

Factus homo factor hominis, factique redemptor,
Redimo, corporeus corpora, corda deus.

(I, man's maker, now made man, and redeemer of him
I made,
God in flesh, redeem all human hearts and bodies.)

In the lower panel are angels bearing the instruments of the passion, namely, the reed, the nails, the spear, the pillar of scourging, and the scourge, the crown of thorns, and the ladder. The work has all the pomp and dignity of Byzantine conventionalism, and for richness of color, and splendor of arrangement is one of the most impressive of this magnificent series. It is deeply devotional in tone and must be looked upon as among the finest Christian painting of the period.

Sargon, sār'gôn, a king of Assyria, successor of Shalmaneser, reigned from 722 to 705 B.C. See ASSYRIA.

Sark, sār'k, the "Pearl of the Channel Islands" (q.v.), situated seven miles east of Guernsey and 13 miles northwest of Jersey, is about $3\frac{1}{2}$ miles in length and $1\frac{1}{2}$ in extreme breadth. It is surrounded by inaccessible rocks, the chief landing-place Creux (hole) Harbor being on the east coast, where a cave has been enlarged and tunneled through the cliff to give access to the interior. The island consists of two portions, Great Sark and Little Sark, connected by a high and rocky isthmus, called the Coupée, narrowing to the width of only a few feet. On the west is the small islet of Brecqhou. Sark is annually visited by several thousand tourists owing to its interesting and picturesque scenery and numerous romantic caves. The inhabitants are chiefly engaged in fishing and agriculture. Sark is administered as a dependency of Guernsey. Pop. (1901) 500.

Sarmatia, sār-mā'shī-a, a name given by the Romans to the country between the Vistula and the Caspian Sea, and corresponding largely to central and southern Russia. The inhabitants were known to the Greeks as Sauromatæ, and to the Romans as Sarmatæ. See SARMATIAN.

Sarma'dian, the name of a people inhabiting the region known as Sarmatia, who were persistent enemies of the Romans. The Sarmatians were of Aryan origin, excellent horsemen and fierce fighters. The modern Russians are probably descended in part from Sarmatians who remained in their native land, and did not fall victims therefore to Roman or Goth.

Sarmiento, Domingo Faustino, Argentine statesman; b. San Juan, Argentina, 15 Feb. 1811; d. Asunción, Paraguay, 11 Sept. 1888. In 1829 he fought in the insurrection against Rosas and was obliged to flee to Chile, but returned in 1836. He was again obliged to leave the country, and going a second time to Chile he established a normal school at Copiapo. He traveled in the United States and Europe 1845-7 studying modern educational systems. Returning to Argentina in 1851 he helped overthrow Rosas and in 1856 organized a department of public education of which he was the head. He was minister to the United States 1861-8, and president of Argentina 1868-74, giving the country one of the most successful and progressive administrations it ever had. Sarmiento established schools and colleges throughout Argentina and founded a national observatory. He was the author of 'Popular Education' (1848); 'Vida de Abrahán Lincoln' (1866); 'Life of Quiroga'; 'Civilización y barbarie'; 'Las escuelas, base de la prosperidad en los Estados Unidos' (1868). See ARGENTINA.

Sarmiento Gamboa, sār-mē-ën'tō gām-bō'ā, **Pedro de**, Spanish mariner: b. Galicia, Spain, about 1530; d. there about 1590. He was in command of the naval station in the Pacific in 1578 and in 1579 was ordered by the viceroy to take possession of the Straits of Magellan for the purpose of intercepting Drake, then engaged his depredations off the coasts of Peru and Mexico. Drake evaded him, returning by way of the Cape of Good Hope, and after waiting for several months he explored the coast and returned to Spain in 1580. In 1581 he was sent by Philip II., with a fleet of 24 vessels to fortify the Straits, holding joint command of the expedition with Diego Flores. The latter became jealous of Sarmiento and deserted him, taking 12 vessels which left Sarmiento with but four, eight having been previously destroyed in a storm. In 1583 he founded San Felipe (Port Famine), garrisoned it with 300 men and in 1584 sailed for Europe, but was captured by the English and imprisoned until 1588. His colony lost all but two of its members by starvation, one being rescued by Cavendish in 1587 and another by Meriche in 1589. After his liberation he endeavored to secure redress for his treatment by Flores, but his complaint was neglected and he died in poverty.

Sarnia, sār'nī-a, Canada, town, port of entry, and county-seat of Lambton County, Ontario; on the River St. Clair, near Lake Huron, and on the Grand Trunk and Lake Erie & Detroit River railways; opposite Port Huron, Mich.

with which it is connected by ferry, and by the famous Saint Clair tunnel, $2\frac{1}{4}$ miles long, built and operated by the Grand Trunk Railway. Sarnia has a good trade in grain and live-stock, and oil and salt refineries, tanneries, breweries, foundries and machine shops, flour and saw mills, and manufactories of carriages, agricultural implements, woolens, wooden-ware, etc. It is lighted by gas and electricity, and has a good water system. Pop. (1901) 8,176.

Saron'ic Gulf (SINUS SARONICUS), Greece, the ancient name of the Gulf of Ægina. See ÆGINA.

Saros, sār'ōs, in astronomy, an ancient Assyrian period, the origin and exact length of which are unknown, though they have been the subject of much disputation. By some authors the saros has been confounded with the Metonic cycle.

Sarpedon, sār-pē'dōn, one of the heroes of the Iliad, slain by Patroclus at the siege of Troy. His grandfather of the same name is represented in Grecian mythology as the son of Zeus and Europa, who founded a kingdom in Lycia.

Sarpi, sār'pē, **Paolo**, Italian historian: b. Venice 14 Aug. 1552; d. 14 Jan. 1622. He entered young into the religious order of the Servites, and was appointed chaplain to the grand duke of Mantua, and lecturer on the canon law. After two years he returned to Venice, and became provincial of his order (1578). He was afterward made Procurator-general of the Servites (1585). His leanings toward Protestantism and his intercourse with Protestant leaders brought on him the imputation of favoring heresy, if not of being a heretic. In a dispute between the Pope and the Venetian government on the subject of ecclesiastical matters Father Paul showed himself a strenuous advocate of Venice, and was summoned to Rome, to answer for his conduct; but the affair was compromised. His political enemies attempted to assassinate him in 1607, on which occasion he received many dangerous wounds. Father Paul employed the latter part of his life in writing the history of the Council of Trent, a work which has proved of little historical value and is now accounted to be untrustworthy on account of its extreme and evident partisanship. His labors extended to diverse branches of knowledge; he was skilled in the canon law, and was also distinguished for his acquaintance with anatomy. He appears to have discovered the valves of the veins which facilitate the circulation of the blood. His 'Istoria del Concilio Tridentino' was first published in London in 1619, having been transmitted to this country through the medium of the British resident at Venice, Sir Henry Wotton, a personal friend of the author. This work is strongly anti-papal, nay, even rationalistic in tone, and was answered by a voluminous work on the same subject by the Jesuit Pallavicino. The works of Father Paul were printed at Verona 1761 (8 vols. 4to), and at Naples, 1790 (24 vols. 8vo). His life has been written in Italian by Bianchi-Giovini (1836); and in English by A. Robertson (1894). Consult also 'Atlantic

Monthly' (Jan. and Feb. 1904); T. A. Trollope, 'Paul the Pope and Paul the Friar' (1860).

Sarracenia, sār-a-sē'nī-ā, a genus of carnivorous plants, of about eight species growing in bogs in eastern North America, and named in honor of Dr. J. A. Sarracin. They have peculiar large nodding flowers solitary on their scapes. The 5 sepals are bracted at the base, and the 5 fiddle-shaped petals are purple, brown or yellow, and hang about a style which is dilated at the apex until it resembles an inverted umbrella, with five rays, terminating in hooked stigmas under the angles. The anthers are grouped about the base of the styles. The 3 to 5 celled ovary becomes a colored capsule in fruit. Just why these flowers should have given the name "side-saddle flower" to the plant no one seems to know, although they do resemble a pillion. The origin of the other vernacular names — pitcher plant, trumpet leaf, or huntsman's horn, is very evident, for the leaves are hollow and with a lid more or less erect.

These leaves are dispersed in rosettes and are very curiously adapted, in the several species, for entrapping and digesting insects. The most common species is *Sarracenia purpurea*, which has tubular leaves, inflated at the middle and contracted at the orifice, where a heart-shaped wing, curved somewhat like a scoop, joins the hollow leaf. Another ribbon-like wing, starting from the base of the leaf, extends along the concave surface of the tube to the orifice. The whole pitcher-like leaf is green, veined with reddish purple. The scoop-like wing at the summit of the leaf catches rain-water and deflects it into the pitcher, which is often half-filled. The inside of the scoop is lined with glandular hairs which secrete honey, and the whole inner surface of the pitcher is lined with stiff spinous bristles, slippery and pointing downward, and the nearer the base the longer the points become. The reason for this apparatus appears when insects are attracted to the *Sarracenia* by the honey secreted in the hood-like wing. Some fly to it, some crawl up from the ground, helping themselves to climb by the longitudinal wing. Once there they feed on the honey, but if they carelessly stray from the wing to the orifice, where the slippery bristles begin, they promptly fall into the water collected in the pitcher. In spite of their struggles they can never crawl up past the relentless chevaux-de-frise of glassy, down-pointed teeth, and ultimately drown in the liquid. So many sometimes meet this tragic death that the putrid odor arising from the pitcher is offensive. Just what happens to the decaying bodies does not seem to be certain. Other carnivorous plants digest their victims with acid secretions and pepsin, and insects seem to be macerated in the *Sarracenia purpurea* pitchers more quickly than by ordinary rain-water, yet it is believed that the plants profit mainly by the liquid manure obtained. Consult Darwin, 'Insectivorous Plants' (London 1875).

Sar'saparill'a, an alterative drug obtained from the roots of the genus *Smilax*, indigenous to Central and South America. The drug yielding species of this genus of the *Liliiflorae*, to which the American cat-briers belong, are not very exactly identified, although sarsaparilla has been known to Europeans since 1536-45, and was extensively used soon afterward. *Smilax of-*

fecinalis, *S. medica*, and *S. papyracea*, are believed to be the principal sources of supply of sarsaparilla. They are tough twining shrubs with square or round prickly stems, small flowers and generally shining leaves. Sarsaparilla plants were somewhat cultivated in Jamaica, but are chiefly obtained by trade with the aborigines of the countries where they grow. The drug itself is extracted from the horizontally creeping roots of the *Smilax*, which radiate from the stems, and are so long that it takes an Indian many hours to disentangle them from the soil and other roots. They are then dried and wrapped up for transportation. The form of the original package in which the roots reach the pharmacist, is an indication of the market from which it is sent, and the country from which it is exported furnishes the commercial name of the drug. Thus, Rio Negro, otherwise known as Para or Lisbon sarsaparilla, is always exported in cylindrical bundles, about 3½ feet long and 5 or 6 inches in diameter, composed of finely wrinkled roots, brown with adhering earth, cut square and even at both ends, and wound closely with the stems of Pothos. Jamaica sarsaparilla (a name which formerly included many other varieties, now differentiated) is sent out loosely. Sarsaparillas are classed as mealy or non-mealy sarsaparillas, according to the amount of starch granules in the parenchyma, a condition which seems to depend upon locality, and they differ in the color of their barks, and in microscopical characters.

Several plants are used as substitutes for true sarsaparilla. The aromatic roots of *Aralia nudicaulis* and *A. hispida*, furnish respectively the wild and bristly sarsaparilla, in America (see *ARALIA*). Texas sarsaparilla comes from the roots of *Menispermum canadense*. Australia has its spurious sarsaparilla in the spindle-shaped root of *Hardenbergia*. Indian sarsaparilla is derived from *Hemidesmus indicus*; German sarsaparilla is the roots of various species of *Carex*, while the Italian drug of that name is the root of *Smilax aspera*.

Sarsfield, Patrick, EARL OF LUCAN, Irish Jacobite: b. Ireland about 1645; d. Netherlands August 1693. He became a colonel in the Irish army in 1686 and was a strong supporter of the cause of James II. in Ireland, by whom he was created Earl of Lucan. He drove the English out of Sligo, fought at every important engagement of the war, and had charge of the defense of Limerick. When that city capitulated in 1691, he crossed over to France where James gave him command of the Irish troops in the intended invasion of England the following year. After the battle of La Hogue, 19 May 1691, he tendered his services to France, fought at Steenkirk on 3 Aug. 1692, and was mortally wounded at Neerwinden in the battle of Landen 19 August.

Sarsi (sär'sē) **Indians**. Also Sarcee, Sarsee, Sussee, etc., from a Blackfoot word said to signify "not good." Their own name is Sotemia. A tribe of the Montagnais division of the Athapascan stock of North American Indians who formerly subsisted mainly by hunting, fur-trading, but who now gain a livelihood by farming, stock-raising, and haying and as laborers. They are under the Sarcee agency at Calgary, N. W. T., Canada, where they numbered 203 in 1902.

Sartain, sär'tān', **Emily**, American artist: b. Philadelphia 17 March 1841. She is the daughter of John Sartain (q.v.), under whom she studied and worked at engraving, afterward studying (1864-70) at the Pennsylvania Academy of Fine Arts, then in Italy, and still later (1871-5), under Luminais, in Paris. She excels in mezzotint engraving, in etching, and in portrait-painting; has accomplished much in book-illustration and the etching of framing prints; and in genre work has also distinguished herself. She received a medal at the Centennial Exhibition in 1876, and the Mary Smith prize at the Pennsylvania Academy in 1881 and 1883. In 1875 and 1883 she exhibited oil paintings at the Paris Salon. From 1881 to 1883 she was an editor of 'Our Continent.' In 1900 she went to Paris as official delegate from the United States government to the International Congress on Instruction in Drawing.

Sartain, John, English-American engraver and editor: b. London 24 Oct. 1808; d. Philadelphia 25 Oct. 1897. Before reaching his majority he did notable work, having studied line engraving under John Swain; and his illustrations for Ottley's books on early Italian prints (1826) gave promise of his future achievements. He came to the United States in 1830, settled in Philadelphia, and introduced in this country mezzotint, which he had begun two years earlier to practise. Entering actively into his work here, he added to engraving miniature-painting on vellum and ivory, and portrait-painting in oil. He was the designer of several public monuments, of which the best known is that to Washington and Lafayette in Philadelphia. He was also editor of the 'Foreign Semi-monthly Magazine,' and of the 'Union Magazine,' which he renamed 'Sartain's Union Magazine.' Among his more important engravings are 'Christ Rejected' (1862), after Benjamin West; 'The Ironworker and King Solomon' (1876), after Christian Schuessele; and the 'Battle of Gettysburg,' after Rothermel. He engraved many other historical paintings, and also portraits of famous Americans, after well-known artists. By his long and varied career of productive work, his services as chief administrator of fine arts at the Centennial Exhibition in 1876, and through the many positions which he held in connection with prominent societies and institutions, he accomplished results of great importance in the development of art, particularly the art of his adopted country. He wrote 'Reminiscences of a Very Old Man' (1899).

Sartain, William, American landscape and genre painter: b. Philadelphia 21 Nov. 1843. He is the son of John Sartain (q.v.), and until 1867 worked under his father; then for two years under Schuessele and at the Pennsylvania Academy of Fine Arts. He next went to Paris, where he continued his studies under Yvon and Bonnat and at the Ecole des Beaux-Arts. In 1875, having sketched in many countries, he exhibited at the Royal Academy, London. Returning to the United States in 1876, he exhibited at the National Academy, of which, four years later, he became an associate. He is one of the original members of the Society of American Artists, and is professor of the Life Class of the Art Students' League, New York. His oil-paintings include an 'Italian Head' (1876); 'Narcissus'

SARTI—SASKATCHEWAN

(1878); and 'Lucia, near Algiers.' Among his works in water-color are an 'Arab Café' (1880); 'View of the Ghetto, Venice'; 'End of the Day'; and 'In the Hackensack Valley.'

Sarti, Giuseppe, joo-sěp'pě sār'tē, Italian composer: b. Faenza 1 Dec. 1729; d. Berlin 28 July 1802. He studied under Padre Martini at Bologna. In 1751 his first opera, 'Pompea in Armenia,' was put upon the stage at Faenza and was well received. Other operas soon followed, and the young composer was invited in 1753 to Copenhagen, where he was appointed court chapel-master. Returning to Italy in 1775 he was nominated director of the Conservatory dell' Oppedaletto, and in 1779 chapel-master of the Milan Cathedral. In 1784 he was invited by the Empress Catharine to Saint Petersburg, and appointed her chapel-master. At the command of the empress he founded a musical conservatory at Ekaterinoslav, and for his services was raised to the highest rank of nobility. He wrote about 30 operas in all. A sacred terzetto, 'Amplius Lava Me,' is still performed. Sarti was the musical instructor of Cherubini.

Sarto, Andrea Del, än-drä'ä dēl sār'tō, Italian painter: b. Florence 17 July 1486; d. there 22 Jan. 1531. His real name was Andrea Angeli, the name del Sarto (of the Tailor) having been applied to him from the occupation of his father, Angelo di Francesco. His teachers were Piero di Cosimo and Franciabigio, but he cultivated his talents principally by the study of great masters, such as Leonardo da Vinci, Fra Bartolommeo and Michelangelo. He painted many pieces for his native city. Francis I. induced him by a considerable salary to go to France in 1518. He soon returned, with a commission from the king to purchase ancient and modern works of art. Among other works he painted about this time the 'Sacrifice of Abraham,' which has since been placed in the gallery of Dresden, a replica being in the Prado at Madrid; 'A Burial, in the Pitti Palace,' and 'The Dead Saviour with Mary and the Saints,' in the gallery of the grand duke; also a beautiful 'Madonna,' in the church of l'Annunziata, called 'Madonna del Sacco,' and several others in Florence; a 'Charity,' now in Basel; 'Tobias with the Angel,' and several 'Holy Families'; the 'History of Joseph,' in two paintings, in the Paris Museum. His coloring both in fresco and oil is full of sweetness and force; his draperies are easy and graceful. The nude, in his compositions, is excellently designed, but his figures want that force and vivacity which animate the works of other great painters, though they possess correctness, truth, and simplicity.

Sarto, Giuseppe. See PIUS X.

Sartor Resartus, sār'tōr rē-sār'tūs, a noted satirical work by Thomas Carlyle, which first appeared in 'Fraser's Magazine' in 1833-4, and in book form in 1835. It is divided into three parts, — introductory, biographical, and philosophical.

Sarto'ris, Adelaide Kemble, English opera singer, daughter of Charles Kemble (q.v.): b. London 1814; d. 4 Aug. 1879. Her operatic success began in 1839 at Venice where she appeared as Norma. She subsequently sang in many cities, but in 1843 left the stage and was married to F. U. Sartoris. Their son (A. C. Sartoris) married the daughter of President Grant

in 1874. Mrs. Sartoris published 'A Week in a French Country House' (1867); a delightful volume, reissued in 1903; 'Medusa, and Other Tales' (1868); 'Past Hours' (1880).

Sarto'rius, the tailor's muscle (from the Latin *sartor*, a patcher, tailor), a muscle of the thigh which is attached at one end to the edge of the anterior, superior, spinous process of the ilium or chief bone of the pelvis, and at the other to the superior, anterior, and internal part of the tibia. It takes its name from the fact that it is by the contraction of the two sartorius muscles that the legs are crossed in sitting in the manner of tailors. See ANATOMY.

Sarts, a name given to the settled inhabitants, whether agriculturists or traders, as distinguished from the nomad inhabitants of Turkestan, Afghanistan, Persia, and the adjacent regions of Asia. Strictly speaking, the name has no ethnological significance.

Sarum, sā'rūm, Old, England, an ancient deserted city of Wiltshire, two miles north of Salisbury, or New Sarum, to which the inhabitants of Old Sarum removed after 1219 owing to an insufficient water supply. Notwithstanding its desertion, the old site retained its electoral rights to return two members to Parliament, until its disenfranchisement by the Reform Bill of 1832. It has passed into English literature as a type of the "rotten borough," acquired by purchase; its most distinguished representative was William Pitt, whose first appearance in Parliament was as member for Old Sarum.

Sarum Use, the revised liturgy prescribed for his diocese by Osmund, bishop of Sarum (the old name of Salisbury), 1078-99; and generally adopted throughout the province of Canterbury. The other English uses mentioned in Act of Uniformity were those of Lincoln, York, and Bangor.

Sas'in, an East Indian antelope.

Saskatchewan, sās-kach'ě-wan, Canada; (1) a river which has its sources in the Rocky Mountains near lon. 115° W. It is formed by the junction of two main branches, called respectively the North and South Saskatchewan, which flow generally east to their junction, about 25 miles east of Prince Albert. Thence the river takes a curve northeast and southeast, receives the Carrot River from the south, and passing through Cedar Lake empties into Lake Winnipeg, after a course of about 1,300 miles measuring along the South Branch, some 70 miles less than along the North Branch. It flows through a region yielding coal, salt, iron, gold, etc., and now attracting numerous settlers. From the South Branch of this great river northwest to Peace River the climate is adapted to the growth of wheat, and the valley of the river is said to be fitted to sustain as dense an agricultural population as any area of equal extent in the world. The main stream and its branches afford about 1,000 miles of navigable waterway, and steamers now ply on it. (2) A large and fertile province named after the river, in the Northwest Territories of Canada, bounded on the south by Assiniboia, east by Lake Winnipeg and Nelson River, north by the 55th parallel, and west by Alberta; area,

107,092 square miles; pop. (1891) 11,150; (1901) 25,679. On 1 Sept. 1905 the province of Assiniboia and the easterly portion of Athabasca were added to Saskatchewan to form the new province of Saskatchewan, thereby increasing the area about threefold and the population to about 100,000.

Sas'saby, or Bastard Hartbeest. See **HARTBEEST**.

Sas'sacus, Pequot Indian chief: b. near Groton, Conn., about 1560; d. Mohawk Settlement, N. Y., June 1637. He was a powerful chief, a great warrior, and was believed by his own and other tribes to possess supernatural powers. The Pequot tribe occupied a large tract of land in southeastern Connecticut and consisted of about 700 warriors who were the terror of the settlers along the New England coast. In 1637 he attacked the English fort at Saybrook, Conn., massacred its inhabitants, and then attacked Wethersfield, where he murdered several women and made captives of others. The colonists mustered their forces under the leadership of John Mason (q.v.) and destroyed the Pequot settlement, 5 June 1637. Sassacus took refuge with the Mohawks, who soon afterward murdered him.

Sas'safras, one of the most familiar, although not one of the largest, trees (*Sassafras sassafras*) in the eastern United States. Since it is readily propagated by seeds or by suckers which spring up from interminable slender rootstocks, and is apparently not liked by cattle, it is one of the first trees to re-forest pastures and fields that have the light, moist soil that it affects. It is a veritable pest to one trying to clear land, as the smallest piece of rootstock left in the soil seems to send up a vigorous sprout. Its long roots, however, make it a difficult tree to transplant, unless young. Near the Mississippi, the sassafras attains its greatest height (about 80 feet), and is stout, with horizontal rugged branches, so that the foliage has a stratified appearance, and a flattish top; it decreases in size as its northern limit is reached until it becomes only a tall shrub. The bark on old trees is very thick, and gray, with longitudinal scaly ridges; on the young twigs it is pale green, and easily slips off. The shining, bright-green leaves will range in shape, on one spray, from an oval to a three-lobed outline, the "mitten shape," with one lobe at the side of the leaf, being characteristic. The flowers appear before the leaves in late winter if sheltered, and are generally unisexual, male and female blooms being found on different trees. They dangle in tassel-like racemes and are honey-colored, and honey-scented, and thus attractive to bees. The staminate flowers are apetalous, with a six-lobed calyx, orange-stalked glands and nine stamens; the pistillate flowers have a similar perianth, a pale green ovary and style, and orange rudiments of stamens. The fruits are very brilliant, dark-blue, oblong, thin-fleshed berries, surrounded at their bases as the cup encloses the acorn, with a bright scarlet calyx-tube, borne on a thickened and elongated stalk. Unfortunately they are so soon taken by the birds that they are seldom seen, but the leaves assume tints in autumn which deepen from soft tones of yellow to dark red.

Sassafras is a member of the laurel family,

to which camphor also belongs, and the whole plant, from the roots with their scaly, orange-colored bark to the leaves, is aromatic. Thoreau says of it: "The green leaves bruised, have the fragrance of lemons and a thousand spices." There is a legend that sassafras odor was wafted to the nostrils of Columbus on his first voyage, and convinced him that land was near.

The roots of sassafras very early in American history became an important article of medicine, worth three shillings a pound, and they were one of the objects for which an English expedition landed in Massachusetts in 1602. It was also called "ague tree," as a decoction of its bark was supposed to cure that disease. In American household practice, sassafras tea, an infusion of the young shoots and roots, has long been a favorite remedy for colds and a tonic, being a sudorific and stimulant. It is also an ingredient of root-beer. The bark of twigs and the pith are rich in mucilage (as are the leaves), and make a lubricant for oculists, and a yellow powder to thicken Creole gumbos, much as okra is used. The oil of sassafras is used for a perfume for soaps, etc. The wood itself is orange-colored, with pale sap-wood, and when stripped of its bark resists decay for some time, while in contact with soil, so that it can be made into fence posts, although too brittle and coarse-grained for any other purpose.

Australian sassafras is the name given to several large evergreen trees with aromatic barks, growing in Australia and Tasmania, namely: *Atherosperma moschata*, *Doryphora sassafras*, and *Daphnandia micrantha*. Brazilian sassafras, or sassafras nut, is the picurim bean. Swamp sassafras is the *Magnolia glauca*.

HELEN INGERSOLL.

Sassanidæ, sās-ān'ī-dē, a dynasty of Persian kings which succeeded the dynasty of Arassidæ in 226 A.D. The founder of the line was Ardeshir, known to the Greeks as Artaxerxes; he was the grandson of Sassan, from which fact the dynasty is named. The Persian empire was much extended under this dynasty as the outcome of successful wars against the Roman and Byzantine emperors. The Zoroastrian religion was brought back and maintained. The dynasty lasted until the death of Yezdegerd III., in 1652. This king had been beaten by the caliph Omar in the battle of Nehavend, 10 years before, his territory having fallen into the hands of the Mohammedans. See **PERSIA**.

Sassari, sās'sā-rē, Italy, in Sardinia, (1) capital of the province of its own name, 12 miles southeast of its port, Porte Torres. It is situated on a height 650 feet above the sea, amid orange and olive groves. It is well built, and has several handsome palaces, churches, monasteries, nunneries, colleges, universities, an old citadel, a library, hospital, etc. Tobacco is the staple manufacture; trade is carried on in grain, oil, cheese, and goat-skins. Pop. (1901) 38,176. (2) The province occupying the north part of the island has an area of 4,122 square miles; pop. (1901) 308,206.

Sassoferato, Giovanni Battista Salvi, jō-vān'nē bāt-tēs'tā sāl'vē sās-sō-fā-rā'tō, Italian painter: b. Sassoferato, Ancona, Italy, 11 July 1605; d. Rome 18 April 1685. He learned the elements of his art from his father, and after-

ward went to Rome and Naples and studied under Raphael, Domenichino, Guido, and Albani. His paintings, whose subject is chiefly the 'Madonna and Child,' are filled with deep and true feeling and the coloring especially is elaborated with exquisite care, the principal scheme of his pictures including warm, luminous flesh tints, bright blue scarfs, and crimson robes, harmonized with inimitable skill. He has also executed some good portraits and landscapes; his pictures are still highly esteemed and in 1858 his 'Marriage of Saint Catharine' was sold for £1,076 sterling, about \$5,880.

Sas'solite, native boric acid, $B(OH)_3$, occurs in the lagoons of Tuscany and in other natural waters, from which it is derived on a large scale by evaporation. It is also found in small, pearly, white scales, and as an incrustation.

Sassulitch, säs-sool'ich (Sassoulitch, Zassulitch), Vera, Russian nihilist; b. Russia 1853. She was accused of complicity in a nihilist plot in 1869 and unjustly imprisoned for many years. In 1878, indignant at the treatment inflicted on a prisoner by the Saint Petersburg chief of police, Trepoff, she armed herself with a revolver and on 5 February coolly attempted his assassination. She was tried and acquitted in April 1878. The trial was afterward declared null and void, but she disappeared and has since lived in retirement in Switzerland.

Sastean (säs'tē-än) **Indians**. See SHASTA INDIANS.

Sátára, sä-tä'rä, or **Sattara**, India, in Bombay, (1) capital of the district of the same name, 56 miles south of Poona, crowns a small, steep, and rocky hill, just below a strong hill fort. It consists of one long street of uniform appearance, excepting the rajah's palace, which is of modern construction. The town was formerly the chief seat of the Mahrattas. Pop. 29,601. (2) The district covers an area of 4,987 square miles. Much of the territory is irrigated, and the chief crops are millet, pulse, oil-seeds, and sugarcane. The manufactures are cotton-cloth, blankets, and brass-ware. The Southern Mahratta Railway traverses the district from north to south. Pop. (1901) 1,146,521.

Sat'ellites, in astronomy, secondary planets or moons. One satellite has been observed with Neptune; four with Uranus; Saturn has eight, Jupiter five, Mars two, and the earth one. The rings of Saturn are composed of a great multitude of small satellites.

Satin, in textile manufacture, a closely-woven silk, with a glossy surface. In the manufacture of other silken stuffs each half of the warp is raised alternately; but in weaving satin the workman only raises the 5th, 8th, or 10th part of the warp; thus the weft is hidden beneath the warp, which, presenting an even, close, and smooth surface, is the more capable of reflecting the rays of light. In this way satin acquires that lustre and brilliancy which distinguish it from most other kinds of silks. The chief seats of this branch of manufacture are Lyons in France, and Genoa and Florence in Italy. From the East Indies are imported those light stuffs called Indian or Chinese satins.

They are either plain, damasked, striped, open-worked, or embroidered. See SILK.

Satin-bird, a kind of Australian bower-bird (*Ptilonorhynchus violaceus*). The adult male is conspicuous for the satin texture of its glossy black plumage. The younger bird is at first entirely of a dull green color, which gradually becomes mottled with black, and eventually changes entirely into that hue. Long before the construction of the nest, and quite independently of it, they, with consummate skill, weave an arbor-like gallery of uncertain length (see BOWER-BIRDS), in which they amuse themselves with the most active glee, the male displaying himself therein to attract the hen bird. The architecture of the bower is excessively tasteful, and scarcely a day passes without some fresh arrangement of the shells, feathers, bones, and other decorative materials, which they bring from long distances in the bush to ornament the bower and the platform on which it stands.

Satin-flower, or **Satin-pod**, a cruciferous plant of the genus *Lunaria*, native to Europe and Asia. One of the two species (*L. rediviva*) is perennial, the other (*L. annua*) is annual or biennial, and is called "honesty." Both are pubescent, branching herbs, with mostly cordate leaves, and are cultivated not only for their four-merous, large violet flowers in terminal racemes, but for the long-stalked pods, which are more than an inch long, very flat, and two-celled. The veined valves covering the seeds, which are long, stemmed, soon fall off with the seeds and leave only the partition wall between the cells. This is elliptic in shape, of parchment-like texture, and shining with a silvery gleam that makes the groups interesting for decoration, and they are much sold on Paris flower-stands for this purpose.

Satin Spar, a name given to the fibrous variety of either gypsum or calcite. These may be distinguished from each other by the effervescence of the calcite satin spar with acids and also by its superior hardness. The color is usually snowy white, sometimes flesh or salmon red. Owing to the fibrous structure, the mineral shows a beautiful satiny or pearly opalescence. It is rather extensively manufactured into cheap jewelry and ornaments. The best material for this purpose comes from England and is sold at many tourist resorts, notably Niagara Falls, near which place small quantities of inferior material occur native.

Satin-wood, the product, principally of the *Chloroxylon swietenia*, of India and Ceylon. This is a small tree with large panicles of whitish flowers and deciduous, long, pinnate leaves, and can furnish a log 3 to 6 inches square. The wood is very hard, close-grained, and durable, and light orange in color; it takes a fine polish and when of the feathered variety is very beautiful, but liable to split. In the 18th century this ornamental wood was much in demand for handsome furniture, with scroll work, and with medallions painted upon it. It is now principally used for cabinet-work, for picture-frames, the backs of brushes, and general turnery. Several other species of trees in the East and West Indies, especially the *Maba buxifolia* and *Xanthoxylum caribaum*, produce woods of similar appearance, quality, and name.

Satinet', an inferior fabric, woven much thinner than ordinary satin. The name is also given to a kind of cloth woven, with cotton warp and woolen weft, to imitate satin.

Satire, a kind of literary composition in verse or prose, in which wickedness or folly is censured and held up to reprobation: it is a word of Latin origin, and the ancient Roman poets were the inventors of the satire. From the time of Lucilius (d. 103 B.C.) till now, says Dryden, "the very name of satire is formidable to those persons who would appear to the world what they are not in themselves." Of the four princes of Roman satire—Lucilius, Horace, Persius, Juvenal—Persius (d. prematurely in the reign of Nero) is the least important. Juvenal (who appears to have produced satires in the reign of Domitian and who survived into the time of Hadrian, 117 A.D.) uses satire with consummate power and spirit, as an engine for attacking the brutalities of tyranny, and the crimes, the follies, and the frenzies of a degenerate society: he is confessedly the foremost satirist not only of ancient but of all times: great modern poets of all countries have translated or imitated the 16 satires of Juvenal; and he has been better translated into English than almost any other ancient poet. Horace (Augustan period) developed satire into a branch of composition peculiarly his own, and in this branch he is without a rival: he ridicules the follies of the world from the point of view of a man of the world; and though his morality does not rise above the level of a prudential moderation, he enforces it with so much dramatic liveliness and gay humor that he has ever been the favorite poet of men of letters and epigrammatists. A totally different form of satire is the mediæval 'Reynard the Fox,' the 'Owlglass' (*Eulenspiegel*), 'Piers Plowman'; followed in the Reformation epoch by Ulrich von Hutten's 'Epistolæ Obscurorum Virorum,' Erasmus' 'Praise of Folly,' Rabelais' 'Gargantua,' Buchanan's 'Franciscanus,' etc. In Spain, where no freedom of criticism existed, the spirit of satire took refuge in the picaresque novel, prototype of Lesage's 'Gil Blas'; Cervantes' 'Don Quixote,' too, might be classed as a satire were it not so much more. Most of the great dramatists of the 17th century were more or less satirists: among them Molière stands pre-eminent. Butler's 'Hudibras' is a model of unadulterated satire; and political satire is carried to perfection in Dryden's 'Absalom and Achitophel.' In France, Boileau was regarded as the modern Horace in satire and in the mock-heroic, but in both respects he was equalled or even surpassed by Pope. In Germany the most conspicuous satirists have been Hagedorn, Kästner, Wieland, Tieck, Goethe; in England in the 19th century the foremost are Byron, Hood, Hook, Jerrold, Thackeray, Carlyle; in the United States James Russell Lowell, through his 'Bigelow Papers,' holds rank among the foremost in political satire.

Satolli, sã-töl'lë, Francesco, Italian ecclesiastic: b. Merciano, Perugia, 21 July 1841. He became professor of dogmatic theology at Urban College of the Propaganda, Rome, and in 1888 was made archbishop of Lepanto. He was the papal representative at the celebration of the

centenary of the establishment of the see of Baltimore in 1889, and returned to the United States in October 1892 in the capacity of appellant judge with extraordinary discretion. His action in regard to several notable Church controversies raised up a party of opposition against some of his proposed measures in ecclesiastical affairs in America. In January of the next year an order came from Rome quelling the opposition and creating Mgr. Satolli permanent American apostolic delegate. He returned to Rome in 1896 and was elevated to the cardinalate.

Satow, sät'ō, SIR ERNEST MASON, British diplomatist b. 30 June 1843. He was educated at University College, London, was made barrister of Lincoln's Inn in 1887, became an interpreter (1865) in the Japanese consular service, and in 1884 was made British agent and consul-general at Bangkok. In 1885 he became minister-resident there, in 1888 at Montevideo, in 1893 envoy extraordinary and minister plenipotentiary to Morocco. In 1895 he was transferred to Tokyo, and in 1900 to Peking. He has edited several books dealing with Japan, prepared (with Ishibashi) an 'English-Japanese Dictionary' (1876), written various papers for the 'Transactions' of the Asiatic Society of Japan, and published: 'The Jesuit Mission Press in Japan' (1888), and 'Exercises in Colloquial Japanese.'

Satrap, sät'rāps or sät'rāps, the name given the governors of provinces in the ancient Persian empire. The power of the satrap, so long as he retained the favor of his sovereign, was absolute; he levied taxes at his pleasure and aped the capricious tyranny of his master unchecked. When the monarchy of Cyrus began to decline many of the satraps threw off their allegiance, and founded independent kingdoms of their own. The term satrap is sometimes used to signify a petty despot.

Satsuma (sät-soo'mä) Ware, a fine kind of pottery or semi-porcelain made in Japan, having a felspathic glaze of a light straw color, the surface of which is covered with a net-work of fine cracks. Red and green colors and dulled gold are employed for decorating the ware. Fine old Satsuma ware is highly esteemed by collectors. See ART; JAPAN; PORCELAIN; POTTERY.

Satterlee, sät'tër-lë, Henry Yates, American Protestant Episcopal bishop: b. New York 11 Jan. 1843. He was graduated from Columbia in 1863, ordained in the priesthood in 1867, was assistant rector at Zion Church, Wappinger's Falls, 1865-75, and rector there 1875-82. From 1882-96 he was rector of Calvary Church, New York, and since then has been bishop of Washington. He was elected bishop coadjutor of Ohio in 1887 and bishop of Michigan in 1899, but declined both positions. His publications include: 'Christ and His Church'; 'New Testament Churchmanship'; 'The Calling of a Christian'; etc.

Satterlee, Walter, American artist: b. Brooklyn, N. Y., 18 Jan. 1844. He was graduated from Columbia College and entered the National Academy of Design. Later he studied with Edwin White in New York and with Léon Bonnat at Paris. He is known as an illustrator and painter in genre. He first exhibited at the

National Academy in 1868. Ten years later he became a member, and in 1886 won the Clarke prize. In 1873 he became a member of the American Society of Painters in Water Colors, and he has divided his attention between work in that medium and in oils. His more noteworthy pictures are 'Contemplation'; 'His Eminence the Cardinal'; 'The Peacemaker'; 'Marguerite'; and 'Love Making in Capri.'

Sattler, Samuel Philip, American chemist: b. Pine Grove, Pa., 18 July 1847. He was graduated from Pennsylvania College in 1867, from the Lawrence Scientific School in 1870, afterward studying at the University of Göttingen. He was professor of natural science at Pennsylvania College in 1871-4, occupied the chair of chemistry at the University of Pennsylvania in 1874-91, and has held that chair at the Philadelphia College of Pharmacy since 1878. He has a high reputation as consulting chemical expert, and has published: 'Hand-book of Chemical Experimentation for Lectures' (1876); 'Text-book of Pharmaceutical Chemistry,' with Coblentz (1895); etc.

Saturation, in meteorology. A space is said to be "saturated" with aqueous vapor when its condition is such that the temperature cannot be reduced by the smallest amount without the production of condensation. In meteorology we have to deal mainly with spaces that are filled with ordinary atmospheric air; and hence the phenomena which relate to atmospheric saturation are those which are of the greatest practical importance. The quantity of moisture that is required to saturate a given mass of air is independent of the pressure of the air, but it depends very largely upon the temperature of the air. A given mass of heated air can contain a much greater quantity of moisture than the same mass can retain when cold; and the quantity of moisture that any mass of air can retain without condensation is sensibly equal to the quantity of moisture that would be required to saturate the space occupied by the air, if the air itself were absent. When a given space contains a given quantity of aqueous vapor, the temperature at which the space is precisely saturated is called the "dew-point," corresponding to the quantity of vapor that is present. If water is introduced into a closed vessel from which the air has been exhausted, a portion of it will evaporate, and the evaporation will proceed until the pressure in the vessel, due to the presence of the aqueous vapor, attains a certain definite value, which depends solely upon the temperature of the vessel and its contents. The limiting pressure (or, as it is called, the "tension of the saturated vapor") so attained at various ordinary temperatures, is given in the following table, due to Mr. Glaisher:

| Temp. Fahr. | Tension of vapor at saturation in inches of mercury | Temp. Fahr. | Tension of vapor at saturation in inches of mercury |
|----------------|---|----------------|---|
| 0° | 0.044 | 45° | 0.299 |
| 5° | 0.054 | 50° | 0.391 |
| 10° | 0.068 | 55° | 0.433 |
| 15° | 0.086 | 60° | 0.518 |
| 20° | 0.108 | 65° | 0.617 |
| 25° | 0.135 | 70° | 0.733 |
| 30° | 0.167 | 75° | 0.868 |
| 35° | 0.204 | 80° | 1.023 |
| 40° | 0.247 | | |

The condition of the air with respect to saturation is called its "hygrometric state"; and the hygrometric state is defined, so far as its numerical estimation is concerned, as the fraction that is obtained by dividing the tension (or pressure) of the vapor that is actually present, by the tension of the vapor that would be required to completely saturate the same bulk of air, at the observed temperature. The tension of the vapor that is actually present in the air under given conditions may be determined by means of the "hygrometer," an instrument which is made in a great variety of forms. In Regnault's form (which is very accurate, although not well adapted to general use), a polished silver tube is placed in a vertical position, and partially filled with ether, into which a delicate thermometer dips. A current of air is then drawn up through the ether by means of an aspirator, and as the ether is gradually chilled by the consequent evaporation, there comes a time when moisture begins to condense from the air upon the polished exterior of the silver tube. The temperature of the ether is then noted by the thermometer that dips into it; and we take this temperature as the "dew-point" of the air that is in contact with the outer surface of the silver tube. By reference to the table given above, we are then able to determine, at once, the tension of the vapor that is actually present in the air; and upon dividing this by the tension of saturated vapor corresponding to the actual temperature of the air, we obtain the fraction which expressed the "hygrometric state" of the air. Suppose, for example, that the temperature of the air is 70° F., so that if it were saturated with moisture the tension of the vapor that it contains would be equal to the pressure produced by 0.733 inch of mercury. Let us further suppose that the hygrometer shows that dew is deposited upon the silver tube when the temperature falls to 50° F. We should then know that the quantity of vapor actually present in the air is sufficient to produce saturation at a temperature of 50° F.; and by reference to the table we see that this signifies that the actual tension of the vapor present in the air is the same as the pressure due to 0.361 inch of mercury. The "hygrometric state" of the air is then found by dividing 0.361 by 0.733. That is, it is 0.492. The table shows that as the temperature of saturation rises, the corresponding tension of the vapor rises more and more rapidly. It follows from this that when two masses of saturated air mingle, the mixture will in general be more than saturated, and condensation may therefore be expected to ensue, and to continue until the quantity of vapor remaining uncondensed is only sufficient to saturate the mixed mass. The visible evidence of such condensation, in nature, consists in the formation of clouds, or the precipitation of rain. A. D. RISTEEN, PH.D.,

Editorial Staff 'Encyclopedia Americana.'

Saturday, so called from the planet Saturn, the seventh day of the week; the *Sabbath* of the Jews. It is called by the Italians *Sabbato*; by the French, *Samedi*; and by the Germans, *Sonnabend* (Sunday eve), or in High German, *Samstag*, a corruption of *Sabbathstag* (Sabbath day); and in Lower Germany, *Saterdag*, of the same origin as the English.

SATURN

Sat'urn, an ancient Italian divinity, husband of Ops and father of Picus. He was the god of seed time and harvest and is represented as bearing a sickle. He was later identified with the Greek Chronos, who, driven from his supreme throne by Zeus, came to Latium and set up his kingdom there. Under his reign was the Golden Age. At Rome his throne was shared by Ops, afterward identified with Rhea, and in the time of the last Tarquin a temple was built to him at the foot of the Capitol and was afterward used as the treasury (*Saturni Atrarium*). The foundations of this temple and eight pillars still remain. The statue of Saturn was all year long swathed in woolen bandages excepting during his festival, the *Saturnalia* (q.v.), when it was uncovered to the eyes of the people.

Saturn, the sixth major planet in the order of distance from the sun. Although this planet is not quite so large as Jupiter, its grand array of rings and satellites renders it the most stupendous object in the solar system. To the naked eye, when near opposition, it shines as a bright star of the first magnitude. Its light is somewhat yellow, bearing a great resemblance to that of Arcturus, both in color and brightness. Saturn, like the other superior planets, is best seen in opposition, when it rises at sunset, and is visible almost the entire night. An opposition occurred about 12 Aug. 1904, and the times to look for it in future years may be found by the rule that it occurs about thirteen days later every year than it did the year before. It will therefore be well seen in the autumn of the years 1906-12 and winter of the years 1913-20. Its time of revolution is 29.6 years, at the end of which period it will return to opposition at the same time as at the beginning, and will present the same general aspect.

The rings of Saturn render it a beautiful and striking telescopic object. They are about 175,000 miles in external diameter, and the central opening of the ring is about 110,000 miles. This makes the breadth of the ring itself, from its inner to its outer circumference, about 32,000 miles, or more than four times the diameter of the earth.

This object was an enigma to the early observers with the telescope. Galileo correctly described it as seeming handles of the planet, a circumstance which, up to the present time, has led to their visible ends being called *ansa*. As Saturn moved forward in its orbit these handles disappeared from view, owing to the rings being seen edgewise, a circumstance which greatly perplexed Galileo, and encouraged those of his opponents who were disposed to throw doubt on the accuracy of his observations. But the correctness of the latter was shown in a very few years by the reappearance of these seeming handles. The mystery was at last solved by Huyghens in 1656, who, after long and careful study, announced that "the planet is surrounded by a thin, plain ring, nowhere touching it, and inclined to the ecliptic."

When the rings of Saturn are carefully examined with a powerful telescope they are found to be quite complex in their make-up. Shortly after Huyghens made known the real form of the rings, Cassini, of the Paris Observatory, an-

nounced that there were really two rings separated by a fine dark line. The outer one was much narrower than the inner one. The line of separation is called the Cassini division. About 1843, Encke of Berlin, announced that the outer ring was sometimes seen as if divided. Careful study of the appearance makes it probable that there is no real division here, but only a somewhat soft, dark marking round the ring. Shortly afterward, it was announced by Bond and others that there was really a third ring between the two hitherto known and the planet, which had escaped observation because it was very faint and dusky, looking somewhat like a band of crape. This dusky ring was for many years an object of much curiosity on the part of observers; but it is now found not to be a separate ring at all, but only a dark-shaded extension of the inner ring. It is now so easily seen in a good telescope that the failure of the earlier observers to see it suggests a possible change in the object. A suspicion that the inner ring at least was becoming broader and its inner edge approaching the planet, was propounded by Struve, who based his conclusions upon a comparison of drawings and measurements made from the time of Huyghens to that of Herschel. But this change is not considered as established.

The equator of Saturn and also its rings are inclined to the plane of its orbit around the sun by about 27° . As the planet moves round the sun, its axis and hence its equator and rings, preserve the same direction in space, on the same principle than the axis of the earth keeps its direction in going round the sun. Consequently there are equinoxes and solstices for Saturn as for the earth. At the time of the Saturnian equinoxes the plane of the rings passes through the sun. There being two such equinoxes, at opposite points of the orbit, the interval between them will be half the time of revolution of Saturn, or 14.8 years. As the earth is quite near the sun compared with the distance of Saturn, the rings will be seen edgewise from the earth about the time of these equinoxes. They are then found to be so thin as to disappear completely in the most powerful telescope. The last occasion on which this occurred was in 1892; other opportunities will be offered in 1907 and 1922. At intervals intermediate between these times, the rings are seen under the greatest angle, which, however, is never greater than 27° , which is their inclination to the orbit of the planet. At these times it is at its brightest, because the rings are opened out the widest to our view.

Another perplexing question was, how these objects could be kept in place—accompanying the planet in its orbit, and always centred on it, without meeting destruction by falling upon it. A very little mathematical calculation suffices to show that two bodies of this shape ought, on the least disturbance, to be gradually attracted toward the planet on one side or the other, falling upon it as surely as a chair, balanced on one of its legs, will fall to the floor. Laplace suggested that this might be avoided by the rings being liquid and not solid. But it was found by subsequent investigation that a liquid ring would fare no better than a solid one. Professor Benjamin Peirce suggested that the rings might be kept in place by the attraction

of the satellites. But this suggestion proved no better than the others.

The mystery was at last solved by Professor Clerk Maxwell of England, in a paper on "The Rings of Saturn," which gained the Adams prize essay from the Cambridge University. He demonstrated, by mathematical analysis, that the only objects which could permanently accompany the planet in the way the rings did would be a cloud of small satellites, possibly particles no larger than pebbles. A suggestion of this fact had been made more than a century before by Cassini, but little notice had been taken of it. This announcement made it of great interest to discover whether any other proof could be found for such a view. One consequence of Maxwell's theory is that the rings cannot all revolve together like a solid body, but that the inner portions must revolve more rapidly than the outer ones, the rate of revolution, in every part of the ring, being that appropriate to a satellite in that position. As the particles forming the rings were separately invisible, there was no way of deciding by telescopic observations whether they followed this law of revolution.

It was reserved for Keeler, at the Allegheny Observatory, by the use of the spectroscope, to demonstrate Maxwell's theory by observation. Bringing Saturn and its rings in such a position that they should fall across the slit of his spectroscope, only a single line of light penetrating the slit, it was found that, after being refracted by the prism, the dark lines of the spectrum were not straight, but were broken exactly in a way to indicate that the inner portions of the ring revolved more rapidly than the outer ones.

Saturn is surrounded by a retinue of nine satellites, more than surround any other planet, their distances having a wide range, as will be seen by the table below:

| Name. | Dist. from Saturn in radii of planet. | Periodic time. | Discoverer and date. |
|-----------------|---------------------------------------|----------------|----------------------|
| Mimas | 3.3 | 0 d. 23 h. | Herschel in 1789 |
| Enceladus | 4.3 | 1 d. 9 h. | Herschel in 1789 |
| Tethys | 5.3 | 1 d. 21 h. | Cassini in 1684 |
| Dione | 6.8 | 2 d. 18 h. | Cassini in 1684 |
| Rhea | 9.5 | 4 d. 12 h. | Cassini in 1672 |
| Titan | 20.7 | 15 d. 23 h. | Huyghens in 1655 |
| Hyperion | 26.8 | 21 d. 7 h. | Bond in 1848 |
| Japetus | 64.4 | 79 d. 22 h. | Cassini in 1671 |
| Phœbe | 233.0 | 550 d. 12 h. | Pickering in 1901 |

Phœbe was discovered at the Harvard Observatory, by photographs of stars surrounding Saturn. It is remarkable in that its motion is retrograde, while that of all other satellites is direct. Its faintness is such that the only telescope which has yet shown it to the eye is that of the Yerkes Observatory, where it was observed with great difficulty by Barnard.

The largest and brightest of these objects is Titan, which may be seen in a telescope of moderate size. The faintest and most difficult is Hyperion, which requires a large telescope to show it. Mimas also is a difficult object to see; but a telescope of three or four inches' aperture will commonly show several besides Titan. The Astronomical Ephemeris gives the apparent orbits and data for each year by which the visible satellites can be readily identified. One difficulty in doing this arises from the small stars which are frequently seen in the neighborhood of the planet.

Japetus, the outer satellite, has the singular peculiarity of being much brighter at the western than at the eastern elongation. The variation of brightness goes on with such regularity that it can be attributed only to one cause—the satellite is darker in color on one side than on the other, and revolves on its axis in the same time that it goes around the planet, thus always presenting the same face to the latter, as the moon does to the earth. Another peculiarity of Japetus is that the plane of its orbit deviates from the planes of all the other orbits. One of the curious features of the Saturnian system is that the rings of the orbits of the seven inner satellites all lie in the plane of the planet's equator. It is known that the planes are thus kept together by the mutual action of all these bodies, combined with the attraction of the equatorial protuberance of Saturn itself.

It will be seen from the distances given in the above table that the satellites are divisible into several groups. The five nearest the planet follow each other at fairly regular and not wide intervals. But the sixth, Titan, is more than twice as far as the one next within it. Hyperion is only a little outside of Titan, and moves in a very eccentric orbit. There is a curious action between these bodies, in consequence of which three revolutions of Hyperion are almost exactly equal to four of Titan; and the motions of the two satellites are so timed that they come into conjunction only at the point where Hyperion is farthest from the planet. These conjunctions occur at intervals of 65 days, during which Titan will have made four revolutions and Hyperion three.

This and other relations which exist between the motions of the satellites have the result that their mutual attractions upon each other give rise to curious results in making first one and then another swing back and forth in their orbits. The mathematical problems thus arising tax the abilities of the ablest investigators of the motions of these bodies.

Physical Constitution and Rotation of Saturn.
—The physical constitution of Saturn would seem to be quite similar to that of Jupiter; but the former, being nearly twice as far as the latter, is more faintly illuminated by the sun, and more difficult of observation. Careful telescopic observations show that Saturn has a slightly mottled or cloudy appearance; but the mottling is so faint that it is impossible to locate any one feature, so as to follow it from hour to hour. It is therefore, as a general rule, impossible to see the rotation of the planet. But on three occasions since the telescope has been used in observing Saturn, a spot or region of unusual brightness has been formed upon its disk which enabled its time of revolution to be observed. The first of these was in the time of the elder Herschel; the second in 1876, when the planet was carefully observed by Professor Hall; and the third in 1903, when a spot was discovered by Barnard and observed by many astronomers. On the second occasion it was found that the spot gradually spread out, the brightest point being near one end, while it gradually faded out at the other end. In consequence of this, it was impossible to fix the period of rotation with entire exactness, because it would depend upon whether we took the brightest part of

the belt into which the spot was stretched, or the middle of the belt, as the point of comparison. The results of the time of revolution on the three occasions, so far as worked out, are as follows:

| | |
|----------------|-------------|
| Herschel | 10 h. 16 m. |
| Hall | 10 h. 14 m. |
| Barnard | 10 h. 38 m. |

Very remarkable is the deviation of the last period from the two others. It is easy to determine what this means. The white spots observed by Herschel and Hall were on or near the planet's equator, while Barnard's spot of 1903 was in middle latitude. We therefore conclude that Saturn is like Jupiter and the sun, in that its equatorial portions rotate in a less period than those nearer the poles.

Saturn also resembles Jupiter in its very small density, which is even less than that of water. We therefore reach the same conclusion as in the case of Jupiter—that the outer visible surface of this planet is probably gaseous; that the planet, in fact, is a ball of vapor surrounding a comparatively dense nucleus.

SIMON NEWCOMB.

Saturna'lia, the name of a Roman festival, instituted, according to the popular belief of the ancients, in commemoration of the happy period under the reign of Saturn, when freedom and equality prevailed, and violence and oppression were unknown. It originated probably as a harvest celebration. The festival continued at first one day; then three; afterward five; and finally, under the Cæsars, seven days, namely, from the 17th to the 23d of December. At the commencement of this festival a great number of wax tapers were lighted in the temple of Saturn, as a sign that no more human victims were to be sacrificed. During its continuance no public business could be transacted, the law courts were closed, the schools kept holiday, to commence war was impious, and to punish a malefactor involved pollution. The slaves were freed from restraint, wore caps as badges of freedom, and went about dressed in tunics, adorned with purple, and in white togas. Masters and slaves changed places; and while the servants sat and banqueted at the tables, they were waited on by their masters and their guests, who, if they did not do this, were obliged to submit to all sorts of ridiculous punishments. Jests and freedom everywhere prevailed; and all ceased from their various occupations.

Satur'nian Verse, a metre employed by the earlier Roman poets. It consists of two members; the first an iambic dimeter catalectic, the other a trochaic dimeter brachy-catalectic. It points to the transition from the accentual versification of Etruria and Latium to the quantitative verse of fully developed Roman literature modeled as this latter was on Greek usage. It was originally employed in the hymns to Saturn sung at harvest time, hence its name; and it is also found in extant fragments of Nævius, Livius Andronicus, Ennius, etc. The basis of the metre is thus shown:

— — — — — | — — — — — |

which corresponds with the metre of the old jingle,

There was a man in our town | wondrous wise and cunning.

The metre is met with in all primitive forms of European poetry, whether Spanish, German, or Anglo-Saxon, and is the underlying measure for almost all ballad literature.

Satyrs, sāt'èrs or sâ'tèrs, in Greek mythology, a race of woodland divinities, who were followers of Dionysus (Bacchus), and represent the luxuriant vital powers of nature. They are not mentioned by Homer, but Hesiod describes them as a worthless race, unfit for work. They were supposed to be the sons of Hermes (Mercury) and Iphthima, or of Silenus. They appear in early works of art and poetry as robust in human frame with bristly hair, broad snub-noses, ears large and pointed like those of animals, two little horny knobs on their foreheads, and a tail like that of a horse or goat. They are described as being fond of wine (whence they frequently appear with a wine-cup or a thyrsus in their hands), and of every kind of sensual gratification, whence they are often represented sleeping, playing musical instruments, or engaged in voluptuous dances with nymphs. Like all the forest and field deities, they were greatly dreaded by mortals. By later writers, especially the Roman poets, the satyrs are confounded with the Italian Fauns, and are accordingly represented with larger horns and goats' feet, although they were originally quite a distinct class of beings. Ancient sculptors were fond of representing the satyr whether in his coarser or finer type—one of the most famous specimens of Greek art being the Satyr of Praxiteles, in which the revolting animal features of the conception have disappeared, and the satyr is portrayed as a beautiful and graceful youth.

Sauerkraut, sowr'krowt, a salted preparation of cabbage, much esteemed in Germany and other northern European nations, and of which large quantities are prepared for winter use. The common white cabbages are taken when they have formed firm hearts; these are sliced into small pieces and packed in layers in a cask with culinary salt, a few juniper berries and caraway-seeds or cloves being added according to taste, the whole mass being packed down as hard as possible without crushing the slices, and covered with a lid pressed down with weights. Partial fermentation sets in after some time, and the watery juice rises to the surface. This juice is poured off, and water containing a solution of salt is poured in, and changed till it rises without a scum and a fetid smell. The cabbage is then fit for use, and is stored in a cool place in the barrels still under pressure. It may be eaten boiled in the same way as fresh cabbages, or stewed with bacon or salted meat.

Sau'ger, or **Sand-pike**, a fish of the rivers and lakes of the northern Mississippi Valley, a pike-perch of the genus *Stizostedion*, and hence a relative of the wall-eyed pike. The sauger (*S. canadense*) is much smaller than the wall-eyed pike, seldom more than 18 inches long, and 1 to 2 pounds in weight. It varies in quality and estimation both as food and as a game fish, but in some tributaries of the upper Mississippi affords good sport by trolling over ripples with a minnow. Its color is olive gray, the sides

brassy or orange with dark mottlings, round black spots on the dorsal fins, and a large black blotch on the base of the pectoral fin.

Saugerties, sâ'gér-tíz, N. Y., village in Ulster County; on the Hudson River at the mouth of Esopus Creek, and on the West Shore Railroad; about 12 miles north of Kingston. A ferry connects Saugerties with the New York Central & Hudson River Railroad at Tivoli, on the opposite side of the Hudson, and there are regular steamer communications with all the Hudson River ports. It is in an agricultural region, and has good water-power for manufacturing. In the vicinity are bluestone and limestone quarries. The chief industrial establishments are factories for making writing-paper, blank-books, envelopes, card board, and coated paper for lithographing purposes, and the pulp mills. There are also brick works and the quarries, and the white-lead factory at Glenerie contributes to the prosperity of Saugerties. The manufactures and export products of Saugerties and the nearby villages are shipped mainly from Saugerties by water. The educational institutions are a high school, the public and parish schools, and the Y. M. C. A. library and reading-room. The national and state banks have a combined capital of \$325,000; the savings bank has a large deposit. The government is vested in a president and board of trustees. Pop. (1890) 4,237; (1900) 3,697.

Saugor, sâ-gör', or **Sâgor**, India, (1) chief town of a district in the Jubbulpore division of the central provinces, 185 miles north of Nâg-pur. The town is 1,758 feet above the sea, and stands on the bank of a lake enclosed by hills. It contains a college, in which branches are taught both in English and the native tongues. The beautiful lake is frequented by large numbers of fish and wild fowl. Saugor was first ceded, together with territory, to the British in 1818. Pop. 44,674. (2) The district of Saugor covers an area of 4,005 square miles. The principal crops are millet, wheat, pulse, oil-seeds, and some cotton. The Indian Midland Railway from Etowah to Saugor has been extended to Katni on the East Indian line. Pop. (1901) 470,666.

Saugus, sâ'gûs, Mass., town in Essex County; on Lynn Harbor and Saugus River, and on the Boston & Maine railroad; about four miles west of Lynn and 10 miles northeast of Boston. Within its corporate limits are the villages of East Saugus and Cliftondale. It is a residential section with several manufacturing establishments, chief of which are woolen mills, and boot and shoe factories. The town has a high school and graded elementary schools. Pop. (1890) 3,673; (1900) 5,084.

Saul, first king of Israel from about 1040 B.C. He was the son of Kish, a wealthy and powerful Benjamite, was noted for his personal beauty and courage; and when the people became dissatisfied with the theocratico-republican constitution, was selected by Samuel for their king. He was not acknowledged by the whole people until after he had gained a victory over the Ammonites. Repeated successes over the Philistines, Edomites, Moabites, Ammonites, and even over a king beyond the Euphrates, confirmed his authority. But Samuel, offended

by the encroachments of the king on the privileges of the priesthood, and by his disobedience to the commands of Jehovah in a war against the Amalekites, secretly anointed David as king. A civil war, which broke out between the partisans of David and those of Saul, was terminated by the death of the latter, who, after the defeat of his forces by the Philistines, fell upon his own sword.

Sault Sainte Marie, soo sânt mǎ'ri or (Fr.) sô sânt mǎ-rê, Canada, town and port of entry of Algoma District, Ontario; on the Saint Mary River, the Sault Sainte Marie Canal, and on the Canadian Pacific and Algoma Central railways. It is connected by the international bridge, 1 mile long, with Sault Sainte Marie, Mich., hence with the Duluth, South Shore, and Atlantic, and the Minneapolis, Saint Paul, and Sault Sainte Marie railways. It is in an agricultural and mining region and is a popular summer resort. In addition to the ship canal around the rapids, Sault Sainte Marie has a large power canal, which already supplies important industries and will supply power to future manufactories. The most important industry is the manufacture of wood-pulp and paper, the large mill at Sault Sainte Marie having cost in construction more than \$1,000,000 and being one of the largest in the world. There are also nickel steel works, utilizing the nickel ores from the Sudbury mines, foundry and machine shops, and lumber mills. The city owns and operates its electric lighting plant and water works. It is the seat of the Anglican Bishop of Algoma and the Roman Catholic Bishop of Northern Canada; has good schools, banks, and weekly newspapers. Pop. (1901) 7,169.

Sault Sainte Marie, Mich., city, port of entry, county-seat of Chippewa County; on Saint Mary River, near the outlet of Lake Superior, on the Sault Sainte Marie (q.v.) ship canal and on the Duluth, S. S. & A. and the Minneapolis, St. P. & S. Ste. M. R.R.'s. The international railroad bridge across Saint Mary River connects the city with the village Sault Sainte Marie in Canada, thus making direct connection with the Canadian Pacific railroad. The principal industrial establishments are lumber mills; other manufactories are machine shops, foundry, planing mills, flour mills, brick works, and shingle mills. It has a shipyard, large lumber yards, and warehouses. The government census of 1900 gives as the number of manufacturing establishments 84; the amount of capital invested, \$723,936; average number of wage-earners, 472; total of wages, \$262,582; and value of products, \$1,166,700. A branch of the State fish hatchery is maintained here. The educational institutions are Saint Mary's Academy, a high school, public and parish schools, and private business schools. The three banks have a combined capital of \$200,000. Pop. (1890) 5,764; (1900) 10,538.

Sault Sainte-Marie, Saint Marys Falls, or the "Soo" Canals. The canals of Sault Sainte Marie, Mich., and Ontario, are located adjacent to the falls of the Saint Mary's River, which connects Lake Superior with Lake Huron, and lower or raise vessels from one level to the other, a height of 17 to 20 feet. The canal belonging to the United States was begun in 1853 by the State of Michigan and opened in

1855, the length of the canal being 5,674 feet, and provided with two tandem locks, each being 350 feet in length and 70 feet wide, and allowing passage of vessels drawing 12 feet, the original cost being \$1,000,000. The United States government, by consent of the State, began in 1870 to enlarge the canal, and by 1881 had increased its length to 1.6 miles, its width to an average of 160 feet, and its depth to 16 feet; also had built a single lock 515 feet long and 80 feet wide, with a depth of 17 feet on the sills, which was located 100 feet south of the State locks. The State relinquished all control of the canal in March 1882. In 1887 the State locks were torn down and replaced by a single lock 800 feet long, 100 feet wide, and a depth of 22 feet of water on the sills. This lock was put in commission in 1896. The canal was also deepened to 25 feet. The Canadian canal, $1\frac{1}{8}$ miles long, 150 feet wide, and 22 feet deep, with lock 900 feet long, 60 feet wide, with 22 feet on the mitre sills, was built on the north side of the river during the years 1888 to 1895. The number of vessels passing through the United States canal in 1902 was 17,588, and through the Canadian canal 4,204. In 1900 the number of vessels passing through the United States canal was 18,144, and through the Canadian canal 3,003, showing an increase of 1,200 in the number of vessels passing through the Canadian canal, and a slight decrease in the number through the United States canal, the increase in the number passing through the Canadian canal having been due to the development of the Michipocoten district. The tonnage passing through the United States canal in 1902 was: Registered tonnage, 27,408,021 tons; in 1901, 22,222,334 tons, against 20,136,782 in the year 1900; the freight tonnage in 1901 was 25,026,522 tons, against 23,251,539 tons in 1900. The Canadian canal shows: Registered tonnage in 1902, 4,547,561; in 1901, 2,404,642 tons, against 2,160,490 in 1900. The volume of traffic through the United States canal exceeds that of any other in the world, the Suez Canal (q.v.) being second with an aggregate in 1901 of 3,699 vessels and a gross tonnage of 15,163,233. A marked contrast between the business of the Saint Marys Falls and Welland canals is found in a comparison of their figures for a term of years. The number of vessels passing through the Welland Canal in 1873 was 6,425, and in 1899 2,202, a reduction of more than one half in the number of vessels. The number of vessels passing through the Saint Marys Falls Canal in 1873 was 2,517, and in 1902, through the American and Canadian canals, 22,659. See CANALS.

Saumarez, sô-mă-ră', or **Sausmarez, James**, BARON DE, British naval officer: b. Saint Peter Port, Guernsey, 11 March 1757; d. there 9 Oct. 1836. He served in the American war; was raised to the rank of commander after the engagement between the English and Dutch in 1781; and was captain of the *Russell* in the combat between Rodney and De Grasse. In 1793 he was knighted for the capture of the Réunion, a French frigate. In March 1795 he was appointed to the command of the *Orion*, in which ship he opened the battle of L'Orient, in which the French fleet was defeated, 23 June; he shared in the victory off Cape Saint Vincent, 14 Feb. 1797, and was second in com-

mand to Lord Nelson in the victory of the Nile, 1 Aug. 1798. In 1801 he was made rear-admiral, created a baron, and appointed to the command of the squadron cruising off Cadiz. He defeated a Franco-Spanish fleet of 10 sail of the line and four frigates. At the beginning of the war with Russia (1809) he commanded the Baltic fleet. In 1821 he became vice-admiral of Great Britain, was raised to the peerage of the United Kingdom with the title of Baron de Saumarez, of Saumarez, in 1831, and thenceforth lived in retirement. Consult: Ross, 'Memoirs of Admiral Lord de Saumarez' (1838).

Saunders, sän'dêrz, Alvin, American legislator: b. Fleming County, Ky., 12 July 1817; d. Omaha, Neb., 1 Nov. 1899. He removed with his parents to Illinois in 1828, and at 16 went to Iowa. He studied law, was postmaster for seven years, and eventually became a banker. He was a member of the convention which framed the constitution under which Iowa was admitted to statehood, was State senator for eight years, and a commissioner to organize the Pacific Railroad Company. In 1861-7 he was governor of the Territory of Nebraska, and during the Civil War sent 3,000 troops to the front besides repelling the attacks of the Indians, although the entire population of the Territory numbered but 30,000. He served in the United States senate in 1877-83, was active in the movement for the resumption of specie payment, secured a labor school for the Indians on the Pawnee Reservation, obtained 600,000 acres for Nebraska by straightening its northern boundary line, and was prominent as a commissioner on Indian affairs.

Saunders, Frederick, American librarian and author: b. London, England, 14 Aug. 1807; d. Brooklyn, N. Y., 12 Dec. 1902. He came to the United States in 1837 and established a branch of his father's publishing house in New York, his purpose being to issue American editions of their London publications and to make an endeavor for an international copyright law. He succeeded in getting a petition before Congress, but the attempt to secure the law was a failure. Deciding to remain in America he then became city editor of the *Evening Post* under William Cullen Bryant, and in 1856 he was appointed librarian of the Astor Library, New York. In 1876 he became librarian, an office which he occupied until 1893, when he resigned. His publications include: 'Memoirs of a Great Metropolis' (1852); 'Mosaics' (1859); 'About Women, Love, and Marriage' (1866); 'Story of Some Famous Books' (1887); 'Story of the Discovery of the New World by Columbus' (1892).

Saunders, Marshall (MARGARET MARSHALL SAUNDERS), Canadian author: b. Milton, N. S., 1861. She was educated in Nova Scotia, Scotland, and France, and is well known as a successful writer of juvenile books. Her publications include: 'Beautiful Joe' (1894); 'The King of the Park' (1897); 'Her Sailor' (1899); 'Tilda Jane' (1901); 'Beautiful Joe's Paradise' (1902); etc.

Saunders, Richard, the name under which Benjamin Franklin published his 'Poor Richard's Almanac,' 1732-57.

Saunders, Thomas Baily, English author: b. Alice, Cape Colony, 2 Dec. 1860. He was educated at King's College, London, and at University College, Oxford, became a barrister in 1886, and has since engaged in literary work. He has made translations of much of the work of Schopenhauer and Goethe and has written: 'Life and Letters of James McPherson' (1893); 'The Quest of Faith' (1899); 'Prof. Harnack and His Oxford Critics' (1902); 'Schopenhauer' (1901); etc.

Saunderson, sän'dër-sön, Nicholas, English mathematician: b. Thurlston, Yorkshire, January 1682; d. Cambridge, England, 19 April 1739. He was blinded by smallpox when a year old, and debarred through poverty from a university course, but nevertheless obtained a wide knowledge of the classics and mathematics. In 1707 he established himself as a lecturer at Christ's College, Cambridge, and in 1711 was appointed to the chair of mathematics at Cambridge, which he occupied until his death. His 'Algebra' was published at Cambridge in 1740.

Saurel, a fish. See SCAD.

Sauria, sä'ri-a, a term variously applied in the classification of the reptiles, but in this work restricted to designate the subclass composed of the orders *Lacertilia* (lizards) and *Ophidia* (serpents). In popular speech the phrase "saurian reptiles" usually means alligators or crocodiles. See REPTILES.

Saurin, Jacques, zhäk sō-rän, French Protestant preacher: b. Nîmes 6 Jan. 1677; d. The Hague 30 Dec. 1730. After study at Geneva, he became pastor in 1701 of a Walloon congregation in London; but in 1705 went to The Hague to take charge of a church of French refugees assembling there in a chapel of the Prince of Orange. Here his pulpit oratory was so greatly admired that it roused the bitter envy of his clerical brethren, who charged him with heresy, and subjected him to a series of petty persecutions which shortened his life. His doctrines were those of moderate Calvinism. As a pulpit orator he has been likened to Bossuet, and so far as vigor of presentation goes this may be thought just. He was the author of 12 volumes of 'Sermons,' selections from which were translated into English, and published between 1775 and 1784, in five volumes (with a 'Mémorial'), a sixth being added in 1796. Among his other works are 'Etat du Christianisme en France' (1725); 'Abrégé de la Théologie et de la Morale Chrétienne' (1722); 'Discours sur les Evénements les Plus Mémorables du Vieux et du Nouveau Testament' (1720-8). Consult 'Life' by Berthault (1875).

Sauropoda, sä-röp'ō-da, a sub-order of dinosaurian reptiles which included gigantic forms, such as *Brontosaurus*, *Morosaurus*, *Diplodocus* and the like. (See DINOSAURIA.) It is difficult, remarks Gadow, to understand how these huge, long-necked *Sauropoda* lived and moved about. The long neck suggests at first sight predaceous habits, but the teeth, rather feeble in *Diplodocus*, and distinctly of the plant-cutting type in other genera, put this out of the question. The high position of the impaired nasal opening, and the shortened nasal bones of

Diplodocus are features indicative of aquatic habits, but the short-toed plantigrade limbs are absolutely adapted to terrestrial life, and we cannot well assume that such enormous brutes as *Atlantosaurus* could possibly have ventured into swampy ground.

Sauropsida, a primary division of vertebrated animals, comprising the reptiles and birds, the other two corresponding divisions being the *Ichthyopsida* (fishes and amphibians) and the *Mammalia*. These divisions, set apart by Huxley, are in accordance with genetic relationships. For the similarities in structure between birds and reptiles, showing descent from a common sauropsidan ancestor, see ORNITHOLOGY; REPTILES.

Saururæ, the name given by Huxley to an order of the class of Birds (see ORNITHOLOGY), constructed for the reception of *Archæopteryx* (q.v.) a fossil bird, the oldest and most primitive bird-fossil known, remarkable for its lizard-like tail.

Sau'ry-pike, or Skipjack, a fish (*Scomberesox saurus*), having a greatly elongated body covered with minute scales, and the jaws prolonged into a long sharp beak. It is about 15 inches long, occurs plentifully on the North Atlantic coasts, frequenting inlets in shoals so dense that it may be taken in pailfuls. In order to escape the pursuit of the porpoise and large fishes it often leaps out of the water or skims rapidly along the surface. Consult Goode, 'American Fishes' (1888).

Sausage, an article of food consisting of minced meat, highly seasoned, and enclosed generally in the intestines of some animal. Among the Romans the sausages of Lucania were held in high repute; they were made of fresh pork and bacon finely minced with nuts of the stone-pine, and flavored with pepper, cummin seed, bay leaves, pot-herbs, and garum. The Bologna sausages of Italy are still highly prized; they consist of veal, salt beef, salt pork, and bacon, finely chopped up, seasoned with sage, mixed herbs, ground pepper, and mixed spice. The smoked sausages of Germany are also considered as a delicacy by many; they are made of fat and lean pork preserved for about a week by salt, saltpetre, black pepper, and all-spice being rubbed into the meat; it is then cut small and mixed with some shreds of shallot or garlic, pressed into an ox-skin, wrapped in a fold or two of muslin, and then smoked in the same way as ham. The pork sausages of our own country are made and seasoned in various ways to please different palates. See PACKING INDUSTRY.

Saussure, sō-sūr, Horace Bénédicte de, Swiss savant: b. Conches, near Geneva, 17 Feb. 1740; d. Geneva 22 Jan. 1799. He began his studies in natural science in Geneva and at 22 was appointed professor of philosophy. Later he was elected member of the Council of Two Hundred in the new legislature of his country. His name has since become famous from his services to geology, geodesy, the geographical distribution of plants, and the applied sciences. His most remarkable work was done in the investigation of plant anatomy. In pursuit of his chosen studies he traveled through France, Holland, England, Italy and Sicily; thoroughly exploring the Alps, especially the glaciers of Chamounix, and was the first to reach the summit of

Mont Blanc (1787) and to measure its height by barometric pressure. He is also the inventor of the electrometer, hygrometer and similar instruments. As founder and president of the Society of Arts of Geneva he did good service to the industries of that city. Among his writings the most important are 'Voyages dans les Alpes' (1779); and 'Partie Pittoresque' (1890).

Sauterne, sō-těrn', a white Bordeaux wine of high repute, produced from grapes grown in the neighborhood of Sauternes, a village in the department of Gironde, near Bordeaux.

Savage, James, American antiquarian: b. Boston, Mass., 13 July 1784; d. Boston 8 March 1873. He was graduated from Harvard in 1803, studied law, was admitted to the bar, served in both branches of the legislature, and then retired from political life to engage in literary work. He published numerous historical and political pamphlets, and edited many works concerning New England history. His work is unfortunately marred by a partisan spirit and is somewhat confused in plan. He wrote: 'Genealogical Dictionary of the First Settlers of New England, showing three Generations of those who came before May 1692' (4 vols., 1802-4); and edited: Winthrop's 'History of New England' (1825-6); Paley's 'Works' (5 vols. 1828); etc.

Savage, Minot Judson, American Unitarian clergyman: b. Norridgewock, Maine, 10 June 1841. He was graduated from the Bangor Theological Seminary in 1864 and was a Congregational home missionary in California 1864-67. Here he established churches in Grass Valley and San Mateo. Subsequently he occupied Congregational pulpits in Framingham, Mass., 1867-9; and Hannibal, Mo., 1869-73. Having become a Unitarian he took charge of the Third Unitarian Church in Chicago 1873-4, and a year later became the pastor of the Church of the Unity in Boston, in which capacity he served 22 years. In 1896 he accepted a call to the Church of the Messiah in New York, a church long associated with the Rev. Robert Collyer, now (1906) its pastor emeritus. He resigned the pastorate in May 1906. He represents the more radical element in his denomination and has been a voluminous writer upon ethical and religious questions. Among his more important works are: 'Christianity the Science of Manhood' (1873); 'The Religion of Evolution' (1876); 'Social Problems' (1886); 'My Creed' (1887); 'Religion for Today' (1897); 'Our Unitarian Gospel' (1898); 'Life Beyond Death' (1901); 'The Passing and the Permanent in Religion' (1901).

Savage, Richard, English poet: b. London 10 Jan. 1698 (?); d. Bristol 1743. He claimed to be the illegitimate son of Anne, Countess of Macclesfield, by Richard Savage, Earl Rivers, but was probably the son of a woman who had been employed to nurse a natural son of the countess by that earl. This child, according to the countess, died when quite young, and she declared that Savage was an impostor. Savage was apprenticed to a shoemaker, having probably received some education at a grammar-school near Saint Albans. He turned to literature and became an author as a means of livelihood. His first work, a pamphlet on the Bangorian controversy, was followed by two comedies, 'Woman's a Riddle,' performed in 1716, and 'Love in a Veil.' These procured him the ac-

quaintance of Sir Richard Steele and Wilkes, the actor. His tragedy 'Sir Thomas Overbury,' was brought out in 1723, the author himself playing the leading part, but with little success. Savage was rising in reputation when, in 1727, he killed a man in a tavern brawl. He was tried and sentenced to death, but through the influence of Lady Hertford was pardoned. In 1728 appeared 'The Bastard,' a poem of some merit. Soon after, Lord Tyrconnel (a nephew of his alleged mother) received him into his house, and allowed him £200 a year. In 1729 he published 'The Wanderer: a Moral Poem.' A quarrel with his patron once more turned him adrift upon the world. A birth-day ode addressed to Queen Charlotte in 1732 procured him a pension of £50 from the queen. In 1735 a satire against the clergy, entitled the 'Progress of a Divine,' caused a prosecution to be instituted against him; but the information was dismissed. From this period he appears to have sunk into the lowest misery. The death of the queen and the loss of his pension completed his ruin, although Pope and a few friends raised a subscription with a view of enabling him to reside in Wales. But at Bristol he was arrested for debt and thrown into the county jail, where, after a detention of some months, he died. Besides the works above mentioned, he was the author of much occasional verse and other miscellaneous writings. Savage was the friend and companion of Samuel Johnson at the time when the latter was sleeping in the streets of London houseless and penniless. Consult: Johnson, 'Life of Savage' (1744); Galt, 'Lives of the Players'; Boswell, 'Life of Johnson'; Thomas, in 'Notes and Queries' (1858).

Savage, Richard Henry, American soldier and novelist: b. Utica, N. Y., 12 June 1846; d. New York 11 Oct. 1903. He was graduated from West Point in 1868 as brevet 2d lieutenant, and in 1871 served as vice-consul of the United States at Rome and Marseilles. In 1872 he was military secretary, with the rank of major, in the Egyptian army and in the latter part of 1872 and during 1873 was United States Commissioner to Texas, to settle the Mexican-Texas border dispute. During the Spanish-American war he served as senior major of the United States volunteer engineers. He was a voluminous writer, published among other books: 'My Official Wife,' which has been translated into 17 languages; 'For Love and Life'; 'In the Shadow of the Pyramids'; 'Brought to Bay'; 'The Midnight Passenger' (1900).

Savage Island, or **Nine**, an island of the South Pacific, 40 miles in circumference, and lying between the Samoa and Tonga groups. It is very fertile. Chief products—copra, coffee and fruit. Trade is almost exclusively with New Zealand, to which it was annexed in 1901. The inhabitants are a mixed race of Samoans and Melanesian. They are a quiet people and have become Christians. They speak a Samoan dialect. Pop. (1901) 4,050.

Savage Station, Battle of. While Gen. Sumner was engaging Gen. Magruder at Peach Orchard or Allen's Farm (q.v.) on the morning of 29 June 1862, Gen. Franklin was informed that "Stonewall" Jackson, after repairing the bridges, was crossing the Chickahominy in force and advancing toward Savage Station. Frank-

SAVAII ISLAND—SAVANNAH

lin immediately withdrew Smith's division from an isolated and exposed position on Sumner's right and notified Sumner, who at 12 o'clock fell back $2\frac{1}{2}$ miles to Savage Station and united with Franklin, who had Smith's division only, Slocum's having been sent by McClellan across White Oak Swamp. McClellan had ordered Heintzelman, with his corps, to hold the Williamsburg road until dark, at a point where were several field-works, and a skirt of timber between these and the railroad; but through a misunderstanding of his orders, and being convinced, he says that the whole open space near Savage's was crowded with troops, more than he supposed could be brought into action judiciously, in the afternoon he marched his entire corps, except two batteries, to the rear across White Oak Swamp, without orders from any one, and without a word to Sumner, who, by seniority, was in command, McClellan not being on the field. On reaching Savage Station, Sumner and Franklin drew up in line of battle in a large open field to the left of the railroad, the left, held by Sumner, resting on the edge of the woods, Richardson's division forming his right, Sedgwick's his left. Smith's division on the right extended down to the railroad, with Hancock's brigade reaching into the woods to the right and front to hold the railroad. Davidson's brigade was in reserve, and Osborn's battery was on the line. It was after these dispositions had been made that Heintzelman withdrew and imperiled the left of Sumner's line. Magruder had slowly and cautiously followed Sumner from the Peach Orchard and it was near 5 o'clock when McLaws' division, moving along the Williamsburg road and through the timber that Heintzelman was supposed to be holding, began an attack upon Sumner's left, and was held in check by the vigorous fire of Sumner's artillery. McLaws pressed his attack with great impetuosity, and a hotly contested fight took place on the Williamsburg road. Six regiments of Sedgwick's division, followed by one of Richardson's, were hastened to the threatened point; Brook's Vermont brigade was thrown into the woods that Heintzelman had abandoned, six batteries opened fire, and at dark, after partial success on either side, the battle ceased, with Sumner's line intact, and the Confederates repulsed. A novel feature of the engagement was the use by the Confederates of a 32-pounder gun, mounted on a platform-car, plated with iron, which was pushed down the railroad, and sent its shells into Sumner's line. Soon after the cessation of the fight, and the destruction of a large amount of supplies, Sumner continued the retreat across White Oak Swamp, abandoning to the Confederates 2,500 sick in the hospitals. McLaws reports a loss of 345 killed and wounded; the total Confederate loss was about 400 killed, wounded, and missing. The Union loss is not accurately known.

E. A. CARMAN.

Savaii (sā-vī'ē) **Island.** See SAMOAN ISLANDS.

Savanil'la, one of the names of the great tarpon (q.v.).

Savannah, sa-văn'a, Georgia, city and capital of Chatham County, located on the Savannah River, 18 miles from its mouth. It is the northern terminus of the Savannah, Florida & Western Railroad, now a part of the Atlantic Coast Line system; the eastern terminus of the Central of Georgia Railway; the southern terminus of the Charleston & Savannah Railroad, a part of the Atlantic Coast Line, and the chief South Atlantic terminus of the Southern Railway and the Seaboard Air Line systems, thus being one of the most important railroad centres in the South. It has regular steamship and sailing connections with Boston, New York, Baltimore, Philadelphia, and other ports.

Parks and Monuments.—The streets are wide and beautifully shaded, and intersected with parks or squares at regular intervals. In Johnson, Monterey, and Madison squares are monuments to Nathaniel Greene, Count Pulaski, and Sergeant Jasper, heroes of the Revolution. In Forsyth Place stands a monument to the Confederate dead. There is also a monument to Tomochichi, the Indian chief, and other public memorials.

Public Buildings.—The city has a County Court-House, United States Post-office and Court-House, City-Hall, Custom-House, Arsenal of the First Battalion Heavy Artillery, Armory of First Regiment of Infantry, Chamber of Commerce, Cotton Exchange, Board of Trade, Saint Joseph's Hospital, Episcopal Orphans' Home, Savannah Hospital, Telfair Hospital for Females, Masonic Temple, Theatre, Odd Fellows' Hall, Georgia Historical Society, Public Library, Telfair Academy of Arts and Sciences, and many large buildings of modern architecture. Ten miles from the city is the Bethesda Orphan House, founded by Rev. George Whitefield in 1740.

Government.—The city is governed by a mayor and city council. The annual cost of maintaining the municipal government is about \$900,000. The artesian waterworks system with 58 miles of mains, cost \$1,250,000. The city has an area of 7 square miles with 98 miles of streets, of which 35 miles are paved. The sewer system covers 18 miles of mains. The streets are lighted by electricity at an annual cost of \$39,000; the police department costs annually about \$90,000, and the fire department \$85,000.

Manufactures.—In 1900 Savannah had 155 manufacturing establishments, employing a capital of \$5,716,491 and 2,870 persons; paying \$1,176,150 for wages and \$3,915,884 for materials. The combined output for 1900 was \$6,461,816. The number of industries and their products has largely increased since 1900. The industries include fertilizer plants, cottonseed-oil mills, iron foundries, saw-mills, planing mills, rice and flour mills, cotton mills, furniture, sash, door and blind, broom and varnish factories, machine shops, ice factories, printing offices, book-binders, a lithographing establishment, breweries, etc. It has also two daily and several semi-weekly newspapers. The assessed property valuation in 1903 exceeded \$41,000,000 and the total bonded debt was about \$3,000,000.

Banks and Banking.—There are two national and seven state banks with a total cash capital of more than \$4,000,000 and a surplus of \$1,500,000. The bank clearances for the year ending 31 Dec. 1903 were \$195,265,562.

Commerce.—Next to New Orleans, Sa-

A VIEW OF SAVANNAH, GA.

vannah is the most important commercial city in the South. It is the greatest cotton port on the Atlantic coast of the United States. It has a water frontage of 6 miles. The largest seagoing vessels load at the city wharves, and the river is navigable by steamers as far as Augusta. It has large exports of cotton, rice, lumber, fertilizers, tobacco and naval stores. For the year ending 31 Dec. 1903 the value of the exports aggregated \$58,566,773.

Churches and Schools.—Prominent among the church buildings are Christ Church, Wesley Monumental Church, Trinity Methodist Church, First Baptist Church, Saint John's Church, Saint John's Roman Catholic Cathedral, Hebrew Synagogue Mickva Israel, and Independent Presbyterian Church. There are over 30 churches in the city, 13 of which are for colored congregations. The city also has the convent of Saint Vincent de Paul and an excellent public school system. There are 9,000 enrolled pupils in the public schools, which are maintained at an annual expense of \$125,000.

History.—Savannah was founded by General James Oglethorpe in 1733 and was chartered in 1789. In 1778 the British captured the city. In October of the following year it was besieged by the American and French forces, and in a battle fought on the 9th of that month the combined armies were defeated. In this assault Count Pulaski was mortally wounded. The town remained in the possession of the British until the close of the Revolutionary War. During the Civil War the city was a prominent depot of supplies for the Confederate armies and was the objective point of Gen. Sherman in his march to the sea. After a brief defense it was evacuated by the Confederates and the Union Army took possession 21 Dec. 1864.

Population.—In 1850 the population was 15,312; (1860) 22,292; (1870) 28,235; (1880) 30,709; (1890) 43,189; (1900) 54,244. The corporate limits of the city have since been extended and the population in 1904 was about 70,000.

J. H. ESTILL,

Editor 'Savannah Morning News.'

Savannah, Mo., city, county-seat of Andrew County; on the Chicago, G. W. and the Kansas City, St. J. & C. B. R.R.'s; 13 miles north of Saint Joseph. It was settled in 1842 and was incorporated as a city in 1854. It is the centre of an agricultural, fruit-growing, and stock-raising region; and has a flour mill and a creamery. The city has a public high school with a school library of over 700 volumes (1904). Pop. (1890) 1,288; (1900) 1,886.

Savannah, a river formed by the junction of the Tugaloo and Seneca rivers, and which, from its source, forms the boundary between Georgia and South Carolina. The length of the channel from its source to its mouth is 450 miles, but from the source to the mouth in direct line is only 250 miles. The area of the drainage basin is about 8,500 square miles. The current in the upper part of its course is rapid; considerable quantities of silt are brought down each year, and bars form in the broad portions of the stream where the current moves slowly. The tidal wave ascends to a point about 25 miles above Savannah. At Savannah the rise and fall of the tide is six and one half feet. The river is navigable for small vessels to Augusta, 230 miles, and for large vessels as far as Savannah.

Savannah to Goldsboro, Sherman's Campaign from (including the battles of Averasboro and Bentonville). Sherman's March to the Sea (q.v.) culminated in the capture of Savannah 21 Dec. 1864. It was a brilliant campaign, but of minor importance compared with that upon which he immediately prepared to enter. He says: "Were I to express my measure of the relative importance of the march to the sea, and of that from Savannah northward, I would place the former at one, and the latter at ten, or the maximum." Before the capture of Savannah Sherman had received from Gen. Grant, a letter dated 6 December, in which he had given his idea of Sherman's further movement, which was to establish a base on the sea-coast, fortify it, leave all artillery and cavalry, and enough infantry to protect them and threaten the interior, so that the militia of the South would have to be kept at home, and with the remainder of his command take transports for James River, join Grant before Richmond, and participate in the destruction of Lee's army and the overthrow of the Confederacy. Sherman replied: "I had expected, after reaching Savannah, instantly to march to Columbia, S. C., thence to Raleigh, and then to report to you." After the surrender of Savannah, Grant (27 December) accepted Sherman's plan and instructed him to start on his expedition northward without further delay, break up the railroads in South Carolina and North Carolina, and join the armies operating against Richmond as soon as he could and by the route he deemed best. Sherman hastened his preparations; Gen. Grover's division of the Nineteenth corps was detached from the Army of the Shenandoah and ordered to Savannah as a garrison, and Gen. Foster, commanding the Department of the South, was instructed to follow Sherman's inland movements by seizing in succession Charleston and other points on the coast, which might be abandoned. Ammunition, rations, and clothing were accumulated, and 14 Jan. 1865 the Seventeenth corps, Gen. Blair, took transports at Savannah for Hilton Head, S. C., and moved to Beaufort, thence to Pocotaligo, on the Charleston & Savannah Railroad, thus threatening Charleston. Later the Fifteenth corps, except Corse's division, joined the Seventeenth. The left wing, Fourteenth and Twentieth corps, under Gen. Slocum, with Corse's division and Kilpatrick's cavalry, moved up the Savannah River, 40 miles, to Sister's Ferry, thus threatening Augusta. When Slocum arrived at Sister's Ferry the river had overflowed its banks and submerged the adjacent lowland, and there was a delay of some days before the waters had fallen sufficiently for a crossing. On 1 February, when the general movement began, the army was composed of two wings: the right wing, under Gen. O. O. Howard, consisted of the Fifteenth corps, Gen. John A. Logan, and the Seventeenth corps, Gen. F. P. Blair; the left wing, under Gen. H. W. Slocum, consisted of the Fourteenth corps, Gen. J. C. Davis, and the Twentieth corps, Gen. A. S. Williams. The cavalry division, under Gen. Kilpatrick, moved with the left wing, as also, at first, Corse's division of Logan's corps. The strength of the army 1 February was 53,923 infantry, 4,438 cavalry, and 1,718 artillery, in all 60,079 men with 68 guns. There were about 600 ambulances, 2,500 wagons, and provisions for 20 days, mostly of bread, sugar,

SAVANNAH TO GOLDSBORO

coffee, and salt. Beef cattle were driven and it was expected that a good supply of cattle, hogs, and poultry would be gathered on the march. The disposition of the forces from Sister's Ferry on the left to Pocotaligo on the right menaced Augusta, Columbia, and Charleston, and left the Confederates in doubt as to the true point upon which Sherman was to move. The Confederates, under Gen. Hardee, whose headquarters were at Charleston, and who had about 16,000 men, occupied the line of the Salkehatchie River, while Wheeler's cavalry operated on the heads and flanks of the advancing column. On 1 February the movement began. Howard's right wing marched from Pocotaligo for the Beaufort and Rivers' bridges of the Salkehatchie, for the purpose of pushing on to the Edisto River, thus flanking Charleston. There was a sharp engagement (3 February) at Rivers' bridge, in which two divisions of Blair's corps waded breast deep through the swamp and carried the bridge with a loss of 88 killed and wounded, the Confederate loss being 52 killed and wounded. The Confederates, driven from the line of the Salkehatchie, retreated to Branchville, behind the Edisto, burning the bridges behind them. The left wing, under Slocum, marched through Barnwell, and on 10 February both wings were in the vicinity of Branchville on the Charleston and Augusta Railroad. Kilpatrick on the left, went as far as Aiken and threatened Augusta. From Branchville the railroads in every direction were thoroughly destroyed, and the army started for Columbia, each of the four corps taking a separate road. Howard went by the Orangeburg road, and on the 16th his head of column approached Columbia, which was occupied by Gen. C. L. Stevenson's division of infantry, and Butler's and Wheeler's divisions of cavalry, in all about 5,000 men. Stevenson fell back to Winnsboro, leaving Wade Hampton, commanding the cavalry, to follow. On the 17th the Fifteenth corps marched through the city and encamped beyond it on the Camden road. During the night the greater part of the city was accidentally burned. Slocum, advancing by Barnwell and Lexington, destroyed the Charleston and Augusta Railroad for several miles and, after menacing Augusta, received orders to cross the Saluda River, at Mount Zion's Church, above Columbia. During the night a bridge was constructed and next day Slocum and Kilpatrick crossed, passed over Broad River and, on the 21st arrived at Winnsboro, destroying on the way several miles of railroad north and south of Alston. Sherman, with the right wing, marched from Columbia, on the 20th, on the direct road to Winnsboro, and threatened Charlotte, N. C. He destroyed the railroad between Columbia and Winnsboro, and joined Slocum at the latter place. On the day that Sherman occupied Columbia Gen. Hardee evacuated Charleston, after destroying the public buildings, two iron-clad steamers, cotton and other property, and with about 14,000 men moved to Cheraw, on the Pedee River, and thence by a long march to Fayetteville, N. C. Next day Charleston was occupied by the Union troops of Gen. Foster, who found 450 abandoned guns. The city had been fired, churches and private residences burned, and everything presented a scene of desolation. Sherman, in his march, had made a clean swath of 40 miles, burning bridges, wrecking railroads, and devouring nearly every-

thing. Each family was left a reasonable amount of food, but all horses, mules, and wagons were taken. From Winnsboro Slocum destroyed the railroad as far north as Chester, threatened Charlotte, and then, forcing to the left the Confederates who were concentrating to dispute the march on Charlotte, the entire army turned eastward for Fayetteville, Slocum crossing the Catawba River at Rocky Mount and joining Howard, who had marched by roads further south, at Cheraw (3 March), where were found 24 guns, 3,600 barrels of gunpowder, and large supplies of stores, public and private, sent from Charleston for safe-keeping. Hardee made no opposition to the occupation of the place, and retreated to Fayetteville, leaving Wade Hampton's cavalry to cover his rear and burn the bridges behind them. On the 6th Sherman resumed his march on Fayetteville, by four different roads, and reached it on the 10th, Hardee again retreating without a show of defense, leaving Wade Hampton to skirmish with Sherman's advance and burn the bridge over the Cape Fear River. Kilpatrick, covering the movement on Sherman's left and rear, was surprised on the night of the 9th by Hampton's cavalry and pretty roughly handled, being driven from his camps and losing all his guns, which, however, he regained. He lost 183 men, of whom 103 were captured. The march through South Carolina had been greatly delayed by almost incessant rains and the swampy nature of the country. Nearly all the way the army was compelled to corduroy the roads before the trains could be moved, in some instances the first corduroying was out of sight before the trains had all passed, and another road was laid over it. All this was done cheerfully by the men, working in icy water up to their knees. Before reaching Fayetteville it was heard that Gen. Terry had taken Wilmington, and the day after the arrival of the army a Union steamer came up Cape Fear River, confirming the news and bringing mails and dispatches. Having thoroughly destroyed the arsenal buildings, foundries, and machine-shops at Fayetteville, the army crossed Cape Fear River on the 13th and 14th for Goldsboro, the objective point of the campaign, where it was to unite with Gens. Schofield and Terry, who were marching on that place from Newbern and Wilmington. It was now known that Gen. J. E. Johnston had been ordered to delay Sherman's advance, and Sherman estimated that he had 37,000 men for the purpose. Apprehending that Johnston would seek an opportunity to strike him on the last stage of the march, Sherman ordered Slocum on the left, to send his trains under a strong guard by an interior road on his right, and to keep at least four divisions with their artillery on the left well in hand, to meet an attack. Under this order Geary's and Baird's divisions were detailed to guard the trains. Slocum, preceded by Kilpatrick's cavalry, advanced on the direct road to Averbosboro, to make a feint on Raleigh, and Kilpatrick was then to strike the railroad near Smithfield. Sherman says he "proposed to drive Hardee well beyond Averbosboro and then turn to the right by Bentonville for Goldsboro." On the 15th Hardee was retiring from before Slocum, having for his rear-guard a brigade composed of artillery troops, that had garrisoned Charleston, under command of Col. Alfred Rhett. During the evening Kilpatrick, in skirmishing with this

SAVANNAH TO GOLDSBORO

rear-guard, near Taylor's Hole Creek, took some prisoners, among whom was Col. Rhett.

Battle of Averasboro.—On the morning of the 16th opposition to the march was quite stubborn, and Kilpatrick, forcing back the Confederate rear-guard, came upon a line of intrenchments, on a narrow neck of swampy land, between Cape Fear and South rivers, and covering the road to Bentonville, along which Sherman intended that Slocum's wing should march to Goldsboro. Kilpatrick's cavalry was moved to the right and Jackson's and Ward's divisions of Williams' Twentieth corps were deployed in front of the Confederate line, and the two divisions of the Fourteenth corps ordered up on Williams' left. Case's brigade was sent by Williams to the left to gain the flank and rear of the Confederate line, and succeeded in striking it in flank and sweeping it from position, capturing McBeth's Charleston battery of three guns and 217 of Rhett's artillery acting as infantry. Jackson's and Ward's divisions advanced and came upon the Confederates in another line of works about 400 yards in rear of the first. Kilpatrick was sent to the right to seize the Bentonville road, but his leading brigade was driven back by a furious attack of McLaw's division, upon which the Union infantry advanced directly against Hardee, who also was advancing, and drove him inside his works, and Slocum went into bivouac in his immediate front. During the night, which was stormy and very dark, Hardee retreated, leaving 108 dead and 68 wounded on the field. His entire loss, as estimated, was about 650, of whom 175 were captured. Slocum's loss was 77 killed and 477 wounded. Next morning Ward's division pursued Hardee a short distance beyond Averasboro and ascertained that he had retreated toward Smithfield.

Sherman was now under the delusion that no serious opposition would be made to his march on Goldsboro. "All signs," he says, "induced me to believe that the enemy would make no further opposition to our progress, and would not attempt to strike us in flank, while in motion." Under this impression his commanders were instructed to march their troops in the easiest manner and by the nearest roads to Goldsboro. The left wing marched from Averasboro, on the direct road and on the night of the 18th, after driving back Hampton's cavalry to a position selected by Hampton for a battle, the Fourteenth corps in advance, encamped 25 miles from Goldsboro and five from Bentonville, at a point where the road from Clinton to Smithfield crossed the one to Goldsboro. Two divisions of the Twentieth corps were camped 10 or 12 miles in rear, while Geary's and Baird's divisions were on other roads, with the trains still farther to the south. Howard's two corps were to the south and east, their advance at Lee's Store, more than a day's march distant. Sherman had been with Slocum and the left wing since the 14th and very early on the morning of the 19th started to join Howard, several miles to the east and south, to concentrate his forces and unite with Slocum at Goldsboro, where he expected to meet Schofield and Terry. He had no suspicion that Gen. Johnston, with a strong force was then in Slocum's immediate front, and supposed that the only opposition to be met would be from cavalry. When about to leave Slocum he expressed the opinion

that Hardee had fallen back to Raleigh and that Slocum could reach Neuse River the next day, in which opinion Slocum concurred. But Gen. Carlin, commanding a division of the Fourteenth corps, and who was nearest the enemy, had observed matters that indicated a large force in front prepared for battle, and sought to impress his own convictions upon Sherman, who made light of them, said nothing but cavalry was in front, and rode away to join Howard.

On 23 February Gen. J. E. Johnston had been assigned to the command of all the forces that could be collected to make head against Sherman. At this time Hardee was moving toward Fayetteville, N. C.; Beauregard was directing the march of C. L. Stevenson from Winnsboro to Charlotte; Cheatham, with his division of Hood's army, had come from Augusta, Georgia, and was moving toward Charlotte, but on the west side of the Congaree and Broad rivers, and A. P. Stewart, with about 1,000 men of Hood's army, was marching for Charlotte. Johnston's first task was to concentrate these troops, which was done at Smithfield, N. C., where he was joined by Hoke's division from Lee's army at Richmond, which had unsuccessfully engaged Gen. Cox, near Goldsboro (see KINSTON, BATTLE OF), and also by S. D. Lee, with about 3,000 men of Hood's army. In all Johnston had about 20,000 men. He had as subordinate commanders Gens. Bragg, Hardee, A. P. Stewart, S. D. Lee, Wade Hampton, and others of high rank, who had long been the pride and ornaments of the Confederate armies.

Battle of Bentonville.—On the 17th Gen. Johnston had become satisfied that Sherman was not marching on Raleigh. He heard on the morning of the 18th that Sherman was marching on Goldsboro, and was informed by Wade Hampton that the Fourteenth corps was in his immediate front, that the Twentieth corps was several miles in rear on the same road, while Howard's two corps were on roads some miles to the south, and he determined to crush the Fourteenth corps before the Twentieth could come to its support, and then fall upon the Twentieth. He ordered Hampton to hold Slocum's head of column in check until he could march from Smithfield, 16 miles distant, and join him to give battle on ground that Hampton had selected, and to which he was forced back that evening, which was at a point about three miles south of Bentonville. In order to attack the head of Slocum's column early next morning, Johnston immediately marched his army from Smithfield, intending to bivouac that night between Bentonville and the road on which Slocum was moving. But the distance was greater than expected, the roads bad, and but a small part of the column reached Bentonville that night, the main column bivouacking some distance in rear. As soon as Hardee's troops reached Bentonville next morning they were marched by the left flank, Hoke's division leading, to the ground selected by Hampton, on the eastern edge of an old plantation, extending 1½ miles to the west, and lying principally on the north side of the road, and surrounded east, south, and north, by dense thickets of black-jack. As there was but one narrow road through the thicket, the deployment of the troops consumed a weary time. Hoke's division was formed with its centre on the road, its line at right angles to it, on the eastern edge of the plantation, and its left ex-

SAVART'S WHEEL

tending some 400 yards into the thicket to the south. Two batteries, the only artillery, were on his right, commanding the ground in front to the extent of the range of the guns. The troops belonging to the Army of Tennessee were formed on the right of the artillery, their right strongly thrown forward, conforming to the edge of the open ground. Meanwhile, and before these dispositions had been completed, the battle had opened. Very early in the morning Hampton had thrown forward his cavalry, and when Carlin's division of the Fourteenth corps began its march at 6 o'clock it became almost immediately engaged with the Confederate cavalry, which offered such a stubborn resistance that Carlin deployed his entire division and brought up his artillery, and one brigade was sent to the left to develop the Confederate line, and as the resistance increased Morgan's division was moved to Carlin's right as a support, and the entire line was ordered to go forward, and was soon severely engaged, convincing Slocum that he had something more than cavalry in his front, of which fact he was soon further convinced by a deserter from the Confederates, who informed him that Johnston was in his immediate front, and that the talk in the Confederate camp was that Slocum was to be crushed.

Slocum prepared for defense by throwing up works, ordered Williams, commanding the Twentieth corps, to throw his train to the right and hasten up, and sent a messenger to Sherman with the information that Johnston's army was in his front. Carlin's division in advancing struck Hoke's division and, after some severe fighting, was repulsed, upon which Johnston ordered Hardee to charge with the right wing, Stewart's Army of Tennessee troops, and Taliaferro's division, and Gen. Bragg to join in the movement with his brigades successively, from right to left, each making the necessary change of front to the left in advancing. Hardee led his men forward and drove Carlin back just as the advance of the Twentieth corps came up, one brigade of which was sent to Carlin's support, and was driven back with him and another put in the gap between Carlin and Morgan just as the Confederates reached the line, the remainder of the corps forming on Carlin's left. The Confederates had become somewhat broken up in advancing through the woods, and when they received a telling fire from behind the slight intrenchments that had hurriedly been thrown up they fell back. On the right Morgan's division of the Fourteenth corps, with its supports, held its ground against Bragg's persistent attacks. The Confederate assaults were repeated several times until a late hour, each assault finding the Union line better prepared to receive it. Johnston had given the Fourteenth corps a heavy blow, but had failed to crush it, and determined not to renew the attack, but only to hold the ground until his wounded could be removed. The battle of the 19th was fought by about 16,000 men of the Fourteenth and Twentieth corps on one side, and about the same number of Confederates on the other.

When Capt. Joseph B. Foraker delivered to Sherman the message from Slocum that he had run up against Johnston's whole army, Sherman was incredulous, but he sent word to Slocum to hold on, ordered the Fifteenth corps, which was well to the rear, to turn at once toward Benton-

ville, and the Seventeenth corps to move in the same direction. Hazen's division of the Fifteenth corps reported to Slocum during the night, and was placed on the right. Early in the morning of the 20th Geary and Baird, each with two brigades, arrived on the field. Baird was placed in front of the works, and moved out beyond the advanced position held on the preceding day. The day was spent in strengthening the position and developing the line of the enemy, which brought on sharp skirmishing. The right wing under Howard came up late in the afternoon of the 20th and on the morning of the 21st. It had marched 20 miles over bad roads, skirmishing a great part of the way with the Confederate cavalry. There was heavy skirmishing during the day, but no general attack, and during the night Johnston retreated, crossing Mill Creek by the bridge at Bentonville and bivouacking on the night of the 22d near Smithfield. The Union loss in the battle was 191 killed, 1,168 wounded, and 287 missing, an aggregate of 1,643. The Confederate loss was 239 killed, 1,694 wounded, and 673 missing, an aggregate of 2,606.

On the 22d Sherman resumed his march on Goldsboro and on the 23d and 24th his entire army was assembled around the place and junction made with Schofield's and Terry's forces, which had occupied it two days before. (See GOLDSBORO, KINSTON, etc.) "Thus," writes Sherman, "was concluded one of the longest and most important marches ever made by an organized army in a civilized country . . . The country generally was in a state of nature, with innumerable swamps, with simply mud roads, nearly every mile of which had to be corduroyed. In our route we had captured Columbia, Cheraw, and Fayetteville, important cities and depots of supplies, had compelled the evacuation of Charleston City and Harbor, had utterly broken up all the railroads of South Carolina, and had consumed a vast amount of food and forage, essential to the enemy for the support of his own armies. We had in mid-winter accomplished the whole journey of 425 miles in 50 days, . . . and had reached Goldsboro with the army in superb order, and the trains almost as fresh as when we had started from Atlanta." E. A. CARMAN.

Savart's Wheel, an instrument for determining the number of vibrations which produce any given musical note. A toothed wheel, furnished with a counter to indicate the number of revolutions, is supported on a frame, and arranged to be driven by a band at high velocities from a rather heavy fly-wheel, and a card is fixed on a frame so as to be struck by the teeth of the toothed wheel. If the wheel be turned slowly a click is heard from the card as each tooth strikes it; on increasing the speed the separate clicks are no longer heard, but a musical note is sounded, which rises in pitch as the velocity is increased. If a large ring having teeth on the inside be fixed, and if the card be made to sweep round against these teeth, a note will be produced depending on the velocity of the card; but if the ear of the experimenter be

placed in an extension of the plane of the ring the note will not be constant, for it will be heightened as the card approaches him, and it will be flattened as the card recedes from him. The note will only be constant when the ear of the experimenter is at a point equidistant from all the teeth of the ring.

Savary, sä-vä-rē, Anne-Jean-Marie-René, DUKE OF ROVIGO. French general: b. Marcq, department of Ardennes, 26 April 1774; d. Paris 2 June 1833. In 1789 he entered an infantry regiment. He served under Custine, Moreau, and Desaix, and accompanied the last named on the expedition to Egypt. After the battle of Marengo he was appointed adjutant to Bonaparte, and soon rose very high in his confidence. His share in the execution of the Duke d'Enghien has never been properly explained, and is one of the darkest spots in his character. After rising to the rank of lieutenant-general he was rewarded, after the victory of Friedland, with the title of Duke of Rovigo. In 1808 the emperor sent him to Madrid, where he negotiated the arrangement by which the Spanish king and his son were kidnapped. In 1810 he succeeded Fouché as minister of police. On Bonaparte's return from Elba he gave in his adhesion to him, and was appointed inspector-general of gendarmes. He was carried to Malta in 1815, but escaped after being a prisoner for seven months. While here he began his 'Memoirs.' Later he stood trial at Paris as one who had contributed to Napoleon's return, but was acquitted. In 1831-3 he was military commander of Algiers.

Savastana. See GRASSES IN THE UNITED STATES.

Save, säv, or Sau, sow, Austria, a river tributary to the Danube, formed near Radmannsdorf from the waters of the Wurzen and Wochlein Save which have their source in the eastern slope of the Julian Alps, and flow southeast through Illyria, along the southern part of Styria, into Croatia. At the frontier it becomes exceedingly tortuous, and finally flows through the Wocheiner See. The fall is rapid until the Leibach is received, and then the river becomes navigable, flowing through a narrow valley enclosed by mountains; it follows a circuitous route for about 540 miles and joins at Belgrade the Danube. Its main tributaries are all on the right—the Kulpa, Unna, Verbas, Bosna and Dvina. In the lower part, forming the boundary between Austria and Servia, it flows through flat plains, often devastating them by inundation. It forms an important outlet for the produce of the districts which it traverses.

Savery, Thomas, English engineer: b. Shilstone, near Modbury, Devonshire, about 1650; d. London May 1715. He became a military engineer, and rose to be captain in 1702. He is known for his inventions, most important of which was a machine for raising water from mines, which was the first practical application of steam-power to a mechanical purpose. A patent granted him in 1698 extended until 1733.

Savage, Eugene Coleman, American physician and author: b. Maryland 21 Oct. 1863. He was graduated from the University of France in 1888, from that of New York in 1880. He was for a time editor of the 'Expressman' and is

now attending gynecologist at Saint Mark's Hospital, New York. He has written: 'Wallingford' (1882); 'Life and Times of Brewster' (1891); 'The American in Paris' (1895); etc.

Savigny, sä-vën-yë, Friedrich Karl von, German jurist: b. Frankfort-on-the-Main 21 Feb. 1779; d. Berlin 25 Oct. 1861. He studied chiefly at Marburg, became a lecturer there in 1800, and in 1803 professor of jurisprudence. In 1808 he was made professor of law in the University of Landshut, in Bavaria, and in 1810 obtained the chair of jurisprudence in the newly established University of Berlin, where he continued to lecture with uninterrupted success for 32 years. He was elected a member of the Prussian Academy of Science, in 1811, was appointed a councillor of state in 1817, and in 1842 minister of justice for the revision of the law. He retired in 1848. His principal works are: 'Geschichte des römischen Rechts im Mittelalter' (1815-31); 'System des heutigen römischen Rechts' (1840-8), to which 'Das Obligationenrecht' (1851-3) forms an appendix; 'Vermischte Schriften' (1850), a collection of essays which had appeared in legal periodicals. He brilliantly applied the historical method to the exposition of the Roman law. Consult the biographies by Bethmann-Hollweg (1867) and Enneceerus (1879).

Savile, säv'il, or Saville, George, MARQUIS OF HALIFAX, English statesman and writer: b. Thornhill, Yorkshire, 11 Nov. 1633; d. London 5 April 1695. On the death of Cromwell he distinguished himself by his exertions in behalf of Charles II. In 1669 he was appointed a commissioner of trade, in 1672 became a member of the privy council, and in 1682 was created Marquis of Halifax and lord privy seal. Under James II. he was made president of the council, but was deposed because he opposed the repeal of the Test and Habeas Corpus Acts. From this time Lord Halifax continued in opposition, and contributed to the elevation of William III. to the throne. He was the author of 'Advice to a Daughter' (1668), and of a variety of political tracts, the principal of which are: 'Maxims of State'; 'The Character of a Trimmer'; 'Character of King Charles II.'; 'Anatomy of an Equivalent'; 'Letter to a Dissenter.'

Savile, SIR Henry, English scholar: b. Bradley, near Halifax, Yorkshire, 30 Nov. 1549; d. Eton 19 Feb. 1622. He was educated at Oxford, became tutor in Greek to Queen Elizabeth, and in 1585 was made warden of Merton College and provost of Eton in 1596. He was knighted by James I. in 1604. In 1619 he founded two professorships in geometry and astronomy at Oxford, besides conferring several other valuable benefactions, both in property and books. Among his works the principal are his 'Commentaries on Roman Warfare' (1591); 'Rerum Anglicarum post Bedam Scriptores' (1596); 'Prælectiones tresdecim in principium elementorum Euclidis' (1621); and his edition of the writings of Saint Chrysostom (1610-13), in eight folio volumes, a work on which he is said to have spent £8,000.

Savona, sā-vō'nā, Italy, in the province of Genoa on the west coast of the Riviera, 26 miles southwest of Genoa, is one of the most important towns of that region. It is picturesquely situated amid vine-clad hills and orange groves. The Castle of Saint George (1542) is now a military prison; the other buildings deserving notice are a Renaissance cathedral, with the magnificent tomb erected by Sixtus IV. to his parents; the Della Rovere Palace, now occupied by municipal offices; other churches, a lyceum, a technical and a commercial institute, other educational institutions, a fine theatre, and a large hospital. It is a centre of the iron industry, having foundries of all kinds, besides glass-works and sulphur mills. It is an important seaport and its chief imports are coal, petroleum, iron, cereals, etc.; the exports consist of tomatoes, wood, and candied fruits. The harbor, which is good, is defended by a fort. Pop. (1899) 28,500.

Savonarola, Girolamo, jē-rō'lā-mō sā-vō-nā-rō'lā, Italian religious reformer: b. Ferrara, Italy, 21 Sept. 1452; d. Florence 23 May 1498. As a boy he was well acquainted with mediæval learning and his family intended that he should become a physician, but a disappointment in love turned his thoughts to the church, and in 1475 he left home secretly and joined the Dominican order. After passing a severe novitiate in the monastery at Bologna he was made a teacher there, and in 1482 was sent to Saint Mark's monastery in Florence where he became disgusted at the corruption in church and state, and began to attack the abuses in his sermons. His first success as a preacher was at Brescia in 1484-5. He fascinated the worldly Italians by his terrible denunciations of vice and wickedness, and returned to Florence with a reputation as a popular preacher. In 1490 he was made *lector* in Saint Mark's, and crowds came to hear him. A year later he was chosen prior of Saint Mark. Though his convent had been favored by Lorenzo di Medici, Savonarola refused to do homage to him, as was customary. Lorenzo tried in vain to conciliate the friar who continually preached against the abuses in state and church. In 1492, Lorenzo di Medici, the chief opponent to the work of Savonarola in Florence, died. In the political confusion that followed, and during the invasion of Italy by Charles VIII. of France, Savonarola by his public services acquired great influence among the Florentines. He desired a democratic government for Florence, and, when in 1494 the people drove out the Medici, he opposed the schemes of the aristocracy to seize the government, called a mass-meeting of the citizens and practically assumed the dictatorship of Florence, superintending the formation of a government in which the people were to fear God and amend their conduct, and prefer public to private interests. A general amnesty was proclaimed, and a council modeled on that of Venice was chosen to administer the government. There was no doge as in Venice, but for three years Savonarola was dictator. His enthusiasm for liberty, his zeal in religion, and his eloquent sermons, caused light-hearted pleasure-loving Florence to become a city of Puritans. Thomas Aquinas and the Old Testament furnished the spirit of the laws. Though not of the Renaissance and hostile to its spirit, especially to the pagan influence derived from the

classics, Savonarola was not an enemy to learning and fine arts, though in 1497 he encouraged committees of children and devotees to search the city for frivolous books, cards, profane songs and music, and works of art of evil tendencies, which were destroyed under the direction of the government. No good books or works of art were destroyed at this time, though the next year many were lost in a second "burning of the vanities." Savonarola aimed at reforming the Church in the same caustic way. With his moral reforms he closely knitted political schemes and doctrines, and several times preached vigorously against Pope Alexander VI., who first tried to conciliate him. Savonarola spurned his advances, and in 1496 was ordered to cease preaching, and to undergo a trial for heresy. Silent for a time, Savonarola was attacked by the Franciscans and began again to preach. In 1497 he was excommunicated and Florence was threatened with an interdict if she harbored him. For a year he defied excommunication and demanded that a general council be called to depose Pope Alexander. But he had presumed too much upon the support of the fickle citizens. Many were weary of the Puritan rule and longed again for the flesh pots of Egypt; the other cities of Italy were hostile to Florence because of her course during the French invasion and because of her democratic government; there had been famine and pestilence, which Savonarola had been unable to alleviate; some of the followers of the Medici had been executed and thus powerful enemies made; and now Florence was threatened with an interdict. Savonarola had to be guarded by armed followers when he went to preach. In 1498, while still powerful, he in a sermon had called upon Heaven to consume him with fire if he had acted from unchristian motives. A friar of the Franciscan order thereupon offered to pass through the ordeal of fire with Savonarola, who treated the offer with contempt. But the Dominicans volunteered to undergo the ordeal to show their faith in Savonarola, and after hesitation, which his enemies made the most of, Savonarola consented to the judgment by ordeal, believing in Divine intervention in his favor. The fires were made ready and the opposing champions seemed ready to enter the flames, when the Franciscans, who had no intention of carrying out the judgment by ordeal, began to raise disputes to cause delay. They insisted that the Dominicans must not bear the crucifix nor the host through the flames. Savonarola would not agree to give up the latter and the dispute lasted until a rain came and gave the Franciscans an opportunity to slink away. But upon Savonarola was blamed the failure of the ordeal. The populace was infuriated because they had missed the show, and called Savonarola an impostor who was afraid of the ordeal. Florence turned against him; he was arrested, accused of heresy and after six days' torture and a hasty and unfair trial, was condemned to be hanged and then burned. The sentence was carried out with all the refinements of cruelty. Savonarola was a powerful, typical mediævalist, hostile to many of the manifestations of the Renaissance spirit. His talent for political organization was profound, but he was mistaken in thinking the Florentines capable of self-control in politics or of puritanism in religion. The Italian despots

understood the people better than Savonarola, and only as a despotic leader was Savonarola himself to any degree successful. His ideals were those of an ascetic, uncompromising, rigid. An eloquent speaker, he, for a time, imposed his ideals upon the Florentines, who when weary of being good, left him to his enemies. Of a mystical turn of mind, he attached great importance to dreams and visions which he related in his sermons. The writings of Savonarola were voluminous, embracing sermons, essays and poems on religious subjects, and a treatise on the government of Florence. Consult: Madden, 'Life of Savonarola' (1853); Villari, 'Life and Times of Girolamo Savonarola,' 2 vols. (1889); Symonds, 'The Age of the Despots' (1875); also George Eliot's 'Romola' (1863), and Alfred Austin's drama 'Savonarola' (1881); O'Neil, 'Jerome Savonarola' (1898); Lucas, 'Life of Savonarola' (1899).

W. L. FLEMING,
West Virginia University.

Savou, sā-voo', **Savoe**, or **Saboe**, an island of the Asiatic Archipelago in the Indian Ocean, near the islands of Timor and Sandalwood. It covers an area of 237 square miles. The surface is elevated in the centre, sloping seaward. It is well-watered and fertile, yielding millet, corn, beans; tropical products as usual in this latitude, including betel, cinnamon, mangoes, cotton, tobacco, etc. Domestic animals are numerous, besides buffalo, wild boars and deer. Horses and tobacco are the chief exports, sent to Timor. The island consists of five principalities, subject to the Dutch government of Timor. The inhabitants are Malays—a strong race with pagan practices, including dog sacrifices. Pop. 16,000.

Savoy, sa-voi', **House of**. The territory of Savoy formed part of ancient Gaul, and from 122 B.C. to 407 A.D. was in possession of the Romans, by whom it was divided into two provinces, the Graian and Pennine Alps. At the latter date it was seized by the Burgundians, but with Burgundy it became subject to the Franks in 534, was included in the Carolingian empire, and on its dissolution in 887 was granted by the Diet of Tribur to Rudolph, king of Transjurane Burgundy, and with that kingdom was united to Cisjurane Burgundy or Arles. On the accession of the last king of Arles to the imperial throne as Conrad II. in 1027, the more powerful nobles of northwestern Italy, such as the Marquis of Susa, the Counts of Maurienne, Turin, and Chablais, became vassals direct of the emperor. Umberto Blancamano, Count of Maurienne, was the first of the family who took a prominent place among the princes of northern Italy. His nephew, Amadeus II. (1060-80), in right of his mother, Adelaide, heiress to the Marquisate of Susa, added nearly the whole of Piedmont to the original possessions of his house. Humbert II., his son and successor (1080-1103), further increased his dominions by the conquest of Tarantasia. Amadeus III. (1103-49) received from the Emperor Henry V. the title of Count of Savoy in 1111; and his grandson, Thomas I. (1188-1233), who supported Frederick II. in his contest with the popes, obtained important accessions in Chambréry, Turin, Vaud, and other lordships. Amadeus IV. (1233-53), like his father a warm adherent of the emperor, obtained the submission of the city of Turin to his rule, and ceded Pied-

mont to one of his brothers, Thomas, count of Maurienne. He was succeeded by Boniface (1253-63), and Boniface by his uncle, Peter (1263-8), who reconquered Turin, which had rebelled. His nephew Amadeus V. (1285-1323) now mounted the throne; he assisted Philip the Fair in his war against Flanders, and accompanied the emperor Henry VII. to Italy. His grandson Amadeus VI. aided the Greek emperor, John Palæologus, against the Turks and the Bulgarians, and accompanied the pretender Louis of Anjou, in his expedition to Naples. His son, Amadeus VII. (1383-91), forced the Count of Provence to cede to him Nice and Vintimiglia. Amadeus VIII., grandson of the preceding (1391-1451), received the ducal title from the Emperor Sigismund in 1416, acquired the county of Geneva, together with Bugey and Vercelli, and re-annexed Piedmont. Louis, who on the abdication of his father had governed as regent, assumed the title of duke in 1440. The elder male line becoming extinct in 1496, the crown devolved on the nearest collateral heirs, Philibert II. (1496-1504) and his brother Charles III. (1504-53). The latter aided the Emperor Charles V. against Francis I. of France, and after losing Valais and Geneva, which joined the Swiss Confederation in 1533, and the canton of Vaud, seized by the Bernese in 1536, he was finally deprived of all his territories by the French king. But his son Philibert Emmanuel, surnamed the Iron Head (1553-80), commander-in-chief of the Spanish army, succeeded in gaining back the greater part of the paternal domains by the treaties of Câteau-Cambrésis (1559) and Lausanne (1564). In 1560 he was induced by the courts of Rome, Spain, and France to attempt the conversion of the Waldenses by force, but they offered such vigorous resistance to his troops in several encounters that he granted them, under certain conditions, the free exercise of their religion (5 June 1561). Charles Emmanuel I. (1580-1630) was defeated by Henry IV. of France, who invaded Savoy and Piedmont. His son, Victor Amadeus I., speedily regained the possessions his father had lost, and added to them Montferrat, Alba, and some other places, surrendering to France in exchange Pignerol, La Perouse, Angrone, and Lucerne. His younger brother Thomas was the founder of the line of Savoy-Carignan. Victor Amadeus II. (1675-1730), grandson of the first of that name, at the beginning of the war of the Spanish Succession, sided with France; but, bribed by brilliant offers, allied himself to Austria by the Treaty of Turin, 25 Oct. 1703. The victories of the Duke of Vendôme compelled him to retire to Genoa, but the defeat of the French under the walls of Turin by Prince Eugene (7 Sept. 1706) restored his possessions. In 1709 he severed the Austrian alliance, and remained neutral till the end of the war. By the Treaty of Utrecht (1713) he received a part of the Duchy of Milan, with the island of Sicily, which conferred upon him the title of king. In 1720 he was compelled to give up Sicily to Austria in exchange for Sardinia, which with Savoy, Piedmont, and his other continental dominions, were erected into the Kingdom of Sardinia. Consult: Wiel: 'The Romance of the House of Savoy' (1901).

Savoy, or **Savoie**, sā-vwä, France, consists of two eastern departments. Savoie and Haute-Savoie, formed in 1860 out of the former duchy

SAVOY CABBAGE — SAVOY DECLARATION

of Savoy, one of the states of the Sardinian monarchy (q.v.); it covered an area of 3,891 square miles, and is exceedingly mountainous. The region is separated from Switzerland by Lake Geneva, and is dominated by Mont Blanc, the loftiest peak of the Alpine chain, whose many ramifications extending in all directions present a relief of successive mountains and valleys. Savoy belongs to the Rhone basin which forms its western boundary. The other rivers are the Arve, Isère and Arc. The chief lakes besides Geneva are those of Bourget and Annecy. The climate is, generally speaking, cold. Savoy is rich in mineral waters, of which the most famous are those of Aix-les-Bains (hot-sulphur), Marlioz, Challes (strong natural sulphur), Salins-Montiers (hot, saline, various minerals), Brides-les-Bains (soda, calcium). The extent of arable ground is limited, but a scarcity of grain is supplied by the chestnut which forms a staple of food among the peasants and poor. The vine is somewhat cultivated in the lower valleys and slopes. The main source of profit is in the cattle and dairy produce, as hay and pasture alone are obtained from much of the land. The forests which cover vast mountain slopes, also afford a rich supply of timber. The minerals are not sufficiently exploited to be of any importance. The manufactures are coarse woollens, linen and cotton goods, felt hats, leather and hardware. Other industries are silk, tanning and weaving. There is an important transit trade carried on between France and Italy, by way of Mont Cenis. Coal, skins, cotton, provisions, are imported; cattle, dairy produce, wood, stones, mineral waters, silk goods, tanned leather and paper are exported. There are some schools, and all speak French and are exclusively Roman Catholic. The University Academy is at Chambéry, and clock-making is taught in two special schools at Annecy, employing 2,000 hands. (Here is also a large cotton mill.) The inhabitants are industrious, honest, hospitable and intelligent; their chief characteristic, however, is the love of country. Though often compelled to leave their homes for winter employment, wandering through France, Switzerland, Spain, or Italy, in order to earn a livelihood, they return to their native mountains at the earliest moment. Sardinia ceded Savoy to France in 1860. It was formed into the two departments of Savoie and Haute-Savoie, whose capitals are respectively, Chambéry and Annecy. Pop. Haute-Savoie (1901) 259,595; of Savoie (1901) 249,460; total, 509,055.

Savoy Cabbage, a variety of cabbage (q.v.) with many sub-varieties, forming large close heads with wrinkled leaves, and cultivated for winter use, requiring a light, rich soil.

Savoy Conference, a conference held in 1661 at the Savoy Palace, London, between a number of Church of England and Presbyterian divines for the purpose of "advising upon and reviewing the Book of Common Prayer; and of taking into serious consideration the several directions and rules, forms of prayer, and things in the same book; of consulting also upon the several objections which shall now be raised against the same; and, if occasion need be, to make such necessary and reasonable alterations, corrections, and amendments as shall be agreed upon to be needful and expedient for the giving

satisfaction to tender consciences, and the restoring and continuing of peace and unity in the churches under his majesty's government and protection." When the Parliamentary cause triumphed in the civil war of 1642-6 the majority of the clergy, who were royalists, were either turned out of their pulpits and their places were filled by Presbyterians, then a strong body in England, and at the Restoration of Charles II. a large number of the ministers connected with the church strongly objected to Episcopalian order and practice being again introduced. The government was fully aware of this state of matters, and it was accordingly resolved that the determination of all matters appertaining to the establishment of unity should be left to the advice of a national synod. On 25 March 1661, therefore, the letters-patent above quoted from were issued, appointing 12 bishops, with nine clergymen as assistants on the Episcopal side, to meet with an equal number of Presbyterian divines, and discuss the matters therein mentioned. The commissioners met for the first time on 13 April. Sheldon opened the discussion by observing that the Episcopal party, being perfectly satisfied with the established forms of worship, had nothing to propose, and would therefore expect that any objections to the existing order of things, and any innovations that might be desired, should be mentioned by their opponents. The Presbyterians moved that Bishop Usher's Reduction of Episcopacy, a scheme in which the elements of the Scotch system of presbyteries, synods, and general assemblies were combined with distinctions of ecclesiastical ranks, should be laid down as a groundwork to treat upon. They further offered several exceptions to the liturgy, against the many responses of the people, and desired that all might be made one continued prayer. They objected to lessons being taken out of the Apocrypha, and wished that the psalms used in the daily service should be according to the new translation. They excepted to many parts of the baptismal service that infer the doctrine of the regeneration of the baptized. They also moved that the practice of kneeling at the Lord's Supper, and that the use of the surplice, the cross in baptism, of godfathers as sponsors, and the celebration of the holy days, should be abolished. It was urged in reply to the demand for the adoption of Usher's scheme, that the king's commission gave them no power even to take into consideration any questions relating to the government of the church; and the Presbyterians proceeded to discuss the minor points, mainly the alterations in the liturgy. Baxter undertook the preparation of what was called a Reformed Liturgy, but the Episcopalian commissioners rejected it at once, without examining it. The two parties finally separated at the end of four months, the period assigned by the letters-patent, without coming to a single resolution, and the government passed in the following year the famous act of uniformity, the stringent clauses of which drove about 2,000 clergymen from the Anglican Church.

Savoy Declaration, the document uttered by the Independents and Presbyterians who met at the Savoy Hospital in London 29 Sept. 1658. In it these religionists declared the principles of their faith and polity. The Declaration is substantially the same as the Westminster Con-

fession. See CONFESSION OF FAITH, WESTMINSTER.

Savoy, Military Order of. See ORDERS, ROYAL.

Sa'vory, an aromatic plant of the labiate genus *Satureja*, native to the Mediterranean region and the Levant. These are herbaceous or half-shrubby plants, cultivated in kitchen gardens. Summer savory is the annual (*S. hortensis*), with slender branching stems nearly a foot high, bearing soft, lanceolate leaves, often stained with purple, and with lilac or white mint-like flowers in the axils. The young shoots are plucked at flowering time, and dried for flavoring stuffings, etc. Winter savory (*S. montana*) is a perennial species, with similar qualities.

Saw-fish, a ray of the family *Pristidae*, so called from the sword-like snout, the sides of which are armed with spines, so as to give it the appearance of a large double-toothed saw. Armed with this formidable weapon, which may measure two or three feet or more in length, the saw-fish is said to attack even whales, and to inflict severe injuries upon them, while it is certainly destructive to shoals of small fishes upon which the saw-fish subsists. The true teeth of the mouth are small, blunt, and arranged pavement-like. The mouth is situated on the under surface of the head, and the breathing apertures are large and set behind the eyes. The fins, tail, and granular scales are shark-like in most respects. About five species are known, all inhabitants of the open ocean, whence they seldom approach the shore; and they prefer warm waters. A common species on the Gulf coast of the United States is *Pristis pectinatus*, which sometimes enters the lower Mississippi or wanders northward on the Atlantic coast; it is 10 to 20 feet long. The *Pristisphorida*, which bear a similar weapon, are sharks.

Saw-flies, insects of the family *Tenthredinidae*. Unlike the wasps, bees, ants, and other members of the order *Hymenoptera*, the abdomen is united by its full girth to the thorax; that is, it is sessile. The most characteristic structure, however, is the ovipositor, which is composed of several parallel blades with toothed edges. With these the insects cut slits in plant tissues for the reception of their eggs. In general they resemble other members of the order in having two pairs of transparent wings with rather few veins and cells, biting mouth-parts, and a complete metamorphosis. The larvæ resemble caterpillars, but have at least six pairs of prolegs instead of five as do the larvæ of lepidopterous insects. They are also frequently slimy, and quite often they keep part of their bodies curved over the edge of the leaf upon which they are feeding. All feed upon living vegetable tissue, and some have been considered troublesome upon cultivated plants. Probably the best known of these is the currant-worm or slug (*Nematus ribesii*), a European insect with a yellow body. The black-dotted green larvæ appear shortly after the leaves in spring, eat gluttonously for about three weeks and transform to adults below the ground. Two or three broods may appear in a season. The pear slug (*Eriocampa cerasi*) is a slimy larva which sometimes damages pear foliage. Rose slug,

grape slug, raspberry slug, turnip fly, and willow saw-fly are other well known species which occasionally seem to overstep the bounds of their usefulness. In such cases they have been combated with an insecticide (q.v.) which must be eaten, though in some cases dust, forcible spraying with water, and other remedies have been reported effective.

Saw-mill, an arrangement of machinery by which logs are converted into planks, boards and timber. The earliest form was the saw-pit with raised trestle horses onto which the log was raised, and then sawed by hand saws or by whip saws. Windmill power was applied about the beginning of the 13th century, and was soon followed, especially in Germany, by water power.

All attempts to establish saw-mills in England during the period of 1660-1770, were unsuccessful on account of the opposition of the hand sawyers; but in the United States, beginning with the erection of the mill at Piscataqua Falls in the State of Maine, in 1634, a vast number of mills have been built in all of the wooded districts of the country, and by the development of improved methods in handling the logs, and in arranging the machinery, have made such States as Maine, Michigan and Wisconsin famous as the greatest lumber producing areas of the world.

Of these mills, the earlier forms are known as gate or sash saw-mills, and consisted of two upright guide posts held in position by a transverse beam at the top. A heavy rectangular wooden frame carrying a straight band saw attached to the top and bottom pieces, worked with a vertical reciprocating motion in slides between the guide posts. The reciprocating motion was imparted to the sliding frame by a connecting rod, the lever end of which extended to one end of a water-wheel shaft. The carriage bearing the log was moved by a rack and pinion arrangement operated by a feed-wheel, and the log was fed endwise to the saw, which was run, usually, at a speed of 150 strokes per minute, and was capable of producing from 500 to 2,000 superficial feet of lumber per day of ten hours.

A larger output was obtained by introducing the "gang" feature, which consisted of attaching several saws to the sliding frame. In the "Yankee gang," the saws were arranged in two sets, with the tooth edges of one set facing in a direction opposite to that of the other set, and enabled the sawing of two logs at one movement of the carriage. Other forms, designated "slabbing gang," "stock gang," and "pony gang," applied the method to special purposes.

The "muley" saw followed the gate and gang saws, and was adopted generally by the smaller mills on account of the great reduction in the weight of the reciprocating parts. In this arrangement, the ends of the saw are attached to two light cross-heads opposite each other, which oscillate up and down. The saw is kept in line by means of slides working in a strong iron frame swung from an overhead beam. The cutting is accomplished entirely by the downward motion, during which the action of the slides causes the saw-teeth to hug close to the wood, and then recede from it during the upward motion, so as to reduce the friction. Muley saws

SAW-MILL

are driven at a speed of about 300 revolutions of the driving wheel, per minute, and are capable of turning out about 6,000 superficial feet per day.

Saw-mills employing circular saws are of comparatively recent date. The experimental point in the use of the circular saw as the main saw of a mill, was passed about the middle of the 19th century, since which time it has been developed to a state of very high efficiency and general usefulness. By its use a continuous cutting motion is obtained, and driven by engines ranging from 25 to 100 horse-power circular saws in connection with steam feeding arrangements are capable of sawing from 20,000 to 100,000 superficial feet per day, practically limited only by the capacity of the handlers to remove the lumber.

The saw, which is a disk of steel with a toothed edge, is mounted on a shaft which is rotated by gear wheels, or by belts operated by the shaft of a water wheel or a steam engine. The cutting depth of the saw is somewhat less than half the diameter of the disk, and the saws generally employed rarely exceed a maximum diameter of 6 feet, on account of the increased thickness required to obtain sufficient rigidity, and the consequent increase in the amount of the kerf or cut waste. Water power was used almost exclusively until 1835, but it has been almost completely supplanted by steam engines. "Band saws," although known a great many years before the circular saw, were not adopted until recent years on account of the difficulty experienced in making saws of sufficient endurance to withstand the severe service. During recent years, however, these difficulties have been overcome, and they are now generally used in all of the great lumber producing countries.

The mechanical arrangement consists of two broad-faced wheels mounted one above the other. Over these wheels, a continuous band of steel, which is the saw, works like a belt over two pulley wheels, with a continuous motion, and the logs are fed endwise against the cutting or toothed edge by a traveling carriage. Mills employing band saws are capable of producing from 40,000 to 80,000 superficial feet of lumber per day, and require from 25 to 45 per cent less driving power than mills employing circular saws.

A thoroughly modern saw-mill employs both circular and gang saws. The mill is usually built upon the banks of a river or pond, and the driving power is obtained from water wheels or from steam engines. The general construction is quite simple, and consists of a saw floor and log deck built at an elevation of about 10 or 12 feet above the water level. A jack ladder constructed of heavy timber with its lower end resting on the bottom of the stream, leads up to the saw floor at the rear end of the mill. Ribbons of iron are fastened to the top sides of the ladder and form the track upon which the log car is operated. The arrangement and installation of the saws vary according to the size of the mills and the kind of work performed. As previously stated, the sizes of the saws generally used are about 6 feet in diameter and the depth of cut is less than three feet, therefore, in mills handling logs of large diameter, increased depth of cut is obtained by mounting

two saws one above the other, so that they cut in the same line—the upper one cutting down from the top of the log to the cut of the lower or main saw. In the mills in California, logs measuring up to 10 feet in diameter, are sawn by arranging four saws one above the other, some cutting horizontally and others vertically, thus permitting the handling of large trees, which up to the present time were considered unavailable.

The gigantic trunks of the redwood trees of California, Washington and other States on the Pacific coast, ranging from 10 to 25 feet in diameter, are first quartered by explosions of gunpowder and then passed through the mills.

One great disadvantage in the use of circular saws is the excessive kerf waste, which is fully 20 per cent greater than that resulting from the use of the band or the gang saws, and is one of the principal reasons for the employment of the last named forms in the smaller mills where the uniform character of the lumber and the saving of raw material are important factors.

The majority of the American mills use single circular saws, but many of them have saws installed upon each side of the mill floor, and the logs are rolled to either side by the log jack placed in the centre of the building. In addition to these rotaries, the larger mills have from one to four gang saws.

The arrangements for handling the logs which are floated down upon the rivers from the distant forests to the mills, consist of piles driven at convenient distances apart, into the bed of the river adjacent to the mill, to which strong "booms," logs, are attached by heavy chains and serve to hold the logs as in a pen, until they are required, and also to leave a free channel in the middle of the stream. When the mill is in operation, the boomed logs are drawn from the water by an endless chain which runs in a V-shaped log slide, and is provided with spikes to prevent the log from slipping back. The logs follow each other in endless succession. When a log reaches the log deck, it is loaded upon the skids by the action of a lever operated by the sawyer, which causes a pair of arms to rise through the mill floor and raise the log forcibly onto the skids. The skids lead to the log carriage, upon the "head blocks" of which the log is securely fastened by the insertion of a "dog," and it is then ready to be advanced to the saw. This is accomplished in several different ways—by rack and pinion; worked by "cone feed," consisting of two parallel cones operating a belt which regulates the motion of the pinion shaft; by "rope feed," consisting of a wire rope which passes over pulleys set in the floor to a drum underneath, and is so arranged as to be under the control of the sawyer in the forward movement of feeding, or in the reverse movement of returning the carriage to its original position; or by "steam feed," commonly termed "lightning feed," derived from the force of a steam cylinder about 10 inches in diameter, which is laid upon the mill floor underneath the saw carriage to which the piston is attached. As the log is fed, and when the first slab has been removed, the sawyer touches a lever and brings the "nigger," a piece of iron-bound timber with spikes upon its front face, through the floor. The spiked

face catches the side of the log and turns it axially, at once, to any desired position. If the log is being "canted," or prepared for the gang saw, the slabs are removed from the two opposite sides, a hook is thrown over the rear end of the cant so as to prevent it from returning with the saw carriage, and it is dropped upon a set of rollers which starts it toward the gang. From the time that the log is drawn out of the water and until it emerges from the gang as a finished product, all of the operations are performed by machinery.

The finished product of saw-mills are planks, boards, and timber of varying sizes in length, breadth, and thickness, too numerous to enumerate specifically; laths, consisting of strips four feet in length, $\frac{3}{8}$ inch in thickness, and $1\frac{1}{2}$ inches in width, used for lath and plaster work; and shingles, thin, flat, tapering pieces of wood usually $\frac{1}{4}$ inches wide, $\frac{3}{8}$ inch thick at one end and $\frac{1}{8}$ at the other, used for roofing purposes.

The annual output of individual mills depends upon their size and the arrangement of their machinery. Large mills in Maine, Michigan, and Wisconsin have records as high as forty million superficial feet per year. The one located at Basin Mills, Maine, is probably the largest mill under a single roof, in the world. The total production of the 31,833 saw-mills in operation in the United States, in 1900, was over thirty billion superficial feet, with a market value of about \$425,000,000. According to the United States census of 1900, these mills represent a total invested capital of \$805,785,236, and give employment to 229,710 workmen.

For technical description of saws see METAL-WORKING MACHINERY, and WOOD-WORKING MACHINERY.

W. MOREY, JR.,
Consulting Engineer.

Saw-whet Owl, a small American owl (*Nyctale acadica*), which takes its name from the rough tone of its cry. It is northerly in its distribution, ranging across the continent, but rarely dwelling as far north as Hudson Bay. It is not so large as a robin, and has inconspicuous ear-tufts; bill black; cere tumid; general color, above chocolate brown, streaked with white; below, white with brown stripes. Its food consists mainly of insects, and its nest is made in a hollow of a tree, in an old crow's nest or any convenient place. Compare SPARROW-OWL.

Sawbill, a motmot (q.v.).

Sawdust, a general name given the accumulated particles caused by sawing wood, stone, etc. Besides the more common uses of sawdust, it is commercially valuable as the basis of various manufactures. Oxalic acid is manufactured on a large scale from wood sawdust. Sawdust is also used in the "carbonating" stage of the process for the manufacture of soda ash. The sawdust of mahogany and rosewood is used in dressing furs, and the small fragments of some woods, such as the pencil cedar, made by saw cuts or the turning tool, yield perfumes. Sawdust sinks in water, though the wood from which it is cut floats.

Saws and Sawing. A saw is a tool consisting of a thin, flat blade of highly tempered steel serrated or having a series of triangular shaped

teeth usually on one of the edges, but sometimes on both edges as in the case of some forms of pruning saws and in the plumbers' saws. It is one of the most important of the various forms of cutting tools, and is extensively used for working wood, metal, stone, and other substances, but principally wood.

Saws are made in a great variety of forms and sizes in order to adapt them to the varying characteristics of the material worked, and to suit them to the particular kind of work for which they are used, and also to suit the circumstances attending the manner in which they are operated or handled.

A general classification of the different kinds of saws according to their form, and the direction of their motion in the act of cutting, together with a comprehensive description of the methods of application, and the use of the various forms of power driven saws are given in the articles under the titles, TOOLS and WOOD-WORKING MACHINERY in this Encyclopædia.

In this article the consideration of the subject will be confined to the construction and

Fig. 1.

adaptation of the various makes of saws for specific purposes, and to the identification of their generally applied trade names with those purposes.

The characteristic action of the saw being the removal successively of minute portions of the material worked by the cutting or tearing action of a series of sharp edges thrust against the material indicates that it is essentially a tool adapted for cross-cutting or cutting at right angles to the fibre of the material. Necessity and custom, however, have compelled its application for ripping or cutting with the grain also, thus adapting it to work which otherwise would be accomplished by the use of cutting tools such as axes and chisels. These conditions define two primary classes of saws—the cross-cut saws and the rip saws which divide all the different kinds of saws into two groups according to the general purposes for which they are used.

Saw Terms.—The principal terms used in describing a saw are as follows: (See Fig. 1, Diag. A.)

SPACE.—The distance between two contiguous teeth, measured from point to point.

PITCH OR RAKE.—The inclination of the face of a tooth or the angle of the face of a tooth

SAWS AND SAWING

measured from a vertical line drawn through its point.

GULLET OR THROAT.—The depth of the tooth from the point to the root.

GAUGE.—The thickness of the blade, usually measured by the wire gauge.

SET.—The amount of lateral inclination

POINT.—The lower intersection of the back and the face.

GULLET.—The upper intersection of the back and the face. It is usually defined as a measurement as already indicated.

Saw teeth vary in spacing, length or depth of gullet, angle, pitch, set, fleam, and form of

Fig. 2.

given to the teeth, either to the right or to the left of the plane of the blade, in order to produce a kerf or cut of sufficient width to effect a proper clearance of the saw dust, and to prevent the saw from binding or being pinched by the sides of the cut.

FLEAM.—The side angle of a tooth.

POINTS.—The number of teeth points to an inch. The coarseness and fineness of saws are

Fig. 3.

usually estimated by the number of points instead of the number of teeth to an inch, and it should be observed that there is always one less tooth per inch than there are points. (See Fig. 1, Diag. B.)

The several parts of a saw tooth are usually described by the following terms: (See Fig. 1, Diag. A.)

FACE.—The front or cutting edge of the tooth.

BACK.—The following or back edge of the tooth.

Fig. 4.

gullet. The teeth may be uniform throughout, or the blade may have several different kinds of teeth. In the latter case all the teeth of a kind are made uniform, or they are arranged in a regular order of change. (See Fig. 2.)

The "angle" of a saw tooth is that which is included in its point between the face and the back. The generic angle is 60° , but it varies in the different kinds of teeth from 45° to 70° ,

Fig. 5.

according to the character of the material worked, and the specific purpose for which the saw is used. The angle suitable for cutting soft wood and for ripping purposes is always more acute than that used for cutting hard wood and for cross-cutting. For soft wood, the front angle varies from 65° to 70° ; for hard wood from 80° to 85° . In saws employed for cutting very hard knotty wood, and in those used for

Fig. 6.

cutting metal, the teeth are arranged in a series of equilateral triangles, the pitch of each tooth being evenly divided between the front and the back. In saws used for a general line of work, the angle usually adopted is 40° , with the pitch evenly divided. In saws used for cutting soft woods and for ripping purposes, an effective placing of the angle is attained by making the face upright, and sloping the back. (See Fig. 3, Diags. A, B, C, respectively.) The pitch of a saw tooth is obtained by subtracting the back angle from the front angle. These terms and

SAWS AND SAWING

rules apply generally to all the different kinds of saws from the smallest hand and machine saws used by jewelers, machinists, and carpenters, to the largest power-driven saws employed in the various classes of saw mills.

The various kinds of saws manufactured and used at the present time are of the following named general types:

The "rip" saw, the "hand" saw, and the "panel" saw. (See Fig. 4.)

The hand saw is usually made about 26

Fig. 7.

inches in length, and is used for the common work of sawing material of moderate thickness both longitudinally and cross-wise. The rip saw and the panel saw are modifications of the hand saw from which they differ in the size of the teeth, and in the length of the blade. The rip saws range from 28 to 36 inches in length, and the panel saws from 12 to 24 inches. The usual spacing of the teeth of the three types is as follows: Hand saws, 5 to 12 points per inch; rip saws, 3 to 5 points at the heel or handle end, and 6 to 8 points per inch at the point; and the panel saws, 8 to 12 points to the inch. All three forms are made with a straight upper edge, or a "skewback" curve as shown in Fig. 5.

Fig. 8.

A novel and useful form is represented by the "combination" saws. These are graduated along the upper edge, and are furnished with a level attachment as shown in Diag. A, Fig. 6. As a tool of general usefulness they possess the additional advantages of a square, a 24-inch rule, a level, a plumb, a straight edge, and a scratch awl. Other useful modifications of the hand saw are the "gauge" saw, the "ship carpenter's" saw, and the "movable-back" saw, shown by Diags. A, B, C, respectively, of Fig. 7. The gauge saw is equipped with a movable attachment by means of which it may be adapted to tenoning, shouldering, curving, cog-cutting, or to any other purpose where a definite depth of cut is required. The movable-back saw combines the advantages of a thin bladed hand saw

and a first class back saw. The ship carpenter's saw has a very long narrow blade and is especially suitable for cutting sweeps or curves of long radius. It is handled like the rip saw, and is extensively used by cabinet-makers, pattern-makers, and others for work requiring a narrow saw.

Fig. 9.

The "compass" saw and its modifications, the various form of "key hole" saws, which are also commonly known as "pad" saws and "socket" saws, are shown in Fig. 8, Diags. A and B, respectively. The blades of the compass saws range from 10 to 20 inches in length, and taper from one eighth inch at the point to two or more inches at the heel. They are used for cutting curves and sweeps by hand and are sometimes called "table" saws. The regular keyhole

Fig. 10.

saw and its modification, the pad saw, are simply smaller forms of compass saws, and are used for cutting curves of small radius such as keyholes and other small holes in the central portions of work. A saw of this type consists of a narrow blade which slides into a hollow handle or pad, to which it is secured in place by one or more set screws, only so much of the blade being drawn out as may be required by

Fig. 11.

the character of the work. These saws are made both singly and in "nests." A nest of saws consists of a handle and three interchangeable blades, one each of the keyhole or pad, the compass, and the table or pruning saws. (See Fig. 9, Diag. A.) A very useful novelty in this line is the nest of saws designed for cutting square holes. In this combination, the keyhole and compass blades are fitted with an attachment at right angles to the plane of the blade as shown at (C) Diag. B, Fig. 9.

SAWS AND SAWING

The "back" saws are a class of hand saws characterized by deep thin blades stiffened with a metallic back as shown in Fig. 10. The principal forms are the "mitre box" saw, the "tenon" saw, the "sash" saw, and the "dovetail" saw. The last named has the thinnest blade, so thin, that simple filing gives the teeth sufficient set. The blades of the others are somewhat thicker and require a slight amount of set. All back saws are best used in a mitre box or in some

Fig. 12.

other form of guide rest. In cutting, they should be held firmly with the least practicable expenditure of force in controlling the direction, and the cut should be commenced by placing the heel of the blade on the farthest edge of the work and then drawing the saw steadily toward the body of the operator. Back saw blades range from 8 to 18 inches in length, the number of teeth varying in number from 10 to 14 per inch.

The "pruning" saws are of several kinds, the principal forms of which are shown in Fig. 11. They vary from a large form of compass saw to straight saws toothed on both edges as shown in Diag. A, and also to those with curved blades as shown in Diag. B, a form extensively used on

Fig. 13.

the Pacific Coast. They are also made of narrow blades attached to metal frames, the shape of which produce a tapered combination which permits of the use of the saw in very narrow spaces. See Fig. 11, Diag. C.

The construction of the tapered pruning saw places it on the dividing line between what may be termed the regular bladed saw and the frame saw. In the former, the pressure on the cutting edge is resisted by the rigidity of the blade itself, while in the latter, the pressure is resisted by the distribution of the tension of the blade through the various parts of the frame. Of the frame saws, the most familiar are the "wood" saws shown in Fig. 12, the "butchers" saws shown in Fig. 13, and the "hack" saws shown in Fig. 14. The last named is shown in its adjustable and extendable form, in which the

frame may be lengthened or shortened to fit blades of varying length. The saw has a thin, narrow blade and equilateral triangular shaped teeth. It is stretched between the upright portions of a wrought-iron or steel frame, the requisite tension being imparted by means of a thumb-screw at the forward end. A handle is attached to the back end of the frame, which is usually grasped by the right hand of the operator, and the downward pressure imparted to the tool during the act of cutting by laying the left hand upon the back or top of the frame. This saw is extensively used by fitters and me-

Fig. 14.

chanics for cutting odds and ends of metal, and has now become one of the most important tools in a machinist's toolbox. For general work, the blades are made with 14 teeth to the inch, but those used for cutting tubing and thin metal are usually made with a greater number of teeth, about 25 per inch, in order to prevent a free bite and to reduce the danger of stripping the teeth. As in the case of the file, the fineness of the bite depends upon the number of the teeth in contact with the work; therefore, the judgment of the operator usually determines the amount of pressure that should be applied to the saw to suit the varying conditions of the cut. As in the case of other cutting tools, experience teaches that a hack saw will work more effectively under a pressure sufficient to make the tool bite freely, than when it is allowed to scrape and glaze the surface under a light pressure. In order to use a hack saw properly, the blade should be strained in the frame to prevent its kinking, and the cutting strokes should be made uniformly at a rate not exceeding 40 per minute.

Fig. 15.

The blades should be as short as possible, so as to reduce the cost and the danger of breakage, and oil should never be used on the teeth as it decreases their cutting efficiency. The reverse is true in the case of wood-working saws. Hack saw blades as regularly manufactured range from 6 to 18 inches in length. Those longer than eight inches for hand saws and 12 inches for power-driven saws are seldom required. The rail saw is a modification of the hack saw, the height of the frame being increased to adapt it for large work, such as the cutting off of rails, large beams, girders, etc., and is found to be a very valuable tool for contractors. The frames are fitted to carry blades ranging from 9 to 18 inches in length.

The cross-cut saws employed for cutting timber and other large work are made in an almost innumerable variety of forms and sizes both as to the blades and to the teeth. The "one man" saws, shown in Fig. 15, range from three to six

feet in length. The particular saw illustrated has the famous "Great American" tooth, commonly known as the M tooth. Fig. 1 shows three forms of the larger saws. They range from

plete translation of the Bible, that of the New Testament being published in 1858, the prophetic books of the Old Testament in 1860, and some of the remaining books in 1864. In some

Fig. 16.

4 to 10 feet in length and are operated by two men, one at each handle. They are made with either curved or straight backs, but are always round-breasted, and differ in this respect from the "drag" and "pit" saws, in which the toothed edge is always straight.

The various forms of circular saws will be found described in the article under the title WOOD-WORKING MACHINERY, in this Encyclopedia.

Sawyer, sâ'yer, Sir James, English physician: b. Carlisle, Cumberland, 11 Aug. 1844. He was educated at Queen's College, Birmingham and at the London University. He is consulting physician to the Queen's Hospital at Birmingham, and the author of several important medical works. Among them are: 'Floating Kidney' (1883); 'Ether in Medication by the Skin' (1890); and 'Causes and Cure of Insomnia' (1904); 'Dietetics of Diabetics' (1904); 'Longevity' (1905); etc.

Sawyer, Josephine Caroline, American novelist: b. Watertown, N. Y., 5 Sept. 1878. She was educated in her native town, and Pelham Hall, Pelham Manor, N. Y., and has published 'Every Inch a King' (1901); 'All's Fair in Love' (1904).

Sawyer, Leicester Ambrose, American clergyman and biblical scholar: b. Pinckney, N. Y., 28 July 1807; d. 1898. He was educated at Hamilton College, studied at Princeton Theological Seminary, and in 1832 entered the Presbyterian ministry. After filling pastorates in New York and Connecticut, he became president of Central College, Ohio. In 1854 he withdrew from the Presbyterian denomination and joined the Congregationalists. He made a com-

plete translation of the Bible, that of the New Testament being published in 1858, the prophetic books of the Old Testament in 1860, and some of the remaining books in 1864. In some

Sawyer, Sylvanus, American inventor: b. Templeton, Mass., 15 April 1822; d. Templeton 25 Oct. 1895. His attention was early turned to invention and in 1839 he engaged in business with his brother-in-law in Augusta, Maine, and invented a steam-engine, a screw propeller, and a car run by foot-power. His first big invention, however, was the machine for making chair-cane from rattan, first invented in 1843 and used in his factories after 1850. Sawyer then turned his attention to gun and rifle projectiles and made important inventions, his projectiles making the rifled cannon a practicality. He also invented in 1853 an arrangement by which shells would explode on impact, by use of percussion caps. These inventions were put into use and did great service against the Confederacy in the ensuing war. Other inventions, after the war, perfected the cast-steel rifled guns, the first battery of which he furnished. His other inventions include: 1867, calipers and dividers; 1868, steam generator; 1876, sole sewing-machine; 1882, centring watchmaker's lathe. The closing years of his life were enthusiastically devoted to agriculture.

Sawyer, Thomas Jefferson, American Universalist clergyman: b. Reading, Vt., 9 Jan. 1804; d. 1899. He was graduated at Middlebury

College in 1829, and held pastorates in New York (1830-45 and 1852-61). Between these periods he served as principal of the Liberal Institute at Clinton, N. Y., in which he also taught theology. He was one of the founders of Tufts College, Medford, Mass., where he became professor of theology. As an advocate of Universalist doctrine, and as a scholarly controversialist he acquired a wide reputation. His discussion with Isaac Westcott was published under the title of 'The Doctrine of Eternal Salvation' (1854). He also published 'Who is Our God? the Son or the Father?' (1859), in which he controverted in particular some of the opinions at that period held by Henry Ward Beecher.

Sawyer, Walter Leon, American author: b. Cumberland, Maine, 23 Oct. 1862. He was educated in Portland, Maine, was editorially connected with journals in Portland, Washington, and Boston, 1882-92, and was an assistant editor of 'The Youth's Companion' 1892-1901. He has published 'An Outline Journey' (1896); 'A Local Habitation' (1899).

Saxe, säks, John Godfrey, American poet: b. Highgate, Vt., 2 June 1816; d. Albany, N. Y., 31 March 1887. He was graduated at Middlebury College and admitted to the bar in 1843. During 1850-6 he conducted the 'Sentinel' at Burlington, Vt., and in 1856 became attorney-general of Vermont and deputy collector of customs. Removing to Albany, N. Y., he edited the *Evening Journal*. He was a conspicuous figure on the lecture platform and at scholastic anniversaries, where he often read his verse. His reputation as a humorous poet was considerable during the mid-century, his verses often appearing in 'Harper's Magazine' and in the 'Knickerbocker.' He published 'Progress, a Satirical Poem' (1846); 'Humorous and Satirical Poems' (1850); 'The Money King and Other Poems' (1859); 'The Masquerade and Other Poems' (1866); 'Fables and Legends of Many Countries' (1872), and 'Leisure Day Rhymes' (1875).

Saxe, Maurice, marshal of France: b. Dresden 28 Oct. 1696; d. Chambord, near Blois, France, 30 Nov. 1750. He was a natural son of Augustus II. of Poland. His military career was begun at the age of 12 and a few years later was put in command of a cavalry regiment which took part in the war with Sweden. After the treaty of Utrecht, he attached himself to the army of France, and in 1720 was made camp marshal to the Duke of Orléans. He was offered the command of the Saxon army at the death of his father, but chose to remain in the French service. For his defense of Alsace in 1743 he was created marshal of France. Carlyle has described his heroic conduct in the battle of Fontenoy, in his life of Frederick the Great. He was one of the most fearless but also one of the most dissolute men of his day. He wrote with a singular disregard of the rules of orthography a book on the art of war, entitled, 'Mes Réveries.' Consult: Karl von Weber, 'Moritz von Sachsen' (1863); Duc de Broglie, 'Maurice de Saxe et le Marquis d'Argenson' (1891-3).

Saxe-Altenburg, säks äl'tën-bërg. See ALTENBURG.

Saxe-Coburg-Gotha, kô'bërg gô'ta, Germany, comprising the provinces of Gotha and Coburg, constitutes one of the central states of the empire, containing an area of 755 square miles. It lies on the south side of the forest of Thuringia. Its principal rivers are the Apfelstedt, Gera, Leina-Horsel, Nesse and Unstrut, in Gotha, and the Itz, Rodach, Lauter and Steinach, in Coburg. Both parts are mountainous with undulating and fertile tracts. The highest summits are the Great Beerberg (2,850 feet), the Schneekopf (2,829), and the Inselberg (2,655). The government is a constitutional monarchy. The educational institutions are gymnasia at both Gotha and Coburg; Salzmann College at Schnepfenthal; commercial school, Gotha; teachers' seminaries and technical schools in both towns; deaf and dumb institute, Coburg; and an observatory near Gotha. The Lutherans predominate. The chief occupations are agriculture and cattle-raising, especially in Coburg. The products are grain, peas, beans, hops, hemp, flax, potatoes (principal article of food), and wine. The forests yield timber, pitch, charcoal and potash. The chief manufactures include machinery, fire-proof safes, nickel goods, rifles, papier-mâché, tobacco pipes, watches, toys, needles, and pottery; besides textile, button and paper industries. There are also numerous breweries, distilleries, tanneries, bleaching establishments and saw-mills. The chief exports are grain, butter, fat, cattle, leather, wood, linen and other manufactured goods. Ruhla is celebrated for its meerschäum pipes and cigar holders, which are exported to all parts of the world. Inselberg, Schneekopf, Ruhla and Friedrichroda are picturesque towns and summer resorts; Neudietendorf or Gnadenthal is a Moravian settlement founded in 1742. The elder line of Saxe-Coburg was founded in 1680. The duke of Albany, grandson of Victoria of England, succeeded to the duchy in 1900. Pop. (1900) 216,603.

Saxe-Meiningen, mi'ning-ën, or **Saxe-Meiningen-Hildburghausen**, hild'boorg-how-zën, Germany, a central duchy of the empire, in Thuringia. It belongs to the basins of three great rivers, the Weser, Rhine and Elbe; is hilly, and covers 953 square miles. The ridges on the north belong to the Frankenwald, on the east to the Thüringerwald, and on the west to the Rhöngebirge. The highest summits are the Kieselrle and the Bless, respectively 2,851 and 2,834 feet high. The high land is interspersed by fertile valleys, watered by the Werra, and various tributaries of the Main and the Saale. There are several small lakes and some mineral springs. The soil is not very productive; in the higher districts it is unfitted for cultivation, but well wooded. The best land is in the valleys of the Werra and Saale. The chief crops are rye, oats, barley, potatoes and wheat. Hops, flax, tobacco and some wine are also grown in sheltered localities. The pastures are good, so that stock-raising is important. The chief minerals are roofing slate, salt and iron. There is a brisk manufacturing industry, especially in Sonneberg, Gräfenenthal, and Saalfeld. The principal articles include various kinds of hardware, glass, and pottery, school-slates, marbles, all kinds of ingenious wooden and pasteboard objects, especially toys; and there is also a small

textile industry. The principal exports, outside of the articles just mentioned, are wood, salt, wool, and cattle. The schools include gymnasia, a normal college, technical schools, etc. The capital is Meiningen, with 14,518 inhabitants, who are mostly Lutheran. The government is a hereditary and limited monarchy. The line of Saxe-Meiningen was founded by Duke Bernhard, son of Ernst I. of Saxony, friend and companion of Gustav Adolf of Sweden. Two-thirds of its present territory was added in 1826. In 1866 it sided with Austria. A compromise in 1871 terminated the long dispute, dating from 1826, concerning the respective rights of the duke and the diet to the state-lands. Saxe-Meiningen entered the North German Confederation with the other states. Pop. (1900) 250,683.

Saxe-Weimar, vī'mār, or Sachsen-Weimar-Eisenach, i'zē-nāh, Germany, a grand duchy, central in the empire, the largest of the Thuringian states, consisting of 3 large and 24 smaller divisions, the former comprising Weimar, Neustadt and Eisenach. The entire area comprises 1,388 square miles. The state is of circular form, with undulating surface, and fertile soil. The Ilm, Saale and Unstrut are the principal rivers. The chief towns: Weimar, the capital, on the Ilm; Jena (with the general university of Thuringia), on the Saale; and Apolda, in the west. Eisenach, the second division in size, yields the poorest crops, contains fine forests and picturesque scenery. Its chief streams are the Werra, Horsa and Ulster. Its highest summits are: The Hohe Vogelheid, Glockner, Ringberg and Ottowald; the Hohe Rain, Einbogen, Bayerberg and the Glaserberg. Eisenach is the only considerable town. Neustadt has no especially interesting features; its principal rivers are the White Elster, Weida and Orla. Neustadt, Auma and Weida are the chief towns. The chief occupation is agriculture in all parts of the duchy, and stock-raising is carried on to some extent. The manufacturing industries are important and include textiles, especially woollens, pottery, scientific instruments, pipes, tobacco, leather, cork, paper and glass. The chief imports, besides colonial goods, are raw wool, hides, coal, meerschaur (from Smyrna and Vienna), amber, horn, etc. The chief exports are timber, wool, gin, and dried fruit. The chief centres of trade are Eisenach and Weimar. There are numerous breweries. The minerals are silver, copper, iron, manganese; besides salt and potters' clay. The government is a limited hereditary monarchy and is constitutional. Most of the inhabitants are Lutherans, distinguished for their industry and intelligence. The reigning family is the oldest branch of the Ernestine line, thus of the Saxon house. Weimar in early times was the seat of a line of counts; it finally fell into possession of Frederick the Mild of Saxony, and did not acquire historical independence until 1640. Later it was split into several factions, but became reunited under Ernest Augustus. The reign of Charles Augustus, his grandson, marks the most brilliant epoch in the history of Saxe-Weimar. Goethe, Schiller, and Herder were members of the illustrious literary society which Charles Augustus gathered about him, and the University of Jena became a focus of light and learning. This prince granted the

duchy a constitution, and freedom of the press. In 1866 the grand duchy joined Prussia against Austria, and later entered into the North German Confederation. The tendency of recent legislation is liberal. Pop. (1900) 362,873.

Sax'horn. See HORN.

Saxic'ava, a genus of bivalved mollusks. See STONE-BORING ANIMALS.

Sax'ifrage, a plant of the typical genus of *Saxifragaceæ*, the name arising from an old Roman notion that the plants, which they often saw growing in cracks in rocks, had split the rocks themselves, and applying the doctrine of signatures (q.v.), they concluded that the saxifrage would also break up stones in the bladder. The many species of saxifrage are found chiefly in the north temperate and arctic zones, increasing in number northwards; they are also characteristic of sub-alpine and alpine floras. This northern and mountain habit has made them valuable for rock-gardening, especially as the Alpine species have comparatively large flowers. The species are easily propagated by stolons and offshoots. Saxifrages are closely allied to the *Rosaceæ*, and have numerous regular flowers, mostly in corymbs or panicles, and white, yellow or pink in color. The individual flowers are generally small, five-merous, with a two-celled ovary, becoming a small two-beaked pod with many seeds.

The London Pride (*Saxifraga umbrosa*) is much cultivated in European gardens, and sends up from a rosette of thick glabrous leaves small pink flowers panicked on a stem nearly a foot high. The purple saxifrage (*S. oppositifolia*) is one of most widely distributed species of Alpine and Arctic floras, and one of the first to bloom. It extends as far southward in the United States as Vermont, and carpets the rocks with its evergreen mats of thick foliage, nearly covered with solitary lilac blossoms. The most familiar saxifrages in eastern America are the *S. virginicus* and *S. pennsylvanica*. The former is one of the first spring plants to bloom. It grows in rock-crevices and begins to open its small white flowers, while they are still close to the rosette of spatulate leaves. As the spring advances, the naked, pubescent flower scape elongates until, in fruit, it is perhaps a foot high and branched in a loose panicle. The swamp saxifrage (*S. pennsylvanica*) is a little later in blooming, larger, and frequents swamps and wet banks; it has greenish flowers in panicles, and oval to oblanceolate leaves.

Saxo Grammaticus, sāk'sō grā-mătī-kūs (that is, Saxo the Grammmarian, or the Learned), early Danish historian: b. about 1140; d. Roeskilde about 1206. He was a native of Denmark, of which kingdom and its dependencies he compiled history down to 1186 under the auspices of Absalom, bishop of Roeskilde, whose secretary or chancellor he appears to have been. This work, 'Historia Danica,' is written in good correct Latin, which Erasmus has praised, and occupied 20 years in its composition. Saxo chose as his models the later Roman historians, especially Valerius Maximus, yet in some of his expressions and in his mode of representation he is quite mediæval, though he stands at the head of his class. The work is divided into 16 books, the earlier of which give a highly colored and imaginative account of ancient Dan-

SAXON—SAXONY

ish history, as learned from tales and traditions, and is full of living pictures of old heroic wars and adventures; the first nine books can scarcely be looked upon as reliable history; but when the writer approaches his own time his history is of the greatest value.

Saxon, the name of a Teutonic race, which took part with the Angles in founding Anglo-Saxon dominion in Britain, and which until a recent period was an important power in Germany. The Saxons (German *Sachsen*) were a warlike people, somewhat given to piracy, and during the existence of the Western Empire a thorn in the side of Rome. Charlemagne subdued them, and caused them to become Christians. After the extensive Saxon emigration to Britain in the 5th century, those who remained in Germany were known as "Old Saxons." The dukedom of Saxony was for a time the most powerful of the German states, and Duke Henry in 919 was elected German king, his son, grandson, and great-grandson succeeding him in that dignity. The duchy afterward passed (1127) to the Bavarian branch of the Guelph family, of which Henry the Lion (q.v.), celebrated for his contest with the emperor, was a member (1146-95). After several changes, which it is unnecessary to enumerate here, Frederick the Warrior, margrave of Meissen and landgrave of Thuringia, became (1424) duke and elector of Saxony. The union of these three countries rendered the Saxon elector one of the most powerful princes in Germany. After the death of Frederick the Good, son of Frederick the Warrior, Ernest and Albert, sons of the former, divided the family possessions between them (1485), and founded the Ernestine and Albertine Saxon lines, which still exist. The latter received Meissen, or Misnia, and now constitutes the royal Saxon house. The former retained the electoral dignity and Thuringia. Ernest was succeeded in the electorate by his sons, Frederick the Wise (1486-1525), and John (1525-32). The former is celebrated as the protector of Luther, the promoter of the Reformation, and the founder of the University of Wittenberg. By the Wittenberg capitulation (19 May 1547) the electoral dignity was transferred to the Albertine line in the person of Maurice. The Ernestine house is now divided into the two branches of Weimar and Gotha, the latter of which consists of the three lines of Meiningen, Altenburg, and Coburg.

The duchy became a kingdom under Frederick Augustus I., who paid by the loss of a large part of his dominions the penalty for taking the side of Napoleon in the struggle between France, on the one side, and Russia, Austria, Prussia, England, and Sweden on the other. Saxony made another expensive blunder when it allied itself with Austria against Prussia in 1866, when the kingdom was spared on condition of paying 10,000,000 thalers to Prussia and entering the North German Confederation. In the war of 1870 against France the Saxons were on the side of Prussia, and the feeling between the two courts has since been cordial. The Saxon people have ceased to be distinct from other Germans, and national patriotism has taken the place of sectional jealousy. The Saxons possess the virtues, without the faults of their distant ancestors, and are noted for industry, frugality, and thrift, while the average

of comfort among the industrial and agricultural classes is as high as in any part of Europe. See GERMANY; SAXONY.

Saxon Architecture, the stage of early English architecture which preceded the Norman. The relics left us of this style exhibit its general characteristics as having been rude solidity and strength. The walls are of rough masonry, very thick, without buttresses, and sometimes of herring-bone work; the towers and pillars thick in proportion to height, the former being sometimes not more than three diameters high; the quoins or angle masonry are of hewn stones set alternately on end and horizontally ("long-and-short" work); the arches of doorways and windows are rounded, or sometimes these openings have triangular heads, their jambs of long-and-short work carrying either rudely-carved imposts or capitals with square abaci. Sometimes heavy moldings run round the arches, and when two or more arches are conjoined in an arcade these are on heavy low shafts formed like balusters. Window openings are often splayed both from the inside and from the outside, and the windows themselves are small. On the outside of towers, walls, etc., there are often found slightly projecting pilaster-like shafts, usually formed of the long-and-short work characteristic of the quoins. See ARCHITECTURE.

Saxony, sāk'sn-ī (German, *SACHSEN*, zāk'sēn), a kingdom of central Germany, surrounded by Prussia, on the north; Bohemia, south; Bavaria, southwest; Reuss, Saxe-Weimar, and Saxe-Altenburg, west. It covers an area of 5,787 square miles, and has the form of a right-angle triangle. Saxony ranks third in point of population among the states of the German confederation. It belongs to the central mountain region, only the districts near Leipsic and along the northern border sloping into the great north European plain. This tract is covered by peculiar and interesting sandstone formations. The chief mountain ranges are the Erzgebirge and Elstergebirge, along the southern border. The mountains of Upper Lusatia (2,600 feet) rise in the southeast, connecting with the Riesengebirge. That portion extending from Bohemia to Pirna on either side of the Elbe is wildly picturesque, hence the name "Saxon Switzerland." The highest summits in these mountains are no more than 2,000 to 2,500 feet high. The Fichtelberg in Oberwiesenthal (3,700 feet) towers above them all. The lowest point in the country is found where the Elbe enters Prussian territory, between Strehla and Mühlberg. The loftiest summits consist generally of sandstone and gneiss, and are rich in mineral deposits as the mountain ranges divide and merge into lower extensions, fertile valleys and plains are formed, suitable to agriculture. Most of Saxony belongs to the basin of the Elbe. At the east this river receives only minor affluents, but on the west, has several important tributaries, the chief of which are the Mulde and Elster, themselves formed by the junction of smaller streams. The lakes are numerous, particularly at the north, but insignificant. Mineral springs are numerous; the chief are: Bad Elster, Augustusbad, Neustadt, Warmbad (near Wolkenstein), Schweizersmühle, Wiesenbad, Hohenstein, Marienborn, Tharandt,

Grünthal (sulphur and iron), etc. The climate in the higher districts, called Voigtland, is cold, otherwise analogous to other countries of Europe in similar latitude. Unhealthy are only some marshy tracts on the Elbe and Pleisse. The Erzgebirge is that in which most rain falls. Leipzig enjoys the driest climate. Saxony is one of the most fertile parts of Germany, yet poor as compared to fertile soils elsewhere. Agriculture was long fettered by ancient customs, a condition no longer existing, and every inch of land now is developed to its utmost capacity. Sheep-farming has declined; cattle-raising is important. The forests are extensive and the mines, the oldest in Germany, are a great source of wealth. The principal crops are rye and oats, potatoes (Voigtland), beets (for feed) and flax (Erzgebirge and Lusatian mountains). Enormous quantities of cherries, plums, and apples are produced in the vicinity of Dresden, Leipzig, and Coldetz. Vineyards, chiefly interesting for their antiquity, are found on the banks of the Elbe near Meissen and Dresden. The chief mining districts are Freiberg, silver and lead; Altenberg, tin; Schneeberg, cobalt, nickel, and ironstone; and Johanngeorgenstadt, ironstone and silver mines. There are 236 mines, 150 of which are in operation, employing 8,615 hands. Coal occurs near Dresden and Zwickau. Peat is abundant in the Erzgebirge, sandstone on the hills of the Elbe; fine porcelain clay occurs near Meissen. Precious stones are found among the southern mountains, such as, jasper, amethysts, fine topazes, etc. The textile industry (employing 184,000 hands) is very important. The chief manufacturing centres are Zwickau, Chemnitz, Glauchau, Meerane, Hohenstein, Camenz, Pulsnitz, and Bishofsverda, and the principal articles are cotton, woolen, linen, damask and lace goods; other industries are straw-plaiting, wax-cloth, artificial flowers, stone and earthenware and porcelain ("Dresden china," celebrated); pianos, leather, cigars, paper, and all kinds of machinery, especially at Chemnitz and Dresden; printing presses, breweries, and distilleries; the smelting and refining foundries, chiefly at Freiberg. Leipzig is the centre of trade, especially for furs and books. The principal exports are the produce of the factories and mines. At the great annual Leipzig fairs at New Year, Easter, and Michaelmas alone, business amounts to \$50,000,000. Commerce has developed rapidly since the introduction of a railway system which covers 1,886 miles. Education in Saxony is highly cultivated, and its foundations of schools and universities of ancient date. The university and conservatory of music at Leipzig; the endowed schools at Meissen and Grimma; the mining academy at Freiberg, and school of forestry at Tharandt, are best known. The art collections of Dresden are celebrated. The government is a constitutional monarchy; the army raised by conscription. The reigning family descends from Wittkind, the native hero who was conquered by Charlemagne and converted to Christianity. The duchy was founded in 880, and in 1423 passed into possession of Frederick, Elector of Saxony. The Ernestine line was succeeded by the Albertine line, now occupying the throne. Frederick Augustus embraced the Catholic religion (1697) to obtain the crown of Poland. The succeeding monarchs fought against France for Poland, and in the

Seven Years' war joined their forces to those of Austria against France. After the battle of Jena, however, Frederick Augustus III., the Elector, and his army fought with Napoleon, who conferred on him the title of king. In 1807 and 1809, Saxony acquired large additions of territory, and in 1813 was the scene of Napoleon's struggles with his allies. The battles of Lützen, Bautzen, Dresden, and Leipzig were followed by a congress at Vienna, when much of Saxon territory was ceded to Prussia (1814). A period of progress followed, interrupted by the revolution of 1848-9. In the Austrian-Prussian war (1866) Saxony sided with Austria, and Prussia would have incorporated the kingdom, had not Austria, supported by France, interfered, and she was admitted into the North German Confederation. In the Franco-Prussian War, Saxony fought with the other German states against France. Albert (crown prince at that time) commanded the German forces at Meuse. Pop. (1900) 4,199,758.

Saxony, Orders and Decorations of. See ORDERS, ROYAL.

Sax'ophone, the name of a group of musical instruments invented by M. Sax. They consist of a conical brass tube, sounded by a mouthpiece furnished with a single reed similar to that of the clarinet. They have 20 holes covered by keys and studs for the first three fingers of each hand, and are all fingered alike.

Sax'ton, Joseph, American inventor: b. Huntingdon, Huntingdon County, Pa., 22 March 1799; d. Washington, D. C., 26 Oct. 1873. Having made his way to Philadelphia he was there employed in watchmaking and later in engraving, and devised, as his first invention, an ingenious machine for cutting the teeth of chronometer wheels. In 1830-7, after having constructed an astronomical clock with a compensating pendulum and original escapement, and having been admitted to the Franklin Institute, he was in England, where in June 1833 he exhibited before the British Association a magneto-electric machine. Here he won a considerable reputation as a maker of instruments of precision, constructing among various apparatus that by which Wheatstone measured the velocity of electricity in its passage through a long wire. Upon his return to the United States he was made constructor and curator of the standard weighing apparatus in the mint at Philadelphia, and in 1843 began the construction of the standard balances, weights, and measures to be presented to each State for securing uniformity. In 1851 he was awarded a gold medal for a large balance of great precision exhibited at the London World's Exhibition of that year. He was also somewhat of a student of archaeology, geology, and mineralogy, and became a charter member of the National Academy of Sciences (1863). Consult the sketch by Henry in Vol. I of the 'Biographical Memoirs' of the National Academy.

Saxton, Rufus, American soldier: b. Deerfield, Mass., 19 Oct. 1824. He was graduated from West Point in 1849 and in 1855 received rank as lieutenant. He led a surveying party across the Rocky Mountains in 1853-4, was on the coast survey in 1855-9 and instructor in military tactics at West Point in 1859-60. He was chief quartermaster on the staff of General

Lyon in the Missouri campaign, participated in the West Virginia campaign under General McClellan in 1861 in the same position, and filled a like post with General Sherman in his Port Royal expedition of 1861-2. He was commissioned brigadier-general of volunteers in 1862, and defended Harper's Ferry against General Jackson in 1862, receiving a medal from Congress in recognition of his services. In 1862-5 he was military governor of the Department of the South, was brevetted major-general of volunteers in 1865, and mustered out of the volunteer service in 1866. After the War he served as chief quartermaster in different departments until 1888 when he was retired with rank as colonel assistant quartermaster-general.

Say, Jean Baptiste, zhôn báp-têst sâ, French economist: b. Lyons 5 Jan. 1767; d. Paris 16 Nov. 1832. His early life was spent in England where he began a commercial career. The French Revolution called him to Paris, and his acquaintance with and interest in the social philosophy and political economy of his time to the staff of the famous 'Courrier de Provence,' the journal of Mirabeau. He was afterward secretary to Clavière, minister of finance. At the close of the Revolution he conducted 'La Décade,' a journal in which he presented with great clearness and ability the economic principles of Adam Smith, and such subjects as the public credit, the currency, and taxation. He wrote 'Catechisme d'Economie Politique' (1815-81); 'Lettres à Malthus' (1820); 'Cours Complet d'Economie Politique' (1828-30). Consult Guillaumin, 'Collection des Economistes.'

Say, Thomas, American naturalist: b. Philadelphia, Pa., 27 July 1787; d. New Harmony, Ind., 10 Oct. 1834. He was one of the earliest entomologists, and is said to have discovered more species of the genus *Insectivora* than any naturalist before him. His contributions to natural science were contained in his reports upon his expedition to the coast of Georgia and Florida in 1818, and that as chief geologist to the United States Survey of the Rocky Mountain region under Major Long in 1819-20, and have been collected by later naturalists. He was one of the founders of the Academy of Natural Sciences in Philadelphia in 1812. In 1825 he joined Robert Owen in his communistic colony at New Harmony. Consult: 'American Conchology,' edited by Birney (1858); 'American Entomology,' with memoir, edited by Le Conte (1859).

Say and Sele, sêl, William Fiennes, Viscount, English politician and colonizer in America: b. 28 May 1582; d. 14 April 1662. From his first appearance in Parliament he was generally of the opposition, which found in him a tactician and debater of considerable skill. During the constantly increasing restiveness under the government of Charles I. he was a prominent malcontent; at the opening of the Long Parliament held high place in the Lords by reason of his identification with the popular party in the lower house; recruited a regiment for Parliament; but from 1647 advocated compromise, and at the king's death retired. On the restoration he was made lord privy seal. With Lord Brook and 10 other associates he obtained from Lord Warwick and the New

England Company a patent for a large tract on the Connecticut (19 March 1632). A shipload of colonists was sent over, and Saybrook (q.v.) was founded under the immediate direction of Lion Gardiner (q.v.). Say and Brook also purchased a plantation at Cocheco (or Dover), in the present New Hampshire. Say later abandoned these enterprises, the Cocheco estate being made over to Massachusetts, and Saybrook being sold to Connecticut. Consult Palfrey, 'History of New England' (1858).

Saybrook, Conn., town in Middlesex County; at the mouth of the Connecticut River, on the New York, New Haven & Hartford railroad; 29 miles east of New Haven. It was first settled at Saybrook Point by the English in 1635. The town was incorporated in 1667, since then several townships have been separated from the original town; these are Chester (incorporated 1836), Old Saybrook (1852), Centerbrook (added to Essex, 1859). The industries include the manufacture of ivory goods, of augers, gimlets, and other small metal articles, and a box factory. The town-hall contains all the official records of the original town of Saybrook. There is a public high school, established in 1892. The Collegiate School of Connecticut (now Yale University) was located at Saybrook from 1701-16. Pop. (1890) 1,484; (1900) 1,634.

Saybrook Platform, a declaration of principles adopted in 1708 by the Congregational Church synod at Saybrook; substantially the same as the Cambridge platform (q.v.).

Sayce, sâs, Archibald Henry, English Assyriologist: b. Shirehampton, near Bristol, 25 Sept. 1846. He received his education at Queen's College, Oxford, where he was graduated in 1868. He was elected a fellow in the following year and became a tutor in 1870. In 1876 he was appointed deputy professor of comparative philology at Oxford, and since 1891 has occupied the chair of Assyriology in the same university. He was a member of the Old Testament Revision Company. He is an honorary member of the Asiatic Society of Bengal, the Royal Academy of Spain, and the Anthropological Society of Washington. His larger and more important works are: 'An Assyrian Grammar for Comparative Purposes' (1872); 'The Principles of Comparative Philology' (1874); 'The Astronomy and Astrology of the Babylonians' (1874); 'Lectures on Babylonian Literature' (1877); 'Introduction to the Science of Language' (1880); 'The Vannic Inscriptions Deciphered and Translated' (1882); 'The Ancient Empires of the East' (1884); 'The Origin and Growth of Religion as illustrated by the Religion of the Ancient Babylonians' (1887); 'Life and Times of Isaiah' (1889); 'The Higher Criticism and the Verdict of the Monuments' (1894); 'Early History of the Hebrews' (1897); and 'Babylonians and Assyrians' (1900). The following popular works: 'The Monuments of the Hittites' (1881); 'Assyria: its Princes, Priests, and People' (1882); 'The Hittites' (1889); 'The Races of the Old Testament' (1891); 'Social Life among the Assyrians and Babylonians' (1893); 'The Egypt of the Hebrews and Herodotus' (1895); and 'Israel and the Surrounding Nations' (1898).

Sayles, sālz, John, American jurist: b. Vernon, N. Y., 9 March 1825; d. Abilene, Texas, 22 May 1897. He was graduated from Hamilton College, Clinton, N. Y., but studied law in Texas, where he was admitted to practice in 1846. In 1851 he was appointed to the Supreme Court of his adopted State, and from 1853 to 1855 served in the Texas legislature. His first contributions to the literature of jurisprudence were published soon after the close of the Civil War, in which he served as brigadier-general in the Confederate Army. In 1880 he became a professor of law in Baylor University, Texas. His writings include: 'A Treatise on the Practice in the District and Supreme Courts of Texas' (1858); 'Treatise on the Civil Jurisdiction of Justices of the Peace in the State of Texas' (1867); and 'Revised Civil Statutes and Laws Passed by the Legislature of Texas' (1888).

Sayre, sār, David Austen, American philanthropist: b. Battle Hill, N. J., 12 March 1793; d. Lexington, Ky., 11 Sept. 1870. He removed to Lexington where he established a mercantile business and later became a banker. He acquired a large property, was the founder of Sayre Institute at Lexington, Ky., to which he gave \$100,000, and he disposed of about \$400,000 in other benevolent projects.

Sayre, Lewis Albert, American surgeon: b. Battle Hill (now Madison), N. J., 29 Feb. 1820; d. New York 21 Sept. 1900. He was graduated from Transylvania University in 1839, and three years later from the College of Physicians and Surgeons in New York. He was made professor of orthopedic surgery in the medical college of Bellevue Hospital in 1861, and professor emeritus at its consolidation with the New York University in 1898. In 1854 he successfully performed the first operation in the United States for the removal of the head of the femur in hip-joint disease, and became known as the greatest American orthopedist. His original methods and his invention of instruments used in the treatment of deformed children made his name familiar to the entire medical world. He was the author of 'Practical Manual of the Treatment of Club Foot' (1869); 'Orthopedic Surgery and Diseases of the Joints' (1876); etc.

Sayre, Robert Heysham, American civil engineer: b. Columbia County, Pa., 13 Oct. 1824; d. 4 Jan. 1907. He entered the engineering corps engaged in the enlargement of the Morris Canal, N. J., in 1840, and was subsequently employed in various canal, railroad, and mining enterprises. He was chief engineer of the Lehigh Valley Railroad in 1855-82, supervising extensions north and west. He was president and engineer of the Southern Pennsylvania Railroad and was largely interested in various iron works and other corporations. He was one of the first to introduce iron bridges, and began the use of steel rails in 1864.

Sayre, Stephen, American banker and patriot: b. Long Island 1734; d. Virginia 27 Sept. 1818. He was graduated from the College of New Jersey (Princeton) in 1757, became a merchant and banker in London, attained there considerable influence in political circles, but was committed to the Tower on an unwarranted charge of treason. The affair soon ended in

his release; but his banking business failed, as a result, and he was compelled to withdraw from England. Subsequently he was private secretary to Franklin, went with Arthur Lee's embassy to Berlin, and at Copenhagen, Stockholm, and Saint Petersburg was successful in obtaining supplies for the furtherance of the cause of independence. He was an opponent of Washington's administration in 1795.

Sayre, Theodore Burt, American novelist and playwright: b. New York 18 Dec. 1874. He was graduated from the New York College of Pharmacy in 1892, but almost immediately began to write for the stage. In 1896 his 'Wife of Willoughby' was produced at the Lyceum in New York and in the following year his 'Charles O'Malley' at the Lafayette in Washington. He has since produced other plays and the novels: 'Two Summer Girls and I' (1898); 'The Son of Carleycroft' (1900); 'Tom Moore' (1902).

Sayre, Pa., borough in Bradford County; on the North Branch of the Susquehanna River, and on the Lehigh Valley Railroad; about 15 miles north of Towanda, the capital of the county, and 18 miles southeast of Elmira, N. Y. Sayre is in an agricultural region and near the coal fields of the State. The industries are connected chiefly with farm and dairy products. The chief industrial establishments are machine shops, stove fixture works, metal works, lumber and coal yards. There is considerable trade in the shipment of farm and dairy products and poultry. The borough has a high school, elementary schools, and a public library. Pop. (1890) 5,243.

Sayula, sā-yoo'lā, Mexico, a town in the state of Jalisco, situated 55 miles south of Guadalajara. Agave and sugar are cultivated in the surrounding country, and the town has a thriving commerce. Pop. (1894) 10,655.

Sbaretti, sbā-rēt'tē, Donatus, Italian Roman Catholic prelate: b. Montefranco, Italy, 12 Nov. 1856. He was educated at the College of Saint Apollinaris, Rome, and was ordained in 1879. For eight years after his ordination he occupied the chair of speculative and moral philosophy in the College of the Propaganda, Rome, and subsequently served as sub-secretary of the Propaganda in affairs concerning the United States. He was made private chamberlain to Leo XIII., with title of Monsignore, and in 1893-1900 was the first to occupy the office of auditor of the Apostolic Legation at Washington. He was consecrated bishop of Havana in 1900, appointed extraordinary Apostolic Delegate to the Philippines in 1901, titular archbishop of Ephesus later in that year, and since 1902 has been Delegate Apostolic to Canada.

Scab, or Scabies, a skin disease in sheep, analogous to the itch in the human subject and to mange in horses and dogs. It is caused by a parasitic mite, *Sarcoptes scabiei*. See ITCH.

Scabbard-fish, the name of certain pelagic fishes, allied to the mackerels, and so called because of their compressed and elongated shape. One is *Lepidopus caudatus*, rare in American waters, but known in the Eastern Atlantic, Indian, and South Pacific oceans. It is the "frost-fish" of New Zealand, where it comes ashore in the surf on moonlit winter nights, and is

SCAD—SCALE INSECTS

caught on the beach by men watching for it. It is a favorite food-fish, and reaches a length of five or six feet, but weighs only about six pounds. Another is the cutlass-fish, silver-fish, or hair-tail (*Trichiurus lepturus*), which attains a length of four feet or more, and whose tail ends in a filiform point without a caudal fin. It is found on the American coast from New England to South America, and is silvery, with a golden lateral line and grayish yellow dorsal; the lower jaw is the longer, with two teeth projecting beyond the upper when the mouth is closed, and the whole armature of the jaws indicates carnivorous habits. It is rarely seen except when found benumbed with cold floating on the surface.

Scad, a name given to several species of fishes of the family *Carangidae*; in the United States to *Decapterus punctatus*, a fish about a foot long found along most of our Atlantic coast and abundant southward, where it is a food-fish of some importance. In England the name belongs to the fish also called horse-mackerel (*Trachurus trachurus*) which appears in large shoals and is dusky olive on the back, the sides variegated by bands of bluish. It is also known as saurel. A related species (*Trachurus crumenophthalmus*), common in the West Indies, and known on most tropical coasts, is called big-eyed scad.

Scad'ing, Henry, Canadian Anglican clergyman: b. Dunkeswell, Devonshire, England, 29 July 1813. He removed to Canada in childhood, earned a scholarship to Saint John's College, Cambridge, England, and was graduated from there in 1837. Returning to Canada in 1838 he took orders in the Church of England and was rector of Holy Trinity Church in Toronto, the first free church in that city, 1847-75. He was editor of 'The Canadian Journal of Science, Literature, and History' (1868-78), and has published 'Shakespeare, the Seer, the Interpreter' (1864); 'Four Decades of Upper Canada' (1865); 'Truth's Resurrection' (1865); 'Christian Pantheism' (1865); 'The First Bishop of Toronto' (1868); 'Toronto of Old' (1873); 'Early Pioneer Life in Canada' (1887); etc.

Scaevola, sĕv'ō-la, **Caius Mucius**, Roman hero and founder of the plebeian family of Mucii: lived about 600 years B.C. Livy tells how Caius Mucius, a young patrician, sought to kill Porsenna of Clusium, the protector of the expelled Tarquins, who was besieging Rome and had reduced the city to great distress. Mucius went to the tent of Porsenna to kill him, but mistaking his secretary for the chief plunged his sword into him. Porsenna, in rage, had Mucius brought before him, whereupon the young Roman expressed regret at not having killed Porsenna himself, and told him that other attempts would be made and would be successful. Upon Porsenna threatening to have Mucius burned alive if he did not betray the conspirators, Mucius thrust his right hand into a flame and held it there. Porsenna, in admiration for this fearlessness, ordered the young Roman freed, and the latter in return of courtesy told Porsenna that 300 Roman youths had sworn to assassinate him or die in the attempt. This so alarmed Porsenna that he raised the siege and withdrew from Rome. Scaevola, meaning "the left-handed," was the name bestowed upon Mucius in honor of his

deed. Quintus Mucius, called "the augur," a Roman tribune, praetor, and consul, d. about 100 B.C., and Quintus Mucius, called "the pontifex," Roman tribune, consul, and pontifex maximus, d. 82 B.C., are descended from Caius Mucius Scaevola.

Scafell, ska-fĕl', or **Scaw Fell**, England, a mountain in the county of Cumberland, bordering on Westmoreland, 13 miles southwest of Keswick. It rises from the centre of the lake region, its two peaks reaching an elevation respectively, of 3,229 and 3,092 feet, making the mountain one of the conspicuous features of the scenery. It consists of granite with a superformation of slate, excepting the summit which is composed of trap porphyry.

Scagliola, skāl-yō'la, an Italian term for an imitation marble used in columns, walls, and floors for surface decoration. It was invented by Guido del Conte in Modena in the early part of the 17th century. It is composed of plaster and glue mixed with splinters (scagliole) of spar, marble, granite, concrete, gypsum, veins of clay, etc., artificially colored, and smoothed down and polished to a semblance of the quality of polished marble.

Scaife, Walter Bell, American author: b. Pittsburg, Pa., 10 Sept. 1858. He was graduated from the University of Michigan in 1880, and since 1889 has lectured at Baltimore, Pittsburg, Washington, and Boston on history and other subjects. He has published 'American Geographical History, 1492-1892'; 'Florentine Life During the Renaissance'; 'A Dissertation on Law and History'; also 'A History of Geographical Latitude' (1889).

Scala, La, lā skā'lā, Milan, Italy, a historic theatre and opera house opened in 1778, with accommodation for 3,600 auditors.

Scald-head, an affection of the scalp, as ringworm of the head, etc., the term being vulgarly applied to various disorders similar in nature. See RINGWORM.

Scalds. See BURNS AND SCALDS.

Scale Insects, certain species of the family *Coccidae* (see COCCUS). Some species of this family are popularly called mealy bugs more often than scales; such species are readily distinguished by being free-moving, whereas the scales are stationary except for a few hours after birth or hatching. The males of the family are remarkable in having a complete metamorphosis (other *Hemiptera* have incomplete, and so do the females of this family), one pair of wings, a pair of hooks replacing the rear wings, and an extra pair of eyes in the adult, instead of mouthparts. The female has six legs when newly hatched, but after molting the legs are wanting and the insects are grub-like, stationary, wingless, and are concealed beneath a powdery, cottony, or waxy secretion and the cast-off skins. On account of their appearance some of the species are called gall insects, a name more correctly applied to species of the family *Cynipidae* and *Gallicole*, which produce nut-galls or galls.

The family embraces several species which have been used by man for many centuries and also some that are regarded as troublesome upon cultivated plants. The scarlet grains of Poland are scale insects (*Coccus polonicus*) which are found on the roots of knawel and were formerly

SCALE INSECTS

an important article of commerce, being used in dyeing various fabrics. Another species found on the roots of burnet has long been used by the Moors for dyeing wool and silk various tints of pink. Kermes or scarlet grain is the dried body of *Lecanium ilicis* which lives on the young shoots of the kermes oak (*Quercus coccifera*), a low evergreen shrub common from Spain eastward to India. In parts of this region this insect furnished a source of revenue to the people. The females grow about as large as peas and before the eggs are hatched, during May, they are gathered, dropped into vinegar, dried in the sun or in ovens, and sold. They have been used for ages to dye cloth a dark brownish-red, but except locally they are almost entirely superseded by cochineal. (See COCCUS.)

Cochineal is a species (*Coccus cacti*) of the mealy bug group. It is a native of Mexico where it feeds upon certain species of cactus, especially the nopal (*Opuntia cochinellifera*), a kind of prickly pear (q.v.). It is also found in many regions where this plant has been introduced, notably in the Canaries, Java, and the Mediterranean region, in some parts of which it has been cultivated. In Mexico pieces of the cactus covered with the insects are cut out at the close of the dry season and protected until the end of the wet season, when they are used for re-stocking the plantation in October. The females lay about 1,000 eggs, about 99 per cent of which produce females. In December the first crop is gathered and other harvests are made until May when the rainy season commences. The females are brushed off the plants, killed by heat, either in ovens, boiling water, or on hot irons, and dried. They usually lose more than half their weight in the process. A day's work is represented by about two ounces of dried insects—that is, more than 8,000! These insects have been used for dyeing scarlet and crimson, for which purposes they are unequaled, though coal tar products, being cheaper, more readily procured, and in greater variety, have largely replaced them. They are used also for manufacturing pigments such as lake and carmine (q.v.) and for coloring confectionery. See COCHINEAL.

Several other species have been used for dyeing, some being employed by the ancient Egyptians, Jews, and Persians for giving the brilliancy or delicacy of tint to certain fabrics formerly highly valued by these nations and the peoples embraced in their commerce.

Other members of the family are noted for their wax, which is used in some countries for candles, varnishes, sealing wax, lacquer, and many other purposes. The wax insect of China (*Coccus sinensis*) is a small white species which lives upon sumac and other trees upon the branches of which it deposits its secretion. This resembles hoar frost during June, but becomes somewhat darker and more continuous by August when it is scraped off and melted in boiling water. After straining and cooling it is ready for use. The French have introduced this species into Algeria. In South America another species is locally, but not commercially, important as a source of wax and in other countries are several species that might become similarly useful. But the principal species are the lac or shell-lac insects of Asia. (See LAC.)

Among the species considered troublesome upon cultivated plants perhaps the cottony cush-

ion scale (*Icerya purchasi*) is perhaps the most noted in the United States. This is an Australian insect which was accidentally introduced into California where, being free from the conditions that held it under control in its native habitat it spread rapidly upon orange, lemon, and other citrus trees to the dismay of the orchardist. It was found that certain species of lady-bird beetles (q.v.) play important roles in checking the spread of this scale in Australia; and so, some were imported in the hope that they would eradicate the scale in California. They did. The scale is now practically extinct in California and the lady-bird beetles, being deprived of their food supply, have followed it, since they seem to be unable to adapt themselves to other foods. This is one of the most remarkable instances of man's intervention to bring natural controls to his aid instead of resorting to artificial methods which are frequently cumbersome or unsatisfactory.

The armored scales of the sub-family *Diaspidinae* are generally of small size, but being exceedingly prolific and voracious are often held in ill-repute. They are generally flattened or slightly convex and covered with a parchment-like membrane, and are of many shapes. The larvæ are either hatched from eggs or are born. They crawl to a suitable place to feed, usually before they are a day old, and become fixed. They are tiny, flat, six-legged larvæ with a pair of feelers and with a long sucking beak which is soon put to use. Soon waxy threads appear, coalesce and cover the creatures. After molting the larvæ are legless. After the second molt the males can be readily recognized, being a pupa with wings, legs, and antennæ visible; the females become still more grub-like. The male soon emerges, flies a short time, pairs, and dies. In some cases the females hibernate, in others they lay eggs, in others bear young, sometimes there may be several generations in a season. Some of the best-known species are the oyster-shell bark-lice, especially *Mytilaspis pomorum*, which is well known upon apple, lilac, willow, and other trees. They are named from the shape of the scale, which resembles the shell of some kinds of oysters. This species winters in the egg, the young appear in May, and in the North there is only one brood; two in the South where the insects are believed to hibernate. A very similar species lives upon citrus fruits, and specimens may often be found upon oranges and lemons, especially those that come from the Mediterranean region. The San José scale (*Aspidiotus perniciosus*) is viviparous and enormously productive. It lives upon the woody members of the order *Rosacea*, for example, apple, cherry, rose, and pear, and upon currants, gooseberries, elm, chestnut, oak, walnut, and many other trees and shrubs. The scurfy scale (*Chionaspis furfurus*) is an oval scale with the cast skin at the small end and is frequently found upon apple and pear trees. The red scale of the orange is a close relative of the San José scale and is well known in California, Florida, etc. (See ORANGE.)

The cottony maple scale (*Pulvinaria innumabilis*) is often found on Virginia creeper, grape vines, and some other plants, as well as on maples. It is a soft scale which is usually rather conspicuous in spring from its cottony appear-

SCALE-TAIL — SCALLOP

ance upon the young growths. The "cotton" is really a gum since it can be drawn out into cobweb-like threads. The black scale (*Lecanium oleæ*) is another soft scale which is well known to California olive and orange growers.

Several species of scale insects are found in greenhouses and nurseries devoted to ornamental plants. But they present no more remarkable features in life-history or habits than the preceding, and being of somewhat smaller importance need not be discussed specifically.

Where the natural controls seem to be inadequate to cope with the species various artificial methods have been tested to determine their efficacy. But in many instances these are so cumbersome, expensive, dangerous either to plant or operator, and difficult to apply intelligently, that they have been discarded. Spraying and fumigation (see INSECTICIDE) are the principal ones in vogue. But it seems highly probable that in many instances the natural controls would hold the scales in check. Man has, however, not yet discovered these controls except in a few cases and in most of these has not made use of them more than experimentally.

Consult: Smith, 'Economic Entomology' (Philadelphia 1896); Comstock, 'Manual for the Study of Insects' (Ithaca 1895); and numerous bulletins of the agricultural experiment stations and the United States Department of Agriculture.

M. G. KAINS,
Crop Expert.

Scale-tail, an African flying squirrel of the family *Anomaluridae*, distinguished from the true squirrels by dentition and various other peculiarities, and especially by the possession of a series of strong keeled scales at the root of the tail, which seems to serve as an aid in climbing. There are several genera and species, of which the best known is *Anomalurus pecti* of the Gold Coast, which is black and white, and is regarded as a delicacy by the natives. The food and habits are similar to those of the northern flying-squirrels.

Scales, **Alfred Moore**, American lawyer, soldier, and statesman: b. Reedsville, N. C., 26 Nov. 1827; d. Greensboro, N. C., 9 Nov. 1892. He was graduated from the University of North Carolina in 1846 and admitted to the bar in 1851. He represented Rockingham County in the legislature in 1852, 1853, and 1856, and was a Democratic representative in the 35th Congress 1857-9. When the Civil War broke out, he entered the Confederate army as a private, and was rapidly promoted to the rank of brigadier-general. He took part in many important battles, including Williamsburg, Fredericksburg, Chancellorsville, and Gettysburg, and after the war resumed his law practice at Greensboro, N. C. He was a member of the State Legislature in 1866-7; of Congress in 1875-85; and governor of North Carolina 1884-8.

Scales. See BALANCE.

Scaliger, skāl'i-jēr, **Joseph Justus**, French scholar and author: b. Agen, France, 4 Aug. 1540; d. Leyden, France, 21 Jan. 1609. He was the tenth son of his learned father, Julius Cæsar Scaliger (a.v.), and received from him a fine classic education, as well as a boastful and arrogant nature. He studied Latin at Bordeaux, and Greek at Paris. According to Henisius, he shut

himself into his room and committed the whole of Homer in 21 days; he memorized the rest of the Greek poets in three months and the entire body of Greek literature in two years. It was his boast that he was equally familiar with 13 languages. In his 22d year he was converted to Protestantism, a fact which probably retarded his advancement in France. From this period until 1578 he traveled extensively, making a poor living from his teaching and writings, but refusing the money offered him by admiring patrons. In 1578 he became professor of belles lettres at Leyden, a position which he held until his death. Joseph Scaliger's most important works are upon chronology. His 'De Emendatione Temporum' (1583) gave the first complete scientific chronology, and for this work, with his 'Thesaurus Temporum' (1609), and on account of his discovery of the Julian Period, he deserves to be called the founder of the science of chronology. He also annotated the principal works of the chief Latin writers.

Scaliger, Julius Cæsar, Italian classical scholar: b. Riva, Lake Garda, 23 April 1484; d. Agen, France, 21 Oct. 1558. He is generally accepted as the son of Bendetto Bordoni, a miniature painter of Padua, but Scaliger claimed descent from the Scaligeri princes of Verona, as did his son, Joseph Justus Scaliger. The elder Scaliger, according to his own account, was a page of Emperor Maximilian for 17 years, then received a pension, studied at Bologna, commanded a squadron under the French viceroy, studied natural law, and in 1525 accompanied the bishop of Agen to his diocese in France where he settled, as physician. In 1530 he married a lady of rank and from that time put forth pretentious claims as to his ancestry. He was a man of unusually great learning, a versatile Latin poet, but bold and arrogant, so that while his writings brought him admirers among the scholars of his day, his personal conduct gained him many enemies. His principal works include commentaries on the work of Hippocrates 'De Insamnis' (1538); of Aristotle, 'De Plantis' and Theophrastus, 'De Causis Plantarum' (1566); an attack on Erasmus, 'Oratio pro Cicerone contra Erasmus' (1531), 'De Causis Linguae Latinæ' (1540); 'Poetices Libri VII' (1561).

Scallop, a well known bivalve mollusk. The scallops form a family (*Pectinidae*) related to the oysters, which they resemble in having a single adductor muscle. The genus *Pecten*, which in the wide sense is nearly coextensive with the family, has the following characters: The shells are more or less orbicular, with an ear developed on each side of the umbo, making a straight hinge-line, generally ornamented externally with more or less developed radiating ribs. The hinge-teeth are lamellar, but usually small and obscure, the principal ligament is internal and solid, and the muscle-scar is single. The mantle margins are open all around, reduplicated and, besides a fringe of tactile filaments, bear numerous conspicuous eyes of a brilliant blue or silvery lustre. These eyes are the most complex known among the *Pelecypoda* and consist of a nervous layer, a choroid coat lens and cornea and receive an optic nerve from the circumpallial trunk. The gills are delicate and of peculiar structure, the foot small and papilliform and in the young has a byssus gland, and the genital ducts open into

the kidneys or near their apertures. Only the posterior adductor muscle is present, and this is large, round, central, and remarkable from its constitution in part of striated and in part of nonstriated fibres. Scallops are remarkable, especially when young, for their activity, and swim in a peculiar jumping fashion by opening and powerfully closing the shell valves as though flying, thus forcing out the contained water and propelling themselves forward. As they become older and the shells heavier they are more quiescent. Fully 200 living and a still greater number of fossil species are known beginning in the Carboniferous strata. Perhaps 40 species occur in North American waters, the great majority southward and in moderately deep water. Several of our own and foreign species are of commercial importance, furnishing the well-known scallops of the markets. *P. Jacobaeus*, a native of the Mediterranean, is the scallop shell which pilgrims were accustomed to wear in front of their hat in token of having visited the shrine of Saint James at Compostella.

Although the richly colored and beautifully formed shells of the scallops are much used in fancy work of various kinds, these mollusks derive their commercial importance from the use of the muscle for food. Before the advent of the white man they were largely gathered for this purpose by the Indians. The principal fisheries are on the coast of Maine, in Long Island Sound, Buzzard Bay and contiguous waters, and on the coasts of New Jersey and California, the first two having the greatest magnitude. South of Cape Cod *Pecten irradians*, which has the shell marked with about 20 prominent radiating ribs on each side, is the species sought. This lives especially in the shoal waters of the bays or on flats in the Sound. Scallops vary greatly in abundance from year to year and the seat of the fisheries changes accordingly, some formerly favorite grounds being abandoned and others developed. The commercial scallop fishery of Maine originated about 1880 and has since developed into an important industry at many points east of Casco Bay. Here the giant scallop (*P. magellanicus*) is the species sought. This is much larger than *P. irradians*, and the valves are marked with numerous fine radiating lines, the lower valve being nearly flat and white and the upper convex and brown. This species lives in deeper water and like the other changes its feeding ground. Scallops are now taken almost exclusively in small dredges, resembling in most features the oyster dredge, and pulled over the ground by means of small boats; larger vessels when used serve chiefly for transportation, etc. The fishing season varies; south of Cape Cod it covers the cold months, but about Mount Desert the bulk of the catch is made during July and August. All of the scallop fisheries south of Cape Cod yielded about 72,000 gallons in 1880 valued at about \$30,000; those of Maine in 1889 had an output of 30,000, the product of 45,000 bushels of scallops, and valued at \$18,647.

Consult: Ingersoll, 'The Fisheries Industries of the United States,' Sec. V. (Washington 1887); Smith, 'The Giant Scallop Fishery of Maine'; Bull. U. S. Fish Comm. 1889 (1891); Stearns, 'Overland Monthly' (1873).

Scalp, the outer covering or integument of the upper part of the skull or brain-case. Except in the fact that hair in both sexes grows

more luxuriantly on the scalp than elsewhere, the skin of the scalp differs but slightly from ordinary skin. But besides its constituent of skin, the scalp is composed of the expanded tendon of the occipito-frontalis muscle, and of intermediate cellular tissue and blood-vessels. Injuries of the scalp, however slight, must be carefully watched, for they may be followed by erysipelas, inflammation, suppuration, or pyæmia that may easily prove fatal. Prompt antiseptic dressing lessens the danger in such accidents. In the treatment of scalp-wounds no part of the scalp should be cut or torn away; and, if possible, stitches should be avoided, as plasters and bandages will generally keep the separated parts in apposition. Burns of the scalp are very liable to be followed by erysipelas and diffuse inflammation, but the brain is comparatively seldom affected in these cases. Tumors of the scalp are not uncommon, the most frequent being the cutaneous cysts popularly known as wens, and vascular tumors. Parasitic diseases also affect the scalp, and require special treatment. Catarrhal inflammation of the hair-follicle and other hair-destroying diseases result from micro-organisms. See DANDRUFF; PITIRIASIS; RINGWORM; SEBORRHOEA.

Scalper, a common term in the United States applied to any person who buys railroad, theatre, or steamship tickets at a discount from people unable to use them, and sells them again at an advance on the price he paid for them. Theatres and transportation companies have devised various plans to break up this trade, and in some States laws have been passed forbidding the sale of railroad tickets at cut-rate prices.

Scalping, the act of partly cutting and partly tearing off the skin of the head, with the hair attached, of a living or a dead victim. Scalping was practised not only by the American Indians, but also, in early times, by most of the savage and barbarous nations of the eastern hemisphere, as the Scythians, Gauls, and other wild peoples of Asia and Europe. Sometimes the entire head was taken in lieu of the scalp. After the scalp was taken, it was tanned and then stretched on a small hoop of wood, and the side opposite to that having the hair was painted in various colors, and even the hair was tinted likewise; sometimes the portrait or the hieroglyphic device of the person scalped was placed on it. Persons scalped did not always die from the effect. Scalps were regarded as trophies of victory and prowess. Joutel relates that in 1687 among the Cenis of Texas, a scalp was waved or offered in ceremony to the four quarters of the world, and that tobacco and hominy were offered to the scalps that were paraded. In 1703, Bienville offered 10 "escus" (écus, about 10 crowns) for every scalp of a man killed or prisoner taken of the Chetimachas and Alibamons (Alibamas). The American colonies offered bounties for scalps. In 1724 Massachusetts offered 100 pounds sterling (about \$500) for Indian scalps; 30 years later, during the so-called French and Indian war, the French offered a bounty for British scalps, and the colonists for Indian scalps. In 1755, 40 pounds sterling (about \$200) was offered by Massachusetts for the scalps of male Indians over 12 years of age, and 20 pounds sterling (about \$100) for the scalps of women and children.

Scaly Ant-eater. See MANTIS.

Scamander, ska-măn'dér (ancient XANTHUS), Turkey in Asia, a small stream in the Troad, rising near the city of Ilium. It had two sources, one of which was hot, the other cold. Strabo asserts, however, that it had but one source, which was in Mount Ida. Its direction was west-northwest, and about two miles from its mouth it received the small river Simois; it emptied into the Hellespont. Since the beginning of the present era these rivers have had separate courses. The Scamander is sometimes identified with the Menderes or Meander (q.v.).

Scammony, a gum-resin obtained from the *Convolvulus scammonia*, native to the bushy wastes of western Asia. This is a climbing plant with irregularly arrow-shaped leaves, white or purplish flowers like morning-glories, and a fleshy tapering perennial root. When in flower, incisions are made obliquely in the upper part of this root, and shells fastened below the gashes, in which the sap is caught as it exudes. They are then emptied, the juice added to scrapings from the root, thoroughly mixed, dried, and kneaded into cakes. Scammony is much adulterated, but when pure or "virgin" is greenish-gray or blackish in color, internally porous and of a resinous lustre, breaking with an angular fracture and translucent in thin pieces. It has a peculiar somewhat cheeselike odor and an acrid taste. Different kinds of the drug are named after the districts in which it is collected and the place of export. Scammony is a strong purgative usually used in combination with other medicines, and supposed to have been known to the Greeks as early as the 3d century B.C., and to have been one of the medicines recommended by Helias to King Alfred the Great.

Scamozzi, Vincenzo, vën-chënd'zō skāmōt'sē, Italian architect: b. Vicenza 1552; d. Venice 7 Aug. 1616. He was taught by his father, also an architect, and by Palladio and Sansovino, at Venice; and at Rome he studied ancient monuments. Returning in 1583 he was commissioned to erect a monument to the family of Marc Antonio Barbari, in the church of the Carita, and so much was this work approved that he was appointed to finish the grand library at Saint Mark's, to build the Trissino Palace at Vicenza and the Cornaro Palace on the Grand Canal, Venice. By this time Scamozzi's fame had spread over Europe and he was in great demand. He built the Ravaschieri Palace at Genoa, and added the second story to the Palazzo Strozzi at Florence (1594). About 1604 he designed the Cathedral of Salzburg, Austria, and a part of the Schloss at Prague, Bohemia. His writings include: 'Discourses on the Architecture of Rome' (1582); and 'Ideas of Universal Architecture,' two volumes of which were completed before his death.

Scanderbeg, skăn'dér-bëg, Albanian prince: b. 1404; d. Lissa, Albania, 17 Jan. 1468. His real name was George Castriotes, and he was the 4th son of John Castriotes, an Albanian prince. The sons being given to Sultan Murad II, in 1423 as hostages of peace, the sultan named the youngest Iskender Bey (whence Scanderbeg) and made him a janissary after having poisoned his three brothers. When Scanderbeg's father died in 1432 and the sultan annexed Albania as a

province, Scanderbeg determined to revolt. He had gained distinction in the Ottoman campaigns, and his opportunity came when, in 1443, he was sent to Hungary against the Christian Huniadi. He entered into agreement with the latter, gave him the victory, and fled to the sultan's powerful fortress of Croia, of which he gained command as the sultan's representative. Abjuring Mohammedanism, he now organized the Albanian forces and successfully repelled the armies of the entire Ottoman empire for 17 years, when the sultan's successor, Mohammed II., made a treaty with him acknowledging the independence of Albania and Epirus. A few years later he was persuaded by the pope to join the Venetians against the Mussulmans and with an inferior force won eight great victories over Mohammed II.

Scandinavia, skăn-dī-nā'vī-a, a general designation for the three north-European kingdoms, Denmark, Norway, and Sweden (qq.v.), sometimes applied in a more restricted sense to the two latter only. In the Middle Ages the name of Northmen was bestowed indiscriminately on the inhabitants of the three countries, whose closely related languages and common mode of life and political fortunes afforded sufficient basis for considering them one people. As a geographical term Scandinavia is rapidly passing out of use, but the appellation is still employed in an ethnographic, and especially in a literary sense. See SCANDINAVIAN LITERATURES.

Scandinavian Literatures. Danish literature having received adequate treatment under DENMARK, the present account deals only with the literatures of NORWAY and SWEDEN.

Norwegian Literature, in the strict sense, is a very young one, dating back only to 1814, when the political union that had existed for over four centuries between Denmark and Norway was dissolved. Norwegian literature, however, may claim a noble and ancient ancestry in the old Icelandic literature (q.v.), which may justly be regarded as an offshoot of that of mediæval Norway, an offshoot which flourished luxuriantly while the parent stem failed to develop any marked growth of its own. Traces of a Norwegian literature appear in the middle of the 13th century in the form of prose translations from the body of chivalric and legendary tales then so popular throughout Europe, as for example the Charlemagne cycle and the story of Dietrich of Bern. With the union of Norway and Denmark in 1387 all independent literary expression in the former country disappears, and whenever men of Norwegian birth attain eminence, it is as contributors to the Danish literature. Such men were Petter Dass in the 17th century and later, Holberg, Wessel, Tullin and Frimann among others. The national spirit, however, remained in full vigor in Norway, and in the mouths of the people the ancient vernacular was preserved, destined to serve as a factor in the development of a new Norwegian literary dialect in the 19th century. In 1774 the Norwegian Society was organized at Copenhagen and its influence, without directly aiming at such an object, came to serve as a source of encouragement for those writers in Danish whose themes dealt with Norwegian nature, life, or modes of thought. With the separation of Norway from Denmark in 1814

begins the national period of Norwegian literature. For some twenty years following that event, the literary productions of the kingdom were marked by a fervidity of patriotic enthusiasm which revealed itself in unmeasured exaltation of the Norwegian land and the Norwegian people, to the great detriment of formal excellence or the development of critical standards. The best known names of this period are M. C. Hansen (1794-1842), H. A. Bjerregaard (1792-1842), and C. N. Schwach (1793-1860). A great advance is marked by the poems of Henrik Wergeland (1808-45), the great national poet of Norway, in whom love of country was more than mere fantastic adulation of its rocks and gorges. Yet Wergeland, too, was carried away by his patriotism to the extreme of denying foreign standards of form and taste. In this position he was assailed by the critic and poet Welhaven (1807-73), who stood for the imposition of approved literary form on the raw matter of national feeling. The contest between the two assumed national importance and split up the intellectual world of Norway into two hostile camps. Welhaven's principles, however, triumphed in the end, as indeed they were bound to do, when with the progress of time cooling national ardor gave way to increasing artistic skill, growing with practice. A. Munch (1811-84), in addition to his dramas and prose works, deserves mention as a writer of gentle and pious verse, marked by a high development of form. Camilla Collett, a sister of Wergeland, was the author of a still extremely popular novel, 'The Magistrate's Daughters.' A period of comparatively mediocre production follows, in which the most prominent names are P. C. Asbjørnsen (1812-85) and Jørgen Moe (1813-82), who jointly published in 1842 a collection of popular myths and traditions which was instrumental in stimulating interest in the folklore; Landstad, Bugge, and Lindemann, who gathered the popular songs of the country; Schulze, Østgaard, and Meltzer, who depicted various aspects of the national life with a high degree of power; and Aasen, who originated the movement for making the popular dialect the basis of a written language. The chief writers among Aasen's followers, were the epic and lyric poet, A. O. Vinje and K. Janson, who wrote verse, prose, tales, and drama.

The greatest era in the history of Norwegian literature is the latest, when with the works of Henrik Ibsen (q.v.), and Bjørnstjerne Bjørnson (q.v.), Norway passes at once from a minor place among the nations of Europe to a prominent position in the front rank of the world's literature. Ibsen and Bjørnson both make use of a vernacular consisting of a blending of literary Danish with the popular Norwegian. The common spirit of this latest phase of the national literature is that of a realistic radicalism which directs its efforts to the thorough exposition of the evils of modern society and the anomalies of the human character and of human civilization. This spirit finds its greatest exponent in Ibsen. In Bjørnson a deep religious feeling turns the lesson of realism to a belief in an ultimate good. Jonas Lie has painted with a light touch the domestic life of the people, while Alexander Kielland and Arne Garborg have devoted their attention to social questions, their writings par-

taking largely of the nature of literature "with a purpose." Outside of belles-lettres, the Norwegian literature contains able monuments of historical and scientific research. In history P. A. Munch and R. Keyser were the pioneers. They laid the foundations for the scientific study of the old history of Norway and were followed by J. E. Sars (the ablest historian the country has as yet produced), G. Storm, N. Nicolaysen, and L. Daase. E. L. Sundt (1817-75) occupies a very prominent place in the field of political economy, and N. Treschow (1751-1833) in that of philosophy. In philology and literature excellent work has been done by C. R. Unger, J. Fritzner, and S. Bugge. See Botten-Hansen, 'Norvège littéraire' (1867); Horn's 'History of the Literature of the Scandinavian North,' tr. by Anderson; Schweitzer, 'Geschichte der skandinavischen Literatur' (1886-9; 'Die Entwicklung der nationalen Dichtung in Norwegen' (1881).

Swedish Language and Literature.—The Swedish belongs to the Scandinavian branch of the Germanic family of languages and with Danish forms a subdivision of that branch sometimes called the East Scandinavian in distinction from the West Scandinavian, which comprises Norwegian and Icelandic. The basis of both divisions was the old Danish language, which entered upon a course of differentiation about the middle of the 9th century, since when the development of the Swedish language has been usually divided into five periods: the first to 1250 marked by some scanty remains in the Runic alphabet; the second to 1400, exemplified in a number of legal codes, comprising the 'Vestgötalag,' the 'Östgötalag' and the 'Gutalag'; the third to 1520, a period of Danish and German influence during which the literary language underwent an important evolution, and the chief monuments of which are sundry historical chronicles; the fourth to 1700, during which the Reformation and the introduction of printing hastened the differentiation between Swedish and Danish, resulting at the end in the assumption by the language of what has remained its distinctive character; the fifth period, to the present day. Swedish has retained to a greater degree than any of the sister languages, excepting of course Icelandic, the peculiarities of the old Scandinavian common tongue. It is rich in terminal endings and is by far the most euphonous of the northern languages. Consult Noreen, 'Altschwedische Sprachen' (1897); 'Geschichte der nordischen Sprachen' (1898).

The oldest remains of Swedish literature are in the form of Runes, which, though scanty in number, would seem to indicate that the country possessed a considerable body of legends and hero-tales in verse form at a comparatively early time. With the introduction of Christianity the ecclesiastical factor becomes the dominant one, and the works produced follow as a rule Latin sources and models. The greater part were in the form of translations for the use of the national clergy, and in this connection the cloister of Vadstena founded by St. Birgitta (1303-73) is famous. There portions of the Bible were translated and collections of legends of the saints made. Outside of the religious sphere, the romances of chivalry attained great popularity. The chronicles of the time possess little histor-

ical value with the exception of the 'Historia' of Olavus Magnus, which gives a faithful description of the peoples of the north; of more interest are the various codes of laws mentioned above. The religious element continued prominent throughout the period of the Reformation; the best known names during this time being that of the reformer Olavus Petri, who translated the New Testament (1526). His brother, Laurentius Petri, edited the whole Bible in 1541, and wrote an excellent history of Sweden. Olavus Petri also wrote the first mystery play, 'Tobie Comœdia' (1550), but was surpassed in the growing field of the drama by Messenius. The Thirty Years' War, in making Sweden the great power in the north of Europe, subjected her literature to foreign influences, and Italian, French, and German models were zealously imitated. A definite classical tendency also becomes apparent and an attempt is made to assimilate ancient standards with the native genius of the language. The greatest name of this period is Stjernhjelm (1598-1672), who wrote didactic verse, odes, and lyrics, more formal than inspired, and in spite of his prevailing classicism fell, to some degree, under the Romantic influence. His followers, Samuel Columbus (1642-79) and Hjärne (1641-1724), carried on the work of introducing foreign metres and verse forms into the language. Rosenhane (1610-84) cultivated the sonnet successfully, and Runius (1679-1713) attained exceedingly great popularity as the facile author of merry-hearted verse. In the beginning of the 18th century the influence of the French pseudo-classicism was considerable; it encountered a rival tendency, however, in the rise of a passionate study of Norse antiquities, carried by Rudbeck to absurd lengths in his 'Atlantica.' Archaeology now gave way to science, which, with the speculative branches to a minor degree, quite overshadowed pure belles-lettres. This is the age of Linnæus in botany, of Celsius in astronomy, of Polhem in physics, and of Scheele in chemistry. Dalin laid the beginnings of historical study, and Ihre and Hof did pioneer work in the field of philology. In the realm of pure thought the figure of Swedenborg (q.v.) overshadows all others. In fine literature Fru Nordenflycht was the centre of a circle that numbered among others, Creutz, author of the idyllic poem, 'Atis och Camilla.' The age of Gustavus III. (1780-1809) was marked by the preponderating influence of French rationalism; the cultivation of the sciences languished, but letters made great progress. Kellgren (d. 1795) was a master of poetic form and embodied in his verse the humanitarian ideas of the later 18th century. In contradistinction to Kellgren's classic muse, Bellman (d. 1795) was essentially Swedish in his light verse dealing with the pleasures of life, reminding one not a little of what is best in Bengt Lidner (d. 1793), combining broad sweep of thought with a vitiating excess of sentimentality. Not less subject to the French influence were Gyllenberg (died 1808), who wrote epics and fables, and Oxenstierna (d. 1818), who during his lifetime enjoyed great popularity.

With the second decade of the 19th century begins a decided reaction against the pseudo-classic traditions of France. The party of

Phosphorists, representing the extreme of Romanticism, now gains the ascendancy, and its most gifted member Atterbom (d. 1855) embodied, in the finest examples of lyric verse the Swedish literature possesses, the very essence of dream life and idealistic aspiration. Palmblad and Dahlgren were stout enemies of classicism, and the latter in his verse produced fine examples of that nature description to which the Romanticists turned to find the reflection of their own moods. Coeval with the Phosphorist Society was the Gothic League, which included among its members Tegnér (q.v.), Geijer (q.v.), and Ling. The Goths turned their attention to the legends and history of the ancient Northland, and Geijer's stirring lyrics and ballads have become a cherished part of the national literature. Tegnér attained the culmination of his genius in the 'Frithjofs Saga,' wherein the old material is treated in the spirit of modern romanticism. Almqvist (q.v.) brought a weirdly fertile imagination to the treatment of life's realities and, dying in 1866, anticipated in many ways the problems and contentions of the naturalists and realists of the last two decades of the century. Malmström (d. 1865) and Böttiger (d. 1879) were the chief representatives of a school which sought to combine the spiritual grasp of the Phosphorists with the simple technique of the Gothic writers. In Runeberg (d. 1877) Finland gave to Swedish literature its greatest poet since Tegnér. Runeberg excelled also in the drama and became the model for a school of writers comprising, among others, Nervander, Stenbäck, and Cygnäus, which has sought to portray the realities of simple life in a simple, though sympathetic, manner. Fredrika Bremer (q.v.) is the best known representative of a school of sentimental novelists which flourished about the middle of the 19th century and has now all but disappeared. Realism is now the dominant tone in Swedish literature, and the influence of the French naturalists and to a greater extent even of the Norwegian masters is apparent. At the head of the realists stands August Strindberg (q.v.), dramatist, novelist, and miscellaneous writer, whose active career began with the publication of 'The Red Room,' a study of Bohemian life, in 1879. With the name of Rydberg, one of Sweden's most gifted poets, the account may be concluded, if we only cast a backward glance to speak of Geijer and Fryxell, the two greatest names in the field of Swedish history. Consult Schweitzer, 'Geschichte der skandinavischen Litteratur' (1886-9); Wollheim da Fonseca, 'National Litteratur der Skandinaver' (1874-7); Anderson's translation of 'Horn's History of the literature of the Scandinavian North' (1901).

RASMUS B. ANDERSON.

Scandinavian Music. Until the 19th century the Scandinavian countries showed no national schools of composition, though the history of music in these countries goes back for nearly four centuries. In Denmark Hartmann (1805-1900) is regarded as the founder of an indigenous school, and the list of great names includes Gade (1817-90), Emil Hartmann (1836-98), and Wending (1835-99). In Sweden Germans were the first composers, the native successors beginning with Benvold (1796-1868)

SCANDINAVIAN MYTHOLOGY

and continuing in Lindblad (1801-78), Södermann (1832-76), Hallén, and Sjögren. In Norway Kjerulf (1815-68) was the first of native composers. Svendsen, Grieg, and Sinding form a notable triad in the national development.

Scandinavian Mythology. The mythology of Scandinavia was distinct from that of ancient Greece and Rome, although both systems resembled each other in certain essential features, and they may possibly have had a common origin in the far-off prehistoric period. The differences were such as might be expected to exist between a nation cradled in the frozen North and nations living in the genial South. In the Scandinavian as in Greek mythology, there are two periods, the prior one apparently reflecting misty traditions of the earth's development from chaos and darkness into order and light, perhaps stories which the cave-man had handed down to his children and they to their children, until they became crystallized into an ideal system of supernatural beings by the Vikings, who afterwards invaded and conquered the Scandinavian countries. Geology has strangely verified the facts which were dimly shadowed forth in the early Northern mythology. The terrible ice age which converted Europe into an arctic waste, and pushed its awful precipices into the Atlantic beyond the Hebrides and the western coast of Ireland, evidently made an indelible impression on the mind of prehistoric man, who learned to regard ice as the deadly enemy of human existence, and the sun, with its vivifying heat, as the source of happiness and joy. This thought, almost a second nature, is reflected in the earlier mythology of the Scandinavian race, in its shadowy and crude mind-picture of something that had really happened, and that, it was feared and believed, might and would happen again.

The second and younger period of Scandinavian mythology reflects a new era. Men have got over their old dread of an ever imminent catastrophe. They have battled with nature, and found themselves often victorious. They have had heroes of their own, sharing their loves and revenges, triumphing in war, and enjoying the rewards of valor and virtue. Nor were their women unwarlike, as became the daughters of heroes. The Amazons, real or imaginary, of Grecian story, had their counterparts in the lore of the North. A new mythology grew out of new conditions, different from, yet linked with, the old, from which it was a natural evolution, and it is with this younger mythology, its gods and goddesses, that Christianity was brought into contact, ultimately crushing it out after a struggle which proved the deep attachment of the Northmen to their ancient faith.

It is to be said for Scandinavian mythology that it never descended to the sensuousness of Greece and Rome, and was equally superior in breadth and imagery to the absurd polytheism of Egypt. It was terrible in some of its ideals, but never depraved. It imaged the spirit of the Viking race, and was well calculated to inspire them to the deeds of prowess which brought to their feet even the militant races that had founded kingdoms on the ruins of imperial Rome.

According to the earlier Scandinavian mythology there was originally no heaven and no earth, but a vast deep, a world of mist in the North called Niflheim, a fountain which was called Hvergelmer that flowed from the mist, and 12 rivers that issued from the fountain. These rivers froze into ice and filled the deep—a picture of the ice age. The world of fire and light was in a southerly direction, and was called "Muspelheim." The light and heat from the world of fire melted the ice from the world of mist, and from the melted drops sprang the ice-giant Ymer. A little man and woman proceeded from Ymer's left arm, and a son from one of his legs, and these were the ancestors of a race of ice-giants. A cow also came into being from the ice and heat, and gave milk to the giant Ymer, at the same time keeping itself fed by licking salt blocks of ice. One evening while the cow was licking the blocks, human hair grew out of them; on the following day a head, and on the third an entire man who was called Bure. Bor, the son of Bure, married Bestla, the daughter of the giant Bolthorn, and they had three sons, Odin, Vile, and Ve. The sons of Bor slew the ice-giant Ymer. From his body they created the heaven and the earth. His flesh became earth; his bones rocks; his teeth and pieces of his jaws became stones; his hair, grass and trees, and his blood the sea and rivers. His skull was used to make the sky, which was extended over the earth, with four dwarfs, Austre, Vestre, Sudre, and Nordre, representing the East and West, South and North, at the four ends. Out of the heat and light from Muspelheim they made stars, which they fixed in the heavens to give light to the earth. Ymer's brain became clouds. From two ash-trees were created a man, Ask, and a woman, Embla, who were endowed with reason, language, hearing, and sight. The tree of the world called Ygdrasil, stood over the well of time, with its top above the heavens, and three great roots, one among the gods, another among the giants, and the third in the lower regions. The fountain of wisdom and the sacred fountain flowed forth near the roots. By the sacred fountain the gods held their councils, and from this and the fountain of wisdom sprang three beautiful maidens, the Norns, similar to the Fates of Greece and Rome. The Norns were Urd (the Past), Verdande (the Present), and Skuld (the Future). The Norns decreed the fate of men, and gave them aid or punishment as they deserved. The gods dwelt in Asgard, in which was Gladsheim, the hall of gladness. The giants dwelt in Jotunheim and men in Manheim.

Nature-worship came in more distinctly with the later Scandinavian mythology. Odin, ruler of the universe, the Jupiter of the North, and his wife, Frigg, have for sons Thor, the god of thunder; and Balder, the god of justice and of eloquence; and Balder is father of Forsete, god of harmony. Njord, god of winds and of commerce, is father of Frey, who gives rain or sunshine, abundance or famine, to mankind, and of Freyja, who is goddess of love, but also, far different from the Grecian Venus, a model of womanly goodness and wifely devotion. Other gods and goddesses there are, most of them beneficent, and representing the better qualities

of heart and conscience; all of them superior to the generally dissolute throng of immortals who sat in the court of Olympus when they were not engaged in some intrigue on earth.

The system was not without its terrors, however, its monsters who personified evil and presided over the doom of those debarred from happiness above. The malignant Loke was father of Hel, goddess of the infernal regions, and from whom is derived the name by which they are designated in the English tongue. She dwelt in Helheim, the hall of grief, with hunger for her table, and disease for her bed. There the prisoners of fate led a dark and cheerless existence, in marked contrast to the delights of Asgard.

Scandinavian mythology dealt also with the future of the world and of humanity, and here again it is remarkably in accord, in some of its features, with the teachings of science, and it may be added also of religion. Heaven and earth are to pass away. The end will be preceded by great wars, severe winters, destructive storms, and a covering of the face of the sun. The wolf Fenrir will devour the earth, and giants will make an attack on heaven. The gods will perish. Then there will be a new sun; the earth, rescued from the jaws of Fenrir, will exist again, and a human pair, saved from the general destruction, will renew the human race.

Such was the faith of the fathers of that race which settled Normandy and conquered England, which gave rulers to Muscovy and Sicily, and guardians to the degenerate heirs of the Constantines—the race from which the English-speaking peoples of to-day are largely descended, and from which some of their most valuable qualities are derived. Consult Anderson's 'Norse Mythology' and Rydberg's 'Teutonic Mythology' translated by Anderson.

RASMUS B. ANDERSON,
Author of 'Norse Mythology.'

Scan'dium, in chemistry, a rare metallic element discovered by Nilson (1879) in the mineral euxenite; symbol Sc; atomic weight 44.1. It is of special interest because its existence and properties were deduced theoretically by Mendeleef from his periodic system of the elements. He called the to-be-discovered element ekaboron. As Nilson's Scandium showed exactly the same atomic weight and chemical properties foretold by Mendeleef it is a further proof of the value of the Mendeleef hypothesis. Scandium occurs in very small amounts in the minerals euxenite, gadolinite and ytrotitanite. It forms a white oxide Sc_2O_3 and a number of salts related to the same. The salts are colorless and have a rather acid astringent taste.

Scan'lan, Lawrence, American Roman Catholic bishop: b. Tipperary, Ireland, 28 Sept. 1843. He is the son of Patrick and Catherine Scanlan and was educated at All Hallows College, Dublin, where he was ordained priest in 1868. Coming to America, he was assistant at Saint Patrick's, San Francisco, Cal., 1868 to 1870, and at Saint Mary's Cathedral in that city for the two years following. In the end of 1871 he was sent to Pioche, Nev., where he built the first church in the section; in 1872 to Petaluma, Cal., in 1873 to Salt Lake City, Utah, where he was first pastor for Utah Territory and then vicar

forane. He was so successful in his management of church finances in Salt Lake that he cleared the church of debt and raised a sum sufficient to purchase a large tract of land, on which he built an academy. This kind of work he followed until 1887, building churches and schools and, in 1886 founding the college of All Hallows, in Utah. On 25 Jan. 1887, he was appointed bishop of Lavenden, *in partibus* and apostolic vicar of Utah. On 29 June 1887 he was consecrated at St. Mary's Cathedral, San Francisco, by Archbishop Riordan, assisted by Bishops O'Connell and Manogue. He became the first bishop of the diocese of Salt Lake, Utah, 30 Jan. 1891.

Scan'nell, Richard, American Roman Catholic bishop: b. Cloyne, County Cork, Ireland, 12 May 1845. He was educated at the College of Middleton, Cork, and at All Hallows College, Dublin, at which latter place he was ordained priest, 26 Feb. 1871. He came to the United States the same year and was appointed assistant in Saint Mary's Cathedral, Nashville, Tenn. He served successively at Saint Columba's church, and as pastor of Saint Mary's Cathedral, 1871-85, being administrator of the diocese of Nashville, 1880-3; and as pastor of Saint Joseph's church, West Nashville, which he organized, 1885-7. On 9 June 1887 he was appointed bishop of the diocese of Concordia, Kan., and was consecrated in Saint Mary's, Nashville, 30 Nov. 1887, by Archbishop Feehan, assisted by Bishops McCloskey and Rademacher. Upon the death of the Rt. Rev. Jas. O'Connor he was transferred 30 Jan. 1891 to the diocese of Omaha.

Scansores, skän-sō'rēz, an obsolete order of birds represented by cuckoos, woodpeckers, parrots, toucans, and trogons and the like, popularly known as that of the "climbing" birds, and distinguished primarily by the fact that the toes are directed two forward and two backward. It was an artificial group, whose members have been scientifically re-classified in the *Coraciiformes* and other groups. Compare NATATORES.

Scape-goat, a goat which according to the Mosaic law, was sent into the wilderness, on the Day of Atonement, bearing the sins of the people. Under later Jewish practice the goat was thrown over a precipice about 12 miles from Jerusalem. Hence the term "scape-goat" is applied to any person who is made to suffer for the wrong-doing of others.

Scaphop'oda, a class of *Mollusca* of a low type, known as fossils from the Devonian to the present, and surviving in only a small number of forms, typified by the tusk-shells (*Dentalium*). The head is rudimentary, the mantle-edges ventrally concrescent, forming a tube opening before and behind, and covered with a slight-curved shell shaped like an elephant's tusk. The body has its dorsal side toward the concave side of the shell, and is attached to the shell by muscles near the posterior or pointed end. The foot, which can be protruded from the anterior or wider aperture, is rather long, pointed, and has sometimes two lateral lobes. All are marine, and some species live in very deep water. Consult Cooke, 'Mollusca' (London and New York, 1895).

Scap'olite, the name of an important group of rock-forming minerals, including the species meionite, wernerite, mizzonite, marialite. Of these minerals wernerite (q.v.) is by far the commonest. All the species of the group crystallize in the tetragonal system and are hemihedral. Their color is generally white, gray, or flesh-red; hardness 5 to 6.5; specific gravity 2.57 to 2.74. They are all silicates of aluminum, calcium, and sodium; chlorine is also often present. Their composition has been explained by Tschermak by placing meionite at one end of the series with a typical formula of $\text{Ca}_4\text{Al}_6\text{Si}_8\text{O}_{28}$ and marialite at the other end with a typical formula of $\text{Na}_4\text{Al}_3\text{Si}_6\text{O}_{24}\text{Cl}$, and assuming that wernerite and mizzonite are isomorphous combinations of these two compounds in varying proportions. The scapolites are thus an interesting group of minerals similar to the feldspars in their formation of a series of compounds gradually varying in composition, the silica, soda, and chlorine increasing as the alumina and lime decrease. Scapolites occur abundantly as primary minerals in Archean rocks in limestone and gneiss; meionite occurs in the volcanic rocks of Vesuvius, but with this exception, the scapolites occur in eruptive rocks only as secondary minerals, being products of the alteration of feldspars.

Scap'ula. See ANATOMY; OSTEOLOGY; SHOULDER-GIRDLE.

Scap'ular, or **Scapulary**, an article of attire worn over the shoulders (*scapula*) by the inmates of monastic houses. Originally, in the Benedictine Order, it was worn over the regular monastic dress by the brethren when engaged in manual labor, but it is now part of the ordinary habit of the older religious orders, whether of monks or of friars. The word, however, is now commonly used to signify a sort of emblematic scapulary, consisting of two small squares of cloth held together by strings, from which the pieces of cloth are suspended so that one square reaches to the breast and the other to the back at the shoulder blades of the devotee who wears the scapular. There are several different kinds of these scapulars, to the wearing of which are attached sundry obligations and sundry spiritual privileges, such as indulgences, participation in the merits and the prayers of their fellow-members of a scapulary confraternity, etc. These miniature scapulars were brought into use in the 13th century by Saint Simon Stock, an Englishman and general of the Carmelite Order.

Scar-tattooing. See TATTOOING.

Scarabæidæ, skär-î-bē'î-dē, an exceedingly large family of beetles, including the most gigantic forms, although some of the species, as the chafers, dung-beetles, etc., familiar in the United States and Europe, are of moderate or small size. They have the terminal segments of the feelers in the form of flattened plates, producing a comb-like club; and, unlike those of their relatives, the *Lucanidæ*, these plates can be brought closely together so that the club appears compact. These antennal plates are relatively larger in the males than in the females. The pronotum, especially in the males, is often ornamented with conspicuous and curiously shaped horns as in the rhinoceros beetle (q.v.), whose purpose is unknown. In structural detail and habits the members of this family differ widely among themselves. Some are dung-

feeders, and certain American species roll together balls of dung wherein they lay their eggs, thus providing food for their grubs. Very many feed on plants, the beetles eating leaves, and the grub roots. The grubs are white and fleshy, usually bent into a semicircle; the large head has powerful mandibles and no ocelli; the body-segments are often transversely wrinkled, and the hindmost segment is often greatly swollen. Some of the *Scarabæidæ* are dull black—the dung-beetles for example; while others are of bright metallic hues. The family ranges all over the world, but is most abundant in tropical countries. A typical example of the group is the sacred beetle of Egypt (see SCARABS), whose carved images are called scarabeids.

Scar'abs, representations of the sacred beetle found on Egyptian gems, coins, mummies, obelisks, and works of art. The appearance and rapid multiplication of beetles in the mud left on the subsidence of the Nile gave rise to the belief in their spontaneous generation, and they became the symbol of creation, and creative power. In their circular shape and the bright, golden tints of their wing-cases they were thought to resemble the shape and lustre of the sun, and thus were taken to be one of the forms under which the sun-god appeared. Accordingly, scarabs were cut in stones and employed as seals and amulets. They were bored through their length so that they could be strung like beads, and easily worn on the person. After the commingling of the Egyptian with other races, Gnostics and Christians interpreted the meaning of these gems in accordance with their own religious systems. Those of the most ancient period, such as are found on mummies, are inscribed with the names of the kings held in highest veneration, Thutmosis III., Rameses II., and Amenophis III., and frequently with some hieroglyphic symbol. The larger of them have some short religious or historic inscription on their under side. Consult: Petrie, 'Historical Scarabs' (1889); Myer, 'Scarabs' (1894).

Scaramouch, skär'a-mowch, one of the grotesque characters of the Italian stage, who was dressed entirely in black, wore a mask, and represented the swaggerer and poltroon. In France the scaramouch was used for a greater variety of parts.

Scarborough, skär'bū-rō, **John**, American Protestant Episcopal bishop: b. Castlewella, Ireland, 25 April 1831. He came to the United States when very young, was graduated from Trinity College, Hartford, in 1854, from the General Theological Seminary in 1857, and was ordained to the priesthood in 1858. He was assistant rector of Saint Paul's, Troy, in 1857-60, rector of the Church of the Holy Comforter, Poughkeepsie, N. Y., in 1860-7, of Trinity Church, Pittsburg, Pa., in 1867-75, and in the last-named year was consecrated bishop of New Jersey.

Scarborough, **William Saunders**, American educator: b. Macon, Ga., 1852. He was graduated from Oberlin in 1875, studied at the Theological Seminary there, and has since occupied various chairs at Wilberforce University, of which he is vice-president. He is of African descent and is actively interested in the education and upliftment of his race. His publications include: 'First Lessons in Greek' (1881);

SCARBOROUGH—SCARLET FEVER

'Our Political Status' (1884); 'Birds of Aristophanes' (1888); etc.

Scarborough, England, in the county of York (North Riding), popularly known as "The Queen of English Watering Places," is on the North Sea, 39 miles northeast of York. The main part of the town is on the south bay, and rises in successive terraces; the new quarters are divided from the older by a deep ravine crossed by two bridges. The modern period of the town dates from the discovery of mineral springs in 1620. The Grand Hotel, on Saint Nicholas Cliff, is one of the largest in England. There is a fine aquarium, a museum—a Roman-Doric rotunda—a mechanics' institute, and the Spa and its grounds are attractive features of the place. There are fine promenades. The People's Park occupies both sides of the valley. Fishing and the manufacture of jet ornaments are the chief occupations. Pop. (1901) 38,160.

Scarey Creek, Engagement at. On 2 July 1861 Gen. McClellan, then preparing to advance from Buckhannon against the Confederate forces under Gen. Garnett at Rich Mountain, ordered Gen. Cox to move with one brigade from Camp Dennison, Ohio, cross the Ohio River at Gallipolis, and operate in the Kanawha Valley, the object of the movement being to secure McClellan's right flank and to prevent Gen. Wise from reinforcing Garnett at Rich Mountain. With three regiments Cox arrived at Gallipolis, where he was joined by another regiment, and on the 10th crossed the river to Point Pleasant, where he received orders from McClellan to drive Wise from the Kanawha Valley. Cox went up the Great Kanawha on steamboats, and at the mouth of Scarey Creek, on the south side of the river, found his passage disputed by a force of 200 men, with two guns, under command of Col. Patton. It was necessary to dislodge Patton, whose two guns commanded the river. A small body of Cox's command had reconnoitered the position, and awaited the arrival of Cox's main body, which came up on the 16th. Cox landed on the north side of the river, and on the 17th Col. Lowe, with the 12th Ohio, two companies of the 21st, and some cavalry, in all 1,020 men and two guns, was landed on the south side of the river and advanced upon Patton, reaching the bank of the creek about 3 P.M. The two guns were put in position and the cavalry advanced, but were speedily driven back by the Confederate guns. The artillery now opened on both sides and, after some sharp firing, Patton's men were seized with a panic; but reinforcements coming up, they were rallied, and the Confederates advanced and took position along the bank of the creek, across which there was quite a severe contest. A small Union force was sent across the creek to turn the Confederate left and seize their guns; but, not waiting for this movement to develop, the main body charged across the creek and drove the Confederates up the hillside, back upon their guns, and another panic ensued. But more reinforcements coming up, the Confederates rallied and poured such a telling fire into the advancing Union line that it fell back in disorder, leaving dead and wounded on the field, recrossed the creek, and continued the retreat. The Union loss was 2 officers and 12 men killed and 47 men wounded; the Confederate loss 1 officer and 4 men killed, and 9 wounded. Two colonels, a

lieutenant-colonel, and two captains of Cox's command, whose regiments were not engaged, but who were led by curiosity to see a fight, left camp on the north side of the river and were taken prisoners. This check delayed Cox's advance up the river several days, until he could get land transportation. Consult 'Official Records,' Vol. II.

E. A. CARMAN.

Scar'idaë, a large family of fishes, represented by the parrot-fishes, which occur in all warm seas, lingering about coral reefs and weedy rocks. Few species are of any value as game or for food, but some are utilized in the West Indies and Hawaii. See ICHTHYOLOGY.

Scarlati'na. See SCARLET FEVER.

Scarlatti, skär-lät'tè, **Alessandro**, Italian composer: b. Trapani, Sicily, 1659; d. Naples, Italy, 24 Oct. 1725. Appointed maestro di capella by Queen Christina of Sweden, he wrote his first opera for performance in her palace. He produced his first oratorio 'I Dolori di Maria sempre Vergine,' in 1693, and was then appointed maestro di capella to the viceroy at Naples. He held the position of chapel-master at Santa Maria Maggiore, Rome, 1707-9, and then returned to Naples. Scarlatti was possessed of great fertility of imagination. In method he opposed the enemies of the counterpoint, being considered the greatest contrapuntist of his age, and the inventor of accompanied recitative. His compositions, few of which have been published, included 115 operas, 200 masses, 9 oratorios, 500 cantatas, and miscellaneous minor pieces. Three of his operas, 'Geroue'; 'Il Flavio Cuniberto'; and 'La Teodora Augusta,' preserved in the original MSS. are at Christ Church, Oxford, England, and another is in the British Museum.

Scarlet Grain, a dye-stuff consisting of coccid insects allied to cochineal. See COCCUS.

Scarlet Fever, or **Scarlatina**, an acute infectious disease of unknown origin, characterized by a rapid onset of fever, general symptoms of poisoning, and later by the appearance of a typical rash. The disease was not definitely described until the latter part of the 16th century, although an occasional case is suggested in literature before that time. Epidemics ravaged Europe for 150 years before the disease made its appearance in America; this was in Massachusetts in 1735; and the disease then spread all over New England and the rest of North America. Not until 1830 did it get a foothold in South America, but since that time epidemics have been widespread and frequently very malignant.

In spite of laborious researches, the causative agent has as yet eluded detection. In every case the micrococci are apt to be very active and productive of some of the symptoms, but there appears to be another agent responsible for certain peculiar features of the disease. This has recently been described as a protozoon, the form of micro-organism that causes malaria; but as yet the observation has not been verified. The disease is transmitted directly from one individual to another, or through articles which have been in the sick-room, such as clothing, bedding, paper, pictures, and particularly those substances from which infectious material is not readily dislodged. The virus is not killed by cold, but dry heat, steam, and gases such as

SCARLET FEVER

formaldehyde or chlorine will destroy it after a comparatively short exposure to their action. The contagion is given off in the discharges of the nose and throat, in the vomit, in mother's milk, and in the desquamated skin. It may also be carried in the milk-supply, as animals are liable to the disease. It occasionally happens that the disease is transmitted before the appearance of the rash, but the most contagious period is after the onset of desquamation. The young are particularly liable to the disease. One attack usually protects the individual for life.

The period of incubation lasts from two to seven days, and occasionally longer. The onset is usually sudden and active, the patient appearing very sick and dull, complaining of sore throat and general pains throughout the body. Severe and persistent vomiting ushers in the attack. The temperature rises rapidly, reaching 103° or 104° F. in the first 24 hours. These symptoms constitute the prodromata, lasting from 12 to 36 hours; at the end of which period the rash appears, first on the front of the neck and chest, and gradually spreads over the entire body in two or three days. This rash is a diffuse blush of brilliant scarlet hue, showing tiny elevations of a deeper color scattered through the general redness. The temperature and severity of the disease increase until the rash is all out, then gradually subsides, the temperature reaching normal about the tenth day. The tongue shows similar elevations to those described on the skin, and hence is described as "strawberry tongue." The throat presents a general intense redness of the pharynx, palate, and tonsils, with sometimes small white spots, or considerable patches of false membrane of a pearly white appearance. Desquamation begins about seven days from the appearance of the rash, and the parts that are first affected are the first to desquamate. The process continues until the entire skin of the body is shed. At first the desquamation is in the form of tiny particles, but after it has continued for a few days the skin begins to peel off in large flakes, sometimes even the entire skin of the hand or foot being shed in one piece. This process is not completed in less than ten days, and may take over six weeks, the skin between the toes and fingers being the last to peel. There may be an entire second desquamation, but it is doubtful if this ever carries contagion. The popular belief that the disease is more serious to adults than to children does not seem to be warranted by the observation of eminent authorities.

The complications of scarlet fever are common and frequently very serious. From the throat germs may pass through the Eustachian tubes to the ears, causing inflammation there. The lymphatic glands of the neck may be enlarged by the poison passing through them, and sometimes they suppurate. Inflammation of the joints having all the characteristics of rheumatism is very common; and affections of the heart may follow this rheumatic complication. There is probably more or less affection of the kidneys in all but the very mild cases, but in some the inflammation of the kidney structure is so severe that the picture of acute nephritis is paramount. (See KIDNEYS.) From such inflammation the patient may entirely recover, being left with normal kidneys, or he may succumb because of their impairment; or, again,

the kidneys may be left permanently changed; this last condition being particularly apt to occur when the inflammation sets in late in the disease or during convalescence. Ordinary cases of scarlet fever are seldom fatal if the complications referred to are absent.

The diagnosis, before the appearance of the rash, is suggested by the rapid onset of the symptoms, the intensely red throat, and the persistent vomiting. The prolonged period of fretfulness, watery eyes, and running nose of measles does not occur in scarlet fever; and, differing from that of scarlet fever, the desquamation of measles is bran-like. If a membrane is formed in the throat, it may be necessary to resort to bacteriological examination to distinguish between diphtheria and scarlet fever. There are many drugs which may cause a rash, closely resembling that of scarlet fever; among them, carbolic, benzoic, boracic, and salicylic acids, salol, alcohol, antipyrin, phenacetin, arsenic, mercury, potassium chlorate, quinine, sulphonal, belladonna, hyoscyamus, copaiba, cubebs, rhubarb, strychnine, and various ptomaine poisons. The rash caused by these substances comes out very quickly, and usually is of very short duration, while differentiation is also made by the absence of constitutional symptoms or the peculiar symptoms of the drug.

The malignant types of scarlet fever have sometimes characterized entire epidemics, but they are now rarely seen. Such cases are seen from the start to be very serious, being attended with high fever, rapid and feeble pulse, intense and persistent vomiting, headache, delirium, and coma, death ensuing in two or three days.

Treatment.—As scarlet fever is self-limiting, and no specific remedy is known that in any way reduces the virulence of the intoxication, reliance must be placed on careful nursing of the patient, constant watch to ward off complications, measures for the relief of such complicating inflammations as do develop, and scrupulous efforts to prevent the spread of the disease. Since isolation must be continued for six weeks at least, it is important to select a bright, sunny room, if possible, having an open fire. The patient is kept in bed for at least two weeks, commonly much longer. The vomiting is relieved by small pieces of cracked ice; the throat is sprayed twice daily with a mild antiseptic, such as boric acid; the patient is bathed with lukewarm water if the temperature is high, but antipyretic drugs are best avoided. After desquamation begins the entire body is covered daily with a simple ointment to favor it and to diminish the possibility of the contagion being carried. For the first four weeks of the disease the diet consists entirely of milk, but careful watch must be kept of the kidneys, as their impairment may demand a longer continuance of that diet. Not until the lapse of six weeks at least is the patient allowed to go out of doors, and not then if the weather be inclement. To prevent the spread of the disease, thorough disinfection of the sick-room and all of its contents is essential. The patient is thoroughly washed with a solution of corrosive sublimate, then removed to another room to be dried and dressed. The mattress is wrapped in wet cloths, removed from the house, and preferably destroyed. Everything that has been left in the sick-room should be disinfected with solutions

of antiseptic property, or subjected to the action of steam in a closed chamber. The wall paper should be scraped off, and the walls, ceiling and floor washed with a strong solution of corrosive sublimate, a mop or a loaf of bread being used. Formaldehyde gas is then to be generated in the room for ten hours, after which the windows are left wide open for several days.

DUDLEY D. ROBERTS, M.D.,
Brooklyn, N. Y.

Scarlet Ibis. See IBIS.

Scarlet Letter, The, a novel by Nathaniel Hawthorne published in 1850. The scene is in Boston about the middle of the 17th century. The chief characters are Hester Prynne; her lover, Arthur Dimmesdale, the young but revered minister of the town; their child, Pearl; and her husband Roger Chillingworth, an aged scholar, who had sent his young wife Hester to the New World before him. At the beginning of the tale Chillingworth arrives in Boston, to find her upon the pillory, her babe in her arms and upon her breast the Scarlet Letter "A" ("Adulteress"), which she has been condemned to wear for life.

Scarlett Tanager. See TANAGER.

Scarlett, Sir James Yorke, English soldier: b. 1799; d. December 1871. He was educated at Eton and Cambridge, entered the army, and in 1854 was sent to the Crimea in command of the heavy brigade. On the 25th of October he led the brigade in its famous charge at Balaklava, and later in the day it brought out of action the remnants of the light brigade after its even more famous charge. In both of these actions Scarlett took a prominent part in the hand to hand conflict. For these services he was promoted to the rank of major-general, on 12 December following, and upon the retirement of Lord Lucan took command of the entire cavalry forces in Crimea. In July 1855 he was created a K.C.B. He commanded the camp at Aldershot 1865-70, and retired from active service in the last named year.

Scarpa, skär'pä, Antonio, Italian anatomist: b. Friuli, Italy, 13 June 1747; d. Pavia, Italy, 31 Oct. 1832. He studied medicine at Padua, in 1772 was appointed professor of anatomy at Modena, and published in that year his first work on the anatomy of the ear, 'Anatomicæ Observationes de Structura Fenestræ rotundæ Auris.' In 1783 he resigned this chair to accept a similar one at Pavia, where he published his great work, 'Anatomicæ Disquisitiones de Auditu, etc.' (1789). At the time of the revolution in Italy he was deprived of his professorship in the university on account of refusal to take the oath required by the Cisalpine Republic. He now published his celebrated work on 'Aneurisms' (1804). When Napoleon, after his coronation as King of Italy, arrived at Pavia (1805), and received the officers of the university, he inquired after Scarpa. He was informed that he had long ceased to be a member of the university, and was told the reason. "What," said Napoleon, "have political opinions to do here? Scarpa is an honor to Pavia and to any dominions. Let him be honorably restored." Scarpa was the author of several other surgical works besides those already mentioned. Most of his works have been translated into English and French.

Scarpanto, skär'pän-tō (ancient CARPATHOS), a Turkish island of the Mediterranean, 28 miles southwest of Rhodes. It is 27 miles long by six miles wide, is rocky and mountainous, and has four harbors, two on the east, one on the north, and one on the southwest side, known respectively as Port Pernesi, Port Avdemo, Port Skomaco and Port Grato. There are indications pointing to a former dense population, as judged from the numerous ruins of towns. Pop. 5,000.

Scarron, skā-rōñ, Paul, French author and playwright: b. Paris, France, 6 July 1610; d. there 6 Oct. 1660. Refusing to take orders he led a wild life in Paris and in Rome, to which city he went in 1634. Shortly after his return to Paris in 1637 he was stricken with an illness which left him a paralytic for the rest of his life. His mind was not affected, however, and he made his livelihood by literature. At one time he was the pensioner of the queen, but losing his pension through the influence of the Cardinal Mazarin, he then wrote in revenge his satirical 'Mazarinade' (1649), one of his best-known works. He married in 1652 the young and beautiful Francine d'Aubigne, afterward Mme. de Maintenon. Both before and after this event, which Scarron survived eight years, his house was the centre of a brilliant literary society. The most famous of Scarron's writings in his own time is said to have been his 'Virgile Travesti' (1648-53), but modern critics prefer his 'Roman Comique' (1651). There have been many editions of his works, the best are those published in Amsterdam, 10 vols. (1737) and reprinted at Paris, 7 vols. (1786).

Scarzonera, a genus of composite plants with numerous species, chiefly indigenous to the Mediterranean regions. The flowers are yellow or rarely rose-colored, having many series of involuclral bracts, plumose and unequal pappus, and achenes without a beak and generally wingless. *S. hispanica*, sometimes known as viper's grass, has long been cultivated for its tapering, fleshy, edible roots, the dark-brown skins of which have caused it to be called black salsify. The leaves are long and lanceolate with waving edges. Other species are also cultivated for their roots.

Scaup, skāp, or Blackhead Duck, a duck (*Aythya marila*), of the same genus as the red-head (q.v.), which it closely resembles in form but from which the green-glossed black head of the male, and the white face of the female, distinguish it. It is a very abundant duck about the shores of the North Atlantic, frequenting the sounds, bays and estuaries of the United States to Central America, in winter and in the spring passing northward and inland to breed. On the coasts of the New England and Middle States the scaup is most abundant during the fall migration, occurring in flocks which feed chiefly upon small mussels, and other marine animals, especially mollusks, secured by diving.

A closely related species is the lesser scaup duck (*A. affinis*), which is almost an exact smaller counterpart of the black-head, except that the head of the male is glossed with purple instead of green and the length is about 16 instead of 18 inches. This species regularly consorts with the larger scaup and is altogether sim-

ilar in distribution and habits. Both species are shot in large numbers by sportsmen and market gunners and regularly sold in the markets, but the flesh is rather coarse and strong-flavored.

Scel'idoth'e'rium. See MEGATHERIUM.

Sceloporus, sē-lōp'ō-rūs, a genus of lizards of the family *Iguanidæ*, to which the Florida chameleon (*Anolis*) and the horned toads (*Phrynosoma*), also belong. Among its kindred, this genus is distinguished by its imbricated keeled scales, the absence of a dorsal crest, of gular folds or a gular sac, and of head-spines. The tympanum or ear-drum is exposed between the small scales of the side of the head; the tongue is fleshy and shaped somewhat like an arrow-head; teeth are confined to the jaws and have trilobate summits. Femoral pores, the secretion of which assists the sexes in mating, are well developed. Between 30 and 40 species of this genus are known, all of them American and most of them confined to Central America, Mexico and the southwestern United States. In this region these lizards are exceedingly abundant and are everywhere conspicuous objects. They are chiefly terrestrial, but many of the species also live upon stone walls or fences or run up tree trunks when alarmed. Their food consists of insects, which they seize with the greatest agility. In temperate regions they hibernate in cold weather. The males are generally ornamented with bright colors on the under parts which may be considered to be secondary sexual characters. The eggs, which have a parchment-like shell hardened with lime, are usually retained in the oviducts until the young are partly or wholly developed; when deposited, holes in the ground, decayed stumps, etc., are utilized for their concealment. As in many other lizards, the tail is easily broken along an unossified plate across the body of the vertebrae, after which it regenerates but always imperfectly. The only eastern species is the common swift or fence-lizard (*S. undulatus*). Consult Cope, 'The Crocodilians, Lizards and Snakes of North America,' U. S. Nat. Mus. (Washington 1900).

Scenic and Historic Preservation Society, American. See AMERICAN SCENIC AND HISTORIC PRESERVATION SOCIETY.

Scepticism, in its widest meaning, is a state of doubt or suspense of judgment. It is often used in connection with religious belief, and here indicates doubt or disbelief of authorized doctrines. The word scepticism has a specific meaning, however, which is implied in its more general uses, and in this meaning it has a philosophical reference and relates to the problem of knowledge. Thus used, scepticism signifies systematic doubt or entire disbelief in the ability of the human mind to attain knowledge of positive or objective truth. Such scepticism has been of frequent occurrence in the history of thought from antiquity to the present time. It has received systematic expression from several noted thinkers who supported their conclusions by explicit arguments. The grounds of systematic scepticism are many and cannot be given in full detail. Its fundamental basis in theory is usually found in the assumption that knowledge arises from a succession of particular sensations which are (1) subjective modifications, and (2) detached and transitory mental

states. As subjective modifications, these sensations are the product of the sense-organs of the individual. Their nature depends upon the structure of the particular sense-organ, which varies with each individual, and also upon the bodily condition of the individual which varies from moment to moment. Hence these sensations, being relative to individual structures and conditions, have only a subjective value, and can yield no truth that is objective and necessary for all. As detached and transitory mental states, these sensations can furnish no criterion of truth beyond the single sensation. Because detached and particular, such a single sensation can justify no conclusion of universal validity. Because itself transitory, such a single sensation can reveal nothing of a permanent and abiding reality. Beside these theoretical considerations, many practical reasons have been urged to support scepticism, such as the difference of opinion and belief among different peoples upon most vital matters of life and morals. In antiquity the first important exponents of scepticism were the Sophists of Greece. Of this school Protagoras held that all truth was relative, since all sensations were subjective. At a later period in Greek thought, a systematic scepticism was developed by Pyrrho of Elis and elaborated by his school. According to the Pyrrhonic scepticism, the real nature of things is entirely unknown to us because of the subjectivity of our impressions and opinions; and, consequently, our proper attitude is one of suspense in judgment, and apathy in conduct. The foremost representative of scepticism in modern times is David Hume. He maintained that "all knowledge resolves itself into probability"; for, being based upon particular impressions, it can reveal nothing of permanent or objective reality beyond the succession of sensations. In estimating the importance of scepticism in the history of thought, one must distinguish between scepticism as (1) a provisional stage, and (2) a final conclusion of thought. As a provisional stage, scepticism has discharged an important office in the development of thought. In the life of both individual and race, periods of scepticism are useful in disposing of traditional beliefs which lack adequate foundation, and so in preparing the way for better-established conclusions. Thus with Descartes a stage of doubt was preliminary to his positive thought, and likewise the scepticism of Hume was preliminary to the constructive philosophy of Kant and his successors. As a final conclusion scepticism has never been permanently satisfactory, because the inherent demand of the human mind is for positive truth.

H. W. WRIGHT,
Cornell University.

Sceptre, originally a staff, the emblem of sovereign power. The *baton*, or short sceptre, has always remained a sign of distinction. In the Greek assemblies a person who wished to speak received a sceptre from the herald; and the judges also bore it while in the exercise of their authority. Kings swore by the sceptre. By degrees it became the emblem of power alone. Through the Roman emperors it passed to the western monarchs.

Schadow, shā'dō, Johann Gottfried, German sculptor: b. Berlin 20 May 1764; d. there 27 Jan. 1850. After many vain struggles to become an artist, he was admitted to the studio of the sculptor Tassaert and thus at length succeeded in devoting himself to his chosen art. Soon afterward he ran off with his sweetheart to Vienna, and there married her; and then, at the expense of his father-in-law, went to Italy, where he wrought with unwearied diligence from 1785 to 1787 in the museum of the Vatican and of the Capitol, winning a prize by his group 'Perseus and Andromeda.' In 1788 he obtained the position in Berlin which had become vacant by the death of his teacher Tassaert. His first great work was the monument erected in the church of Saint Dorothea, Berlin, to the memory of the margrave, natural son of Friedrich Wilhelm II. This was followed by the colossal statue of Ziethen in hussar uniform; the statue of Frederick the Great in Stettin; of Leopold of Dessau in Berlin; of Blücher in Rostock; the Tauenzien monument in Breslau; Luther's in Wittenberg, etc. The four-horse chariot of Victory, over the new Brandenburg Gate of Berlin, was modeled by Schadow. Schadow executed many busts of his eminent countrymen, and numerous reliefs and statuettes. In 1788 he was made rector, and in 1822 director, of the Academy of Art in Berlin, a position which he retained till his death. He was one of the first of the modern sculptors who dared to withstand the fantastic mannerism of the 18th century for which he substituted a powerful representation of character based on a study of the antique. His most eminent pupil in this respect is Rauch; among his other pupils may be named Dannecker, Tieck, and Zauner. His chief literary works are: 'Wittenberg Denkmäler der Bildnerei, Baukunst, und Malerei, mit historischen und artistischen Erläuterungen' (1825); 'Polyklet, oder von den Massen des Menschen nach dem Geschlechte und Alter' (1834); 'National-physiognomien, oder Beobachtungen über den Unterschied der Gesichtszüge und die äussere Gestaltung des menschlichen Kopfs, in Umrissen bildlich dargestellt' (1835); 'Kunstwerke und Kunstansichten' (1849). Consult Dobbert, 'Gottfried Schadow' (1887).

Schadow, Rudolph, son of the preceding, German sculptor: b. Rome 9 July 1786; d. there 31 Jan. 1822. He was trained as sculptor by his father and his principal works are 'Spinning Girl'; 'Achilles and Penthesilea'; 'John Baptist'; and 'Virgin and Child.'

Schadow-Godenhaus, shā'dō gō'dēn-hows, Friedrich Wilhelm, younger brother of the preceding, German painter: b. Berlin 6 Sept. 1789; d. Düsseldorf 19 March 1862. He received his first lessons in drawing from his father, then turned to painting, and became the pupil of Weitsch. He served in the war between 1806 and 1807 and three years later resumed his artistic studies in Rome, where Cornelius, Overbeck, Veit and others had founded the new school of the Nazarenes (q.v.). He joined their company and from that time made the Italian masters his models, while the favorite subjects of his pencil were biblical, or selected from the mystical and allegorical wonders of mediæval tradition. As in the case of Overbeck, his devo-

tion to this latter field of human imagination led him to become a member of the Roman Catholic Church. He painted 'Heaven's Queen' for Madame von Humboldt, and a 'Holy Family' for the Crown Prince Ludwig of Bavaria. The best work he did at Rome is seen in the frescoes for the Casa Bartholdy; 'Jacob with Joseph's Bloody Coat'; 'Joseph in Prison' (both in the Berlin National Gallery). In 1819 he was called to Berlin as professor of the Art Academy there. During his incumbency he painted the 'Bacchanalian Procession' on the proscenium of New Theatre; many portraits; the 'Visit of the Wise Men' in the Garrison Church at Potsdam and another altar-piece for the church at Schulpforta. One of his finest pictures is 'Freeborn Poetry,' a lovely winged maiden rising from earth to heaven. In 1826 he was made director of the Academy in Düsseldorf and with a circle of enthusiastic pupils became the founder of the Düsseldorf school. Among his religious paintings are 'Christ on the Mount of Olives'; 'Christ at Emmaus'; 'The Dead Body of Christ watched over by his Mother surrounded by Angels' (1836). His health drove him to seek a change in the warmer climate of Italy (1840), and at Rome he painted 'Earthly and Heavenly Love'; 'Piety and Vanity in their Relationship with Religion,' the last appearing under the form of the Saviour, and 'Heaven, Purgatory, Hell' after Dante. As an author he wrote 'The Influence of Christianity on the Painter's Art' (1843). He was perhaps more successful as a teacher and demonstrator than as a creative artist, but he had a very distinct, even though one-sided influence, upon the religious art of Germany. He gave a new and vigorous impulse to the oil painting of his day without resorting to that pre-Raphaelite realism which sometimes lent to the canvases of Cornelius a certain crudeness bordering on the grotesque. Consult Hübner, 'Schadow-Godenhaus und seine Schule' (1869).

Schaeberle, shā'bērl, John Martin, American astronomer: b. Württemberg, Germany, 10 Jan. 1853. He was brought to Ann Arbor, Mich., in his infancy, and was graduated from the University of Michigan in 1876 as a civil engineer. He has, however, devoted himself to the study of astronomy, to which department of knowledge he has made valuable contributions. From 1876 to 1888 he taught astronomy in the University of Michigan, and was then called to the Lick Observatory at Mount Hamilton, Cal., where he made several important astronomical investigations. He had charge of the expedition to witness the eclipse at Cayenne in 1889, and of those for the same purpose to Chile in 1893, and to Japan in 1896. Since the latter date he has been chiefly engaged in the construction of telescopes. He has discovered three comets.

Schaff, shāf, Philip, American clergyman and scholar: b. Coire, Switzerland, 1 Jan. 1819; d. New York 20 Oct. 1893. He studied at Tübingen, Halle, and Berlin, and was a lecturer in the latter university in 1842-4. He then came to this country where he was professor in the theological seminary of the German Reformed Church at Mercersburg (Pa.) 1844-63. In 1864-9 he was lecturer in several theological institutions, and in 1870 became professor of sacred literature in Union Theological Seminary,

New York. This post he held till his transference in 1887 to the chair of church history in the same institution. He was one of the founders of the Evangelical Alliance and went as delegate to its general conferences at Basel in 1879 and at Copenhagen in 1884. He was president of the American Bible-revision committee, organized by him in 1871 at the request of the British committee. He was a prolific writer, his works including 'History of the Apostolic Church' (1853); 'History of the Christian Church' (1867; new and enlarged edition, seven vols. 1880-92); 'Creeds of Christendom' (1877); 'Schaff-Herzog Encyclopædia of Religious Knowledge' (as editor); 'Dictionary of the Bible' (1880); 'Church and State in the United States' (1888); 'Literature and Poetry' (1890).

Schaffhausen, shāf'how-zhēn, Switzerland: (1) capital of the canton of its own name, situated on an eminence overlooking the Rhine, 24 miles north of Zürich. It is quaintly and irregularly built. The buildings most worthy of notice are the feudal castle of Munot, of Roman construction, standing on a commanding height; the parish or Saint John's Church; and the Cathedral (1052), a massive basilica containing a bell whose inscription suggested Schiller's 'Song of the Bell,' and Longfellow's 'Golden Legend'; the town-house (1412); the Imthurneum, containing theatre, concert rooms, etc., the museum containing MSS. collections of Johann von Müller, who was born here, the town library, etc. There are primary and high schools. The environs are beautiful; three miles distant are the celebrated falls of the Rhine, almost 300 feet broad, falling more than 70 feet in three cascades formed by two pillars of rock. The Fäsenstaub is a fashionable promenade. The principal industrial works are the wagon and carriage factories, cotton and woolen manufactories, iron works, distilleries and breweries. Pop. (1900) 15,275. (2) The canton of Schaffhausen covers an area of 113½ square miles, and occupies the most northern angle of the Swiss territory. It belongs to the Swabian Jura, and the population uses almost exclusively the German tongue. The canton entered the Swiss Confederation in 1501, and by the Constitution of 1876 became exceedingly democratic. Education is compulsory. The taxes are very low. Financially it is the most favored among the Swiss cantons. All the cereals are raised, besides hemp and flax. There is abundance of fruit, especially grapes. The principal manufactures are: aluminum, wagons, wool, ropes, and watches. Pop. (1900) 41,514.

Schäffle, shā'flē, **Albert Eberhard Friedrich**, German political economist and sociologist: b. Nürtingen, Württemberg, 24 Feb. 1831; d. Stuttgart 24 Dec. 1903. He was educated for the ministry at Tübingen but adopted a journalistic career. In 1861 he was called to the University of Tübingen as professor of political economy, and in 1868 to Vienna. His principal contributions to the literature of political science are his 'National Economy' (1873); 'Capital and Socialism' (1870), and 'The Fundamental Principles of Taxation' (1880). In 1895 he began to write upon sociological questions and to develop the biological theory of society. His 'Bau und Leben des sozialen Körpers' is a

more detailed attempt to explain society as a living organism than that essayed by any previous writer. This book, completed in 1890, placed him in the ranks of modern sociologists.

Schalcken, shāl'kēn, **Godfried**, Dutch artist: b. Dordrecht 1643; d. The Hague 16 Nov. 1706. He was the pupil of Samuel van Hoogstraten, and Gerard Dow. He visited England where he executed portraits, especially one of William III. His best work is in genre, and here he approached though still remained inferior to his master Dow. He was fond of representing scenes by candle light, though he was scarcely ever quite true in the color representation of such light. When he attempted portraits in full length, as the fashion of the time of Sir Godfrey Kneller demanded, his efforts were not successful, with the possible exception of the portrait of William III., now in the Amsterdam Museum. Some of his best works are at the museums of Vienna, Dresden, Munich, Berlin, Amsterdam, The Hague, and at the Louvre.

Schamyl, shā'mīl (SAMUEL), Tartar imam and warrior, leader among the tribes of the Caucasus: b. Aul Himri, northern Daghestan, 1797; d. Medina March 1871. From 1824 to 1831 he took energetic part in Kasi Mollah's "holy war" against the infidel Russians, being severely wounded at the storming of Himri. A Sufi, he labored for the recrudescence of his faith in Daghestan, and was markedly successful. From 1837 he was temporal and spiritual head of the mountain tribes. His guerrilla method of warfare long enabled the Circassians to continue the struggle against Russia. During the Crimean war he was supplied by the allies with arms and money. After incredible escapes he was at last taken (6 Sept. 1859), and kept under surveillance, though treated with consideration.

Scharf, shārf, **Sir George**, English artist: b. London 16 Dec. 1820; d. Westminster 19 April 1895. He studied art under his father, a Bavarian artist who had settled in England, and in 1838, after gaining medals from the Society of Arts, entered the Royal Academy schools. In 1840 he visited Asia Minor and again in 1843 as draughtsman to a government expedition. On his return he devoted himself to painting in oil and to book-illustration, among the books illustrated by him being Murray's 'Prayer Book,' Macaulay's 'Lays,' Milman's 'Horace,' Kugler's 'Handbook of Italian Painting,' Layard's books on Nineveh, Keats' Poems, and Sir W. Smith's Classical Dictionaries. He rendered valuable assistance to the Crystal Palace authorities in planning the Greek, Roman, and Pompeian courts, and to Charles Kean in his Shakespeare revivals of 1851-7. He was art secretary to the Manchester exhibition of 1857, and on the foundation of the National Portrait Gallery he began to make a special study of portraits, on which he soon became a recognized authority, and in 1882 he received the title of director of the gallery. His publications comprise: 'Recollections of Scenic Effects' (1839), the part on sculpture in Waring's 'Art Treasures of the United Kingdom' (1857). To his great knowledge and industry the National Portrait Gallery owes almost its whole value.

Scharf, John Thomas, American historian: b. Baltimore, Md., 1 May 1843; d. there 28 Feb. 1898. At the outbreak of the Civil War he entered the Confederate army, was engaged in the battles around Richmond, at Cedar Mountain, the second battle of Bull Run and at Chancellorsville, and in 1863 became a midshipman in the Confederate navy. He participated in the capture of the Underwriter, near New Berne, N. C., and after the blockade was established he again joined the army. While on his way to Canada with despatches he was captured. In 1874 he was admitted to the bar, was a member of the legislature in 1878 and in 1884 he was appointed commissioner of the land office of Maryland. He was editor of the Baltimore 'Telegram' and of the 'Morning Herald,' and wrote: 'Chronicles of Baltimore' (1874); 'History of Maryland' (3 vols. 1879); 'History of the Confederate States Navy' (1887); 'Natural and Industrial Resources and Advantages of Maryland' (1885-90); etc.

Scharnhorst, shärn'hörst, Gerhard Johann David von, Prussian general: b. Bordenau, Germany, 12 Nov. 1755; d. Prague 28 June 1813. He entered the Hanoverian army in 1780 and soon distinguished himself as an officer of artillery. In 1804 he was knighted by the king of Prussia, and in 1813 attained the rank of general in the Prussian army. In the reorganization of the army of Prussia in 1809-13 he proved himself an able general. The national spirit, awakened by the loss of the territories west of the Elbe, was greatly augmented by the genius of Scharnhorst, who infused the military spirit throughout the scattered populations of the Prussian domain by raising a large and well disciplined volunteer army for the war of Liberation. In this campaign he was chief of staff under Blücher, but was mortally wounded at the battle of Lützen. Consult 'Life' by Lehmann (1886-7); von Boyen, 'Erinnerungen' (1891).

Schechem, shëk'ëm, Palestine. See **NABULUS**.

Schechter, shën'tër, Solomon, American theologian and Orientalist: b. Fokshan, Rumania, 1847. Participating in the rabbinical training given to Jewish children of his environment, in maturer years he attended the Berlin and the Vienna universities, and was graduated as rabbi in Venice. He was reader of Semitics, Cambridge University, England 1892-1902, and professor of Hebrew at University College, London 1898-1902. He traveled in Italy, Egypt, and Palestine, and made interesting discoveries of MSS. in Cairo, of peculiar value to students of the Old Testament. He has written: 'Aboth de Rabbi Nathan' (1887); 'Studies in Judaism' (1896); 'The Wisdom of Ben Sira' (1899), and since 1902 has been president of the Jewish Theological Seminary of New York.

Schedone, shā-dō'nā, or Schidone, Bartolommeo, Italian painter: b. Modena about 1570; d. there 1615. He acquired an admirable style by a careful and long continued study of Correggio, and his natural genius under the inspiration of that master enabled him to produce a great number of graceful and delicate pictures, both in fresco and oils. His portraits are the most remarkable of his productions and he

Painted many of the principal citizens of his native town. He also executed a great many religious paintings, and was a successful etcher.

Scheele, shā'lë, Karl Wilhelm, Swedish chemist: b. Stralsund 9 Dec. 1742; d. Köping 21 May 1786. His early education was received at Gothenburg. In 1770 he was made assistant professor of chemistry at Upsala, and there became celebrated as one of the greatest scientists of his time. His independent discovery of oxygen, a few months after that of Priestley, places him in the front ranks of the early physicists. He is known also as the discoverer of tartaric acid, chlorine, baryta, glycerine, and prussic acid. A new coloring matter commonly known as Scheele's green, was obtained by his experiments with arsenic. He was the author of: 'Chemical Observations and Experiments on Air and Fire' (1777); 'Essay on the Coloring Matter in Prussian Blue' (1782).

Scheelite, native calcium tungstate. A mineral often found in crystalline quartz, associated with cassiterite, topaz, fluorite and wolframite. It is distinguished by its high specific gravity, 5.88 to 6.14, moderate hardness, 4.5 to 5, vitreous to adamantine lustre, the pyramidal hemihedrism of its tetragonal crystals, and their eminent pyramidal cleavage. Its streak is white, but its superficial colors vary greatly, white, yellowish or brownish being the most common. It is a widely distributed, though not an abundant mineral, its occurrences in Bohemia, Saxony, Piedmont, and England are the best known, while in Tasmania and at Trumbull, Conn., it is found in commercial quantities and has been mined as an ore of tungsten. Molybdenum is usually present replacing part of the tungsten.

Schefer, shäf'ër, Leopold, German author: b. Muskau, Lower Lusatia, 30 July 1784; d. there 16 Feb. 1862. After a gymnasial training, he devoted himself to literature, the only post he held being that of superintendent of the estates of Count Pückler, with whom he made in 1816-20 a journey to Italy and the East. His study of Oriental philosophy and religion appears in much of his verse. His works of fiction, structureless and vague in characterization, are greatly inferior to his poetry, which is collected in such volumes as: 'Vigilien' (1842); 'Gedichte' (3d ed. 1846); 'Das Laienbrevier' (1834; 18th ed. 1884); and 'Der Weltpriester' (1846). The last two were turned into English by C. T. Brooks (q.v.), as 'The Layman's Breviary' (1868), and 'The World Priest' (1873). Schefer was also something of a composer, writing an opera ('Sakontala') and several quartettes. His 'Ausgewählte Werke' appeared in 1845-6 (2d ed. 1857). Consult the biography by Brenning (1884).

Scheffel, shëf'fël, Joseph Victor von, German poet: b. Karlsruhe 16 Feb. 1826; d. Karlsruhe 9 April 1886. He was educated for the law at Heidelberg, Munich, and Berlin, but gave up his legal career almost as soon as it was begun for that of literature. His first and greatest book, 'Der Trompeter von Säckingen,' appeared in 1854. This poetic romance of the Thirty Years' war reached its 100th edition in 1891. His second book, a romance in prose entitled 'Ekkehard,' was also one of the most

popular of German love stories. His other works are: 'Hugideo' (1884), and 'Gaudeamus' (1867-91); both romances; 'Frau Aventiure' (1863-83); 'Bergpsalmen' (1870-83); 'Waldensamkeit' (1880). Consult: *Lives by* Pröess (1887); Ruhemann (1866); Pilz (1887), and Zernin, 'Erinnerungen' (1886).

Scheffer, shĕf'fēr, **Ary**, Dutch painter: b. Dort, Holland, 1795; d. Argenteuil, near Paris, 15 June 1858. At an early age he sought Paris to study for the profession of an artist. Here he became a pupil of P. Guérin. His first picture, 'Abel singing a Hymn of Praise,' was exhibited in 1812, and at once established his reputation. In 1817 he produced the 'Death of Saint Louis'; in 1819 the 'Surrender of Calais to Edward III.'; and in 1822 'Francesca da Rimini.' Of extremely versatile talents, Scheffer

traversed a very wide field in the domain of art, and his pictures comprise subjects both sacred and secular, historical and imaginative. Of the first of these the most celebrated are 'Christ Blessing Little Children'; 'The Agony in the Garden'; and 'Christ the Comforter.' From the writings of Goethe he has produced some admirable works, such as 'Margaret,' 'Mignon,' the 'King of Thule,' and others; from Dante, 'Beatrice,' from Byron, 'Medora'; and from Schiller, 'Eberhardt.' Scheffer's pictures are principally remarkable for the refinement of expression and depth of feeling which they display. They are highly prized by collectors and a small replica of 'Paolo and Francesca da Rimini' was sold in 1870 for \$9,607. Many of his chief works are in the Luxembourg or at Versailles.
